Reading the stars

Every bull in this draft has been genomically tested with **RePRO BI**, the multi-breed test built for northern-adapted cattle. Seven of the eight traits are rated out of five stars against the rest of the northern reference herd, with his percentile shown beside them.

More stars is better on all seven. A high puberty rating means his daughters are expected to cycle earlier. A high temperament rating means quieter cattle in the yards. Hip height is the one exception and keeps its own ladder.

THE STARS

Five stars is the top fifth of the reference herd, one star the bottom fifth. The figure beside them is his percentile.

HIP HEIGHT READS DIFFERENTLY

Frame is not a more-is-better trait. Taller sits at the top and shorter at the bottom, so read it against the country he is going to.

What each trait means for you

Wt Liveweight

Growth and mature size. Bulls higher up the ladder put more weight on their progeny by turn-off.

HH Hip height, read differently

Frame size, taller at the top to shorter at the bottom. Read it against the country he is going to.

BCS Body condition

Ability to hold condition. Cattle that carry condition through the dry hold together in tougher country.

Pub Heifer puberty

How early his daughters reach puberty. Earlier heifers get in calf sooner and stay in the herd longer.

P4M Rebreed

How quickly his daughters resume cycling while lactating — the trait behind a tight calving pattern.

Temp Temperament

Docility in the yards. Quieter cattle handle better, bruise less and gain more on feed.

Tick Tick resistance

Natural resistance to cattle tick burden. Higher-ranking bulls cut chemical treatments and lost condition in tick country.

Fly Fly lesion

Resistance to buffalo fly lesions. Higher-ranking cattle carry cleaner hides and hold condition through the wet.
