RED CEDAR AG

GIBBERELLA STALK ROT

SEE IT IN THE FIELD

Acres: 17766

	2024	2025
% High Risk	33.9%	31.4%
% Moderate Risk	28.3%	24.9%
% Low Risk	37.8%	43.8%

About

Gibberella is one of the major stalk rots of corn. It is responsible for hundreds of millions in losses every year across the Midwest.

Yield can be impacted due to the plant's inability to move nutrients during grain fill, but the more serious risk comes from increased lodging due to weakened stalk strength.
