DEADLINE TO ORDER ITEMS: **Thursday, May 21st, 2026**

When Ordering **Grass Carp** Please Complete the Following:

County: _____ Township _____ Pond Size _____ Acres

## LARGEMOUTH BASS

Largemouth bass are the primary predator in midwest bodies of water. They will feed on live fish and spawn every spring.

## CHANNEL CATFISH

Channel catfish are classified as a scavenger. Their diet ranges from live fish to crayfish, to commercial fish food. They will rarely reproduce in small ponds, unless provided with the appropriate structures.

## BLACK CRAPPIE

Black Crappie are a known predator whose dietary needs are equivalent to those of a largemouth bass. Black crappie typically do not perform exceptionally well in ponds less than 5 acres due to competition for live forage. Black crappie will spawn once a year.

## TRIPLOID GRASS CARP

Triploid Grass Carp are introduced into a pond to control or eliminate vegetation growth. The diet of a grass carp consists of a variety of species of vegetation.

## STANDARD RECOMMENDATIONS

600 BLUEGILL
200 LARGEMOUTH BASS
100-200 CHANNEL CATFISH
100-200 REDEAR SUNFISH
100-200 HYBRID BLUEGILL
12-18 TRIPLOID GRASS CARP
20# FATHEAD MINNOWS

- PER SURFACE ACRE -

## REDEAR SUNFISH

Redear Sunfish thrive on a diet that consists mainly of snails, worms, and insects. The diet of a redear makes them a wonderful aid in controling or eliminating parasites within a body of water. Redear Sunfish will reach a mature size larger than that of a bluegill and will spawn once a year.

## BLUEGILL

Once mature, bluegill spawn 3 times a year. The prolific reproduction of the bluegill creates a substantial source of forage for the predator population of a body of water. We recommend a ratio of 3 bluegill to every 1 predator fish in order to sufficiently support the nutritional needs of the predator population.

## HYBRID BLUEGILL

Hybrid bluegill are the product of a female sunfish and a male bluegill. Hybrid bluegill reach a mature size larger than a straight bluegill and are known for being a more aggressive pan fish. Hybrid bluegill rarely reproduce due to the fact that roughly 80% of the population are males.

## FATHEAD MINNOWS

Fathead minnows are introduced into a pond as a forage source for predators. They rarely reach a size larger than 3" and will reproduce every 3 weeks.
