

## Luminosa 150 Oak Log Fuel Bed Arrangement

Fit the log **LED Brackets** to the fuel bed as shown on page 13 then position the **Large Ember Pieces** as shown below.

Position one of the taller **Large Ember Pieces** in the centre against the rear screen and place the other pieces along the front edge so that the LED's along this edge shine through the ember pieces. (It will help if the front log lights are turned on to help with good position)

Once the **Large Embers Pieces** are in position add the **Small Black Embers** to cover the fuel bed plate in a single layer.

**Front Log Lights** are in these four locations along the front edge.

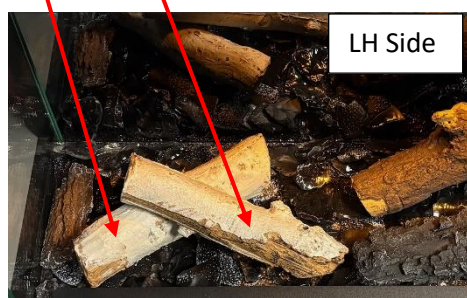

Observe how these **Large Ember Pieces** work with the **Front Log Lights**. Care in positioning these can enhance the overall effect.

Select the **4 Large Log Shapes** that are hollow and position them so the cutout fits over the **Log LED's** and the log is supported by the projections on the bracket. Position them so that their burnt area is to the rear and reflects in the rear screen,

Position the 5 **Solid Birch Logs** two at each end and the **Split Log** in the middle of the fuel bed resting on the **Large Ember**.

Position the remaining **Small Birch Log Pieces**, and the **Bark Pieces** on any open area of the fuel bed

The Finished fuel bed arrangement should generally look like this.
