### Invisible orthodontics with comparative approaches in class II and class III malocclusions

Invisible orthodontics, including lingual appliances and clear aligners, provides aesthetic solutions for treating Class II and Class III malocclusions. This presentation examines differential approaches, comparing the biomechanics, clinical applications, and outcomes of these techniques. Class II and III malocclusions require tailored strategies to optimize function and aesthetics, considering factors such as skeletal patterns and patient compliance. Through clinical cases, the advantages and limitations of lingual appliances and aligners in managing these conditions are highlighted. The goal is to provide a framework for integrating invisible solutions, enhancing treatment precision and patient satisfaction.
