Coir / Coco Pots – and how to use them!

Dig a hole double the width of the pot you intend to plant. **DO NOT REMOVE THE POT!** Either make a few slits in the top rim of the pot and bend it over or cut the top rim off so the top of the pot is level with the soil inside it. Place the pot in the hole and back fill the hole with soil, taking extra care to cover the coco fibers completely. Any coco fibers that are left above soil level will create a wicking effect and dry out your plant. Water your plant a minimum of 3 times a week for the first two weeks. Within a few weeks the plant should break through the coco fibers and root into the native soil in its new location. The pot will break down and be absorbed by the native soil around it.
