NOLTS PROPANE CONNECTIONS, LLC With thanks to God and all the honor and glory to our King, Nolt's Propane Connections has been a family-owned business for the last 58 years. In 1965 Grandpa John Z. Nolt saw the need for propane hookup fittings and started selling parts (to the neighbors and friends) from the tobacco shed. He later started filling propane cylinders. The second generation John H Nolt and Sons took it to the next level and started offering products to the general Public. Today, the third generation is now in charge of daily operations along with the fourth generation helping out.

Thanking GOD
for over **58 Years**
of Propane Safety

"Since 1965"

We have a team of friendly and knowledgeable guys. If you have a minor propane question or hookup need, get your answer and parts at the sales counter. We have many years of combined experience.

Propane tanks are the main part of what we do. We educate you on the type and size of tank that is the most practical to fit your needs. We are equipped to install all sizes of propane tanks. Get a free estimate before you start. Please note that we do not deliver propane or fuels.

We also repair most propane and natural gas systems. Diesel and gasoline tanks are also sold, and Highland skid tanks are very popular in the 300, 500 and 1,000 gallon sizes.

Nolt's Propane, LLC is located at 676 North Shirk Road, New Holland. If you have any concerns regarding propane tanks, hookup fitting or parts, please call 717-354-5691. You may also email us or fax 717-354-5693. Hours are Monday through Friday, 7:00 a.m. to 5:00 p.m. Saturday, 7:00 a.m. to 11:00 a.m., closed on Sunday.

What Causes Underground Tanks to Corrode?

In a word... soil. When soil meets the steel of an underground tank an electrochemical reaction occurs. This reaction is DC current flowing between the tank and the soil. When the current is flowing from the tank to the soil corrosion occurs. When the current flows in the opposite direction, from the soil to the tank, corrosion doesn't take place.

How To Avoid Underground Tank Corrosion?

There are two ways to protect the steel of an underground tank from corroding. The first way is through an external coating using an epoxy powder paint. This paint will protect over 99% of the tank. The second way to protect the steel of an underground tank is cathodic protection. Both of these methods should be used as a combined shield against corrosion because no coat of paint is perfect. Paint can be damaged by construction, or soil can create tiny defects in the paint.

How Does Cathodic Protection Work?

Easy. By creating a galvanic connection between two different metals. Ok, let's explain that. A galvanic connection is when there is an actual electrical contact with the ground. This is done by connecting an anode bag to the underground tank. Anode Bags are usually made of magnesium because magnesium has a really low electrode potential. In other words, magnesium is a metal that will corrode before most other metals, and because it will corrode faster than steel it will create a DC current that will flow away from the underground tank which as we learned in the first paragraph is the direction we want the current to flow to keep the underground tank from corroding.

Empire Vented Heaters

RH-25 RH-35 RH-50C

RH-50B RH-65B

- Includes thermostat Empire vented heaters
- Heats without electricity
- Optional blower on RH25, RH35
- Matchless Piezo Ignition
- Made in USA

Maximum air flow and heating are the strong points of the RH25 and RH35 Console Vented Room Heaters. Delivering warmth to your medium-size rooms, each unit is designed for style and efficiency. Add the optional Internal blower for added circulation. Quiet burners, a vent safety switch, "matchless" Piezo ignition, and all the safety features you expect from Empire Comfort Systems® are standard equipment. Plus, for total reliability, these room heaters include a hydraulic thermostat (needing no electricity to operate). Ideal for medium to large rooms, each unit can be installed anywhere there is access to a vent. They're housed in a durable powder-coated/textured beige cabinet, these room heaters look as good as they work.

Log Options

Existing Wood-Burning Fireplaces

Traditional Charred Log Set

Driftwood Log

Available in 30-inch and 35-inch models, Rushmore Direct-Vent Inserts turn your wood-burning fireplace into an attractive and efficient centerpiece. The TruFlame system combines technology with aesthetics to create truly realistic flames and a glowing ember bed, reminiscent of a wood fire. Beneath the logs, the massive field of glowing embers assures everyone that this fireplace has been warming your home all day. Concealed beneath the logs and embers, the two burners let you vary the flame and the heat output to create the perfect mood.

Log Set Burners - Vent Free Fireplaces

Slope Glaze Burners and Matching Log Sets

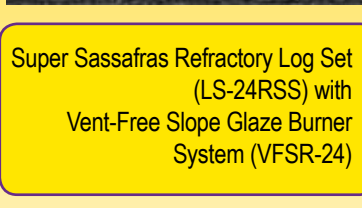

The Slope Glaze Burners contain ceramic beads which tumble the gas to create exceptionally realistic flame movement. We offer **ceramic fiber**, **traditional refractory concrete**, and **Bumcrete®** logs. Each log is hand-painted to bring out the rich detail.

These Vent-Free Burners are approved for use in any certified firebox. They may be also installed in an existing wood-burning fireplace, with the damper closed, to operate as a vent-free heating system. For applications where you want the ambiance of a fire without the heat, the Millivolt and manual burners are also certified for installation as a decorative vented log sets.

- 16, 18, 24 and 30-inch Vent-Free Burners - up to 38,000 Btu
- Millivolt (VFSR), Manual (VFSM), Intermittent Pilot (VFSE), and Variable Flame (VFSV) models
- Choose from Refractory, Ceramic Fiber, and Bumcrete® Log Sets.

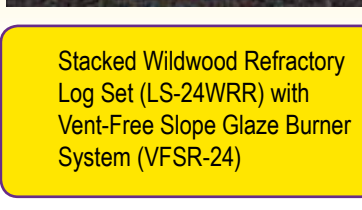

Sassafras Refractory Log Set (LS-24RS)
Vent-Free Slope Glaze Burner System (VFSR-24)

Super Sassafras Refractory Log Set (LS-24RSS) with
Vent-Free Slope Glaze Burner System (VFSR-24)

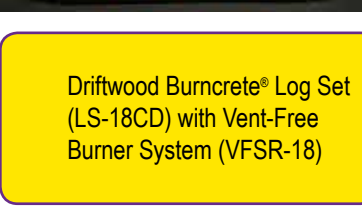

Ponderosa Refractory Log Set (LS-24P) with Vent-Free Slope Glaze Burner System (VFSR-24)

Stacked Wildwood Refractory Log Set (LS-24WRR) with
Vent-Free Slope Glaze Burner System (VFSR-24)

Super Stacked Wildwood Refractory Log Set (LS-24WRS) with Vent-Free Burner System (VFSR-24)

Driftwood Bumcrete® Log Set (LS-18CD) with Vent-Free Burner System (VFSR-18)

Birch Bumcrete® Log Set (LS 24CB) with Vent-Free Burner System (VFSR-24)

Flint Hill Log Set

The Flint Hill Log Set features richly detailed, hand-painted Ceramic Fiber logs mounted atop our Vent-Free Contour Burner. Includes glowing embers to add to the illusion of a real wood fire at any heat setting.

This competitively priced log/burner is ideal for existing fireplaces and fireboxes and for new construction.

Vent-free Contour Log Set/Burner Systems

The systems combine the burner and log set into one package. Because they require a minimum of just 12 inches firebox depth, these systems fit easily into most fireplaces.

- 18, 24 and 30-inch Vent-Free Burners - up to 40,000 Btu
- Millivolt (VFDR), Manual (VFDM), and Thermostat (VFDT) models
- Special 10,000 Btu Millivolt model for bedroom applications (where allowed by code)
- Choose Whiskey River Refractory or Flint Hill Ceramic Fiber model.

Flint Hill Ceramic Fiber Log Set and Vent-Free Burner Combination (VFDR-24-LB)

With the many choices, you can have a Log Set that creates your '**realistic burning log**' to be enjoyed by family and friends.

Portable Construction Heater

Reflective radiant heat with the warmth of the sun. That is the MR Heater Portable Radiant Heater in a nutshell. This Radiant 125,000 BTU Portable Liquid Propane Heater requires no electricity and provides 360 degrees of heat, all while operating much quieter than forced air heaters of the same size. With factory installed features, like a tip-over safety switch and a thermoelectric safety valve, the only thing you need to make this heater the most useful tool you own is a 100lb propane tank. Just hook the tank up to the supplied 10ft hose and regulator, then enjoy the quiet warmth of the MH125LP.

- 125,000 BTU per hour

What is an Anode Rod?

Positively charged electrode by which the electrons leave a device. The negatively charged electrode of a device supplying current such as a primary cell.

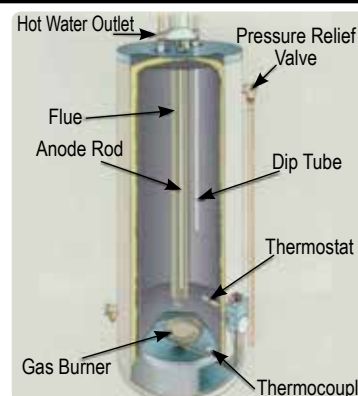

An anode rod is a rod that is in a storage tank style water heater. The anode rod serves a critical purpose for your water heater; it helps to keep it from rusting prematurely. Many anode rods are created with magnesium, or a similar material that is designed to be eaten by the water before other components of your water heater are destroyed, like the elements and the steel tank. The anode rod delivers electrons into the water that helps to create an environment that prevents corrosion.

How Long Does an Anode Rod Last? Anode rods can last several years in most water heaters, but that isn't always the case. There are a lot of factors in play when it comes to the condition and lifespan of an anode rod, and the biggest factor is the quality of the water. The more minerals and hardness in the water the quicker your anode rod will die and the shorter lifespan you will have with your water heater.

200lb & 420lb Vertical Propane A.S.M.E. Cylinders

All cylinders must be set on solid concrete slabs!!

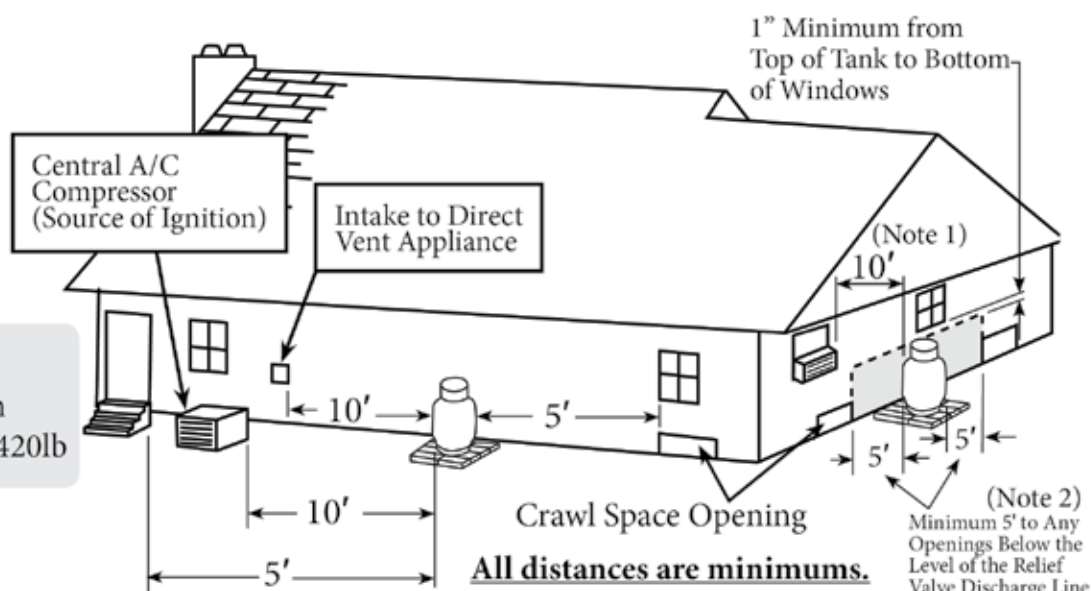

Before positioning slabs, place landscape fabric or similar product to prevent weeds growing against the cylinder.

Location of A.S.M.E. Cylinders
From NFPA 58, Appendix I

Federal, state, and local ordinances and regulations should be observed at all times.

Typical A.S.M.E. Cylinder Filled From Bulk Truck 200lb & 420lb

Notes:

- Regardless of size any ASME container filled on site must be located so that the filling connection filling connection and liquid fixed liquid level gauge vent connection at the container must be at least 10 ft from any exterior source of ignition, openings into direct-vent gas appliances, or mechanical ventilation air intakes.
- The distance is measured horizontally from the point of discharge of the container pressure relief valve to any building opening below the level of the relief valve discharge.

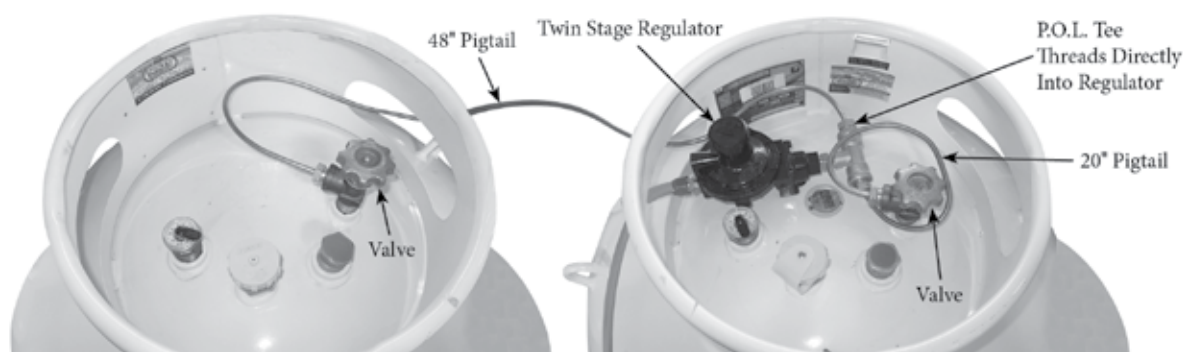

These instructions are intended only for a basic installation guide. Always refer to federal, state, and local ordinances and regulations or NFPA 58. 3-18

250-500 Gallon (Aboveground Installation Guide)

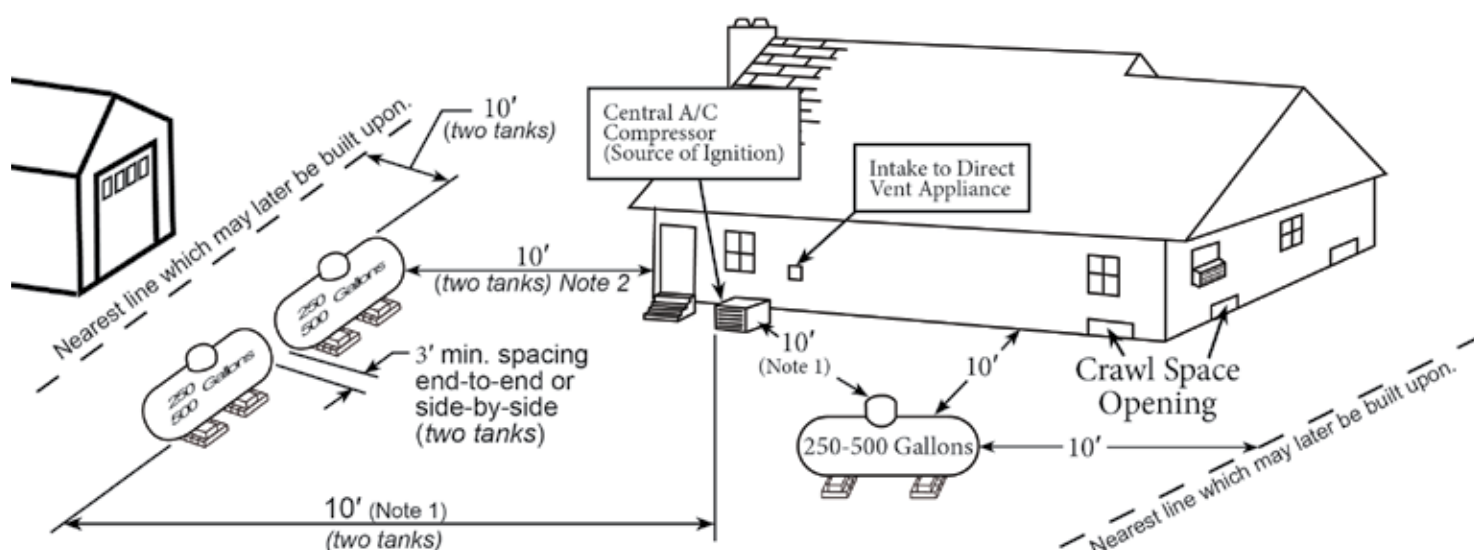

All cylinders must be set on solid concrete slabs and lintels!!

Before positioning slabs, place landscape fabric or similar product to prevent weeds growing against the cylinder.

** If transferring liquid propane, tanks must be 25 ft. from buildings and property lines.

All distances are minimums.

Notes:

- 1) Regardless of its size, any ASME tank filled on-site must be located so that the filling connection and fixed liquid level gauge are at least 10' from external source of ignition (i.e. open flame, window A/C, compressor, etc), intake to direct vented gas appliance or intake to a mechanical ventilation system.
- 2) May be reduced to 10 feet minimum for 1200 gallons water capacity or less if it is located at least 25 feet from any other LP-Gas container of more than 125 gallons water capacity.
- 3) Where the container may be subject to abrasive action or physical damage due to vehicular traffic or other causes, it must be protected against such physical damage.

These instructions are intended only for a basic installation guide. Always refer to federal, state, and local ordinances and regulations or NFPA 58. 5-23

250-500 Gallon (Aboveground Installation Guide)

2-Stage System

(Burial Guide) 500 Gallon Underground Installation

Notes:

Propane tank may not be under or against buildings. Bury at least 6" below grade, 18" if under parking lot, add bollards around valve cover if less than 10' from traffic / roadway. Tank valve cover must be at least 10' from exterior sources of ignition, (air conditioner, transformer or generator) openings into direct-vent gas appliances, or mechanical ventilation air intake, no part of underground tank shall be less than 10' from any building (foundation), well, septic system or adjoining property line which may later be built upon.

Wet area? Tie down to 10" thick concrete pad 3' wider and longer than tank, one #4 rebar / foot.

Approx. 3-6 tons of pipe sand needed to get 6" around complete tank, sand is, (Available at New Enterprise, Honey Brook Quarry, PA).

New Enterprise: **Order/Delivery** - 717-335-4503 (option 1)

Picking Up Order - 610-273-2921

Important!!

- 1) Dig hole as shown in diagram (reverse side); Evenly place 6" of pipe sand in bottom of hole then set tank in hole; attach (1) 17lb anode per 500 gallon tank; Remove cardboard box and plastic bag from anode and keep in fabric bag; Lay anode on native soil at bottom of hole; connect copper wire (shipped with anode) to tank; (tank) has a bolt with (2) washers and (2) nuts, strip approximately 4" of copper wire and wrap around stud between washers; tighten nut to ensure a good connection.
- 2) Pour 5 gallons of dirty water onto anode to activate it, inadequate moisture will keep anode from protecting tank, place pipe sand around and over tank until you have 6" of pipe sand on top of tank before backfilling with dirt.
- 3) **Important!! Dirt shall not touch tank! Or excessive pitting will occur!** Keep sloped finished grade to direct water away from tank. An initial cathodic test must be done upon final hook-up, and test it annually by a propane service man with a potential meter to make sure anodes are working properly. Potential meter shall read -.85 volts DC or above. If test fails, tank is not protected. Repair connection or add more anodes.
- 4) **Important!!** Place tall flag next to cover; to alert landscapers, lawnmower, dozer operators and to help locate tank in the snow.
- 5) **Important!!** Fill tank promptly! At least to 40% or more. If excessive rain saturates earth the tank can float up.

These instructions are intended only for a basic installation guide. Always refer to federal, state, and local ordinances and regulations or NFPA 58. 5-23

Location of A.S.M.E. Cylinders From NFPA 58, Appendix G

1000 Gallon (Aboveground Installation Guide)

All cylinders must be set on solid concrete slabs and lintels!!

Before positioning slabs, place landscape fabric or similar product to prevent weeds growing against the cylinder.

** If transferring liquid propane, tanks must be 25 ft. from buildings and property lines.

Notes:

- 1) Regardless of its size, any ASME tank filled on-site must be located so that the filling connection and fixed liquid level gauge are at least 10' from external source of ignition (i.e. open flame, window A/C, compressor, etc), intake to direct vented gas appliance or intake to a mechanical ventilation system.
- 2) May be reduced to 10 feet minimum for a single container of 1200 gallons water capacity or less if it is located at least 25 feet from any other LP-Gas container of more than 125 gallons water capacity.
- 3) Where the container may be subject to abrasive action or physical damage due to vehicular traffic or other causes, it must be protected against such physical damage.

These instructions are intended only for a basic installation guide. Always refer to federal, state, and local ordinances and regulations or NFPA 58, 5-23

(Burial Guide) 1000 Gallon Underground Installation

Notes:

Propane tank may not be under or against buildings. Bury at least 6" below grade, 18" if under parking lot, add bollards around valve cover if less than 10' from traffic / roadway. Tank valve cover must be at least 10' from exterior sources of ignition, (air conditioner, transformer or generator) openings into direct-vent gas appliances, or mechanical ventilation air intake, no part of underground tank shall be less than 10' from any building (foundation), well, septic system or adjoining property line which may later be built upon.

Wet area? Tie down to 10" thick concrete pad 3' wider and longer than tank, one #4 rebar / foot.

Approx. 15-16 tons of pipe sand needed to get 6" around complete tank, sand is, (Available at New Enterprise, Honey Brook Quarry, PA).

New Enterprise: **Order/Delivery** - 717-335-4503 (option 1)
Picking Up Order - 610-273-2921

Important!!

- 1) Dig hole as shown in diagram (reverse side); Evenly place 6" of pipe sand in bottom of hole then set tank in hole; attach (2) 17lb anodes per 1000 gallon tank; Remove cardboard box and plastic bag from anode and keep in fabric bag; Lay anode on native soil at bottom of hole; connect copper wire (shipped with anode) to tank; (tank) has a bolt with (2) washers and (2) nuts, strip approximately 4" of copper wire and wrap around stud between washers; tighten nut to ensure a good connection.
- 2) Pour 5 gallons of dirty water onto anode to activate it, inadequate moisture will keep anode from protecting tank, place pipe sand around and over tank until you have 6" of pipe sand on top of tank before backfilling with dirt.
- 3) **Important!! Dirt shall not touch tank! Or excessive pitting will occur!** Keep sloped finished grade to direct water away from tank. An initial cathodic test must be done upon final hook-up, and test it every three years by a propane service man with a potential meter to make sure anodes are working properly. Potential meter shall read -.85 volts DC or above. If test fails, tank is not protected. Repair connection or add more anodes.
- 4) **Important!!** Place tall flag next to cover; to alert landscapers, lawn mower, dozer operators and to help locate tank in the snow.
- 5) **Important!!** Fill tank promptly! At least to 40% or more. If excessive rain saturates earth the tank can float up.

Heater Troubleshooting Tips

Before calling for troubleshooting support, here are a few easy & simple things to check

#1 What color is your flame?

- All **blue** is the IDEAL FLAME.
- **Yellow/Orange** TIPS are signs of a LACK OF OXYGEN
- PILOT & MAIN BURNER FLAMES should be all **blue**.
- BLUE FLAME is hotter than a yellow flame.

ODS Pilot

Pilot Does Not Stay Lit

Step 1:

- 1) Almost always there is dirt or dust in the pilot burner
- 2) To properly clean it; first make sure the gas is turned off and the heater cooled down.
- 3) With the unit off, remove a panel or get access to the pilot burner with an air blow gun, you really need a flexible spout on your air blow gun (sold in this catalog - page 20) to get to where it really counts. You can also use a small soft bristled brush or blow through a drinking straw if compressed air is not available. **Do not use a pin or sharp object to clean out the orifice!**

Do not remove any gas line. Blow air in reverse through the pilot with an air blow gun. In other words, blow air in where the pilot flame usually comes out and also on the pilot burner about 2" from the tip down on the side. You will see a hole where oxygen enters, blow in there, in other words you are cleaning the pilot burner tube (venturi). Fact is you need a proper mixture of gas & oxygen to create a blue flame. Countless times people think they have a bad thermocouple while the only problem is dust in the pilot burner.

Step 2:

- 1) If you have a blue flame and pilot is still not staying on.
- 2) Clean off any carbon that may have built up on thermocouple.
- 3) Make sure the pilot flame is hitting the thermocouple, at least 1/4" or 3/8" of tip is in the flame.

Step 3:

If you have a blue flame and a clean thermocouple tip and its still not staying on, it's time to replace the thermocouple. Thermocouples are like batteries, they may last 3-6 years depending how much it gets used. There are many different ones on the market, so be sure to provide us the name and model number of the heater. Other options are sending us the old thermocouple, laying it on flat bed scanner/fax machine (with a white piece of fabric on top to block light) and fax a copy, or email a picture.

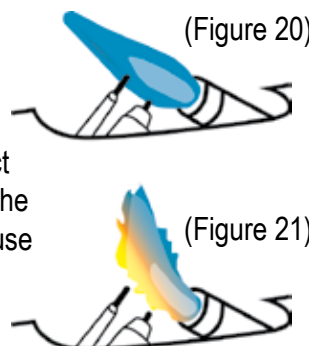

Step 4:

Most unvented wall heaters and fireplaces are equipped with an ODS (oxygen depletion sensor), it is a safety that will shut off the heater and pilot if the oxygen gets too low in the room. Try opening some doors or windows to see if the problem of the heater going out continues. If the ODS is the reason for shutdown, you may have too big a heater in a too small or too tight a room.

Step 5:

While you are using the air blow gun clean the main burner as well. Blow air in and alongside where the orifice feeds the burner, when doing this you may see a cloud of dust lift off the burner. Also, blow air across burner to remove all air borne dust and to remove all lint, pet hair, or any foreign material out of the entire unit.

(Figure 20) shows correct pilot flame pattern. (Figure 21) shows incorrect pilot flame pattern. The incorrect pilot flame is not touching the thermocouple. This will cause the thermocouple to cool, which shuts the heater off.

WARNING: If yellow tipping occurs, your heater could produce increased levels of carbon monoxide.

PLEASE NOTE: In high traffic areas or dusty locations, it's recommended to air-clean before each heating season.

- Roof: 4.0mm (6ga) corrugated steel

When open they create a wide unobstructed opening.

Interior:

- (6) vertical e-track and (20) tie-down rings
- Anti-condensation spray on ceiling
- 19mm marine grade plywood flooring (standard)

Options

* Swing Doors Opening

68" W x 78" H

Pair of swing doors provides the same wide opening with slightly more inside vertical height than the roll-ups.

All hardware for both door types is provided. Includes latches and hardware to securely hang and latch doors. Latch sets accept padlocks to secure units.

* Roll-up Doors Opening

68" W x 69" H

Conceals the door into the container's ceiling providing a completely unobstructed opening.

* **Interior Partitions** to subdivide units - Partitions divide units into individual units. i.e. A unit with four doors and three partitions creates four individualized units.

Rental Income

Have a property and all you're doing is maintaining it and paying taxes... Why not turn it into an income source with portable storage units? When that day comes when you may want to sell the property, up-sell the land with the units in place. Or if you choose, sell the units for some additional cash from the investment that has long since paid you back.

Create an **Income Source** with Portable Storage Units!

They're portable, you can sell them to put additional cash in your pocket if you sell the land.

No foundation required. Place them on grass, dirt, gravel, asphalt, or concrete.
