

# Is your healthy baby at risk for **PNEUMOCOCCAL DISEASE?**

## Learn about a clinical research study.

Clinical research doctors are studying an investigational vaccine designed to possibly protect against pneumococcal disease.

Pneumococcal disease is caused by a type of bacteria that is a major cause of ear infections, sinus infections, and pneumonia.

Clinical research investigators will evaluate the safety and tolerability of the study vaccine. Another purpose of this study is to see how the study vaccine works when given at the same time as other recommended childhood vaccines.

Your baby may qualify for this study if he or she:

- is 42 to 89 days old at beginning of the study
- is healthy based on medical history
- has not received their 2-month old vaccinations

There are additional eligibility criteria that the study doctor can discuss with you.
