

VII b

Key risks and mitigations

The i-loop project, thanks to its uniqueness, its ability to address pain by interacting with the underlying cause without side effects, and the scenario resulting from market analyses, presents no implementation challenges.

Furthermore, statistical data predicts an increase in pain sufferers that will ensure unimaginable demand for this technology.

Some studies show a 45% increase from 2024 levels in 10 years or less.

One challenge could be, the discovery of some miracle, that can resolve pain without side effects. We are not aware of any at this time.

Having dedicated over twenty years to this project, we have considered every possible variable to ensure its results and the resulting business performance.

Our passion, dedication, and personal involvement are further guarantees of verification, monitoring, and development for the project's success.

The FDA would be considered a risk but because our device has electrical outputs similar to TENS and IFC devices the approval of our device will be similar to these devices which are approved routinely.
