

NURTURE

NHS CASE STUDY

THE VALUE ADD PROGRAMME THAT GIVES OPPORTUNITY TO YOUR DATA TEAMS

The students' research projects often form the basis of wider research initiatives, and provide early insight into potential areas of development. One project involved predicting breaches in our RTT pathways, using a new cloud-based dataset that our team hadn't yet investigated.

Although the performance of the final model could have been improved, the project was extremely well received by the team and the university, because the student correctly identified the limitations and gave suggestions for improvements. These model failures are really common in our type of research, it's all just part of the experimentation process.

The significant analytical legwork & experimentation that was carried out by the Nurture student, formed the basis of additional work that is having a real benefit to the trust.

KEY OUTCOMES

- 1 Provides a fresh talent & new perspectives, enabling alternative solutions and cultivates a creative mindset
- 2 Provides a natural, structured and repeatable framework for developing leadership and management skills
- 3 Creates a positive & productive work environment, with greater capacity - often a springboard for future research
