

IIb.

I LOOP and the technology behind it

- I LOOP is a device capable of restoring the body's natural electrical energy. I LOOP conditions the energy for acceptance by the body, reads, through its biofeedback capability, the result of this energy frequency and the software algorithms then determine which frequency the body requires next. This results in the body's electrical energy levels achieving peak levels. When our body is at peak energy we call this Redox Equilibrium which then enables the elimination of inflammation and cellular regeneration. In other word pain is gone and the body area of pain begins to heal. This is in effect promoting healing rather than blocking the pain signal. Other benefits are biological increases such as ATP production increases and other biomarkers that improve healing.
- I LOOP exists in the form of a clinical device. This device needs to be reduced in size and cost. We have a plan in place to build the current generator with biofeedback as a small box that will hang on the patient's waist. This device will connect to the hands and feet and be controlled through a phone app with the software in the cloud.
- The technology/knowhow is contained in the software algorithms. The algorithms are our primary IP. They are patentable according to "Allices rule" which allows patent of algorithms when they drive a medical device.
- The black box needs to be designed and engineered. We will use contractors to achieve this and they will also be able to submit application for FDA certification. The app and software will be achieved by current software contractor that wrote the original software. Software is currently in Windows but needs to be converted to Android for cloud application. The software is protected by various technologies will be written to be cyber safe.
- We have allowed up to 12 months to re-engineer and receive FDA 510k certification. It is possible that we will achieve this sooner thus speeding our market debut.
