Bedding Area Weed Control

Technician Name: _____

Today, _____, we treated your Ornamental Bedding areas (where possible):
____ With pre-emergent weed control
____ With post-emergent weed control
____ For Bermuda grass control in bedding areas

What To Do Next:

- Keep pets and people off sprayed areas until dry, usually about 1 hour.
- Wait 24 hours or more, then thoroughly water for 15 to 20 minutes. Watering helps maximize the effectiveness of the weed control by moving it into the soil
- Remove dead weeds from beds.
- Hand weeding and regular bed maintenance will still be necessary.

When can I expect to see results?

- Broadleaf weeds typically will begin to change color and start dying in 5-10 days.
- Bermuda grass and grassy weeds often show symptoms after approximately 7-10 days.
- REMEMBER: Notify us when re-mulching the bedding areas. Pre-emergent needs to be applied on top of the new mulch for best results in controlling new weed germination.

Client Portal: View your account and make payments online. Visit PersonalLawnCare.com and click “My Account.” To create or access your account, enter your Client ID (found on the upper right section of your invoice.) For assistance, please call our office.

Keep in mind that these applications are designed to suppress weed growth and deter germination of new weeds. It may not provide total weed control in your beds. Therefore, it will still be necessary to hand weed and provide regular bed maintenance.

Please note that these products are most effective when a bed is mulched regularly and typically provide reduced effectiveness when no mulch is present.

Thank you for the opportunity to service your lawn! Please let us know if there are any questions.
