

Where patented brush technology and ecology come together for a perfect end result

Cleaning wooden terraces without fiber damage

ZHF Tuinen is a young but ambitious gardening company specializing in total projects: from garden construction and maintenance to cleaning paved surfaces. Owner Elias Azahaf has been active in the sector for five years now and combines his experience with a clear vision on quality and sustainability. "A garden project is only really finished when everything looks well cared for – including the terrace and paved areas," he says.

For cleaning terraces, pavers, and natural stone, ZHF Tuinen previously worked, like many in the sector, with high-pressure cleaners and chemical products. "But honestly? Before you know it, you are spraying more damage than you repair," says Azahaf. According to him, this not only applies to stony materials but certainly also to wooden terraces and decking, where high pressure damages the fiber structure and makes the surface rough and slippery.

Controlled cleaning, without chemicals

The switch to controlled cleaning came via the Terrazza TMC® Kit, a professional terrace cleaning machine with slow-rotating brushes and patented brush technology. The owner was immediately convinced after a demonstration on site. "What this does cannot be compared to high pressure. It cleans deeply, but in a controlled way, without damaging the surface or joints."

This approach proves particularly suitable for wooden terraces and decking, a material sensitive to damage and graying.

Thanks to the patented brush technique, dirt is removed without pulling open the wood fibers. "The surface feels clean again but remains closed," says Elias. "That not only reduces the risk of splinters and slipperiness but also ensures that new dirt adheres less quickly."

The Terrazza TMC® Kit works completely without chemicals and uses only water combined with brushes with long and short hairs. These clean both the surface and the joints, with a light polishing effect that contributes to a longer lifespan of both stony materials and wood.

'What this does cannot be compared to high pressure'

Efficiency from the first projects

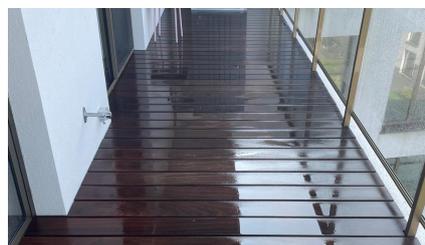

Also in terms of efficiency, the Terrazza TMC® Kit scores high. Depending on the substrate, ZHF Tuinen efficiently cleans multiple terraces and driveways smoothly, with a visibly better and more consistent end result than traditional methods. The investment? "It has long since paid for itself," says the owner decisively.

Not unimportant: customers also respond very positively to the ecological aspect. "Especially with wooden terraces, people worry about their lawn, planting, and drainage. Being able to say that you only work with water and the loosened dirt gives confidence."

What makes the difference for ZHF Tuinen is the flexibility and expandability of the Terrazza TMC® Kit. "You can perfectly respond to the substrate and the pollution by simply attaching different brushes," concludes Elias Azahaf. "This way we can properly finish every project, from wood to natural stone, with one and the same machine."

Before...

... and after.
