

---

## 1. Product Definition and Information

### 1.1. Description of Company/Organization

Firestable Insulation Company is a leading manufacturer of fire-resistant spray polyurethane foam systems and operates in two manufacturing facilities:

- In Houston, Texas, USA:  
size of site: 125k ft<sup>2</sup>  
Number of employees: 23
- In Essex, Connecticut, USA:  
Size of site: 25k ft<sup>2</sup>  
Number of employees: 13

### 1.2. Product Description

#### Product Identification

This declaration covers water blown closed-cell spray polyurethane foam insulation manufactured under Firestable brand by FIC.

#### Product Specification

Spray polyurethane foam (SPF) is made on the jobsite by combining polymeric methylene-diphenyl diisocyanate (pMDI/MDI or A-side) with an equal volume of a polyol blend (B-side). Sides A and B react and expand at the point of application in the building envelope to form polyurethane foam. The formed-in-place SPF provides both thermal insulation and air sealing to the building.

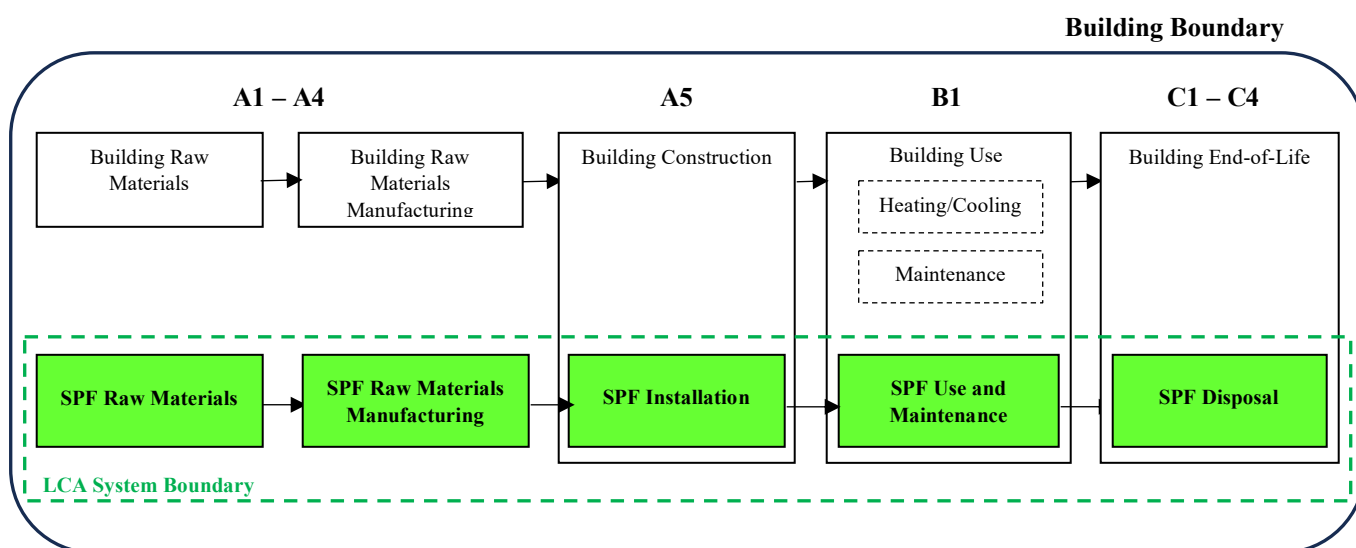

The Firestable 2.0 provides a water-resistant insulation, water-vapor control, air-sealing and delivers an additional structural performance to the building envelope.

SPF products are commonly used in residential, commercial, institutional, and certain industrial applications. Typical properties of the various SPF products are shown on Table 1.

*Table 1: Typical WB ccSPF properties*

PROPERTY	VALUE
Density [lb / ft <sup>3</sup> ]	2.0 to 2.8
Thermal resistivity [R / in]	5
Air permeable material	✓
Integral vapor retarder	✓
Water resistant	✓
Cavity or exterior insulation	✓
Continuous insulation	✓
Soil Gas Barrier	✓
Rainscreen	✓
Fungi Resistant	✓
Air Quality	✓
Structural Improvement	✓

## Flow Diagram

**Figure 1: Product flow diagram**

### 1.3. Application

Closed-cell product applied to the interior or exterior side of the building envelope as an insulation, water-sealing, vapor-sealing, structural integrity and air-sealing material.

### 1.4. Declaration of Methodological Framework

This EPD is declared under a cradle-to-grave boundary. As such, it includes all life cycle stages including any off-gassing emissions from the blowing agent associated with use of the product. Per the product category rules (UL Environment, 2018), the assessment was conducted using a building service life of 75 years. Material and energy inputs were allocated on a mass basis. Recycled content and disposal at end-of-life follow the cut-of allocation approach. No inputs or outputs were deliberately excluded from this EPD.

### 1.5. Technical Requirements

All SPF products must meet numerous performance requirements to comply with building codes. The detail of these requirements is described in specific tests listed in consensus standards for material performance and code compliance. A summary of these consensus standards is provided in Table 2 below:

*Table 2: Summary of technical Standards for SPF in Construction*

Standard Type	ROOFING	CLOSED CELL	OPEN CELL
ASTM	ASTM C1029 Type III and IV or ASTM D7425	ASTM C1029 Type I and II	ASTM WK30150
CAN/ULC		S705.1	S712.1
ICC Building Code Compliance		ICC-ES AC-377 ICC-1100-20XX NFPA 275	

#### ATM Standards

- C1029-15 Standard Specification for Spray-Applied Rigid Cellular Polyurethane Thermal Insulation UL Canada Standards
- S705.1-15 Standard for Thermal Insulation – Spray Applied Rigid Polyurethane Foam, Medium Density International Code Council Standards.
- ICC-ES AC-377 Acceptance Criteria for Spray-Applied Foam Plastic Insulation
- ICC-1100-20xx Standard for Spray-Applied Polyurethane Foam Plastic Insulation Canadian Construction Materials Centre
- CCMC Evaluation Reports and Listings
- NFPA 275 Certification

Typical material performance requirements per ICC-1100 are provided in Table 2 below.

*Table 3: Summary of Typical Material Performance Requirements for SPF in Construction*

PERFORMANCE REQUIREMENT	STANDARD	VALUE
Thermal Resistance (R-value)	ASTM C518, C177 or C1363	As reported (typ R4.4-5.0/inch)
Surface Burning Characteristics	ASTM E84 or UL723	Flame spread index $\leq 75$ Smoke developed $\leq 450$
Core Density	ASTM D1622	As reported (typ 2.0-2.8 pcf)
Closed-Cell Content	ASTM D2856 or ASTM D6226	~ 90%
Tensile Strength	ASTM D1623	15 psi min (100kPa)
Compressive Strength	ASTM D1623	15 pi min (100 kPa)
Dimensional Stability	ASTM D2126	15% max change
Water Vapor Permeance	ASTM E96 (dry cup)	As reported (typ 1 US perm @ 2" thk / 60ng @ 51 mm)
Air Permeance	ASTM D E283 or D2178	As reported (typ imperm @ 2.5" thk / 38mm)
Water Absorption	ASTM D2842	< 5% max

## 1.6. Properties of Declared Product as delivered

The A-side and B-side required to produce SPF are delivered to the job site in separate containers. On the job site, these chemicals are mixed in equal volume proportions to create SPF.

## 1.7. Material Composition

The A-side of SPF is made from a blend of polymeric methylene diphenyl diisocyanate (MDI). The B-side is a mixture of polyester and or polyether polyols, flame retardants, blowing agents, catalysts, and other additives that, when mixed with A-side, creates foam that can be applied for insulation.

Since one half of the formulation by volume is MDI (A-side), the table focuses on the other multi-component half (B-side). Firestable Insulation Company product composition is proprietary, so an approximative composition of chemical components is shown.

While some of the ingredients may be classified as hazardous, per the Resource Conservation and Recovery Act (RCRA), Subtitle 3, the product as installed and ultimately disposed of is not classified as a hazardous substance, as hazardous ingredients are rendered chemically inert after installation.

*Table 4: Firestable 2.0 formulation*

CHEMICAL		COMPOSITION
Polyols	Polyether	< 25%
	Mannich	< 20%
	Proprietary	< 25%
Fire Retardant	TCPP	< 20%
Blowing Agent	Reactive (H <sub>2</sub> O)	< 3%
Catalyst	Amine	< 4%
	Metal	< 2%
Surfactant	Silicone	< 2%
Dispersing additive	Unsaturated polycarboxylic acid polymer and polysiloxane copolymer	< 0.5%

## 1.8. Manufacturing

During the B-side production process, materials are blended in tanks and packaged. The B-side formulation is made by two facilities, one in Texas and one in Connecticut. The Texas facility utilizes technology to minimize dust contamination and the release of gaseous material during material transfer and processing. Waste materials are typically reintegrated into the formulation without additional collection, transport, or processing.

## 1.9. Packaging

---

The high-pressure SPF chemicals are packaged in steel drums. Finished packaged products are loaded onto pallets, where additional shipping materials, such as strapping, cardboard, and plastic wrap, are used. In this study, it is assumed that the empty chemical containers are properly cleaned and taken to a recycler.

### **1.10. Transportation**

---

Final products are distributed via container truck, either directly to customers, or first to warehouse, prior to being sent to customers. Table 5 details distribution assumptions for finished SPF products.

### **1.11. Product Installation**

---

Firestable SPF series are installed by trained/certified professional applicators by on-site mixing of the A-side and B-side chemicals.

Installation includes insulation of the walls, floors, and ceilings of entire buildings. These chemicals are delivered to the jobsite in unpressurized containers (usually 55-gallon drums) and heated to approximately 110-130 °F (43-54 °C) and pressurized to about 1000 psi by specialized equipment. The chemicals are transferred by a heated hose and aerosolized by a spray gun and combined by impingement mixing at the point of application. Personal protective equipment such as goggles, protective suits, and respirator cartridges is required to protect applicators from chemical exposure during installation. Also needed are disposable materials such as masking tape and drop cloths. The schematic in Figure 2 shows the typical equipment components used to produce high-pressure SPF foam, including unpressurized A-side and B-side liquid drums with transfer pumps, which are connected to the proportioner system for heating and pressurizing the chemicals, and then through a heated hose connected to a spray gun for application.

Disposal of Packaging materials is modeled in accordance to the assumptions outlined in Part A of the PCR (UL Environment, 2018). All ancillary installation materials are assumed to be sent to landfill.

**Figure 2: Schematic of a High-Pressure SPF**

### 1.12. Use

As this study only looks at the life cycle of spray foam insulation, and not the building, the use phase only contains the emissions of any chemicals off gassed from the foam.

### 1.13. Reference Service Life and Estimated Building Service Life

The reference service life (RSL) for SPF is the life of the building or 75 years. Additional information is provided in Table 7.

### 1.14. Disposal

---

When the building is decommissioned, it is assumed that only manual labor is involved to remove the foam. Wastes are estimated to be transported < 5 miles to the disposal site. The spray foam is assumed to be landfilled at end-of-life, as is typical for construction and demolition waste in the US. This study assumes the spray foam is inert in the landfill (Kjeldsen & Jensen, 2001).

## 2. Life Cycle Assessment Background Information

---

### 2.1. Functional or Declared Unit

---

The product function is providing insulation to buildings. Accordingly, the functional unit for the study is 1 m<sup>2</sup> of installed insulation material with a thickness that gives an average thermal resistance of  $R_{si}=1\text{m}^2\cdot\text{K}/\text{W}$  (in imperial units,  $R_{si}=1$  is equivalent to  $R = 5.68 \text{ h}\cdot\text{ft}^2\cdot^\circ\text{F}/\text{Btu}$ ) with a building service life of 75 years (packaging included).

### 2.2. System Boundary

---

The study uses a cradle-to-grave system boundary. As such, it includes upstream processing and production of materials and energy resources needed for the production of SPF, transport of materials (all chemical inputs for production and packaging) to SPF formulation sites, formulation of SPF components, transport of the components to the installation site, installation of insulation, removal and transport of insulation to disposal site, and end-of-life-disposal. Building energy savings from the use of insulation are excluded from this analysis.

### 2.3. Estimates and Assumptions

---

The material and energy inputs and outputs were modeled according to data provided by the representative site, while the electricity grid and natural gas mix were chosen based on the locations of the production facility.

### 2.4. Cut-off-Criteria

---

The cut-off criteria for including or excluding materials, energy and emissions data of the study are as follows:

- **Mass** – If a flow is less than 1% of the cumulative mass of the model it may be excluded, providing its environmental relevance is not a concern.
- **Energy** – If a flow is less than 1% of the cumulative energy of the model it may be excluded, providing its environmental relevance is not a concern.
- **Environmental relevance** – If a flow meets the above criteria for exclusion yet is thought to potentially have a significant environmental impact, it was included.

---

Material flows which leave the system (emissions) and whose environmental impact is greater than 1% of the total of an impact category that has been considered in the assessment must be covered. This judgment was made based on experience and documented as necessary.

Packaging of incoming raw materials (e.g. pallets, totes, super-sacks) are excluded as they represent less than 1% of the product mass and are not environmentally relevant. Capital goods and infrastructure required to produce and install SPF (e.g. batch mixers, spraying equipment) are presumed to produce millions of units over the course of their life, so impact of a single functional unit attributed to this equipment is negligible; therefore, capital good and infrastructure were excluded from this study. No known flows are deliberately excluded from this EPD

## 2.5. Data Sources

---

The LCA model was created using the GaBi software system for life cycle engineering, developed by Sphera Solutions, Inc. The GaBi 2022.2 LCI database provides the LCA model as well as the background data used.

### **Temporal coverage.**

The data are intended to represent spray polyurethane foam production during the 2024 calendar year.

### **Geographical coverage**

The background LCA represents FIC's product produced in the United States. Primary data are representative of this country. Regionally specific datasets were used to represent each manufacturing location's energy consumption. Proxy datasets were used as needed for raw material inputs to address lack of data for a specific material or for a specific geographical region. These proxy datasets were chosen for their technological representativeness of the actual materials.

### **Technological coverage**

Data on material composition were collected directly from FIC. Manufacturing data were provided by FIC for the Firestable Series product. Waste, emissions, and energy use are calculated from reported annual production during the reference year

## 2.6 Period under review

---

Primary data collected represent production during the 2024 calendar year. This analysis is intended to represent production in 2024.

## 2.7 Allocation

The cut-off allocation approach is adopted in the case of any post-consumer and post-industrial recycled content, which is assumed to enter the system burden-free. Only environmental impacts from the point of recovery and forward (e.g., inbound transports, grinding, processing, etc.) are considered.

**Table 5: Transport to the building site (A4)**

NAME	UNIT	VALUE
Fuel type		Diesel

## 4. Life Cycle Assessment Results

4.1. As this cradle-to-grave declaration, all modules are declared, as seen in Table 10. However modules B2 to B7, C1 and C3 do not contribute impact and are therefore declared as zero.

*Table 10: Description of the system boundary modules*

	PRODUCT STAGE			CONSTRUCTION PROCESS STAGE		USE STAGE							END OF LIFE STAGE				BENEFITS AND LOADS BEYOND THE SYSTEM BOUNDARY
	A1	A2	A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	C3	C4	D
	Raw material supply	Transport	Manufacturing	Transport from gate to site	Assembly/install	Use	Maintenance	Repair	Replacement	Refurbishment	Building operational Energy Use During Product	Building Operational Water Use During Product	Deconstruction	Transport	Waste processing	Disposal	Reuse, Recovery, Recycling Potential

### 4.3. LCIA Results Summary

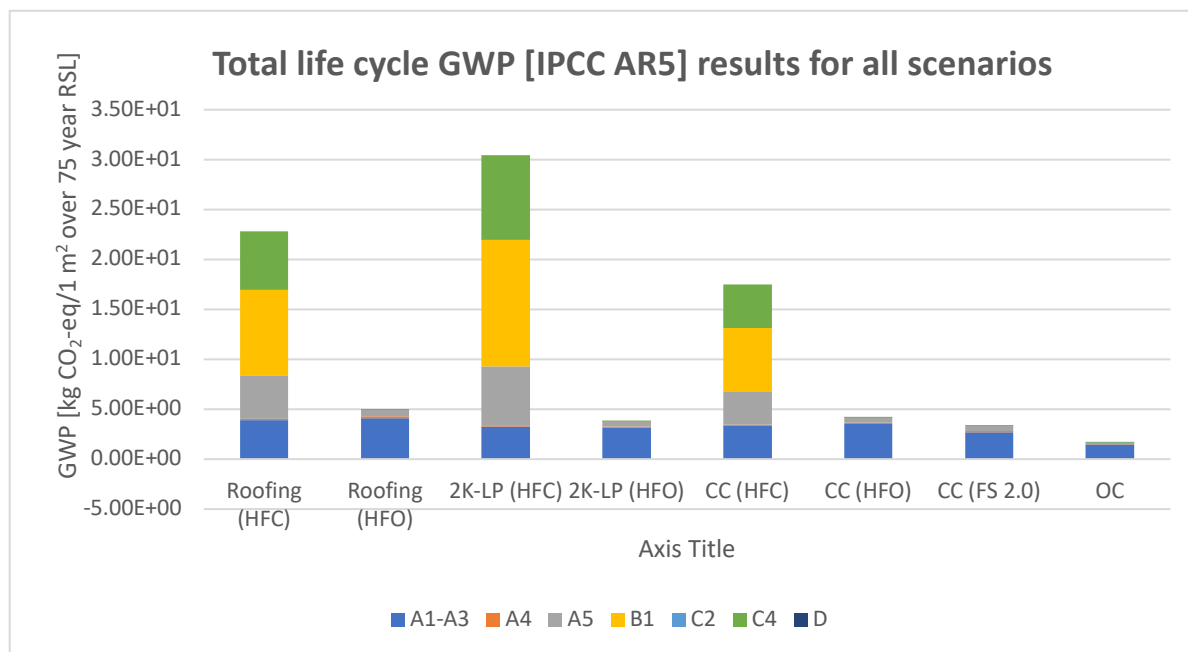

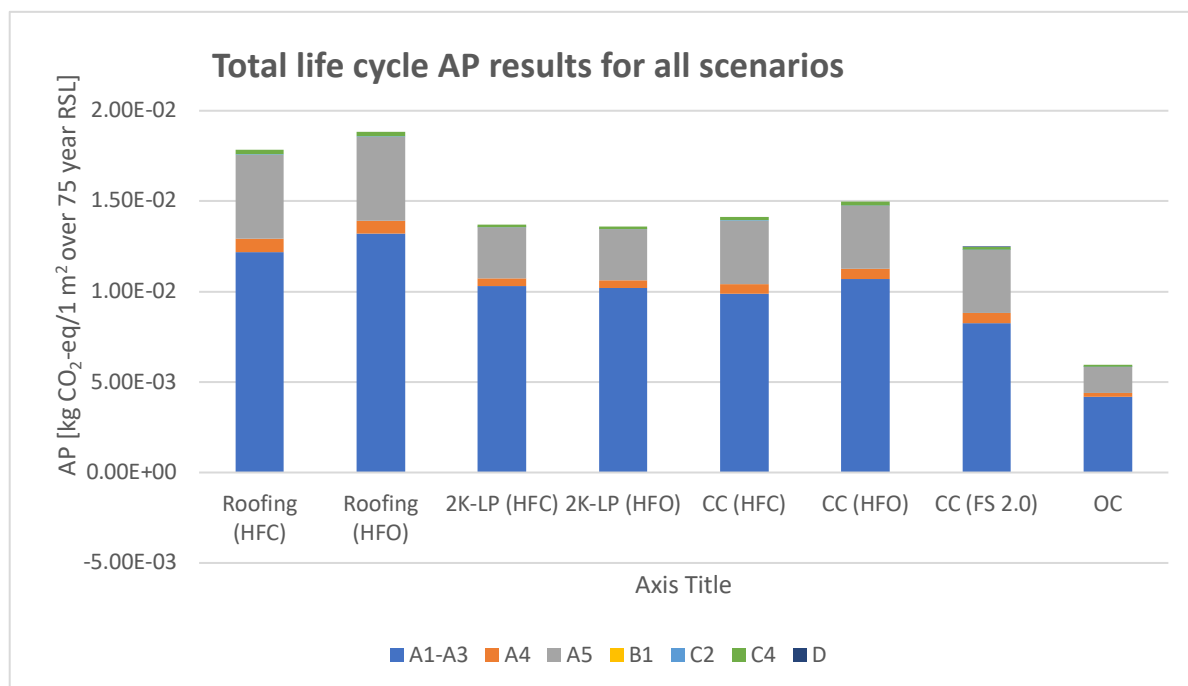

To better understand the differences between the products discussed previously, the total life cycle results are presented in Figure 4-8, Figure 4-9, Figure 4-10, Figure 4-11, and Figure 4-12 for GWP [TRACI 2.1], GWP [IPCC AR5], AP, EP, and SFP impact categories, respectively.

**Figure 14: Total life cycle GWP [TRACI 2.1] results for all scenarios**

## Firestable FS 2.0 - Water Blown Spray Polyurethane Foam Insulation

## Firestable FS 2.0 - Water Blown Spray Polyurethane Foam Insulation

According to ISO 14025, and ISO 21930:2017

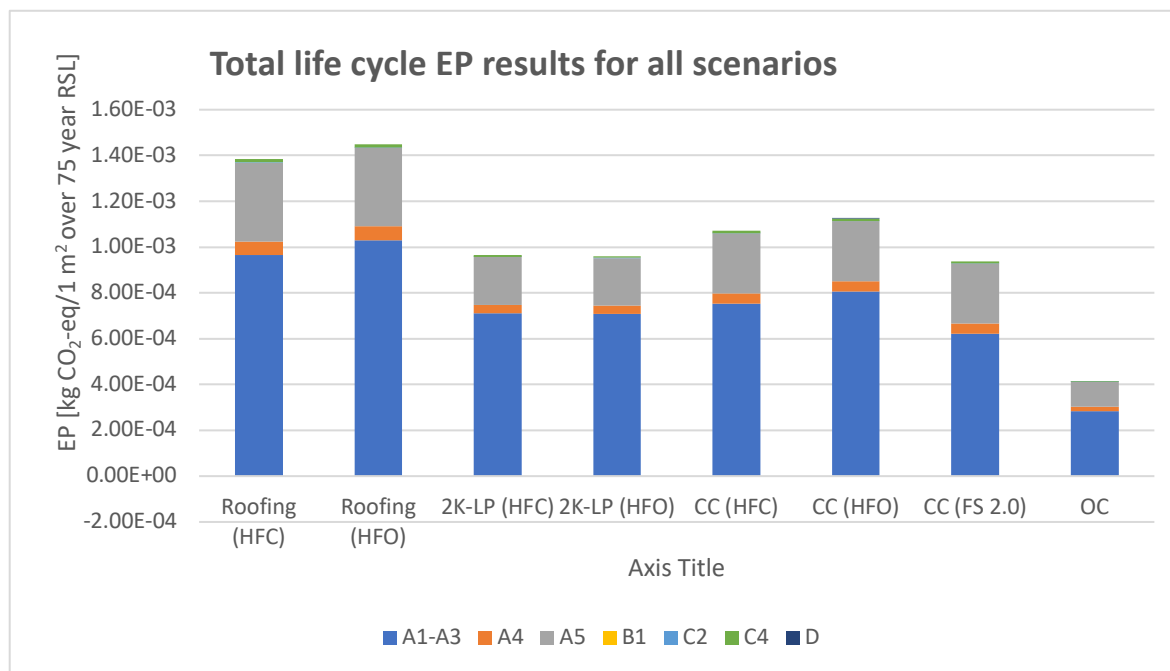

Figure 17: Total life cycle EP results for all scenarios

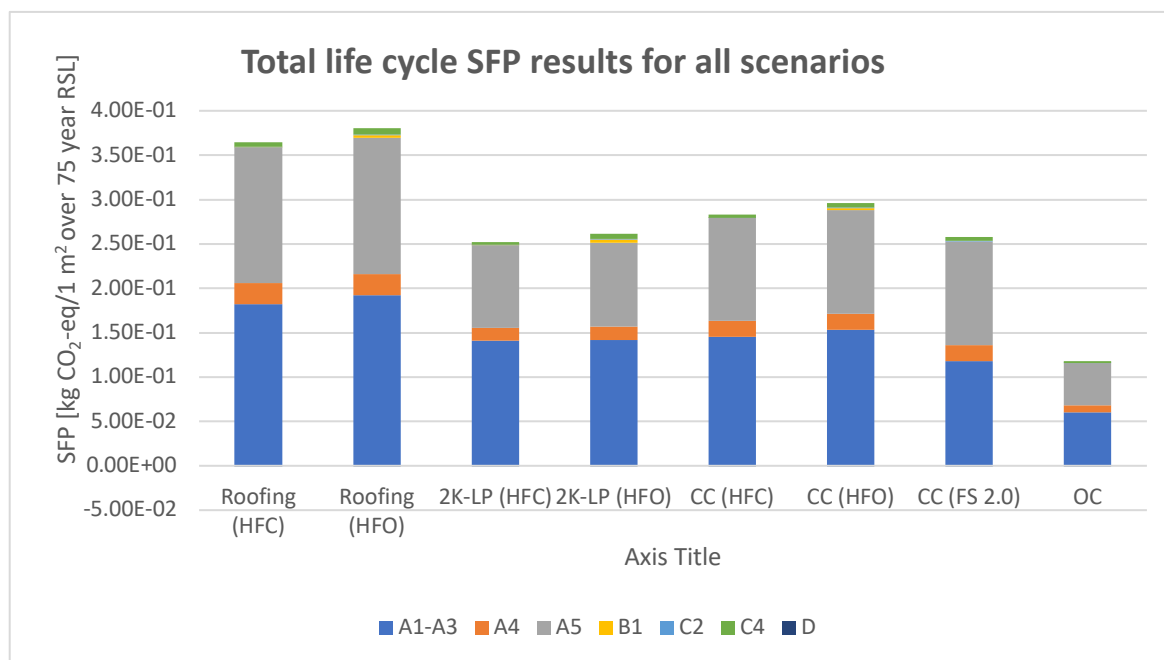

Figure 18: Total life cycle SFP results for all scenarios

## 5. LCA Interpretation

For HFC containing products, installation (A2), use (B1) and disposal (C4) are the greatest contributors to the GWP category due to the emissions of HFCs over the course of its lifecycle. HFO and Water Blown formulations do not have pronounced GWP impacts across the life cycle due to the lower blowing agent GWP characterization factors.

Firestable® FS 2.0 is a water blown **closed cell** foam. Declaration #ASTM – EPD070 has verified data for HFO closed cell foam. A linear calculation based on reactive foam percentage density difference was used to populate Table 11A for FS 2.0 using the LCA logic below:

- A1- A3 is similar to HFO closed cell SPF.
- A1 raw material supply of FS 2.0 is less than closed cell due to density
  - HFO closed cell density range of 1.5-2.5 pcf, mostly 2.2-2.4 pcf, avg 2.3pcf.
  - FS 2.0 has a 2.4pcf, with base density being 1.775pcf before FRP solids material inclusion.

A1 Calculation:

$1.775\text{pcf}/2.3\text{pcf} = .772$  material correction multiplier. Using the multiplier for stated A1 in the baseline HFO closed cell table (Table 11), generates the specific A1 value shown in column 'A1' of Table 11A – 'Firestable FS 2.0 results'.

In nearly all other impact categories, SPF environmental performance is driven primarily by raw materials (A1). Installation tends to be the second highest driver of impact due to the use of on-site diesel generators, as well as waste foam disposal.

- A4 & C2 values match CC baseline as material volume, weight and packaging both inbound and outbound (post field application) would be the same.
- C4 & D values follow the model of the A1 calculation, above. The FR solids and 'base density' of FS 2.0 enable the use of the correction multiplier.

Though some raw materials are transported thousands of miles, the inbound transportation module (A2) has a modest contribution to overall impact. Other transportation modules representing transport to site (A4) and transport to end-of-life (C2), have negligible contribution to life cycle results.

## 6. Additional Environmental Information

### 6.1. Environment and Health During Manufacturing and Installation

Manufacturing of SPF formulations and upstream chemicals are performed in an industrial manufacturing facility. Like many manufacturing processes, hazardous chemicals and manufacturing procedures may be employed. These manufacturers follow all local, state, and federal regulations regarding safe use and disposal of all chemicals (US EPA), as well as safety requirements required of the generally manufacturing operation of equipment and

---

processes (US and State OSHA) and safe transport of all materials (US DOT) Environment and Health During Installation.

Installation of SPF involves potential exposure to certain hazardous chemicals that requires risk mitigation through the use of personal protective equipment and on-site actions including ventilation and restricted access. Of greatest concern is the potential exposure to airborne and liquid isocyanates during and immediately after installation of SPF. Isocyanates are known chemical sensitizers and exposure can occur through contact with the skin, eyes and respiratory system. Ventilation of the work zone, coupled with use of proper personal protective equipment is required during and immediately after SPF installation. Please visit [www.spraypolyurethane.org](http://www.spraypolyurethane.org).

## 6.2. Extraordinary Effects

---

### Fire

Spray Polyurethane foam, like all foam plastics and many construction materials – including woods – is a combustible material and will emit toxic gases including carbon monoxide during a fire. When used in buildings and other construction applications, foam plastics may need to be protected with fire-resistant coverings or coatings when used in certain construction applications, as dictated by the building codes. All foam plastics materials and assemblies should meet the fire test requirements of the applicable building codes.

### Water

Closed-cell SPF products meet the FEMA Class 5 requirements<sup>1</sup> for flood-damage resistant insulation materials for floors and walls.

### Mechanical Destruction

Should the assembly the SPF is installed in, i.e. the wall or ceiling, have to be replaced then the SPF will have to be replaced as well.

## 6.3. Environmental Activities and Certifications {Red is pending}

---

Firestable Insulation Company has certified or tested its insulation products to various VOC standards to measure emissions of volatile or semi-volatile compounds. These standards include:

- 415.EPD for SPFA-EPD-20181029.pdf
- SPFA\_EPD\_Background\_Report\_10\_29\_2018.pdf
- Currently, an ASTM workgroup is developing a small-chamber emissions test protocol for chemical compounds specific to SPF that include MDI, blowing agents, flame retardants and catalysts.

Firestable FS 2.0 - Water Blown Spray Polyurethane Foam Insulation

According to ISO 14025, and ISO 21930:2017

---

#### **6.4. Low-GWP Blown Agents**

---

This EPD is based on an LCA of SPF products that use Water as chemical blowing agent. Because of the low global warming potential factor of CO<sub>2</sub>, the emissions account for a small percentage of the global warming potential life cycle results.
