

# Global Warming and CO<sub>2</sub>

## Challenging the Cause of Global Warming: Myth vs Reality

Given my background as a professional geologist and geophysicist, I was surprised by claims that mankind was causing a **“climate change crisis”**. I was aware of prior ice ages, climate change and changing sea levels that occurred throughout geologic history and well before mankind arrived. I was also aware that CO<sub>2</sub> is essential for plant life. This drove me to research this subject in much more detail and start the Jersey Climate Forum.

Graeme Phipps

Professional Geophysicist and Geologist

President of the Jersey Climate Forum

# Global Warming and CO<sub>2</sub>

## Challenging the Cause of Global Warming: Myth vs Reality

This presentation shows the results of extensive research into this subject obtained from 37 books, 300 articles, 150 videos and 64 well-respected and highly competent scientists and professionals.

These results are contrary to what is being said in mainstream media and have important implications for future Jersey Government actions and expenditures.

We formed an association called the Climate Forum to further evaluate these implications.

For my comprehensive research presentation, see:

# Global Warming and CO<sub>2</sub>

Quote from Thomas Drolet

**“Two prevalent myths are damaging our economy and hurting the less fortunate:**

- 1) that greenhouse gases, chiefly carbon dioxide, are causing dangerous global warming; and**
- 2) that wind and solar can easily replace fossil fuels, nuclear, and hydro in electricity generation.**

**Both are false yet widely accepted. ”**

Thomas S. Drolet has had a 57-year international career in many phases of Energy, including Nuclear Power, Fusion Power, Nuclear Fuel Supply, major projects in Coal, Natural Gas, Distributed Generation, Oil and other Renewables (Geothermal, Hydroelectric, Solar and Biomass). He has advised on a variety of management and energy-associated issues.

# Global Warming and CO<sub>2</sub>

## Climate Crisis Realities: Cost Concerns

### Jersey's going "Carbon Neutral" makes no detectable impact

- Jersey pumps 403,000 metric tonnes of carbon dioxide into the atmosphere each year which is 0.001% of the world's 36,000,000,000 metric tonnes

### £60 to 360 million Cost for Jersey to go "Carbon Neutral"

- All new cars will have to be electrically powered (£17,000 to £40,000+) plus costs to install electric charging stations across Jersey (Cost/station times x # of stations will be significant)
- The need to strengthen car parks - may not be able to handle the added weight of electric cars;
- Houses will require wall and roof insulation (35,000 homes at £12,000/home, totalling £420 million), all house heating and cooking systems using oil or gas must be removed and replaced (
- All processed food produced outside of the island will need to have the carbon value of its production included.
- Council for Climate Change annual administration costs
- Social cost - Travel to and from the island by air and sea will also need to be curtailed.
- Safety concerns from electric car "blow-up" fire concerns

# Global Warming and CO<sub>2</sub>

## Climate Crisis Realities: Implementation Concerns

**What does “the Science” really say about the “Climate Crisis” due to CO<sub>2</sub>?**

**What are the actual costs to the Jersey Government and Jersey citizens?**

**What are the transition implications of going “Carbon Neutral” and is it doable?**

**What are realistic and cost-effective electric supply options?**

**What is the rest of the world’s governments doing (recent trends)?**

# Global Warming and CO<sub>2</sub>

## Climate Crisis: Myth vs Reality

**“The Science” Doesn’t Support a CO<sub>2</sub> Climate Crisis:**

**More CO<sub>2</sub> is good**

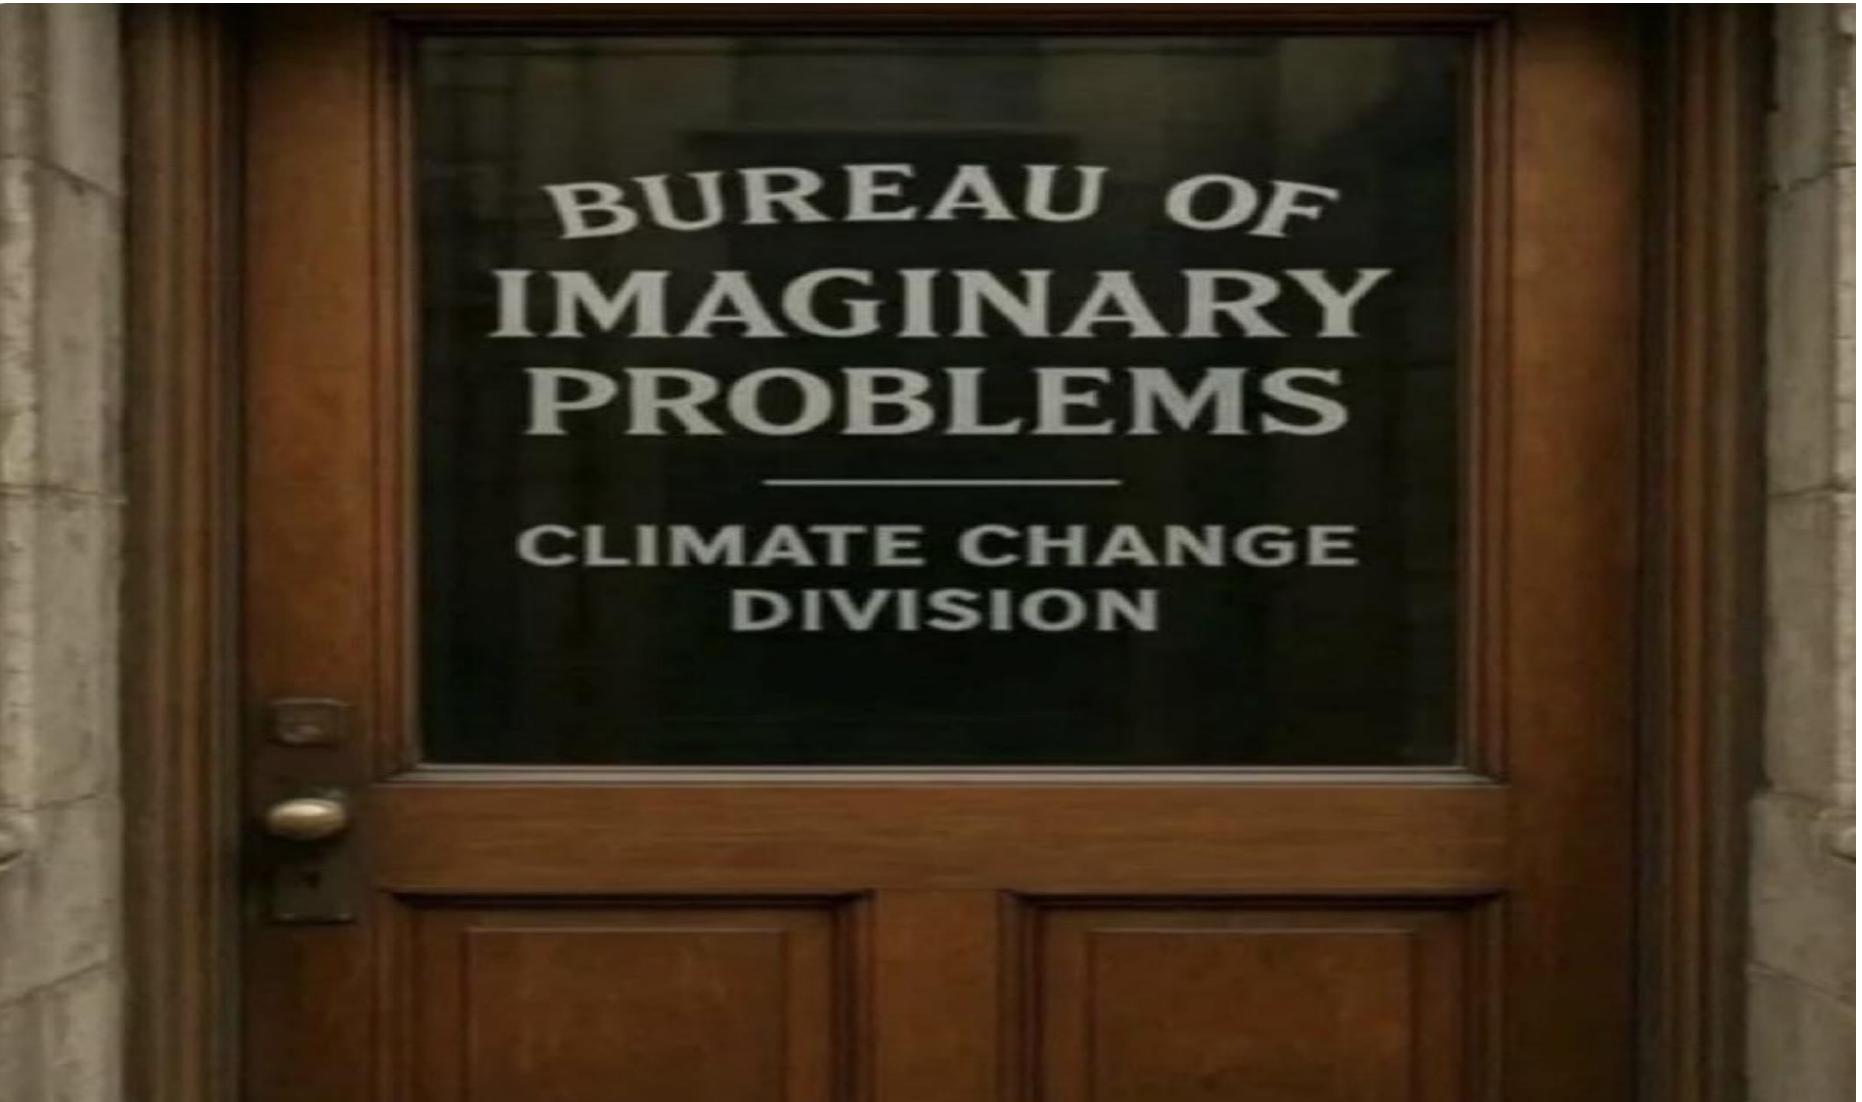

**Warmer temperatures are good**

**Global Warming is not caused by increased CO<sub>2</sub>**

**We are not in a “Climate Crisis”**

## 1+C Increase in World Temperatures is Catastrophic: Myth vs Reality

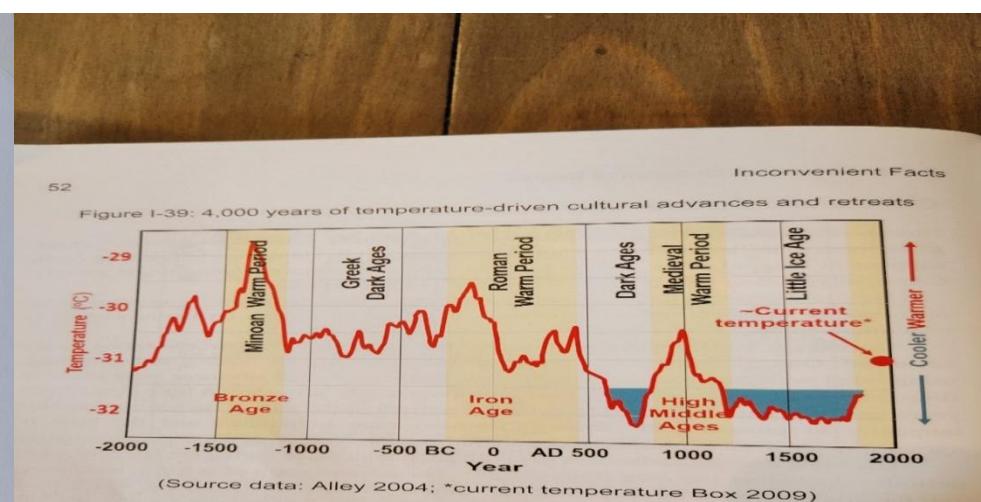

### Reality - Warming of a Few Degrees C is Good

- Changing temperature is a natural phenomenon that has occurred throughout the Earth's history and was much higher than at the present time.

Earth's Temperature History

Temperature –Driven Cultural Advances and Retreats.

As we saw earlier, scientific measurements from ice and sediment cores indicate that the Minoan Warm Period was much hotter than today. This Inconvenient Fact is supported by historical documentation such as the growing of millet as far as Scandinavia—an activity that occurs today only in tropical or subtropical regions.

- Historically, mankind thrived under warmer temperatures than today.
- Significantly more people have died related to cold versus warm temperatures.
- Climate-related disaster deaths have decreased by 98% over the last century.
- 60,000 years ago, Jersey's sea levels were 100m lower than today

# Global Warming and CO<sub>2</sub>: 1) The Science

## Natural events impact the changing atmosphere

### Reality - Natural events impact the changing atmosphere

#### Hunga Tunga Ha'apai Volcano Impacts Global Atmosphere

The eruption of the Hunga Tonga-Hunga Ha'apai volcano 490 feet under the waves on January 15, 2022, blasted an enormous amount of water and volcanic gases into the sky, higher than any other eruption in the satellite era. This underwater explosion sent 146 million tons of water from the South Pacific Ocean into the stratosphere.<sup>[60]</sup> changing the water composition of Earth's atmosphere and potentially heating it up *for years*. In just a few days, the superheated water from the Hunga Tonga eruption blanketed the entire globe, pole to pole, East to West. It caused the most intense atmospheric explosion ever recorded by modern instruments.

The amount of water vapor ejected was 10 percent of the stratosphere's typical stock.<sup>[61]</sup> It was enough to temporarily warm the surface of Earth. It is estimated that an excess of water vapour should remain for 5–10 years.<sup>[59]</sup> Hunga's eruption broke all records for injection of *water vapor*—the most powerful greenhouse gas— into the atmosphere. [NASA](#)

# Global Warming and CO<sub>2</sub> 1) “The Science”

## Climate Crisis due to Added CO<sub>2</sub>: Myth vs Reality

### Reality – CO<sub>2</sub> is not the Major Cause of Global Warming

- Over geologic time, global temperatures changed independently of changing CO<sub>2</sub> levels, which have generally been decreasing **over the last 150 million years**.
- Under glaciation periods, CO<sub>2</sub> increases in response to temperature increases (650 to 6000 years after) and therefore does not cause these temperature increases.

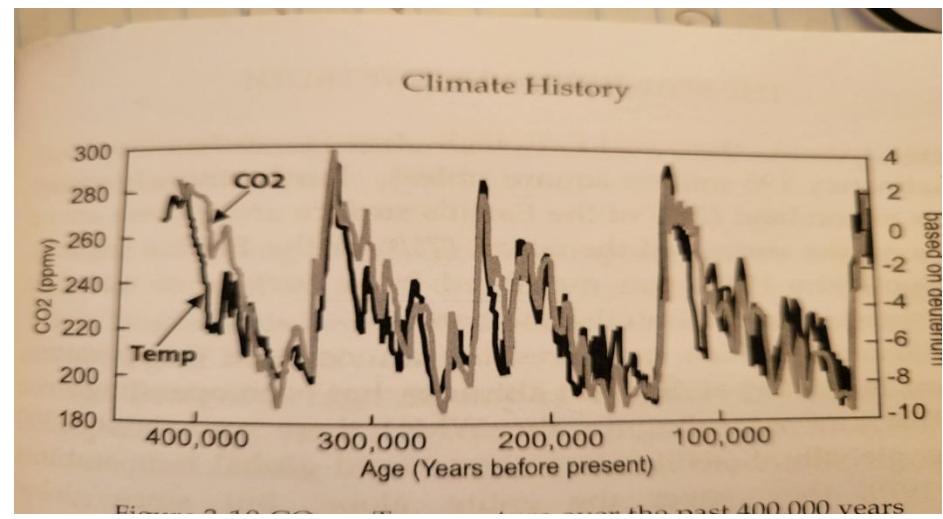

1. Analysis of the Temperature Oscillations in Geological Eras by Dr. C. R. Scotese © 2002, J. Ruddiman, W.F. 2001, Earth's Climate: past and future W.H. Freeman & Sons, New York, NY. 3 - Mark Pagani et al.,

Marked Decline in Atmospheric Carbon Dioxide Concentrations During the Paleocene, *Science*, Vol. 309,

No. 5734; pp. 600-603. 22 July 2005. [Reprinted on 07 July 2008 (CO<sub>2</sub>: Ordovician Period)].

Reconstructed atmospheric carbon dioxide concentrations (Berner, 2001) & global mean surface temperature (Scotese, 1999) over the last 550 million years.

- Many factors impact climate, the biggest factor being the Sun.
- Solar activity and climate changes closely correlate.
- The rate of glacier shortening and ice melting and sea level rise has remained <sup>10</sup> constant since 1825 and has not been impacted by recent, higher CO<sub>2</sub> levels.

# Global Warming and CO<sub>2</sub> 1) “The Science”

## Climate Crisis due to Added CO<sub>2</sub>: Myth vs Reality

**Henry’s Law** explains why warmer temperatures cause higher CO<sub>2</sub> levels and not the other way around, as is claimed by those supporting a CO<sub>2</sub> driven climate crisis.

Henry’s Law states that, at a constant pressure, the amount of gas that dissolves in a liquid is proportional to the partial pressure of that gas above the liquid. Henry’s Law itself is about pressure, but **the Henry’s Law constant is temperature-dependent**.

In practice, **warming fluids hold less gas. This is well-established physical chemistry.**

This principle is **uncontroversial** and accepted by physical chemists, oceanographers and climate scientists.

**Temperature effect is important in understanding the warming ocean’s release of CO<sub>2</sub>**

- As temperature increases, the solubility of most gases in liquids decreases.
- Warm water holds less dissolved gas than cold water. Cold oceans can hold more CO<sub>2</sub>.
- Warm oceans release CO<sub>2</sub> more easily

Why this happens: Gas molecules are only weakly bound in a liquid. When the liquid warms up, molecules move faster and it’s easier for dissolved gas molecules to escape back into the atmosphere

# Global Warming and CO<sub>2</sub> 1) “The Science”

## Danger of Adding More CO<sub>2</sub>: Myth vs Reality

### Reality - More CO<sub>2</sub> is Good for Life in Our World

Carbon dioxide has two relevant properties: as a creator of food and oxygen, and as a greenhouse gas

- Greenhouse gases keep the world warm; humans could not exist without them..
- CO<sub>2</sub> levels have been more than 10 times higher throughout geologic time.
- CO<sub>2</sub> levels were dropping to a recent low of 180 ppm. A further 30 ppm decline in atmospheric CO<sub>2</sub> would have brought about the end of life on Earth.
- Tests prove that plants grow much better with higher CO<sub>2</sub> levels
- NASA satellite images show the world has been greening with increases in CO<sub>2</sub>.
- Crop yields have also improved significantly with increased CO<sub>2</sub>.
- The Greenhouse effect of adding more CO<sub>2</sub> is now small. Doubling CO<sub>2</sub> from 400ppm to 800ppm, according to basic physics, is only 0.71 °C of warming. The Earth’s historic temperatures and CO<sub>2</sub> levels back this.
- Climate models are wrong, significantly overestimating actual climate change

# Global Warming and CO<sub>2</sub> 1) “The Science”

## We Are Facing a Climate Crisis: Myth vs Reality

### Reality - We Are Not Experiencing or Facing a Climate Crisis

- Extreme weather events show no long-term trend that can be attributed to human influences or CO<sub>2</sub>
- Hurricanes, tornadoes, heat waves, droughts, floods, forest fires and ocean acidification are not increasing.
- Polar bear population has been increasing since 1960. Coral reefs have been expanding.
- Since the melting of the North American ice cap, sea level rise has decreased dramatically and has been comparatively stable over the past 6,000 years.

**This is what catastrophic sea-level rise actually looks like**

- All prior Climate Crisis predictions have been proven to be false
- Projections of future climate-based disasters are based on faulty climate models. There are no reliable climate models that can accurately replicate the past or future predictions

# Global Warming and CO<sub>2</sub>: 1) “The Science”

Warmer temperatures and higher CO<sub>2</sub> are good for mankind and nature

- For most of the last 10,000 years, temperatures were higher than today.
- The Earth has experienced 20 times the present CO<sub>2</sub> levels and life has prospered
- CO<sub>2</sub> is essential to terrestrial and marine life. Increases in CO<sub>2</sub> are beneficial and result in the creation of surplus food, plus expansion of both vegetation and forestation.
- The Earth is greening with higher CO<sub>2</sub> and beneficial to humans; crops harvested worldwide have increased dramatically.
- Mankind has historically prospered in up to 2°C+ higher average temperatures than today but did poorly under colder temperatures
- Significantly more deaths occurred under colder temperatures than warm temperatures.
- The polar bear population has been increasing since 1960. Coral reefs have been expanding.
- Extreme weather events show no long-term trend that can be attributed to human influences or CO<sub>2</sub>
- Hurricanes, tornadoes, heat waves, forest fires and ocean acidification are not increasing.
- Projections of future climate-based disasters are based on faulty climate models. There are no reliable climate models that can accurately replicate the past or predict the future.

# Global Warming and CO<sub>2</sub>: 1) “The Science”

Reputable scientists disagree that mankind’s emissions of CO<sub>2</sub> is causing a climate crisis

*There is consensus that temperatures have been and are increasing and that mankind has increased CO<sub>2</sub> levels. However, there is no consensus regarding the degree to which mankind’s CO<sub>2</sub> emissions are impacting temperatures or that this is causing a climate crisis.*

A large and increasing number of world-renowned scientists speak out against this, including:

Dr. John Christy, professor of Atmospheric Science, Director of Earth System Science Center U. of Alabama

Dr. John F. Clauser has degrees from Caltech and Columbia Universities, a Nobel Prize winner in science

Dr. Judith Curry climatologist, former chair Earth and Atmospheric Sciences Georgia Institute of Technology

Dr. Ivar Giaever professor emeritus at the Rensselaer Polytechnic Institute, Nobel Prize in Physics

Dr. William Happer, Physics professor Emeritus, Princeton Univ., atomic physics, optics, spectroscopy

Dr. Steven Koonin theoretical physicist, and former director Center for Urban Science at New York Univ.

Dr. Richard Lindzen MIT atmospheric physicist on the dynamics of atmosphere and ozone photochemistry

Dr. Patrick Moore, ecologist, UBC, co-founder of Greenpeace

Dr S. Fred Singer, Atmospheric physicist, professor emeritus of environmental science, U. of Virginia

**2000+ Scientists sign World Climate Declaration: THERE IS NO CLIMATE EMERGENCY** stating: i) natural as well as anthropogenic factors cause warming; ii) warming is far slower than predicted; iii) climate policy relies on inadequate models; iv) CO<sub>2</sub> is plant food, the basis of all life on Earth; v) Global warming has not increased natural disasters; vi) Climate policy must respect scientific and economic realities

<https://principia-scientific.com/46-climate-change-denying-statements-made-by-former-ipcc-scientists/>

Many governments are also moving away from or delaying carbon-neutral implementation

# Global Warming and CO<sub>2</sub>: 2) Jersey Impact

Change in Jersey's mean temperature since recording began in 1894 has changed by only about 1.5C over the last 128 years. Summer days to winter nights change over 30C

- Jersey's annual average air temperatures taken from the Maison St. Louis Observatory and recorded from the same site since 1894, show about a 1.5 °C increase over the last 128 years.
- At these rates, the impact on Jersey temperature over the next 100 years would be about 1C, but also would require double the added CO<sub>2</sub> from the prior 100 years (if the temperature is driven by added CO<sub>2</sub>). Mean temperatures from 1990 on may also have been affected upwards by local conditions, including increasing urban siting and the urban heat island effects.
- Jersey temperatures range from night lows of 0C- to day highs of 30C+. Why are we concerned with +°C?

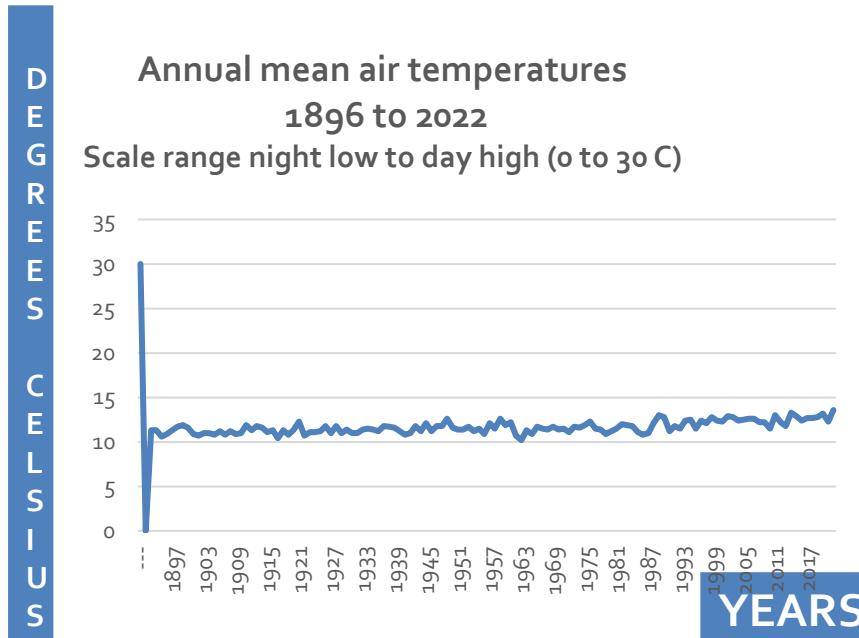

- Reference Jersey Government weather station.

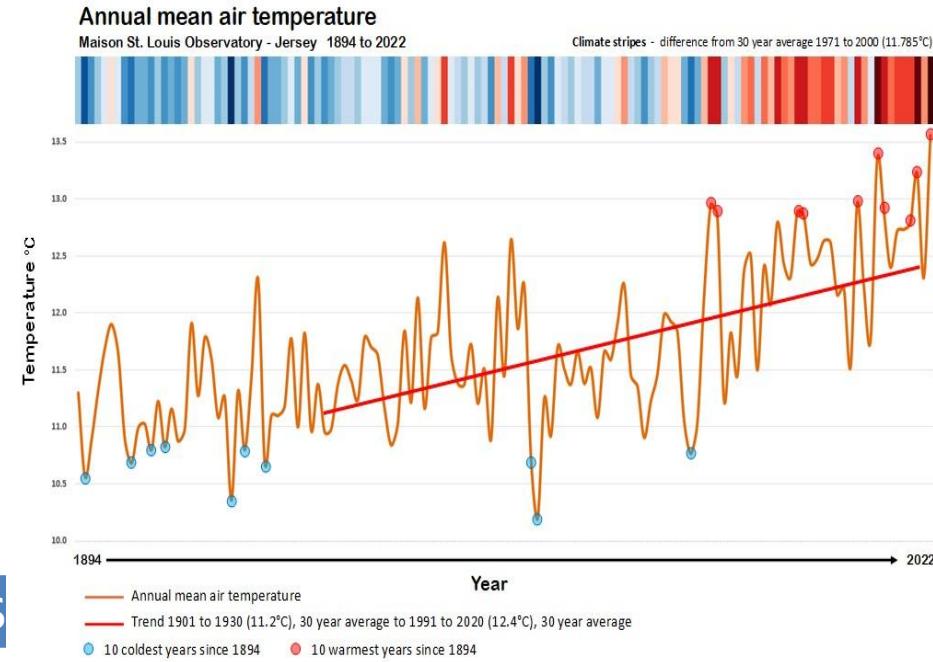

# Global Warming and CO<sub>2</sub>: 2) Jersey Impact

The impact of changing scale of graphs can be very misleading. Scale time and range matters

- These graphs have the exact same data gathered from the Jersey Government weather station
- However, the scales are different with the left graph ranging from 0 °C to 30 °C, which are day-to-night seasonal ranges experienced in Jersey; the right graph, obtained from the Meteorology Department – Jersey Met., ranges from only 10 °C to 13.5 °C, visually magnifying these changes
- Scales chosen can magnify change and mislead the viewer
- Picking proper scales to allow changes to be put in perspective is very important

Reference data from the Jersey Gov. weather station

## Reference graph from Jersey Met.

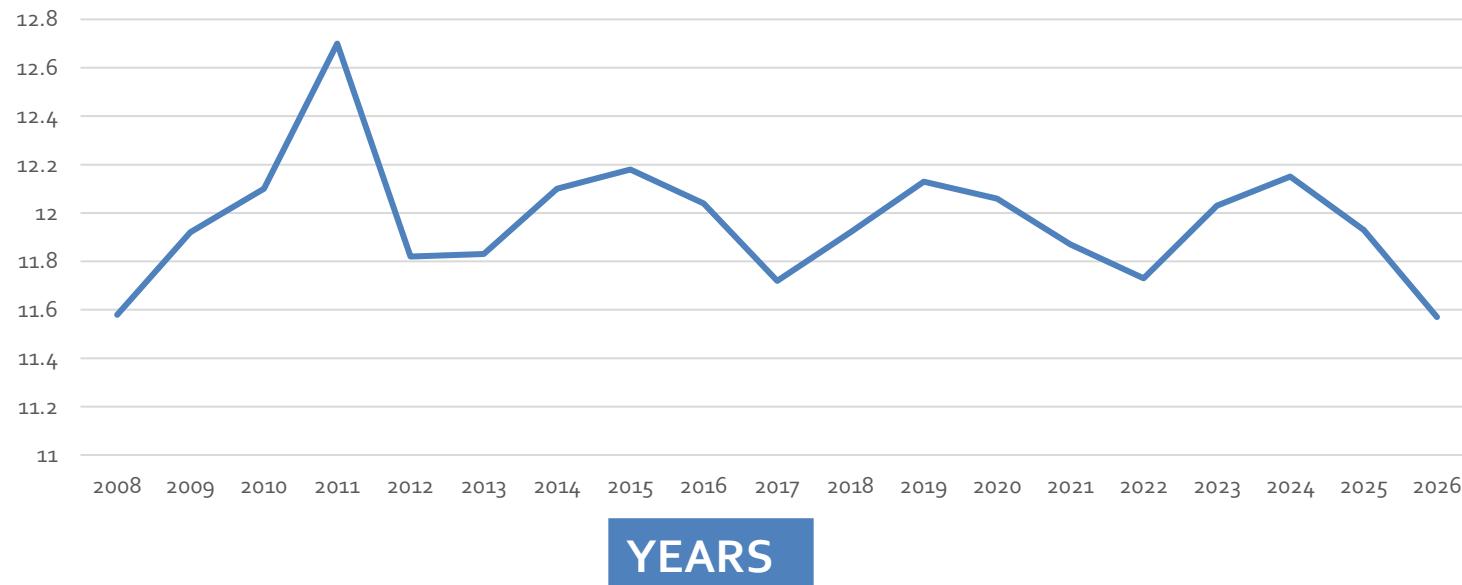

# Global Warming and CO2: 2) Jersey Impact

Minimal change in high tide sea levels since recording tide levels in 2008

- If sea level changes impact Jersey, this will show up during high tide periods.
- Records of tidal ranges since 2008 show high tidal ranges have shown little variance since 2008, with the exception of 0.5 m higher in 2011. Any ongoing increases are small and manageable.
- Recent, available records of high tide levels in Jersey do not show any rise in high tide levels over this 18-year (plus forecast next 4-year) period. Jersey high tide data is not available prior to 2008
- 60,000 years ago, the Jersey sea levels were 100m lower than today

[Trump's Withdrawal From Collapsing Climate Narrative](#)

# Global Warming and CO<sub>2</sub>: 2) Jersey Impact

Jersey going “Carbon Neutral” makes no global impact

It is estimated that Jersey pumps 403,000 metric tonnes of carbon dioxide into the atmosphere each year. However, the world population produces 36,000,000,000 metric tonnes each year, with China now being the biggest emitter with about 10 billion metric tons. (Government of Jersey sourced information). Jersey's going **Carbon Neutral** will reduce the world's carbon emissions by .001% making no difference, but with significant costs

Before proceeding, the Minister for the Environment should outline the precise ‘social, environmental and economic benefits’ that Jersey will experience as a result of being carbon-free by 2050 and the full costs and associated hardships to do so.

# Global Warming and CO<sub>2</sub>: 2) Jersey Impact

Jersey going “Carbon Neutral” makes no global impact

## What is the Jersey Government’s Climate Emergency Investment Plan?

Is spending £35 million over the next 5 years “Value for Money”? Will it make any difference?

£ 3

Climate Emergency Fund		2023	2024	2025	2026
£'000		Estimate	Estimate	Estimate	Estimate
Opening Balance		7,998	5,348	2,486	1,585
Transfer from the Consolidated Fund		4,400	4,400	4,400	4,400
Income		-	-	-	-
Expenditure, of which:		(7,050)	(7,262)	(5,301)	(5,900)
- <i>Policy Development</i>		(300)	(300)	(300)	(300)
- <i>Carbon Neutral Initiatives</i>		(6,325)	(6,577)	(5,001)	(5,600)
- <i>Biodiversity Crisis Initiatives</i>		(425)	(385)	-	-
Closing Balance		5,348	2,486	1,585	85

Table 47: Climate Emergency Fund

- Reference: Jersey 2022 Government Plan
- Note Proposed Budget (Government Plan 2025 – 2028) shows 2025 to 2028 expenditures £21 MM
- **The 2025 budget has £19 million for a “Climate Emergency Fund, but there is no “Climate Emergency” in Jersey**

# Global Warming and CO<sub>2</sub>: 3) Cost Considerations

The actual costs to go “Carbon Neutral” will be significant

Considerable costs for the Jersey public to bear if we are to become carbon neutral by 2050.

- All new cars will have to be electric-powered (£17,000 to £40,000+)
- Costs to install electric charging stations across Jersey (Cost/station times x # of stations will be significant)
- The need to strengthen car parks as they may not be able to handle the added weight of electric cars;
- Houses will require wall and roof insulation (35,000 homes at £12,000/home totaling £420 million),
- All house heating and cooking systems using oil or gas must be removed and replaced (£12,500 to £25,000+)
- All processed food produced outside of the island will need to have the carbon value of its production included.
- Council for Climate Change annual administration costs
- Social cost – Travel to and from the island by air and sea will also need to be curtailed.
- Lord Hammond, former UK Chancellor, states that there are significant true costs (£1 trillion) for the UK to go “Carbon Neutral” and the inevitable consequence of slower rising living standards

<https://www.telegraph.co.uk/politics/2023/07/29/tory-pms-systematically-dishonest-1-trillion-cost-net-zero/>;

- Electric car “blow-up” safety concerns also need to be addressed (recent car ferry sinking, etc.)
- The dominant requirement to source supplies from China (supply and cost risks)
- Jersey’s overall cost has been estimated at between £60 million and £360 million. This may be low. Achieving this ambition of carbon neutrality will mean serious tax increases (2022 Fiscal Study Group)

# Global Warming and CO2: 3) Cost Considerations

Jersey going “Carbon Neutral” does not add value for money nor make any difference

- The 2023 Jersey Government Plan (2023 – 2027) budgeted £30.5 million over the next 5 years to go “Carbon Neutral”.
- Jersey 2022 CO2 amounts to 403,000 metric tonnes. Emissions globally are 36 billion tonnes. (Jersey States Environment Department Source). ~ On this basis, Jersey accounts for only 0.001% of global emissions.
- Jersey going “Carbon Neutral” would have a negligible impact on worldwide CO2 emissions levels and make no difference.
- Based on recent, recorded temperature and tidal trends, changes in the next 100+ years in Jersey are small and manageable
  - Impact of temperature changes is likely about 1° C (not a concern)
  - Given no material high tide rises over the last 14 years, plus low global rate rises, the impact of sea level rise is also not a significant concern. Any likely potential rise over the next 100 years is manageable.
- Spending valuable funds on ongoing “Carbon Neutral” can be better invested elsewhere.

# Global Warming and CO<sub>2</sub>: 3) Cost Considerations

A full cost/benefit analysis and debate is needed

The Fiscal Policy Panel, which is a group of independent economists from the UK who are charged with assessing Jersey's economic future, made it very clear in their annual report last year that "the Climate Emergency Fund will not be sufficient to finance the transition to Net Zero. "The funding strategy will need to consider the careful use of both taxes and expenditure to create the right economic incentive to deliver Net Zero."

## CONCLUSION:

The Jersey Minister for the Environment should outline in clear terms the anticipated full costs and precise social, environmental and economic benefits and changes, along with related hardships, that Jersey will experience as a result of going carbon-neutral by 2050. A full cost/benefit analysis of this initiative should be provided and debated before proceeding further

# Global Warming and CO<sub>2</sub>: 4) Global Trends

Increasing lack of political support for “Carbon Neutral” plans

“a ridiculously small contribution to global warming. they would rise up against the plan. I think politicians in the UK are beginning to realize that and are getting lukewarm about it”

There is clear evidence, from reading the daily UK newspapers and listening to news bulletins on radio and television, that there is a growing unease about Britain’s plans to be carbon-neutral by 2050. Many in the UK government are now realizing that achieving carbon neutrality by 2050 will be extremely expensive. The UK public is also beginning to realize that it is going to have to foot most of the bill for it. There is a growing backlash against the proposals, which is intensifying.

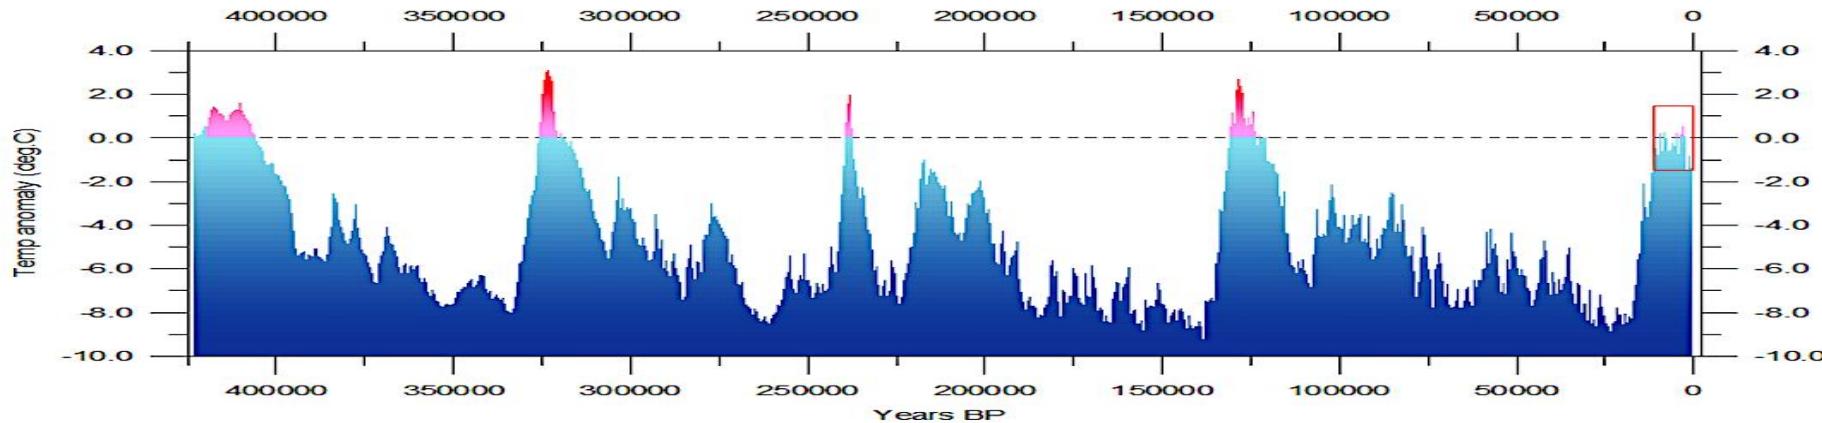

Recent announcements that Britain has approved a new offshore field development and will be approving more than 100 further drilling licenses in the search for more gas and oil fields in the North Sea off Scotland. By voting against ULEZ (Ultra Low Emissions Zone), voters did not necessarily reject net zero, as ULEZ is ostensibly about air quality, not global warming. The by-election hung on an environmental question. The eco side lost.

“If I buy an electric car, the cheapest family-sized model that can go a reasonable distance and climb a hill begins at around £27,000; solar panels are about £7,000; an air-source heat pump £2000-£9,000; insulation of the house to make the pump worthwhile over £2,000; and all this during a cost-of-living squeeze. As laws and targets gradually push net zero from lifestyle choice to mandate, it shifts from “nice idea” to “you must be joking”.

## Statistics Norway Recent Government Report Findings

With Russian gas off the table, US natural gas has real geo-strategic significance. Two-thirds of US LNG exports are now going to Europe. And US gas production is going to continue growing, particularly in the Permian Basin.

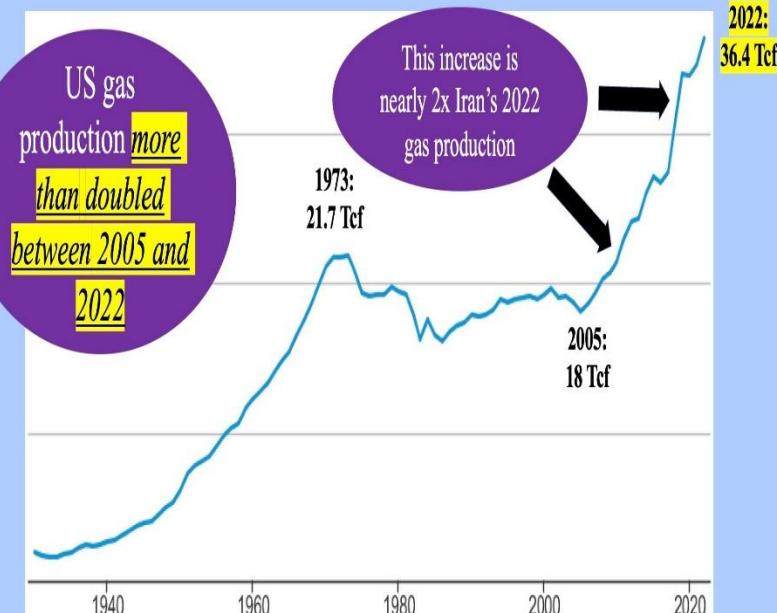

### The oil-shale development impact in US

#### US Oil Production Is Setting New Records: 13.2 Million Barrels/Day

Domestic Oil Production, 1920 to September 2023

#### US Nat Gas Output Is Also Setting Records: 36.4 Trillion Cubic Feet In 2022

Domestic Dry Gas Production, 1930 to 2022

# Global Warming and CO<sub>2</sub>: 4) Global Trends

## 1) Statistics Norway recent Government report findings

- The government agency, Statistics Norway, recently released a [report](#) that concludes that *the effect of man-made CO<sub>2</sub> emissions does not appear to be sufficiently strong to cause systematic changes in the pattern of temperature fluctuations. our analysis indicates that with the current level of knowledge, it seems impossible to determine how much of the temperature increase is due to emissions of CO<sub>2</sub>*
- The report looks at the last 400,000+ years of Earth's climate history: *The preceding four interglacial periods are seen at about 125,000, 280,000, 325,000 and 415,000 years before now, with much longer glacial periods in between. All four previous interglacial periods are seen to be warmer than the present. The typical length of a glacial period is about 100,000 years, while an interglacial period typically lasts for about 10-15,000 years. The present interglacial period has now lasted about 11,600 years. Similarly, on the time scale of recent millennia, current temperatures are nothing unusual: Kobashi et al. (2011) have reconstructed Greenland surface snow temperature variability with a new method that utilizes argon and nitrogen isotopic ratios from occluded air bubbles. These data indicate that warmer temperatures were the norm in the earlier part of the past 4,000 years, including century-long intervals nearly 1°C warmer than the decade (2001-2010).*

# Global Warming and CO<sub>2</sub>: 4) Global Trends

## 1) Statistics Norway Recent Government Report Findings

- *Therefore, it appears that the current decadal mean temperature in Greenland has not exceeded the envelope of natural variability over the past 4,000 years. During the past 10,000 years, temperatures over long periods were higher than they are today. The warmest phase occurred 4,000 to 8,000 years ago and is known as the Holocene Climate Optimum or the Atlantic Period.*
- It criticizes the models on which climate alarmism is based; there is nothing alarming in the observational record. *In the global climate models (GCMs) most of the warming that has taken place since 1950 is attributed to human activity. Historically, however, there have been large climatic variations. Temperature reconstructions indicate that there is a ‘warming’ trend that seems to have been going on for as long as approximately 400 years. Prior to the last 250 years or so, such a trend could only be due to natural causes. The length of the observed time series is consequently of crucial importance for empirically analyzing the pattern of temperature fluctuations and for having any hope of distinguishing natural variations in temperatures from man-made ones.*
- The Norwegians’ defection is important because climate alarmism can survive only if it is deemed an official “consensus,” so that people who point out inconsistent facts can be censored. Once the purported consensus is punctured, it rapidly becomes clear that the Climate Emperor is unclothed.

# Global Warming and CO<sub>2</sub>: 4) Global Trends

Increasing lack of political support for “Carbon Neutral” plans

- The backlash against net zero is intensifying, not because the UK is a nation of climate-change deniers but because the government thinks the magic solution is to impose expensive and flawed technology such as electric cars and heat pumps on everyone. The difference Jersey would make via net zero is dwarfed and outweighed by the impact of China and the 3<sup>rd</sup> world continuing to develop.
- To put that in its context, China and India send 31% of the world’s greenhouse gases into the atmosphere and the UK, which is 19<sup>th</sup> on the list of countries that produce these gases, about 1%.
- Jersey, which produces about 0.007% of global CO<sub>2</sub>, doesn’t even get on the list of the 40 countries, so tiny is our contribution.
- The cancellation of the vast windfarm project off the Norfolk coast as it is not financially worth the cost:
- China is dominating the EV market and the threat to the security of this dominance in sourcing supplies from China

- 15) Statistics Norway recently released a report that concludes: *the effect of man-made CO<sub>2</sub> emissions does not appear to be sufficiently strong to cause systematic changes in the pattern of temperature fluctuations*

# Global Warming and CO<sub>2</sub>: 5) Energy Supply

## Solar and wind are poor choices

- Solar and wind can't replace fossil fuels, nuclear, and hydro in electricity generation. Solar and wind generation techniques are costly, need backup, are unreliable and not sufficient.
- **Pursuit of Wind and Solar energy generation does not have the capacity to provide the required world energy needs and replace hydrocarbon energy. *It comes down to the issue of energy density.*** In order to supply the required Quads (a very big #of BTUs) of energy to the world, solar and wind can't do the job (they are basically the lowest on the energy density scale). The energy generated per acre is very, very low.
- **Without subsidies and Government support, wind and solar energy are not economic**
- **Both wind and solar energy are intermittent and need significant backup capacity**
- **Required storage capacity and materials for these batteries are limited, making total energy conversion to wind and solar unattainable**
- **Wind and solar energy have their own environmentally negative impacts, including extensive land space usage and negative visual impact, negative impact on animal life, significant open pit mining implications, limited country supply sourcing (China plus limited other countries for raw material supplies), etc.**
- **There aren't nearly enough required minerals to allow for a complete transition to EV vehicles**

# Global Warming and CO<sub>2</sub>: 5) Energy Supply

## Pursue cost-effective, realistic energy options

- Continued reliance on obtaining the majority of Jersey's total electric needs from France's nuclear-generated source may have supply risks, but is cost-effective and reliable
- Burning disposable waste does provide a base level Jersey-sourced electricity
- Long-standing electric vehicle vulnerabilities include high input costs, grid inadequacies, issues surrounding cold-weather performance and a skeptical market in which uptake, though pushed, has so far been anemic. Electric vehicle safety (explosion and uncontrolled fire impact) concerns also need to be addressed
- In the future, other sources of energy should be considered, including Jersey tidal and nuclear-sourced electric energy generation
- An economic migration from fossil fuels over time, utilizing cost-effective, reliable energy sources (not present wind and solar options), should be pursued in a realistic, gradual fashion while not impacting the supply cost of electricity. No need to rush to replace the existing electricity contract.
- <https://www.cer-rec.gc.ca/en/data-analysis/energy-markets/market-snapshots/2016/market-snapshot-canadian-tidal-power-capacity-fourth-in-world-with-potential-add-up-7-000-mw-more.html>

- Limitations of wind farms <https://youtu.be/ogqVE6VFFtI?si=eGew3ldscgir1rKJ>
- This presentation is an introduction to Thorium as a nuclear fuel.

# Global Warming and CO<sub>2</sub>: 5) Energy Supply

There is time to make viable energy choice options

Are renewable energy sources for Jersey realistic at this time?

- 1) We have a long-term, low-cost electric supply from France
- 2) We have some on-site supply from the existing combustion of refuse
- 3) We had an electric supply source from burning oil, which could be brought back onstream in an environmentally sound way with minimal pollution beyond H<sub>2</sub>O and CO<sub>2</sub>
- 4) Mini-nuclear modular reactors can safely supply our electricity needs in a phased approach, as needed
- 5) New technologies, like tidal energy, continue to develop
- 6) Offshore wind farms are not a good option

# Global Warming and CO<sub>2</sub>

## Climate Crisis: Reality Check

### We Need Reasons for Going “Carbon Neutral”

**Is there really a “Mankind’s CO<sub>2</sub> Emissions Climate Crisis”?**

**Who is behind the “Climate Crisis” and why?**

**What will it cost Jersey to go “Carbon Neutral”**

**Is it affordable to the State and individuals?**

**What are the implications of going “Carbon Neutral”**

**Are the required steps to “Carbon Neutral” doable?**

**Are renewable energy sources for Jersey realistic today?**

# Global Warming and CO<sub>2</sub> Climate Crisis – Reality Check

## Drivers behind the “CO<sub>2</sub> Climate Crisis”

### Who is behind the “Climate Crisis” and the move to “Carbon Neutral”?

Politicians

IPPC, UN, WEF, other environmental groups

Renewable energy and other companies

### Why? A Self-Reinforcing Alignment of Perspectives and Interests:

The Media - fear sells <https://www.telegraph.co.uk/news/2023/08/04/net-zeros-dam-has-burst-but-bbc-is-still-papering-over/>

Politicians - political gain

Scientific Institutions - \$\$ pressures

Scientists - \$\$ and position pressures

Activists and NGOs - influence gain

The Public - constant reinforcement of the climate crisis narrative

# Global Warming and CO<sub>2</sub>

## Evaluation Results of Eleven Relevant Questions and Supporting Evidence

**1) Is present Global Warming a crisis or a natural phenomenon?**

**Answer:** Global Warming is a natural phenomenon

*Present temperature changes are not different from historic temperature changes and the earth is now in one of the coldest periods in its history. There is nothing unusual in today's warming.*

**2) Are warmer temperatures and higher CO<sub>2</sub> levels causing a climate crisis?**

**Answer:** No, warmer temperatures and CO<sub>2</sub> levels are not causing a climate crisis

*Forest fires, hurricanes, tornadoes, heat waves, droughts and other weather-related concerns have not increased with recent higher CO<sub>2</sub> and temperature levels.*

**3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?**

**Answer:** Higher CO<sub>2</sub> and warmer temperatures are good for humans and plants

*Plants and crops benefit and grow better with higher CO<sub>2</sub>. Mankind has also done better under higher temperatures.*

**4) Are CO<sub>2</sub> atmosphere levels dangerously high or historically low?**

**Answer:** CO<sub>2</sub> levels are at historically low levels when viewed over geologic time

*CO<sub>2</sub> levels have been dropping over the last 150 million years to a recent low of 180 ppm; a further drop of only 30 ppm would have ended all plants and therefore all life on Earth. With mankind's added CO<sub>2</sub> emissions, today's CO<sub>2</sub> level rose to about 415 ppm, which is only 0.0417% of total atmospheric gases. An optimum level for plants would be between 1,000 to 2,000 ppm, but for humans, serious physiological effects begin above 2,000 ppm.*

# Global Warming and CO<sub>2</sub>

## Evaluation Results of Eleven Relevant Questions and Supporting Evidence

5) What could have caused changes in CO<sub>2</sub> levels over geologic time?

Answer: Natural events have caused changes in CO<sub>2</sub> over geologic time

*Cold oceans and plant life absorb CO<sub>2</sub> and concentrated carbon and CO<sub>2</sub> in limestone, coal, oil and gas deposits. Over geologic time, plate tectonics and volcanoes have added CO<sub>2</sub> at much higher amounts than recent mankind-induced CO<sub>2</sub> emissions and with no negative impact.*

6) Is climate change mainly caused by mankind's emissions of CO<sub>2</sub>?

Answer: Mankind has increased CO<sub>2</sub> levels, but this is not causing major climate change

*Temperatures and climate changed dramatically and well before mankind's recently added CO<sub>2</sub> emissions. Rates of recent temperature increases, glacial retreats and sea level rise have not changed with recent increases in CO<sub>2</sub>. During glaciation periods, CO<sub>2</sub> levels changed after temperature changed and therefore could not be causing these specific temperature increases.*

*Oceans cool, then absorb CO<sub>2</sub>; oceans warm, then release CO<sub>2</sub>. NASA states that climate change occurs because of changes in the Earth's solar orbit.*

7) What is the impact of CO<sub>2</sub> on climate warming?

Answer: Additional CO<sub>2</sub> will have a very minimal future impact on temperature

*Mankind added CO<sub>2</sub> has had an impact on temperatures, but likely a minor impact overall. Major factors that impact weather and climate include Sun intensity (day and night, seasons), Sun spot activity, ocean currents, clouds, plate tectonics and volcanoes. As CO<sub>2</sub> concentration increases, CO<sub>2</sub> has less and less warming effect; adding more CO<sub>2</sub> has a logarithmically reduced impact.*

# Global Warming and CO<sub>2</sub>

## Evaluation Results of Eleven Relevant Questions and Supporting Evidence

### 8) Is sea level rise and rate of rise unusual and a major concern?

Answer: Sea level rise has not changed with higher CO<sub>2</sub>, isn't unusual and is manageable

*Sea levels have changed significantly over the Earth's entire history. Since the last glacial period the earlier rapid rate of sea level rise has recently reduced as the majority of land ice has already melted. Societies can adapt to the present rate of sea level rise (about 20 cm per 100 years) by implementing managed retreats, accommodating coastal change and protection with sea walls, dune rehabilitation and beach nourishment. There is no evidence that reducing our CO<sub>2</sub> emissions will reduce sea level rise or materially impact temperature.*

### 9) What about scientists' consensus regarding the man-made Global Warming crisis?

Answer: The stated scientific consensus is false; many reputable scientists disagree

*There is consensus that temperatures have been and are increasing and that mankind has increased CO<sub>2</sub> levels. However, there is no consensus regarding the degree to which mankind's CO<sub>2</sub> emissions are impacting temperatures or that this is causing a climate crisis.*

### 10) If CO<sub>2</sub> is good and the climate always changes, what about other fossil fuel pollutants and alternative energy adoption?

Answer: Focus on removing the actual pollutants at refinery levels, engine combustion process levels and at coal burning sites for electricity plants – pursue economic, realistic energy transition replacement options, like small nuclear reactors, over time

### 11) What are the negative implications of pursuing a carbon-neutral policy?

Answer: Overall energy supply, plant life, 3<sup>rd</sup> world economies and their ability to improve, animal life and the environment (land use, etc.) are all negatively impacted.

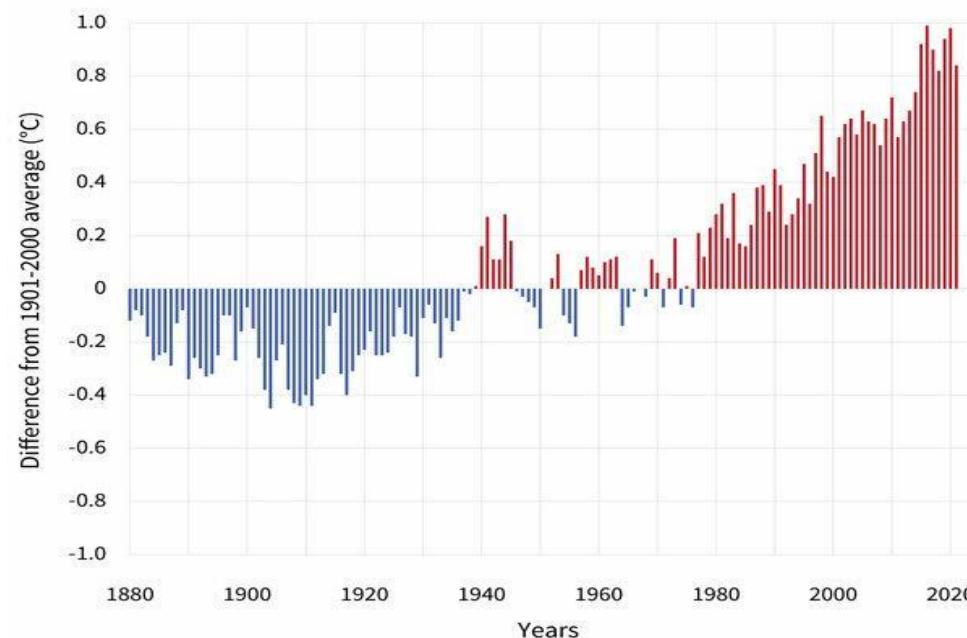

The data supporting these findings can be seen in the next section, plus by question, on the link below:

# 1) Is present Global Warming a man-made or a natural phenomenon?

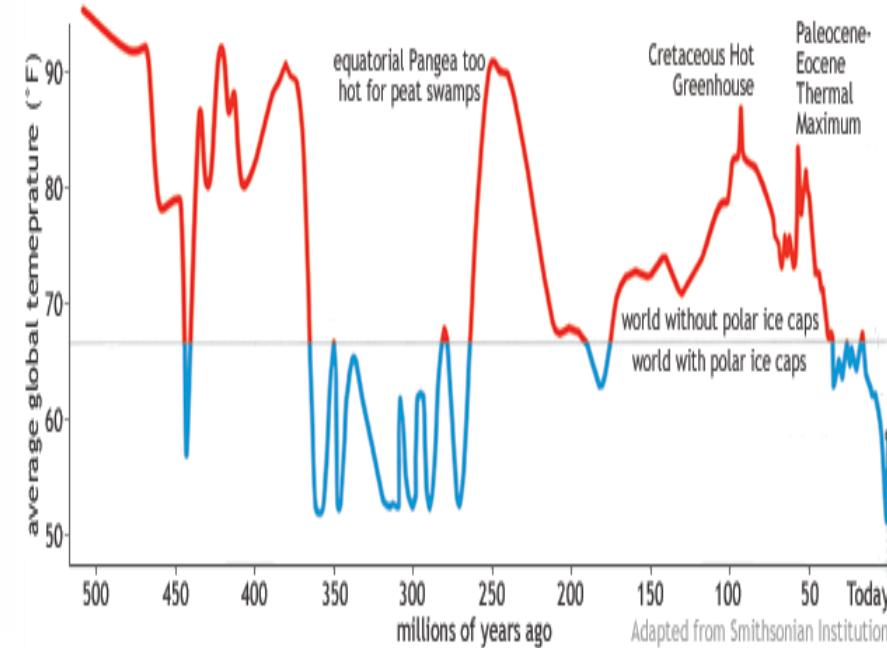

Earth's temperature changed much more over last 500 million years than last 100 years

- . Talk of global warming in the media might make people believe that the Earth is rapidly plunging into a hot cauldron of doom, but the truth is that the Earth's temperature has risen less than 1°C in the past 100 years.
- The Earth has been much hotter in the past when man-made CO<sub>2</sub> was not a factor in any previous heating events.

## GLOBAL AVERAGE SURFACE TEMPERATURE

Estimated global temperature over the last 500 million years

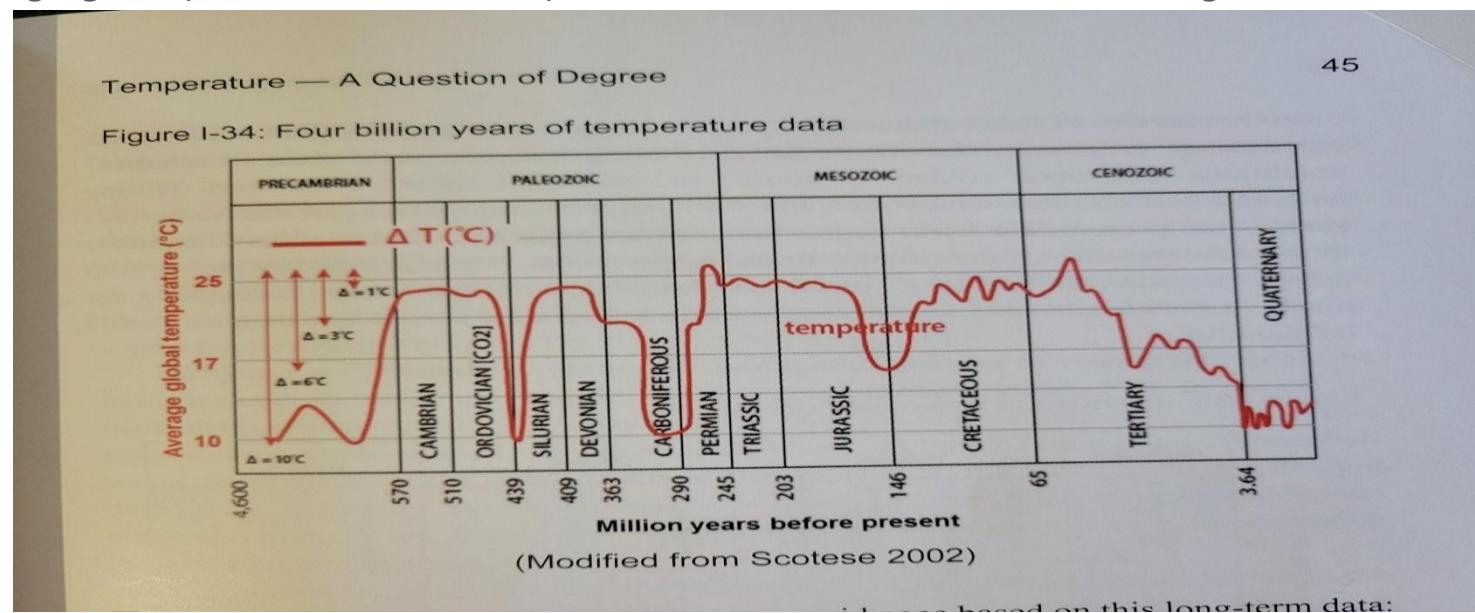

Reference Tyler Durden

# 1) Is present Global Warming a man-made or a natural phenomenon?

## The Earth's temperature changed significantly over last 600 million years

- For over 600 million years of geologic time, temperatures changed dramatically while plants and animals evolved and thrived (historic records of living species began in the Cambrian time).
- Over most of recorded geologic history, temperatures were much higher than at the present time.
- Temperatures at the equator changed little, with the bulk of temperature changes occurring at the poles.
- Changing temperature is a natural phenomenon that has occurred throughout the Earth's history

Paper: An Assessment of the Conventional Global Warming Narrative. Dr. Richard Lindzen Published by the Global Warming Policy Foundation, Sept. 22, 2022

## 2) Are warmer temperatures and higher CO<sub>2</sub> levels causing a climate crisis?

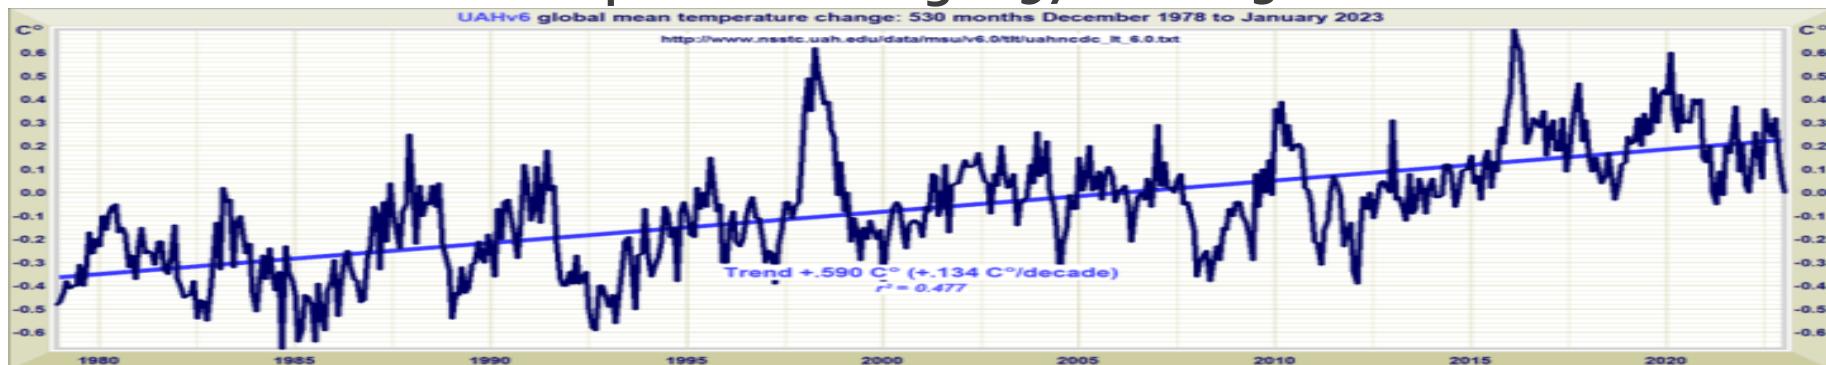

Global warming is slow, small, harmless and on the evidence to date, beneficial

There has been a warming trend since the late 19<sup>th</sup> century of only about + 1.2 – 1.5 °C since pre-industrial times (1850- 1900 baseline), recovering from the Little Ice Age, a cooler period centred on Eurasia. However, over the last 541 million years, Earth's average temperature has often hovered around 19 – 25 °C, far warmer than today's ~ 16 °C, with thriving ecosystems and no human influence. Our current interglacial is relatively cool. A degree or two of variability fits natural cycles

Actual changes in temperature are occurring well below climate model predictions

## 2) Are warmer temperatures and higher CO<sub>2</sub> levels causing a climate crisis?

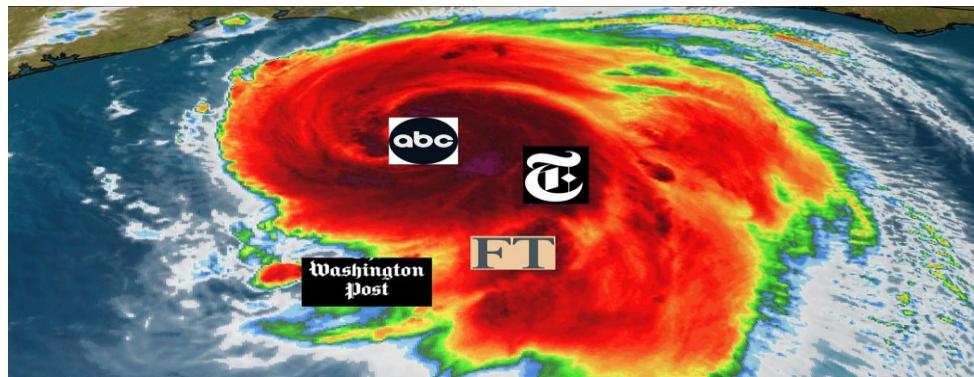

Media and political reporting can be misleading

### Media Lying About Climate And Hurricanes

#### **Media Lying About Climate And Hurricanes**

It's time to state the obvious.

Michael Shellenberger  
October 5, 2022

Over the last several weeks, many mainstream news media outlets have claimed that hurricanes are becoming more expensive, more frequent, and more intense because of climate change.

- *The Financial Times* [reported](#) that “hurricane frequency is on the rise.”
- *The New York Times* [claimed](#), “strong storms are becoming more common in the Atlantic Ocean.”
- *The Washington Post* [said](#), “climate change is rapidly fueling super hurricanes.”
- *ABC News* [declared](#), “Here’s how climate change intensifies hurricanes.”
- Both the *FT* and *N.Y. Times* showed graphs purporting to show rising hurricane frequency using [data from the U.S. government’s National Oceanic and Atmospheric Administration \(NOAA\)](#).

All of those claims are false.

The increasing cost of hurricane damage can be explained entirely by more people and more property in harm’s way. Consider how much more developed Miami Beach is today compared to a century ago. Once you adjust for rising wealth, there is no trend of increasing damage.

#### Article on media bias

[open.substack.com/pub/rogerpielkejr/p/climate-journalism-is-broken?r=ukert&utm\\_campaign=post&utm\\_medium=email](https://open.substack.com/pub/rogerpielkejr/p/climate-journalism-is-broken?r=ukert&utm_campaign=post&utm_medium=email)

A pro-human, pro-freedom policy for CO<sub>2</sub> emissions

### 3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?

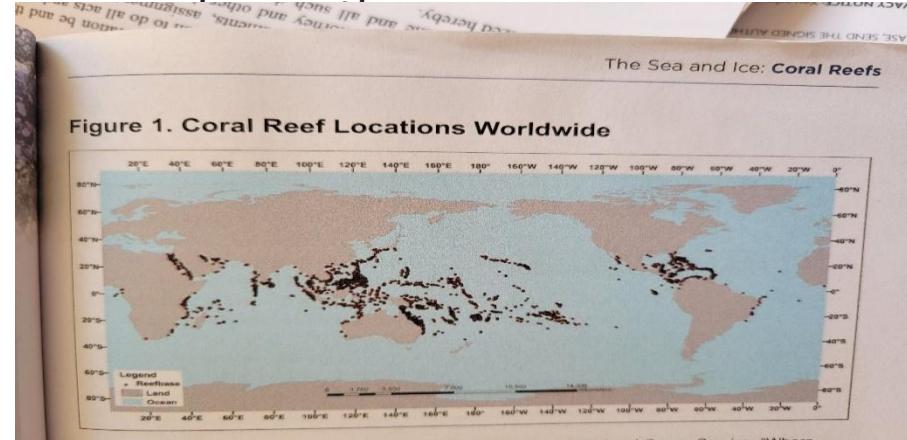

What about claimed loss of polar bears and coral reefs with rising temperature?

- There are almost four times as many polar bears today versus 1960.
- Coral reefs thrive in warm water, not in cold water. Recent warming has allowed corals to expand their range poleward while still thriving near the equator. The Great Barrier Reef is thriving and expanding, not dying.
- Corals have existed continuously for the past 40 million years under higher temperatures and CO<sub>2</sub> levels and continue to do so today.

#### Polar Bear Population Increasing

#### Expanding Coral Reef Locations

### 3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?

#### Test shows improved tree growth with higher CO<sub>2</sub> levels

- Greenhouse gases keep the world warm; they absorb heat and radiate it back to Earth, warming the surface and atmosphere; humans could not exist on Earth without this warming effect.
- When CO<sub>2</sub> increases, plants thrive, becoming larger and able to absorb more CO<sub>2</sub>.
- These trees were grown under the same conditions except with varying CO<sub>2</sub> atmosphere levels.
- A standard procedure for greenhouse growers is to increase the level of CO<sub>2</sub> to 800 to 1,200 ppm.
- Improving Tree Growth With Increasing CO<sub>2</sub> Levels Optimum plant growth CO<sub>2</sub> levels 1000 – 1400 ppm

[Trees Get Bigger Around the World Thanks to Higher CO<sub>2</sub> Levels](#)

<https://www.nbcnews.com/world/latin-america/amazon-rainforest-giant-trees-bigger-carbon-dioxide-climate-change-rcna234064>

### 3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?

Between 1982 to 2015 the world has been greening with increases in CO<sub>2</sub>

- NASA satellite images show vast regions with increased growth due mainly to higher levels of CO<sub>2</sub>, as increased CO<sub>2</sub> levels mean plants require less water to grow. Examples are the greening of the lower Sahara and the retreating deserts in China. More CO<sub>2</sub> has resulted in more and more rapid plant growth with significant greening. Since 1980, the semi-arid areas have greened by 40%
- Global warming increases cold temperatures much more than warm temperatures. Temperate and Arctic regions are affected much more than tropical areas, where temperatures have varied little
- As CO<sub>2</sub> continues to rise in the atmosphere, global plant growth will also increase.

**Increases in Leaf Areas between 1982 -2015**

Reference book: Inconvenient Facts page 76, 213

Source: Modified from NASA 2016, permission R Myneni

### 3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?

Increases in CO<sub>2</sub> have very beneficial effects

#### Positive Impacts of Added CO<sub>2</sub>

- Global crop yields have risen 15 – 20 % since 1960, almost entirely attributed to CO<sub>2</sub> fertilisation (Idso, 2013, IPCC AR6 WG1 Ch5). Famine deaths have also plummeted over time as the world's population doubled. CO<sub>2</sub> deserves much of the credit. Increased CO<sub>2</sub> over the past century has supported this explosion in plant life and available plant food from booming agriculture.
- There has been a more than 18% increase in the global leaf area in 40 years (from CO<sub>2</sub> fertilisation). Warmer, more balmy temperatures are also lengthening the growing seasons. Every 100 ppm increase in CO<sub>2</sub> typically boosts plant growth by 25-50 % in all non-water-limited conditions. My analysis draws on 776 studies from 1993-2019, clearly showing that an increased CO<sub>2</sub> level delivers an increase in global biomass.
- This is an astonishing windfall for life on earth, chiefly from CO<sub>2</sub>, a trace gas at 420 ppm (or 0.04%). It also has a secondary benefit for life by contributing to baseline levels of warmth around the planet, along with water vapour and other trace gases with similar properties, like methane (1,920 – 1830 parts per billion). However, this is not enough to be the defining control knob for changing the climate around the world.
- These are the reasons why commercial greenhouses pump CO<sub>2</sub> to 1000-1500 ppm. It ensures that crop yields jump by 20-70% depending on the crop. If 1000 ppm is good for tomatoes, why is 420 ppm an emergency for the planet?

### 3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?

Increases in CO<sub>2</sub> have very beneficial effects

#### Positive Impacts of Added CO<sub>2</sub>

- Water vapour and cloud cover are the mainstays of rainfall and the entire hydrologic cycle, returning water as precipitation to rivers, lakes and maintaining the oceans (where 78% of rain ends up).
- The world population has more than doubled since 1970, going from roughly 3.7 billion to over 8 billion by 2022-2025. The population tripled since 1950. This massive global expansion was supported by increased food production and agricultural advancements, known as the Green Revolution.
- CO<sub>2</sub> is the foundation for life on Earth and the chief source of photosynthesis. It also delivers the calcium carbonate in water to produce exoskeletons for all shellfish. This is the miracle of CO<sub>2</sub>, enabling green chlorophyll plants and algae to convert sunlight into food energy and oxygen. In this way, CO<sub>2</sub> supports every food chain on earth.
- Science shows that 500-1000 ppm of CO<sub>2</sub> plus 1-2 ° C extra warming hits the sweet spot for all terrestrial and marine life, including human civilisation. We should be managing adaptation and energy abundance, not waging a war on a trace gas that makes the planet greener. Higher CO<sub>2</sub> gives a net benefit to life on Earth. This means the current carbon-neutral policy of driving down CO<sub>2</sub> levels - the purpose for net-zero - is anti-life.

### 3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?

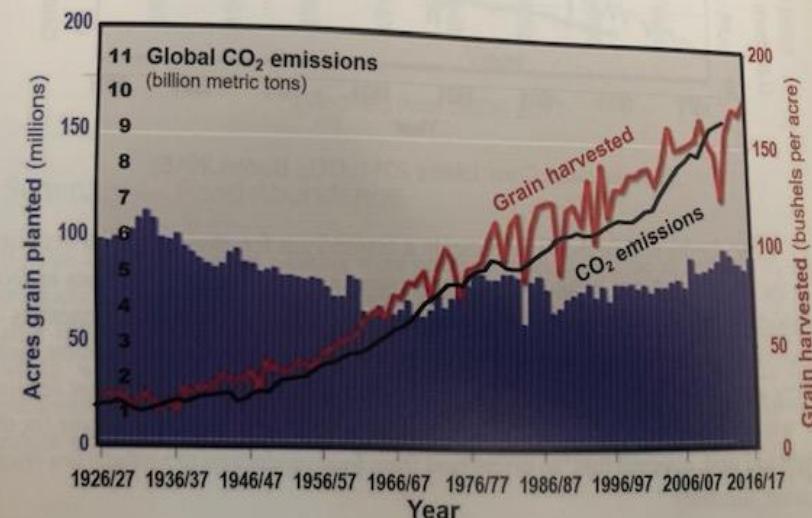

Crop yields and per acre crops improve with higher CO<sub>2</sub> and temperature levels

- Increases in CO<sub>2</sub> benefit crop production as CO<sub>2</sub> works as an aerial fertilizer.
- Bushels of grain per acre harvested worldwide have improved with increased CO<sub>2</sub> emissions.
- Global warming lengthens growing seasons, reduces frost events and adds available farmland

**Increases in Bushels of Grain Harvested Worldwide**

**With Increased CO<sub>2</sub>**

### 3) Are higher CO<sub>2</sub> levels and warmer temperatures good or bad?

#### Tests show improved crop yields with increased CO<sub>2</sub> for plants

- Crop yield growth improved with 300 ppm more CO<sub>2</sub> based on 3,586 experiments on 549 plant species. These tests show that plants benefit from higher CO<sub>2</sub>.
- **The degree to which plants respond to more CO<sub>2</sub> varies, but it is always positive.** An increase in CO<sub>2</sub> to 800 parts per million (ppm) or so—more than double the current atmospheric concentration—increases yields by 10% to 100%.
- In greenhouse farming, carbon dioxide levels are elevated to 1,000 ppm or so to increase the yields of tomatoes and cucumbers by 20% to 40%. Plants, such as corn, sugarcane, and millets, also benefit from higher atmospheric CO<sub>2</sub>, whose positive effect on them is even more evident in the presence of drought. Vijay Jayarai

# 4) Are CO<sub>2</sub> atmosphere levels dangerously high or historically low?

## Graph showing global atmospheric CO<sub>2</sub> levels over last 600 million years

- CO<sub>2</sub> levels have been much higher throughout geologic time while life on Earth evolved and developed.
- CO<sub>2</sub> highs in the Jurassic time of dinosaurs were about 2,800 ppm and nearly 8,000 ppm in the Cambrian period when recorded life began on Earth. Today's CO<sub>2</sub> concentration is only 415 ppm (over 10 times lower than in the past when life flourished). However, modern humans appeared only some 100,000 years ago.
- Concentrations up to 1,000 ppm are common in classrooms. Physiological effects begin above 2,000 ppm.

# 5) What could have caused changes in CO<sub>2</sub> levels over geologic time?

Graphs showing both temperature and CO<sub>2</sub> levels changed over last 600 million years

- From about 550 to 350 million years ago (the Paleozoic Era), while life was restricted to the oceans, CO<sub>2</sub> fluctuated from 10 to 25 times higher than today's levels. CO<sub>2</sub> dropped sharply in response to the appearance and spread of land plants about 350 million years ago, then shot up again during the Mesozoic Era..
- From peak CO<sub>2</sub> values of more than ten times the current levels 150 million years ago, CO<sub>2</sub> began a long, gradual decline to today's low levels, as seen in the ice core samples.

# 5) What could have caused changes in CO<sub>2</sub> levels over geologic time?

Graphs showing both temperature and CO<sub>2</sub> levels changed over last 400,000 years

- Because of the oceans' volume and depth, it takes much longer for the oceans to warm from increasing temperatures than for land. Colder and denser water absorbs CO<sub>2</sub>. As temperature increases, warming oceans slowly release CO<sub>2</sub> into the atmosphere. As seen in these historic ice records, CO<sub>2</sub> increases occur in response to temperature increases and therefore do not cause these temperature increases.

CO<sub>2</sub> vs Temperature Over the Past 400,000 Years

## 6) Is Climate change mainly caused by mankind's emissions of CO<sub>2</sub>?

### 1) Graphs showing global temperature pause (flat temperatures) for 18 years

- CO<sub>2</sub> levels have risen continuously since 1998, yet global temperatures were flat for 18 years

#### Global Mean Temperature Change September 2014 – June 2022

This Pause, like its predecessor, which was an impressive 18 years 8 months (UAH), or 18 years 9 months (HadCRUT4), is, as always, not cherry-picked. It is derived from the UAH monthly global mean lower-troposphere temperature anomalies as the period from the earliest month starting with which the least-squares linear-regression trend to the most recent month for which data are available does not exceed zero. Whatever the data show, I show. Or, in the immortal words of Dr Roy Spencer, speaking of his dataset, "It is what it is". In that splendid dictum speaks all true science.

The least-squares trend, which Professor Jones at the University of East Anglia used to recommend as the simplest and most robust method of deriving global-temperature trends, takes due account of all monthly values, not merely of the starting and ending values.

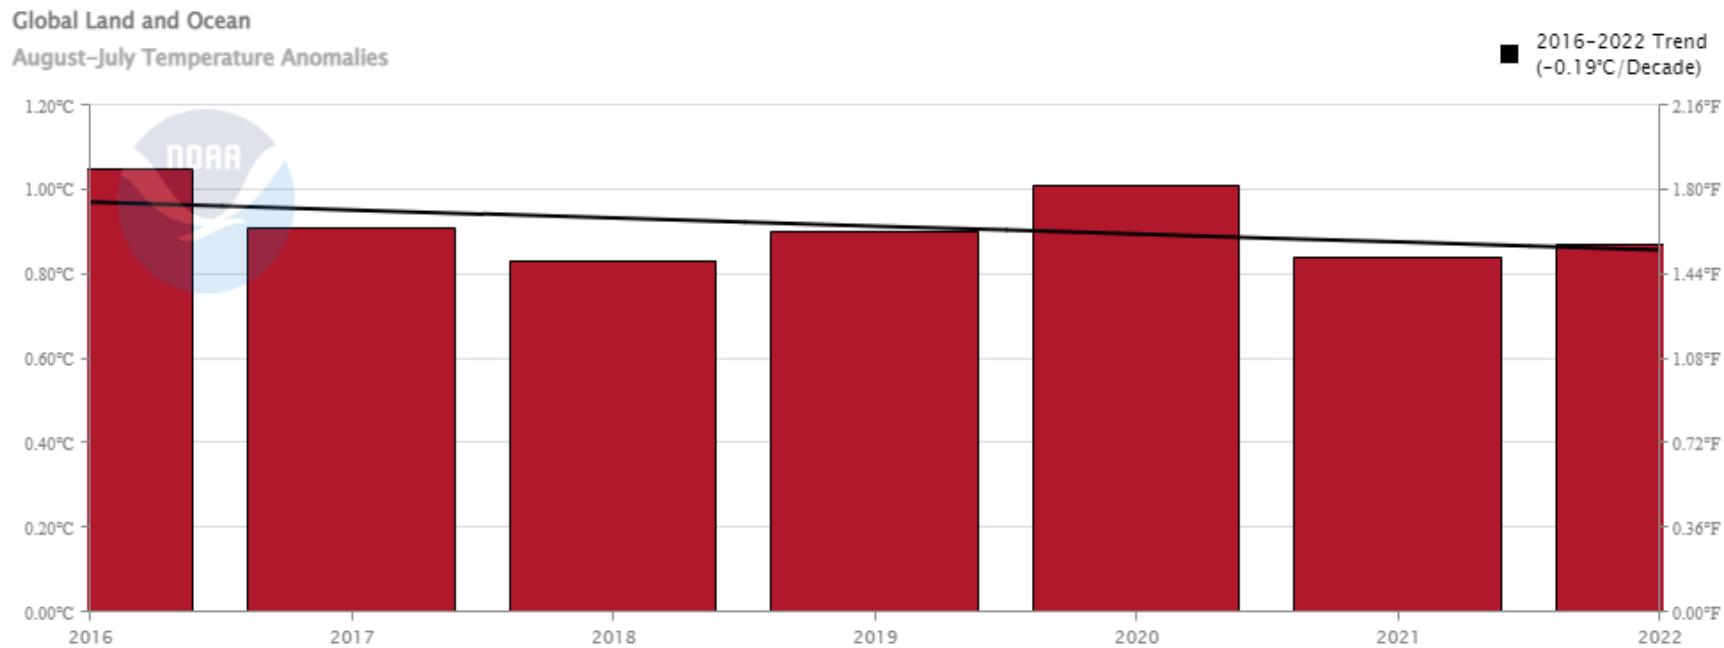

# 6) Is Climate change mainly caused by mankind's emissions of CO<sub>2</sub>?

NOAA released in January the year-end global temperature data for 2022

**NOAA** shows that since 2015 there has not been any global warming despite the emission of more than 450 billion tons of CO<sub>2</sub> emissions

- The agency's 'Global Time Series' temperature tool plots the current 'Land and Ocean' rate of decrease as **0.19C per decade**, up from a decrease of 0.11C per decade at the start of the year

## NOAA CHARTS REVEAL RECENT GLOBAL COOLING

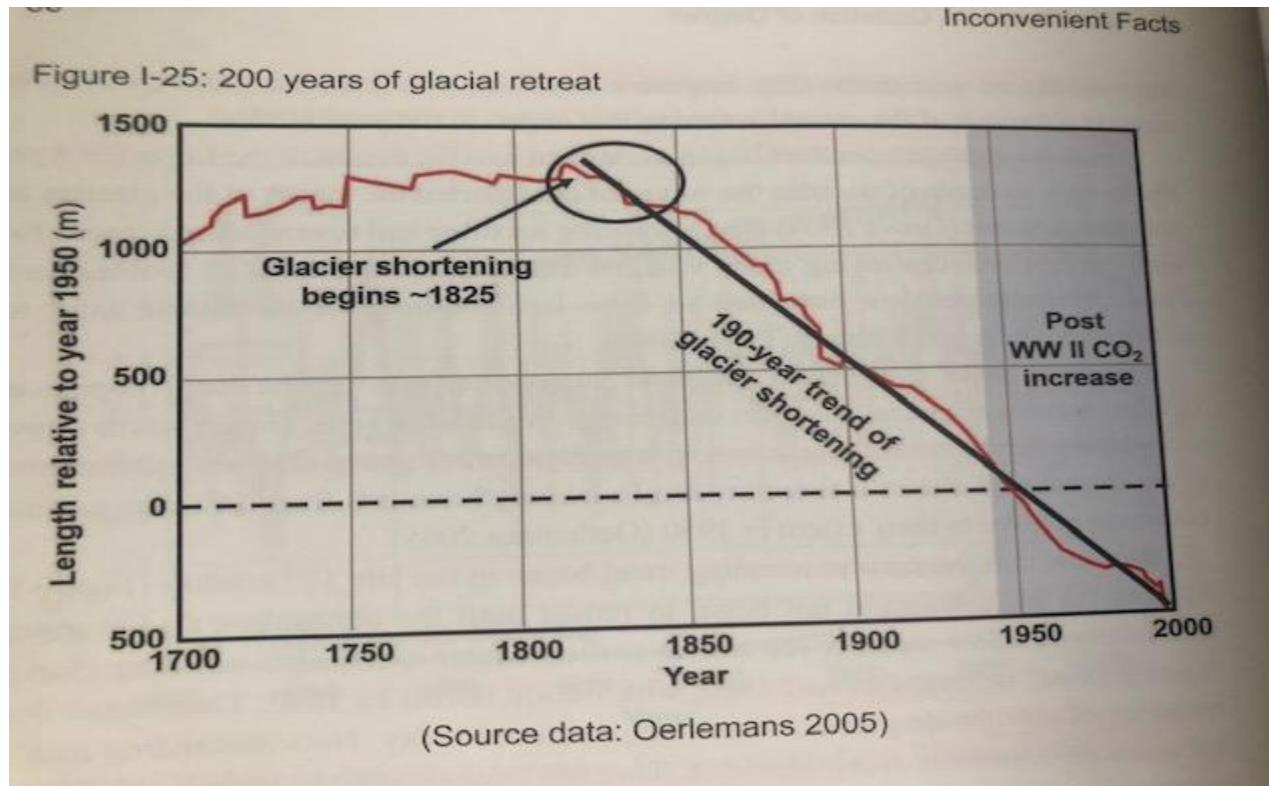

## 6) Is Climate change mainly caused by mankind's emissions of CO<sub>2</sub>?

Graph showing rate of glacial retreat between 1700 and 2000 with period of increasing CO<sub>2</sub>

- The rate of glacier shortening and ice melting has remained constant since about 1825 and does not appear to be impacted by recent, higher CO<sub>2</sub> levels.

### 200 Years of Constant Glacial Retreat

Reference book: Inconvenient Facts page 36

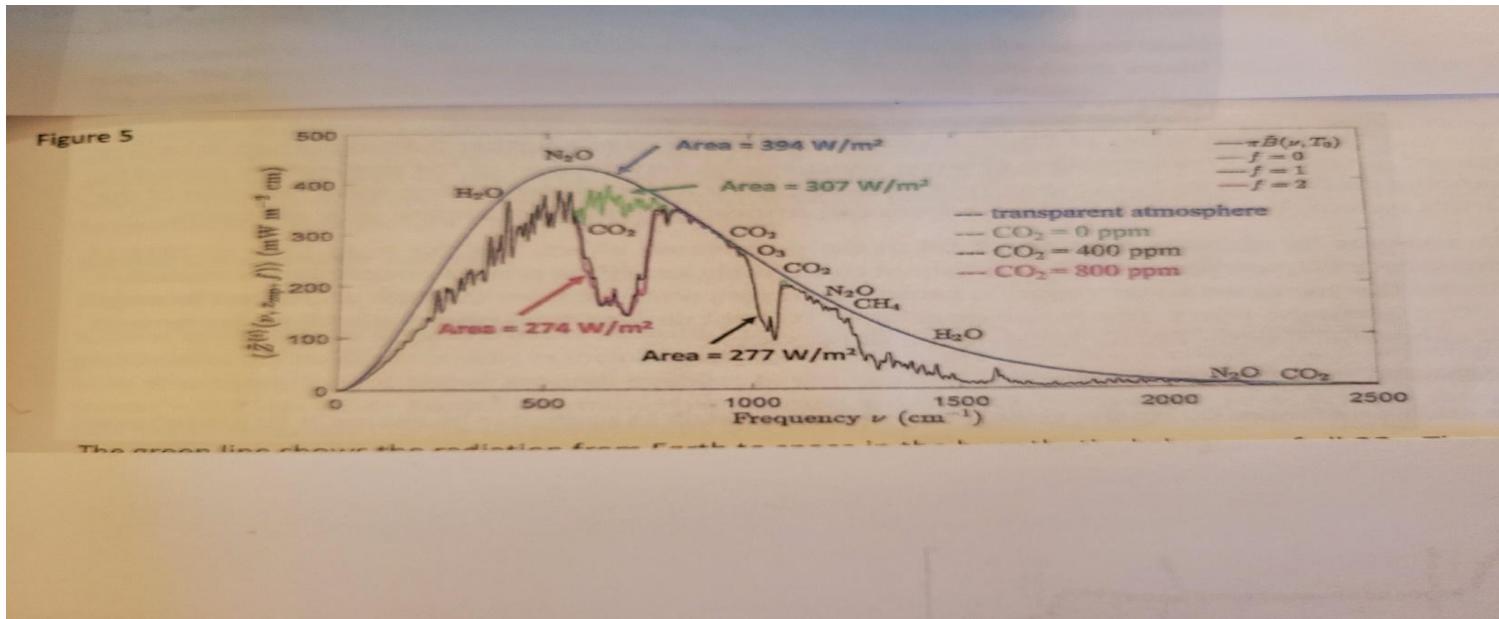

Source: Oerlemans 2005

# 7) What is impact of increasing CO<sub>2</sub> emissions on climate warming?

## Planck curve shows the insignificant impact of doubling atmospheric CO<sub>2</sub>

- The absorption sensitivity of CO<sub>2</sub> reduces logarithmically (twice as much CO<sub>2</sub> is needed for the same added impact).
- Max Planck delineated the spectrum of radiation from warm bodies. The horizontal scale is the frequency of thermal radiation. The vertical scale is the thermal power going out into space. The area under the curve corresponds to the cooling power of the radiation. If there were no greenhouse gases, the radiation into space would be comprised within the upper blue curve.
- The infrared radiation from Earth to space with CO<sub>2</sub> at 400 ppm is shown by the jagged black line. The red line is what the Earth would radiate into space if the concentration of CO<sub>2</sub> were to double to 800 ppm.
- The impact of doubling CO<sub>2</sub> from 400 ppm to 800 ppm, according to basic physics, is only 0.71°C of warming.

### Planck Curve Showing the Effect of CO<sub>2</sub> on the Heat Spectrum of the Earth

Reference: Climate All Is Well, All Will Be Well Jeremy Nieboer page 13

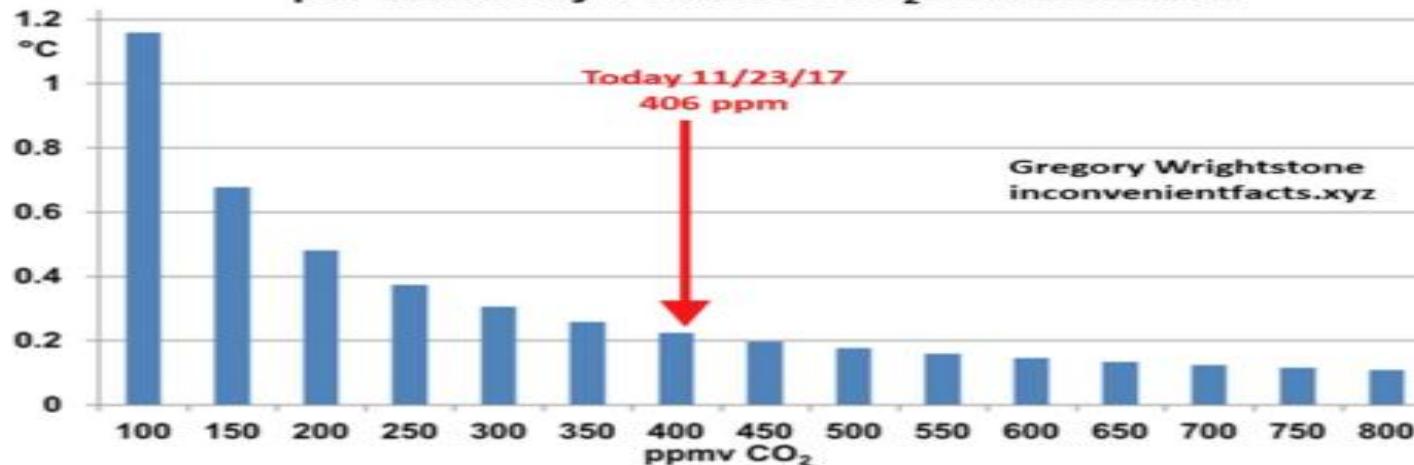

# 7) What is impact of increasing CO<sub>2</sub> emissions on climate warming?

## Graph shows warming impact decreases with additional atmospheric CO<sub>2</sub>

- The warming effect of CO<sub>2</sub> declines (logarithmically) as its concentration increases.
- Adding more CO<sub>2</sub> has an ever-decreasing impact on the Greenhouse gas effect on the climate.
- From 1898 to 1998 global temperatures increased 0.8C and CO<sub>2</sub> increased from 295 ppm to 367 ppm. Since 1998, CO<sub>2</sub> has increased from 367 ppm to 420 ppm, half of the previous increase, while temperatures rose slightly.

### Temperature Impact Decreases with Increased CO<sub>2</sub>

# 7) What is impact of increasing CO<sub>2</sub> emissions on climate warming?

CO<sub>2</sub>-driven climate models over estimate actual trend of climate change

## Computer climate models vs actual results

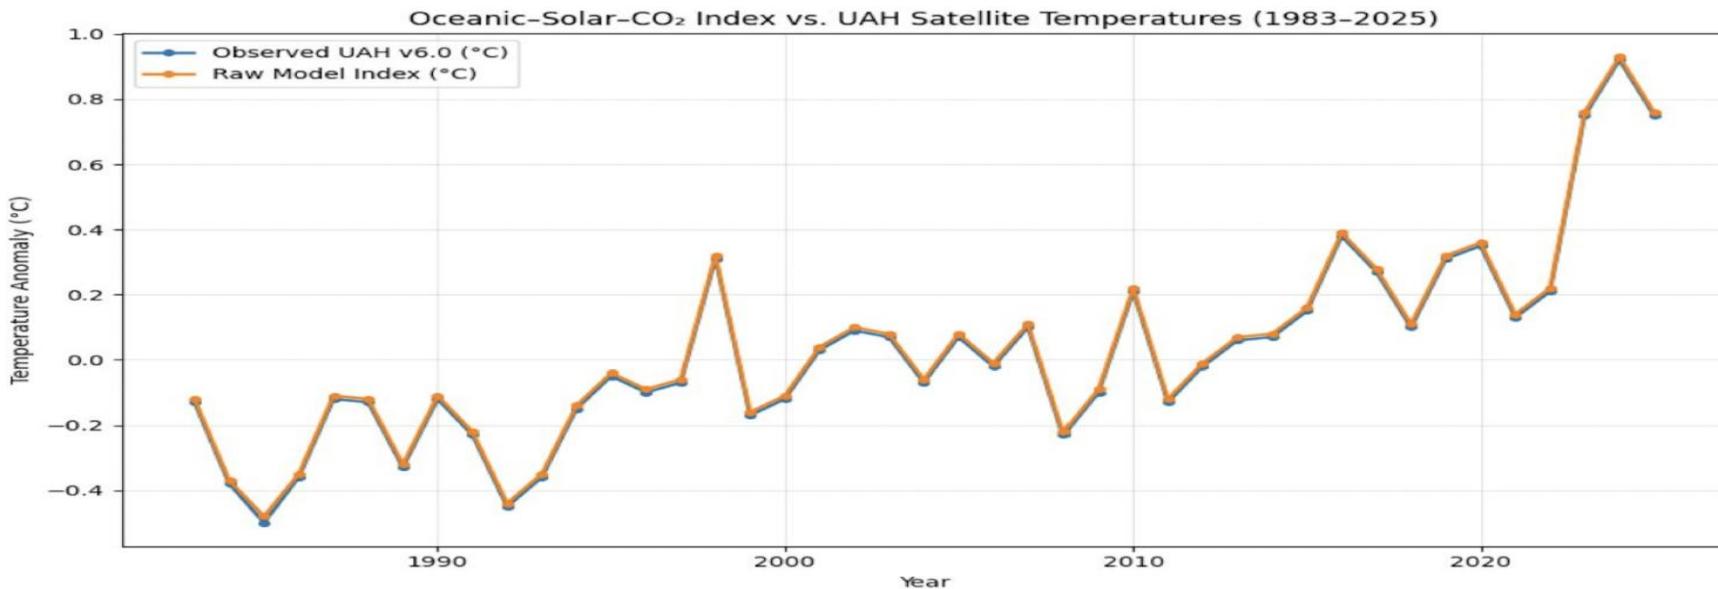

# 7) What is impact of increasing CO<sub>2</sub> emissions on climate warming?

Finally, a successful climate change model that matches historic results

Paul Burgess's Oceanic – Solar – CO<sub>2</sub> index-based temperature modelling results versus satellite temperatures show an excellent match between 1983 and 2025. Having the model explain the temperatures so exactly shows that since 1983, 75% of the modest global warming experienced occurred due to natural events, strongly impacted by ocean current changes, with only minor CO<sub>2</sub> impact. Only 25% was due to mankind's added CO<sub>2</sub>. Based on this model, another 1 degree warming, beneficial to mankind, will occur in the next 175 years.

## Yearly Temperature Modeling Results 1983 -2025

Paul Burgess paper The Oceanic-Solar Index and Sea Surface Temperature A Plain-English Physical Explanation

[The Sun, The Clouds, The Oceans In My Most Important Video Ever](#) Paul Burgess's successful modelling shows that since 1983, temperature can be replicated simply by looking at the new Oceanic Index and the amount of solar radiation, not the CO<sub>2</sub> and a small element of CO<sub>2</sub>.

[At last the answer: how much warming is natural and how much warming is from mankind?](#) Paul Burgess

# 7) What is impact of increasing CO<sub>2</sub> emissions on climate warming?

Paul Burgess has successfully modelled climate change, showing it is impacted by the oceans

Changes in Sea-Surface Temperature (SST) are linked to the Oceanic-Solar Index, which provides a direct, physical explanation of why CO<sub>2</sub> downward reflected energy cannot make a strong impact on ocean temperatures.

## 1. How Energy Enters the Ocean

The ocean is warmed mainly by shortwave radiation from the Sun. This energy moves downward into the ocean and is absorbed throughout the upper water column. In contrast, **CO<sub>2</sub>-related infrared radiation is absorbed only at the very surface (due to its radiation frequency), but does not penetrate into the ocean beyond the ocean skin surface.** Sunlight heating penetrates further downward and warms a large volume of ocean water.

## 2. The Hairdryer and Bath Analogy

Trying to warm the ocean using CO<sub>2</sub> is like trying to heat a bath with a hairdryer. The air just above the water warms briefly, but the bath itself hardly changes temperature. To heat the bath, energy must be delivered deeper into the water, not just across its surface.

## 3. The Oceanic-Solar Index Connection

Natural ocean cycles change winds and cloud cover. With cloud coverage, less sunlight moves downward into the ocean, reducing absorbed energy and lowering the SST.

The Oceanic-Solar Index captures this sequence and the successful modelling explains (matches) the timing of observed warming associated with the oceans and not changes in CO<sub>2</sub>.

[The Sun, The Clouds, The Oceans In My Most Important Video Ever](#) Paul Burgess's successful modelling shows that since 1983, temperature can be replicated simply by looking at the new Oceanic Index and the amount of solar radiation, not the CO<sub>2</sub> and a small element of CO<sub>2</sub>.

## 7) What is impact of increasing CO<sub>2</sub> emissions on climate warming?

Paul Burgess has successfully modelled climate change, showing it is impacted by the oceans

### 4 Satellite Measurements Show Limited Impact from CO<sub>2</sub>-Reflected Heat

Using satellite measurements, the Oceanic-Solar explanation of Earth's energy balance, rather than surface ocean temperatures, demonstrates why the CO<sub>2</sub> downward reflected wavelength energy has minimal impact. These satellites measure how much sunlight enters the climate system, how much is reflected back by clouds, and how much energy leaves Earth again. The energy budget can be separated into two parts: all-sky covered conditions (including clouds) and clear-sky conditions (clouds mathematically removed). The key finding is that recent warming appears strongest in the all-sky covered data but is much weaker in the clear-sky data. This shows that the dominant energy change is linked to clouds and sunlight, not to greenhouse trapping in clear air. When cloud effects are removed, the apparent excess heating largely disappears, supporting the cloud-impacted solar ocean heating mechanism.

The pattern of ocean heat uptake matches what is expected from sunlight entering from above and being reflected downward, rather than from infrared heating confined to the surface.

### Conclusion

Sea-surface temperature changes are controlled mainly by how much sunlight enters the ocean. Because sunlight penetrates deeply and CO<sub>2</sub> does not, the Oceanic-Solar Index provides a physically consistent explanation for observed ocean warming confirmed by independent satellite energy measurements.

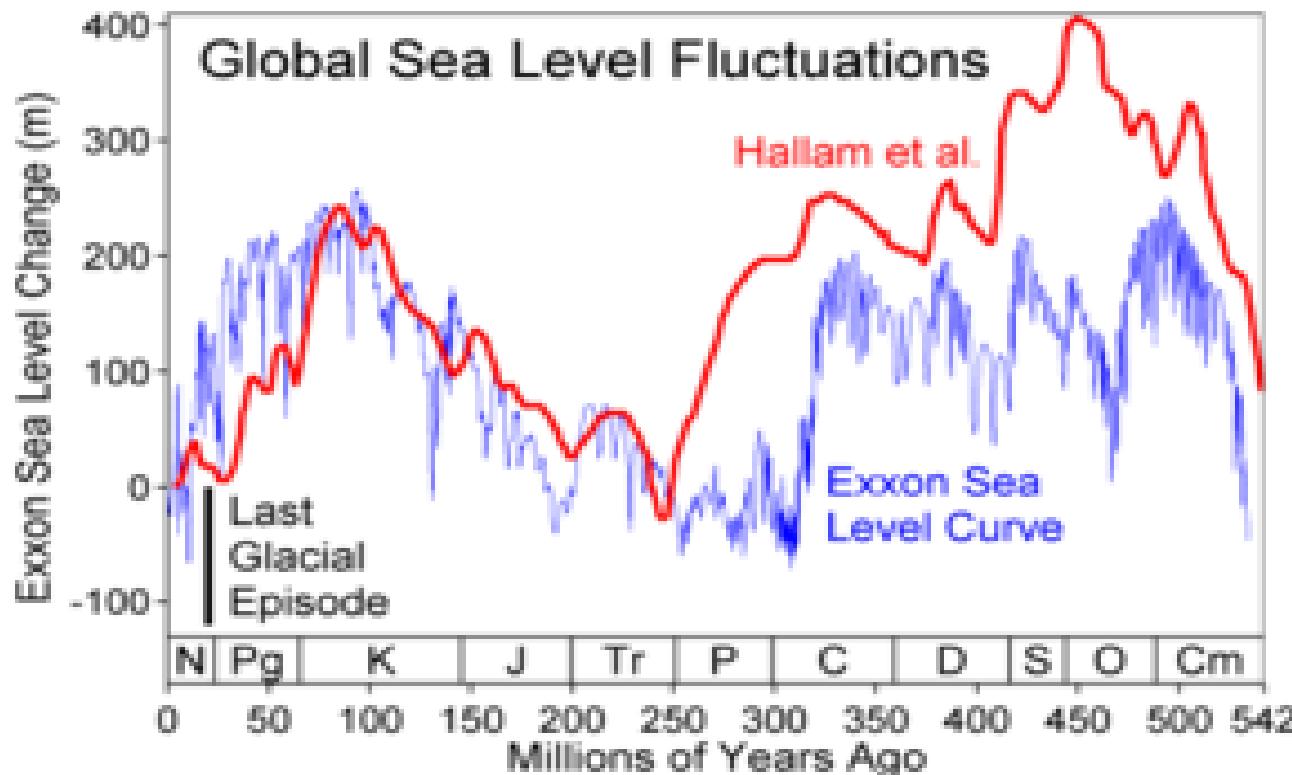

Paul Burgess paper The Oceanic-Solar Index and Sea Surface Temperature A Plain-English Physical Explanation

[The Sun, The Clouds, The Oceans In My Most Important Video Ever](#) Paul Burgess's successful modelling shows that since 1983, temperature can be replicated simply by looking at the new Oceanic Index and the amount of solar radiation, not the CO<sub>2</sub> and a small element of CO<sub>2</sub>. <sup>81</sup>

## 8) Is sea level rise and rate of rise unusual and a major concern ?

Two independent graphs showing sea level changes over last 542 million years

- Global sea level has changed significantly over Earth's history and change is not new.
- 6,000 years ago, the average sea level was more than 6 feet higher than today.
- The main factors affecting sea level are the amount and volume of available water, including water taken up as ice caps and the shape and volume of the ocean basins.

- Geologists have used this global sea level change information to assist their exploration efforts.

Source: Wikipedia, Peter Vail publications

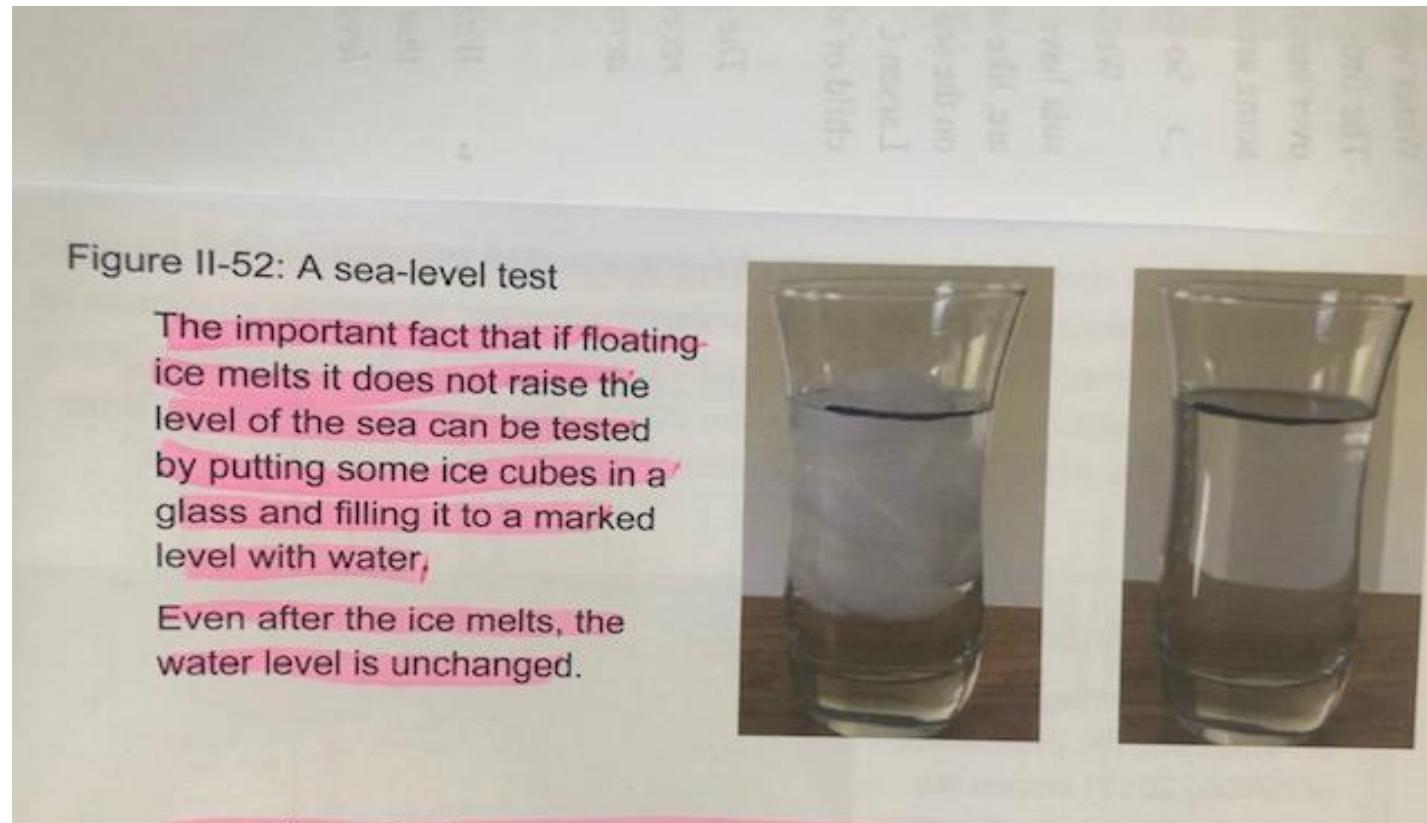

Source: Heaven and Earth, Global Warming and the Missing Science Plimer 2009

## 8) Is sea level rise and rate of rise unusual and a major concern ?

### Basic physics: experiment showing impact of melting ice in water

- When ice in a glass of water melts, there is no change in water level.
- Melting the remaining polar ice caps that float on water will not impact sea levels; only the remaining ice on land can raise sea levels.

#### Water Level Test: Ice in Water and Melted Ice – No Change in Water Level

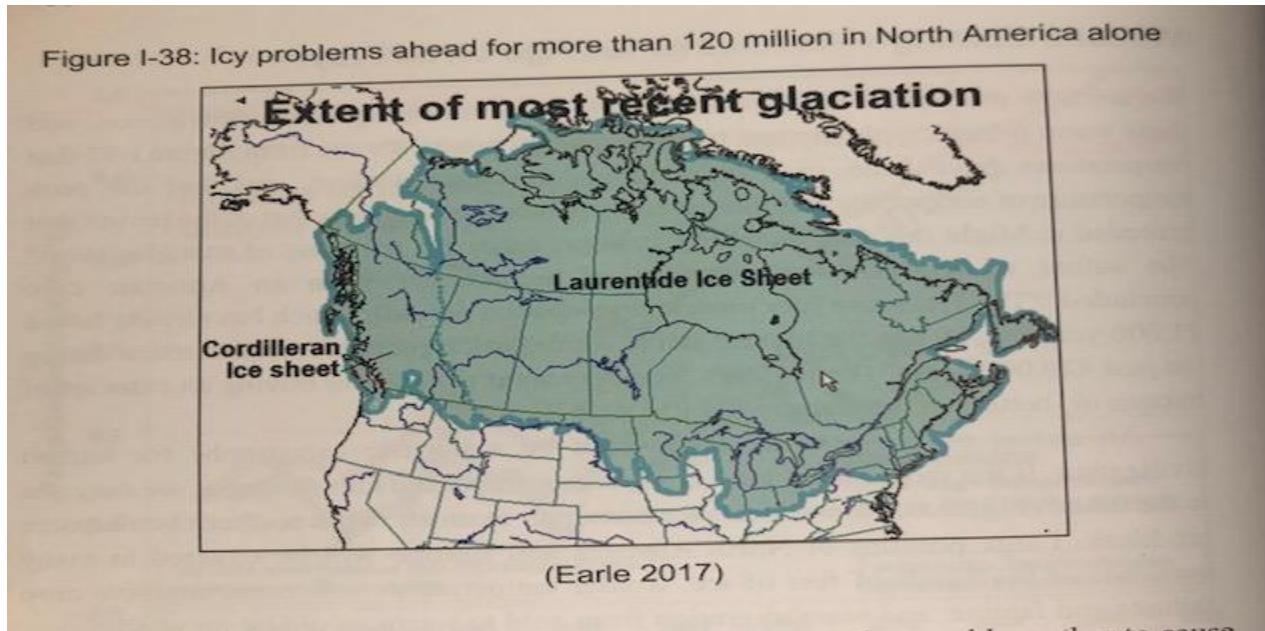

## 8) Is sea level rise and rate of rise unusual and a major concern?

### Map showing extent of most recent glaciation over North America

- Most of North America's large ice cap has now melted, resulting in a previously experienced rapid rise in sea level. Only Greenland, Iceland, northern Alaska and northern Siberia now contain glaciers in the Arctic region.
- The global remaining ice caps on land are now much less, with correspondingly less impact.
- Following glaciation, sea level rise was due to ice melting plus sea warming and expanding.

#### Extent of Most Recent, Melted North America Glaciation

Reference book: Inconvenient Facts page 50

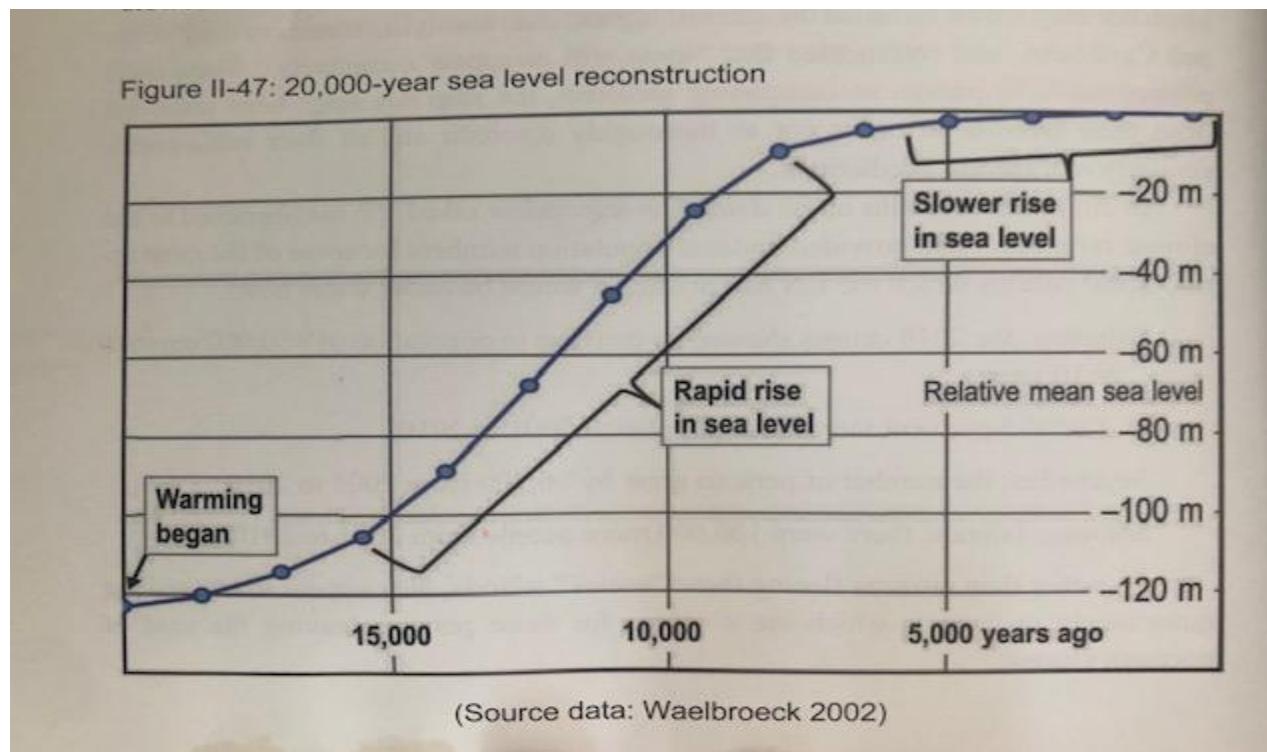

Source: Earle 2017

## 8) Is sea level rise and rate of rise unusual and a major concern?

Graph showing stages of sea level rate changes through melting ice cap over last 20,000 years

- Over the last 6 million years of several ice ages, the primary driver of sea level changes were periods of glaciation, which locked up huge amounts of water, drawing down sea levels, followed by periods of melting and rising seas. Warming and thereby expanding seas added to rising sea levels.
- During warmer interglacial periods, melting ice from land yielded much higher sea levels with less recent impact

### 2000-Year Sea Level Reconstruction

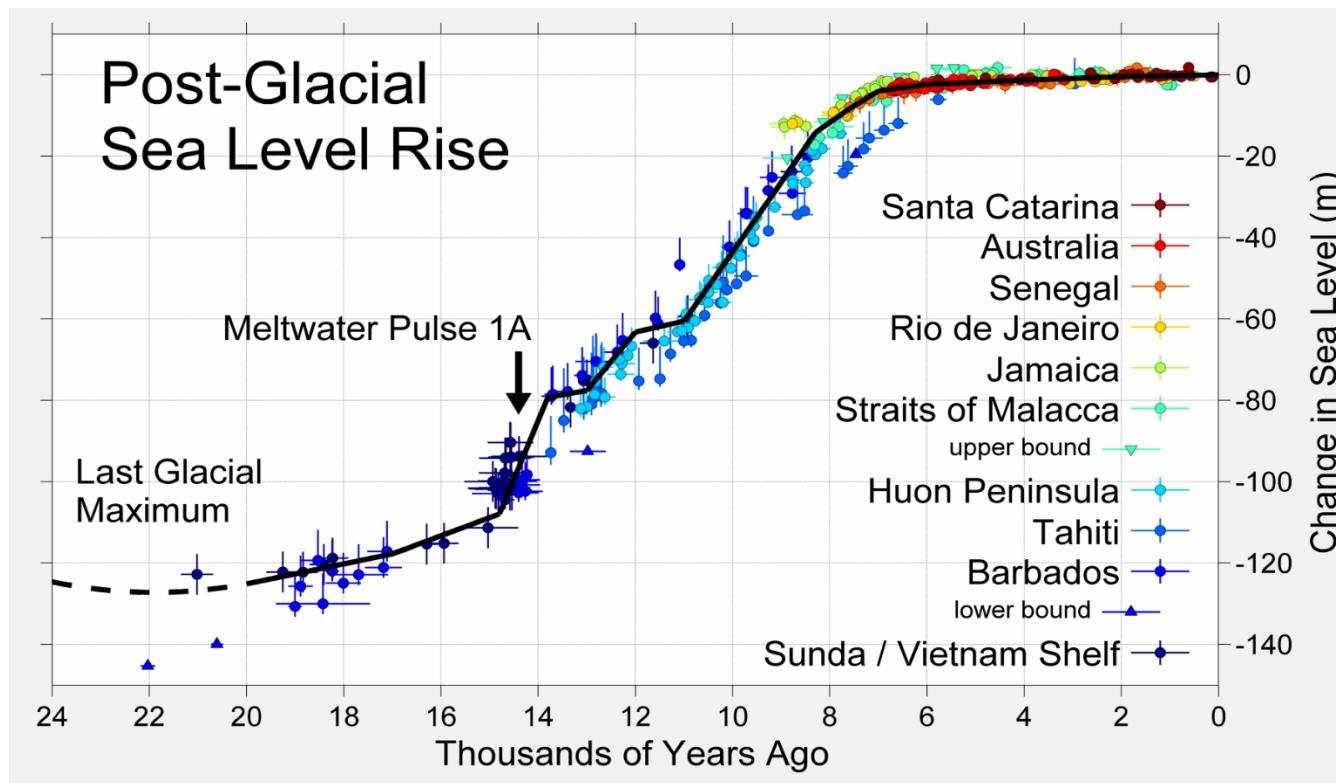

Reference book: Inconvenient Facts page 114

Source: Waelbroeck 2002

## 8) Is sea level rise and rate of rise unusual and a major concern?

Graph showing measured sea level changes through melting ice cap over last 24,000 years

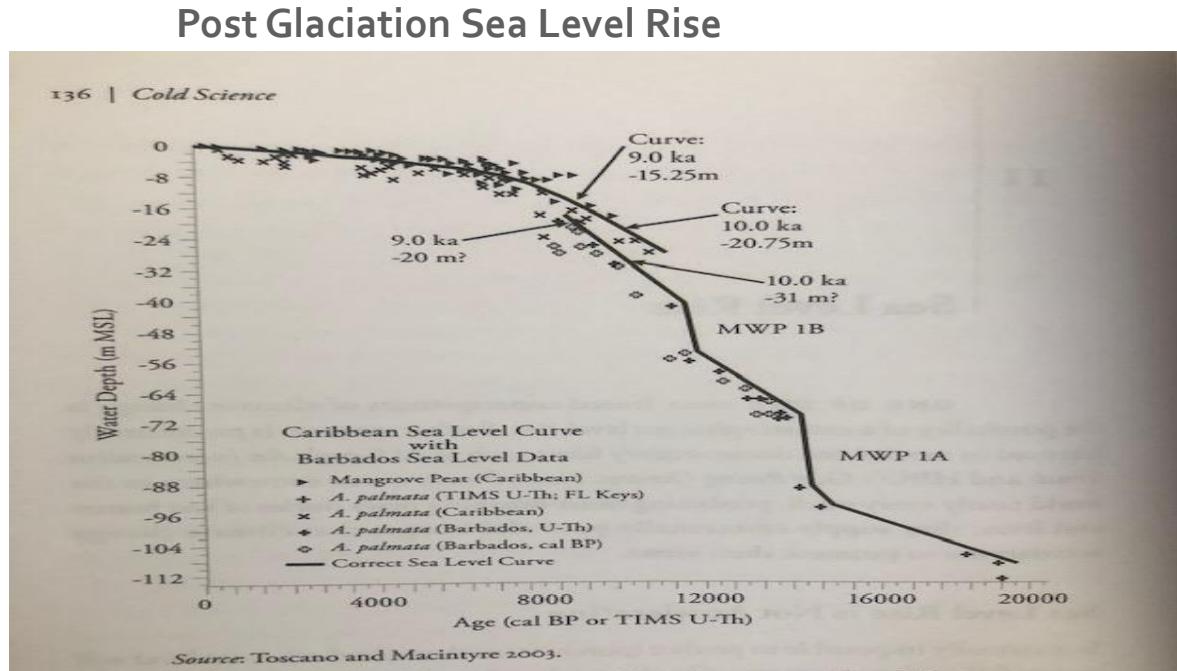

- Since the melting of the North American ice cap, sea level rise has decreased dramatically and has been comparatively stable over the past 6,000 years
- Between 1901 and 2018, the globally averaged sea level rose by only 15 to 25 cm

# 8) Is sea level rise and rate of rise unusual and a major concern?

Graph showing measured sea level changes through melting ice cap over last 20,000 years

- Sea level since the last glacial maximum, as deduced from coral and peat data, also shows the rapid sea level rise as continental ice sheets melted and a more modest rise since then.
- This modest rise was irrespective of global temperature fluctuations and recent increases in CO<sub>2</sub>.

- Sea levels may continue to rise at these rates (about 20 cm per 100 years), but this is manageable.
- Societies can adapt to sea level rise in three different ways: implement managed retreat, accommodate coastal change, or protect against sea level rise through hard-construction practices like seawalls or soft approaches such as dune rehabilitation and beach nourishment. Focusing on reducing CO<sub>2</sub> emissions won't help.

Reference book Hot Talk Cold Science page 136

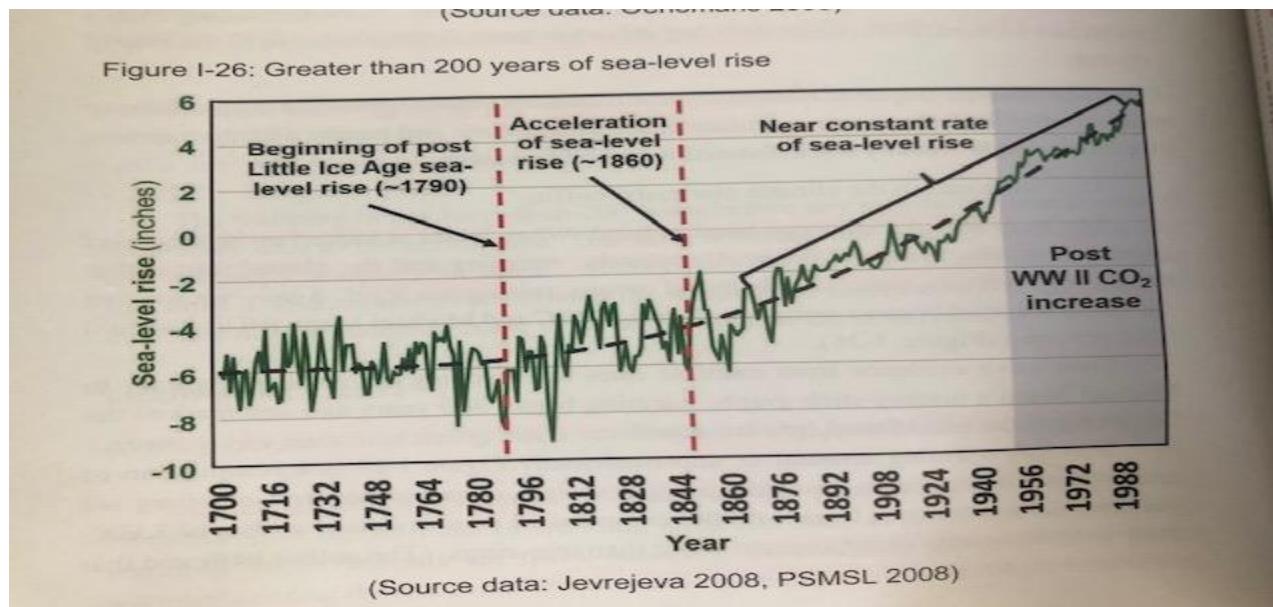

Source: Toscano and Macintyre 2003

## 8) Is sea level rise and rate of rise unusual and a major concern?

Graph showing rate of sea level rise between 1700 and 2000 with period of increasing CO<sub>2</sub> highlighted

- Sea level rise rates since 1844 have not changed with CO<sub>2</sub> increases.
- From 1898 to 1998 sea level has risen 20 cm, which is the same rate (20 cm per 100 years) over the previous 100 years – there was no change in the rate of sea level rise with more recent CO<sub>2</sub> increases.

Sea Level Rise 1700 - 1988

## 8) Is sea level rise and rate of rise unusual and a major concern?

### Recent increase in snow fall levels in Northern Hemisphere

- NOAA and Rutgers University released new data that showed snow cover across the Northern Hemisphere reached the highest level since measurements began in 1967 and is currently above the 56-year mean

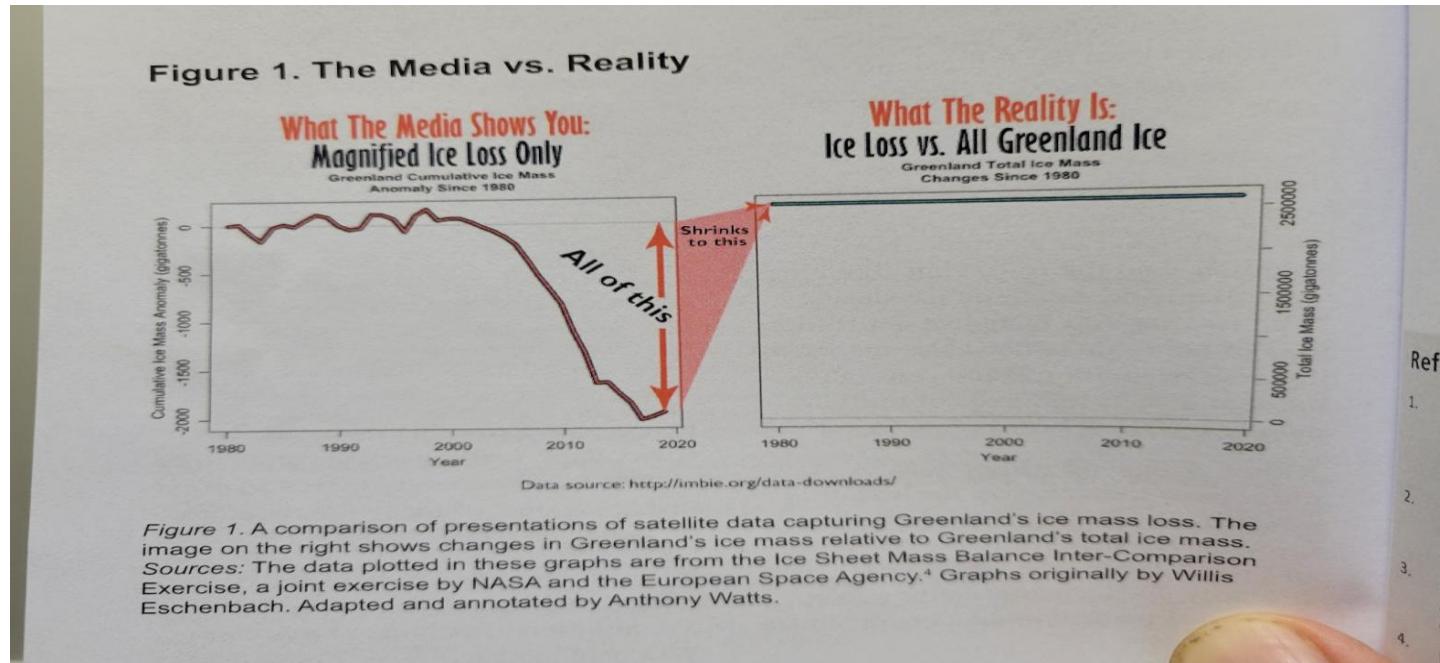

*Source:* NOAA and Rutgers University

## 8) Is sea level rise and rate of rise unusual and a major concern?

An example of misrepresenting information – recent loss versus total Greenland ice

- Climate activists claim the Greenland ice sheet is melting six times faster than it was 30 years ago, but 30 years ago, it was not melting.
- When recent ice loss is compared to the full Greenland ice sheet, the loss is minimal.
- The Antarctic has been experiencing record sea ice coverage since satellite measurements began.

### Recent Greenland Ice Sheet Melt vs Total Greenland Ice Sheet Size

Reference book: Climate at a Glance page 27, 28

Source: The Ice Sheet Mass Balance NASA and the European Space Agency

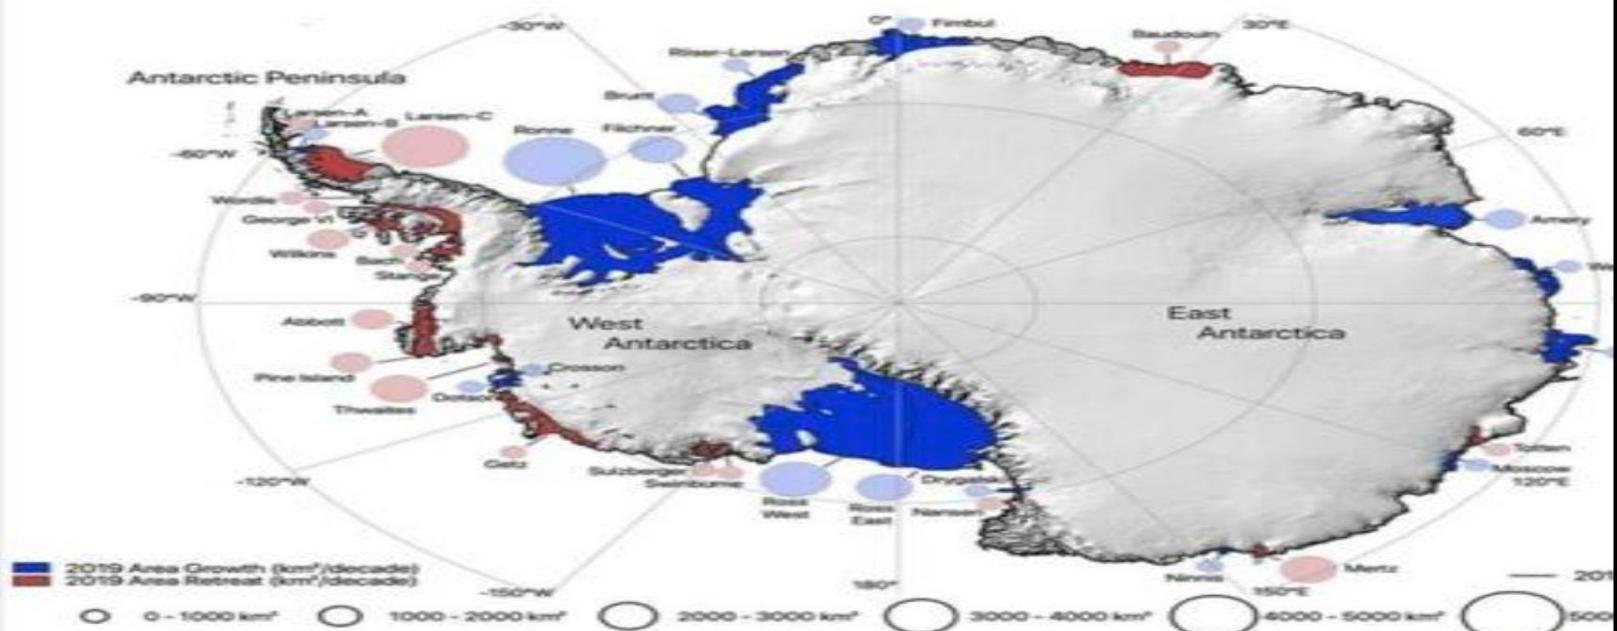

Reference Book: Cool It by Bjorn Lomborg page xiv Foreword

## 8) Is sea level rise and rate of rise unusual and a major concern?

### Recent gain in Antarctic ice sheet

Antarctic ice shelves provide buttressing support to the ice sheet, stabilizing the flow of grounded ice and its contribution to global sea levels. Over the last decade, a reduction in the area on the Antarctic Peninsula ( $6693 \text{ km}^2$ ) and West Antarctica ( $5563 \text{ km}^2$ ) has been more than offset by growth in East Antarctica ( $3532 \text{ km}^2$ ) and the large Ross and Ronne–Filchner ice shelves ( $14\,028 \text{ km}^2$ ).

**Nature can't be fooled: New study reveals Antarctic ice shelf area has grown by  $5305 \text{ km}^2$  from 2009–2019**

[tc.copernicus.org](https://tc.copernicus.org) • 4 min read

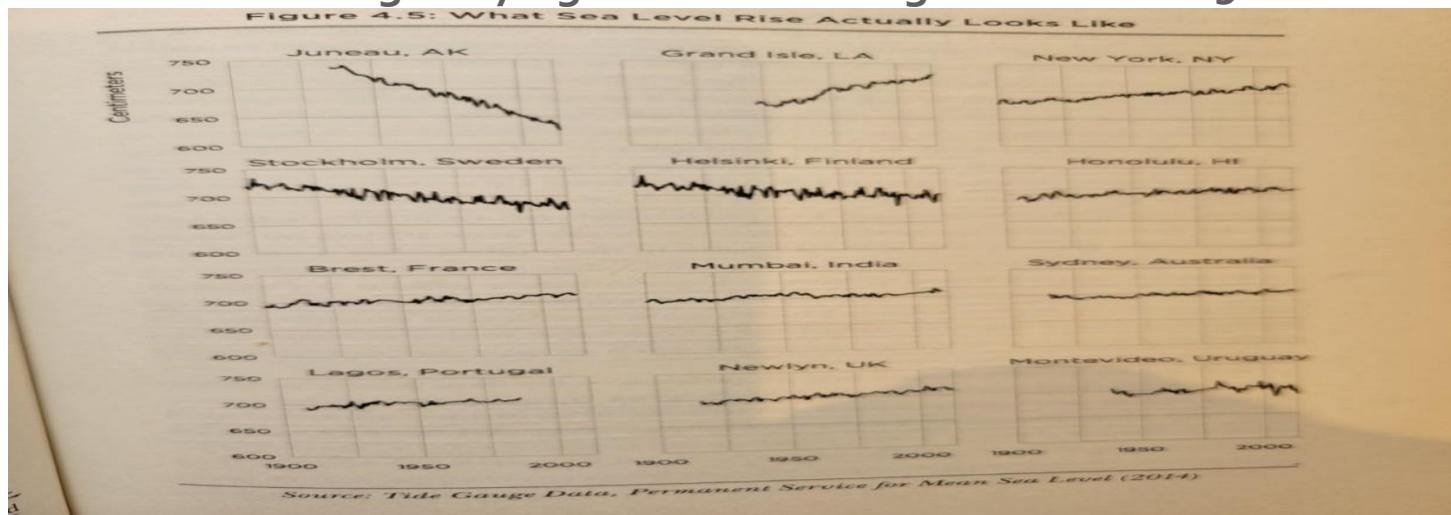

**Change in Antarctic ice shelf area from 2009 to 2019**

## 8) Is sea level rise and rate of rise unusual and a major concern?

### Area comparisons of changing sea levels between 1900 and 2000

- Given the moderate temperature changes since 1900, we wouldn't expect warming to have a dramatic effect on sea levels and it hasn't.
- From 1900 to 2000, sea level trends from locations throughout the world are variable; some smooth, some rising, some falling.
- Local sea level rise differs due to local factors like tectonic subsidence and changing temperatures and currents

### Areas Showing Varying Sea Level Changes Between 1900 - 2000

## 8) Is sea level rise and rate of rise unusual and a major concern?

Area comparison of changing sea levels between 1898 and 2017

**This is what catastrophic sea-level rise actually looks like**

<https://wattsupwiththat.com/2023/10/06/nothing-to-sea-here-folks/>

## 9) What about the scientists' man-made Global Warming crisis consensus?

2000+ Scientists' World Climate Declaration: THERE IS NO CLIMATE EMERGENCY

### **There is no climate emergency**

- A global network of over 1828 scientists and professionals has prepared this urgent message. Climate science should be less political, while climate policies should be more scientific. Scientists should openly address uncertainties and exaggerations in their predictions of global warming, while politicians should dispassionately count the real costs as well as the imagined benefits of their policy measures.

### **Natural as well as anthropogenic factors cause warming**

- The geological archive reveals that Earth's climate has varied as long as the planet has existed, with natural cold and warm phases. The Little Ice Age ended as recently as 1850. Therefore, it is no surprise that we are now experiencing a period of warming.

### **Warming is far slower than predicted**

- The world has warmed significantly less than predicted by IPCC on the basis of modeled anthropogenic forcing. The gap between the real world and the modeled world tells us that we are far from understanding climate change.

## 9) What about the scientists' man-made Global Warming crisis consensus?

2000+ scientists World Climate Declaration: THERE IS NO CLIMATE EMERGENCY

### **Climate policy relies on inadequate models**

- Climate models have many shortcomings and are not remotely plausible as global policy tools. They blow up the effect of greenhouse gases such as CO<sub>2</sub>. In addition, they ignore the fact that enriching the atmosphere with CO<sub>2</sub> is beneficial.

### **CO<sub>2</sub> is plant food, the basis of all life on Earth**

- CO<sub>2</sub> is not a pollutant. It is essential to all life on Earth. Photosynthesis is a blessing. More CO<sub>2</sub> is beneficial for nature, greening the Earth: additional CO<sub>2</sub> in the air has promoted growth in global plant biomass. It is also good for agriculture, increasing the yields of crops worldwide.

### **Global warming has not increased natural disasters**

- There is no statistical evidence that global warming is intensifying hurricanes, floods, droughts and natural disasters, or making them more frequent. However, there is ample evidence that CO<sub>2</sub> mitigation measures are as damaging as they are costly.

### **Climate policy must respect scientific and economic realities**

Reference Clintel Foundation [There is no climate emergency](#)

## 9) What about the scientists' man-made Global Warming crisis consensus?

### 2000+ scientists World Climate Declaration: THERE IS NO CLIMATE EMERGENCY

- There is no climate emergency. Therefore, there is no cause for panic and alarm. We strongly oppose the harmful and unrealistic net-zero CO<sub>2</sub> policy proposed for 2050. If better approaches emerge, and they certainly will, we have ample time to reflect and re-adapt. The aim of global policy should be 'prosperity for all' by providing reliable and affordable energy at all times. In a prosperous society, men and women are well educated, birth rates are low and people care about their environment.

### Epilogue

- The World Climate Declaration (WCD) has brought a large variety of competent scientists together from all over the world\*. The considerable knowledge and experience of this group is indispensable in reaching a balanced, dispassionate and competent view of climate change.
- From now onward, the group is going to function as "Global Climate Intelligence Group". The CLINTEL Group will give solicited and unsolicited advice on climate change and energy transition to governments and companies worldwide.
- *\* It is not the number of experts but the quality of arguments that counts*

## 9) 9) What about the scientists' man-made Global Warming crisis consensus?

### 10) Reputable scientists disagree that mankind's emissions of CO<sub>2</sub> is causing a climate crisis

*There is consensus that temperatures have been and are increasing and that mankind has increased CO<sub>2</sub> levels. However, there is no consensus regarding the degree to which mankind's CO<sub>2</sub> emissions are impacting temperatures or that this is causing a climate crisis.*

A large and increasing number of world-renowned scientists speak out against this, including:

Dr. John Christy Professor of Atmospheric Science, Director of Earth System Science Center U. of Alabama

Dr. John F. Clauser has degrees from Caltech and Columbia Universities, a Nobel Prize winner in science

Dr. Judith Curry climatologist, former chair of Earth and Atmospheric Sciences Georgia Institute of Technology

Dr. Ivar Giaever professor emeritus at the Rensselaer Polytechnical Institute, Nobel Prize in Physics

Dr. William Happer Physics professor Emeritus Princeton Univ. atomic physics, optics, spectroscopy

Dr. Steven Koonin theoretical physicist and former director Center for Urban Science at New York Univ.

Dr. Richard Lindzen MIT atmospheric physicist on the dynamics of atmosphere and ozone photochemistry

Dr. Patrick Moore ecologist, UBC, co-founder of Greenpeace

Dr S. Fred Singer Atmospheric physicist, professor emeritus of environmental science U. of Virginia

[https://youtu.be/P\\_nH1BAfDhs?si=OVxNpHIBiUNKX20t](https://youtu.be/P_nH1BAfDhs?si=OVxNpHIBiUNKX20t) <https://principia-scientific.com/46-climate-change-denying-statements-made-by-former-ipcc-scientists/>

## 10) If CO<sub>2</sub> is good and climate always changes, what about other fossil fuel pollutants and alternative energy adoption?

### Are scientists, institutions, activists and NGOs contributing to climate misinformation?

Conformance pressures are real in the media, governments, corporations, NGOs, schools and the public

#### Possible factors: A Self-Reinforcing Alignment of Perspectives and Interests.

- 1) **The Media:** As the age of the internet advances, headlines become more provocative to encourage clicks. The general lack of knowledge of what the science actually says, the drama of extreme weather events and their heart-rendering impact on people and pressure within the industry all work against a balanced coverage in popular media <https://www.telegraph.co.uk/news/2023/08/04/net-zeros-dam-has-burst-but-bbc-is-still-papering-over/>
- 2) **Politicians:** Politicians win elections by arousing passion and commitment from voters – by motivating and persuading. The threat of climate catastrophe resonates with everyone. Politicians declare “the science” is settled and label anyone who questions that “a denier”
- 3) **Scientific Institutions:** When it comes to climate, institutions frequently seem more concerned with making the science fit the narrative than ensuring the narrative fits the science. Assessment reports often summarize or describe the data in ways that are misleading. Scientific institutions have been willing to persuade rather than inform.
- 4) **Scientists:** For academics, pressure occurs to secure funding through grants, plus the matter of promotion and tenure, plus peer pressure.
- 5) **Activists and NGOs:** Have built organizations based on “climate emergency” that rely on donations to exist, making claims that climate change is one of the most devastating problems that humanity has ever faced.
- 6) **The Public:** Concerns about climate change are as old as humanity. Public attitudes mostly involve unquestioning acceptance of wisdom handed down from on high and do not have the time or ability to examine the science themselves. Getting information from social media can also be misleading.

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*Reducing CO<sub>2</sub> emissions is bad for plants*

1) Reducing CO<sub>2</sub> levels in the atmosphere is bad for plant growth and life.

- Plants need and thrive on CO<sub>2</sub> levels. Increased CO<sub>2</sub> levels are bringing about improved crop growth plus a greening of the Earth, especially in desert areas. Reducing CO<sub>2</sub> levels will mitigate this positive and desirable effect.

Some refer to it as 'Sustainable', I agree, only if its definition changes to 'break your back if you want to eat even though you'll be poor forever' I am weeding our maize. !\[\]\(860f6ca531d79f6a24efece2c339c9ee\_img.jpg\) <https://t.co/9FYo8Pql5W>" / Twitter](#)

[\(855\) Net Zero 'Slavery' EXPOSED By Local Resident – YouTube](#)

Michael Shellenberger interview <https://www.youtube.com/watch?v=Ey7iWsDYnJ8>

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*Reducing fossil fuel usage would negatively impact 3<sup>rd</sup> world economy and these people*

Access to fossil fuel energy will greatly help 3<sup>rd</sup> world economies and lifestyles.

In the developing world, climate activism movements, often bankrolled by foreign non-governmental organizations (NGOs), have stalled critical projects across continents. These efforts ignore the human toll of energy poverty: children studying by candlelight, hospitals without power, and economies stunted by unreliable grids.

First, the developing nations should investigate the funding and motives behind climate activism. Who bankrolls these NGOs? Are their campaigns aligned with national interests, or do they serve foreign agendas?

Greenpeace International, for example, has undertaken protests of power generated by fossil fuels and nuclear reactors and of coal and aluminum mining across India, while half of India suffers from unreliable electricity supplies.

Greenpeace leadership enjoys the comfort of an industrial economy but is asking poor people in the Third World to forgo energy abundance and rely instead on useless wind turbines and solar panels and accept generational poverty for the sake of addressing a fabricated climate emergency.

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*Reducing fossil fuel usage would negatively impact 3<sup>rd</sup> world economy and these people*

Access to fossil fuel energy will greatly help 3<sup>rd</sup> world economies and lifestyles.

Africa, home to over 600 million people with limited access to electricity, stands at the frontline of energy deprivation. Nigeria, Angola, and Mozambique have vast natural gas reserves, yet face continual opposition from international lobbies.

In the Democratic Republic of Congo, one of the world's poorest countries, the non-profit 350Africa.org coordinated demonstrations against oil and gas exploration, mobilizing hundreds of groups. In Uganda and Tanzania, the \$3.5 billion East African Crude Oil Pipeline (EACOP), a lifeline for regional energy, has faced relentless opposition from groups like StopEACOP.

**Second**, governments must assert authority over energy policy, curbing local states or municipalities that align with crusades against fossil fuels. Many cities across the developing world have designated themselves as Net-Zero entities under an initiative of the World Economic Forum.

It is exasperating to see cities, still struggling to provide basic services for the health and safety of their citizens, are willing to prioritize foolish opposition to rational energy development. It is even more weird that municipal leaders would align with foreign organizations like the World Economic Forum and the United Nations in opposition to their own national interests.

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*Reducing fossil fuel usage would negatively impact 3<sup>rd</sup> world economy and these people*

Access to fossil fuel energy will greatly help 3<sup>rd</sup> world economies and lifestyles.

**Third**, legal mechanisms should be used to deter frivolous lawsuits and protests.

African nations rich in energy resources could adopt statutes penalizing activism that delays critical infrastructure without evidence of harm, mirroring the U.S. Attorney General's mandate to challenge unconstitutional state and local laws. Such measures would shift the burden onto activists to justify their claims, rather than paralyzing projects by default.

Energy security is national security, and no ideology should usurp that. From Nigeria's oil fields to India's coal mines, national leaders must dismantle efforts to stymie sensible energy use and clear a path for energy abundance and the eradication of poverty.

This commentary was first published at [Townhall](#) on April 22, 2025. *Vijay Jayaraj is a Science and Research Associate at the [CO<sub>2</sub> Coalition](#), Arlington, Virginia. He holds an M.S. in environmental sciences from the University of East Anglia and a postgraduate degree in energy management from Robert Gordon University, both in the U.K., and a bachelor's in engineering from Anna University, India.*

# 11) What are the negative implications of pursuing a Carbon Neutral policy?

*The cost of going "Carbon Neutral is significant"*

## 3) There are significant direct and indirect costs to going "Carbon Neutral"

Cost items include:

- Costs to move home heating and cooking to electric from oil or gas
- Costs to install electric charging stations across the country
- Industry and business costs, etc.
- Costs for significantly increased electricity supply and distribution

Lord Hammond, former chancellor, states that there are significant true costs of about £1 trillion for the UK to go "Carbon Neutral" and the inevitable consequence of slower-rising living standards

<https://www.telegraph.co.uk/politics/2023/07/29/tory-pms-systematically-dishonest-1-trillion-cost-net-zero/>;

<https://driving.ca/column/motor-mouth/scary-putting-out-ev-fire-fighting-battery-electric-vehicle>

- Electric vehicle safety concerns also need to be addressed 2 electric car collision

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*The cost of going "Carbon Neutral is significant"*

- **THE NATIONS THAT DOMINATE THE GLOBAL ECONOMY**...will be those that adopt sane energy policies. Unfortunately, that group does not include the U.S. Our government is determined to drive the coal industry and coal-fired power plants out of business, with natural gas next on the list.
- *As the United States continues to rapidly retire its dwindling fleet of coal-fired power plants in the name of fighting climate change, the world's two most populous nations, China and India, continue efforts to dramatically expand their own coal usage. These two starkly divergent approaches inevitably lead to questions about which philosophy will prevail at the end of the day, and whether there is actually any "energy transition" happening at all.*
- *Like many other developing nations, India and China have been rational actors when it comes to fulfilling the energy needs of their societies, choosing factors like affordability and reliability over the Western norm of policymaker virtue signaling. This is a stark contrast to the approach in the US, which has been working overtime to kill the nation's once-dominant coal industry in its feverish pursuit of often arbitrary and irrational climate goals. This rapid dismantling of US coal recently led one commissioner at the Federal Energy Regulatory Commission (FERC), Mark Christie, to question, "Are the lights going to stay on?"*
- You can't keep the electricity on 24/7 with power sources that work only occasionally and unpredictably. No one has ever done it, even on a small scale. Nowhere on Earth is there even a demonstration project to show how a town or village can run itself on wind and solar energy, plus batteries.

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*The cost of going "Carbon Neutral is significant"*

- *[In the U.S.], “Announced coal retirements total 44,700 MW over the next 4 years and 83,400 MW during the next 6 years. ”That is a problem because we have no plan to replace that dispatchable capacity:*
- *Given that the permitting, funding, construction and starting-up of dispatchable replacement capacity can take 7-10 years under ideal conditions in the US, consideration of that 6-year time frame becomes especially crucial. Yet, as the report notes, no one in the Biden administration appears to be attempting to address the situation in any real way despite consistent warnings since 2019 of a looming shortage of reliable generating capacity on the grid.*
- *China, meanwhile, continues to permit **1 to 2 new coal-fired power plants every week**, and now has 243 GW of new capacity permitted and under construction, according to the Center for Research on Energy and Clean Air.*
- So China alone has 243 gigawatts of new coal capacity already coming online, while we are planning to retire a little under 45 gigawatts. And that is just what they are currently building. There are many more coal-fired power plants where those came from, as coal is plentiful. And India has almost doubled its coal-fired power production, with much more yet to come. There are other governments, too, that are not crazy.
- All of which is to say that anyone who thinks we are somehow helping the climate with our energy policies is deluded. We are simply condemning the U.S. to second-class power status, and our citizens (except for our virtue-signaling elites, of course), to a sharply declining, ultimately third-world, standard of living.

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*The cost of going "Carbon Neutral is significant"*

### Europe is waking up to the follies of 'green energy'

- JPMorgan Chase CEO [Jamie Dimon](#) says that Europe has gone from 90 percent of America's GDP to 65 percent.
- The Wall Street Journal's front-page story — "[Europe's Green Energy Rush Slashed Emissions – and Crippled the Economy](#)". "High-profile, net-zero projects are being postponed or scrapped," impairing Europe's ability to attract artificial intelligence and other vital economic drivers and job creators. The "green" energy shift is killing jobs and inflicting cost-of-living shocks.
- Germany now has the developed world's highest domestic electricity prices. Britain has its highest industrial rates, and Italy isn't far behind. Average prices for Europe's heavy industries are twice those in the U.S. Price volatility has risen as the share of renewable electricity generation has [increased to 54 percent](#).
- Although wind and sunlight are free, [harnessing them](#) requires major infrastructure investments, including battery storage for windless and sunless periods. These additional costs are typically hidden behind subsidies and carbon taxes, but the net result is [much higher electricity prices](#), blackouts, and economic disruption.

## 11) What are the negative implications of pursuing a Carbon Neutral policy?

*The cost of going "Carbon Neutral is significant"*

### Europe is waking up to the follies of 'green energy'

- Glass, steel, aluminum, petrochemical, and automobile manufacturing, along with other energy-intensive companies and industries, are all shrinking or being exported from Europe to the U.S. or Asia.
- Thousands of high-paying jobs are disappearing. Entire cities and regions are cascading into economic chaos. Families cannot afford proper food and heat. Elderly people often resort to heating only one room or one floor to reduce heating costs. Welfare and cold-weather support programs are strained to the limit.
- The End Fuel Poverty Coalition estimates that in Britain, living in cold homes caused nearly 5,000 excess deaths during the 2022-2023 winter. People died because they were too cold and weak to survive illnesses, chronic diseases, or poor health.

## 11) What are the negative implications of pursuing a Carbon-Neutral policy?

*Wind and solar energy cannot meet world's needs, promoting unrealistic energy options*

4) The pursuit of Wind and Solar energy generation is not cost-effective and does not have the capacity to provide the required world energy needs and replace hydrocarbon energy

- Wind and solar energy potential combined fall very short of meeting world energy needs
- Without subsidies and Government support, wind and solar energy are not economic
- Both wind and solar energy are intermittent, needing significant backup capacity
- Required storage capacity and materials for these batteries are limited, making total energy conversion to wind and solar unattainable
- Wind and solar energy have their own environmentally negative impacts, including extensive land space usage and negative visual impact, negative impact on animal life, significant open pit mining implications, limited country sourcing (China plus limited other countries for raw material supplies)

<https://www.foxnews.com/politics/study-casts-doubt-electric-vehicles-climate-cost-benefits-wont-achieve-goals-intended>

## 11) What are the negative implications of pursuing a Carbon-Neutral policy?

*Wind and solar energy cannot meet world's needs, promoting unrealistic energy options*

More and more wind turbines and solar panels are not the answer because they can never fully supply the required electrical grid or provide energy reliability without full dispatchable backup.

- *"An electrical grid powered mostly by intermittent generators like wind and sun requires full backup from some source, and if that source is to be stored energy, the amounts of storage required are truly staggering. When you do the simple arithmetic to calculate the storage requirements and the likely costs, it becomes obvious that the entire project is completely impractical and unaffordable. The activists and politicians pushing us toward this new energy system of wind/solar/storage are either being intentionally deceptive or totally incompetent."*

## Biography of Graeme Phipps compiler of this presentation material

- A professional Geophysicist/Geologist and director of 2 oil and gas companies with over 50 years experience in the International oil and gas industry. Graeme has spent 21 years as director of various companies (11 different Boards, 7 public, with roles on Audit, Reserves, Compensation, Corporate Governance, EH&S and Special Committees plus being Chairman of one public company, plus the principal of Phipps and Associates – an oil and gas consulting firm). Graeme was President of CEP International/PetroKamchatka Plc./East Siberian Plc. (2007 – 2020). In 2005, Executive VP of PetroKazakhstan to become President and CEO which was successfully sold for \$4.2B in late 2005. Exploration and International VP for Petro-Canada (2001 -2002) and VP Corporate Planning and VP Canadian Division for Nexen (1994 -2001). Graeme spent his first 20 years (1974 -1994) with Esso Resources and Exxon in technical, operational and management roles.
- Oil and gas experience in the Western Canada Basin, the Beaufort Sea area, the Arctic Islands and off the East Coast in Canada, the Gulf of Mexico USA, Yeman, North Africa, Romania, China, Gambia, Australia, Malaysia, Indonesia, Nicaragua, UK North Sea, Kazakhstan, Russia.
- Consulting and advisory experience (2002 – present) as the principal of Phipps and Associates, an Oil and Gas Executive Management consulting company, plus 5 years experience in Corporate planning: three years as VP Corporate Planning and Business Development at Nexen and two years with Exxon in their NY head office.
- Presently a director Tundra Oil and Gas Ltd and Buried Hill Serdar Ltd. and recently was a member of the Public Accounts Committee, Government of Jersey
