## MEET YAZ

### YAZ PORRITT

**CANINE WELLNESS CONSULTANT  
& VETERINARY REHABILITATION  
THERAPIST**

Yaz Porritt is the award winning founder and director of Yorkshire Pooches Therapies, the Home of Holistic Canine Pain Management and Canine Wellness Education. Yaz is a Canine Wellness & Applied Herbal Choices Consultant specialising in Pain Management and Species Appropriate Nutrition.

Yaz brings both academic rigor and a compassionate approach to her work, providing consent based treatment to painful dogs with complex behavioural needs. Her credentials include qualifications in Canine Massage, Canine Biomechanics, OFQUAL Canine Nutrition, WSAVA Pain Management and Photobiomodulation (Photizo). She is also studying towards a degree in Biomedical Science, to help further her understanding on the emotional component of pain and the microbiome's influence on pain.

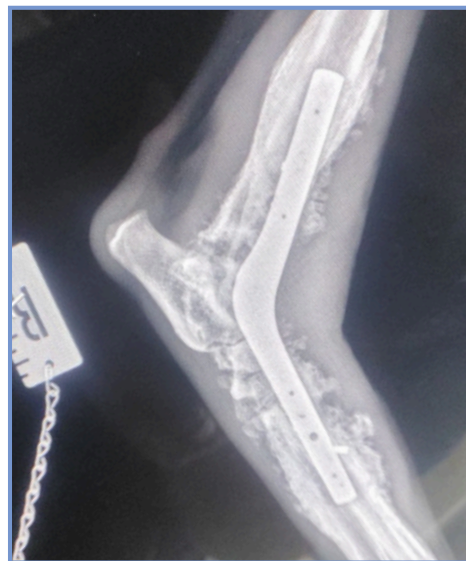

Yaz is a published author with her book, Your Dog's Pain Diary: A Blueprint for Monitoring a Pain Trial, designed to help empower both professionals and pet parents. A fierce advocate for canine wellness- both in person and online for pet parents across the globe. Providing Online Gait Analysis has allowed Yaz to support many dogs on their pain management journey.

Yaz believes that through education we can make the world a nicer place for dogs living in chronic pain.

## MEET DORIAN

Dorian enjoyed an active sporting life, but sadly, following undiagnosed OCD and two failed orthopaedic implants, he had to have his LHL amputated. Dorian's pain management is complex given his history and current pathology, so he is monitored closely.

His current management involves regular massage, Photizo, analgesia, homoeopathy and lifestyle management. Dorian still lives a full, active life and when a sore appeared on his LFL digit we created a bespoke healing plan.

# PHOTIZO & WOUND HEALING

Photizo Vetcare is simple-to-use and was developed for pet and animal owners to use at home to treat pain caused by a range of underlying health conditions as well as wounds. I have personally used this device in my clinic since day 1 and have never looked back!

It uses red and near infrared LEDs to stimulate cell activity which accelerates the natural healing process, and is an affordable alternative to professional laser treatments. It provides drug-free pain management for degenerative conditions in animals.

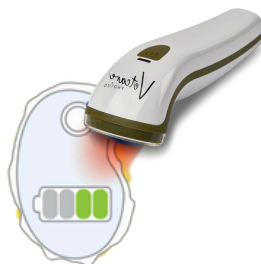

## 1. Normal Cell

## 2. Damaged Cell

With injury or disease a cell is unable to function correctly, like a flat battery.

## 3. Photizo Application

The battery of the compromised cell recharges and manages surrounding inflammation

## 4. Repaired Cell

Now the battery is charged, enough energy is produced to restore function.

# WOUND HEALING PROTOCOL

## STEP 1- LEUCILLIN

Anti-bacterial, anti-viral and anti-fungal spray. Leucillin works in harmony with the bodies' own immune system by containing the active ingredient Hypochlorous.

Hypochlorous (HOCl) is a naturally occurring chemical in the mammalian body produced by white blood cells.

Wound flushed and cleaned daily with Leucillin

## STEP 2 - PHOTIZO DOSAGE

Held approximately 1 inch away from the wound, 3 doses applied daily. This was alongside the normal daily Photizo routine. Wavelengths 633 nm (red) and 850 nm (infrared) – each dose includes both wavelengths simultaneously.

## STEP 3 - FRENCH GREEN CLAY

Applied daily to the wound to draw out impurities and form an antibacterial barrier.

## DAY 12

**-ANY RECOMMENDATIONS DO NOT CONSTITUTE OR REPLACE  
VETERINARY ADVICE-**

Dorian's sore was fully healed within 12 days. Wound management is always important, but even more so in an amputee who doesn't have the ability to 'not' use his LFL. Dorian is a big, lovable goofball, and sadly, we are likely to see these sores again.

Changes in weight bearing will inevitably put pressure on new areas of the digits, where we can see a loss of hair and in some cases, sores. As part of his ongoing pain management, we will continue to monitor for the start of any new sores.

With wound healing, we are looking to promote healing from the wound bed up. The last thing we need to heal over is the outer layer of skin. This ensures we are not prematurely closing the wound and running the risk of trapping infection under the skin. I have found that the 3 doses of Photizo approximately 1 inch away from the wound, is sufficient to support healing on a cellular level.
