

Vaccination is the key to protection from chickenpox for your little ones

Join our clinical research study to help bring greater accessibility to vaccines for your babies

The Lullaby-002 Study is looking at a new investigational vaccine (called the “study vaccine”) to help prevent chickenpox in children. The Lullaby-002 Study will look at how safe the study vaccine is, and will involve about 1840 healthy children globally.

The study vaccine will be compared with an approved chickenpox vaccine. We are looking for healthy children, 12–15 months of age, who have **not** had chickenpox or vaccination against chickenpox.

Your child may be able to take part if they:

- have not been vaccinated against:
 - measles, mumps, and rubella
 - hepatitis A
- are not taking part in another clinical study.

Other criteria apply. The study doctor will check if this study is right for your child.

We plan to enroll a variety of children because chickenpox and vaccines may affect children differently based on their race, ethnicity, gender, age, and background.
