

PRESS RELEASE: 29th Jan 2026

Broadcast Radio Launches Myriad Schedule Pro: A New Era of Intelligent, Standalone Radio Scheduling

Significant update introduces advanced Research & Analysis, “Future Moves” automation, and native support for third-party playout systems.

HESSLE, UK – 29th January 2026 – Broadcast Radio today announced the official launch of **Myriad Schedule Pro**, a sophisticated evolution of its industry-standard scheduling software. Designed for the modern broadcast environment, Myriad Schedule Pro moves beyond simple music rotation to offer deep data analysis, automated song lifecycle management, and—for the first time—the ability to schedule for almost any third-party playout system on the market.

Myriad Schedule Pro replaces the popular Myriad Schedule Plus, with all existing "Plus" users receiving an immediate upgrade to the Pro tier at no additional cost.

Standalone Power for Any Station

The most significant shift in Myriad Schedule Pro is its ability to operate as a completely standalone scheduling solution. While it remains the perfect partner for Myriad Playout, it can now be configured to schedule for third-party systems including **RCS Zetta**, **WideOrbit**, **Enco DAD**, **PlayoutOne**, **PlayIt Live**, and **Station Playlist**.

“We wanted to build a scheduler that was powerful enough for the world’s biggest stations but flexible enough to work with the tools they already use,” says Liam Burke, Commercial Director at Broadcast Radio. “Myriad Schedule Pro delivers that. Whether you’re running a full Myriad ecosystem or using a different automation platform, you now have access to enterprise-grade scheduling and analysis.”

Desktop, Cloud, or Hybrid: Scheduling Without Borders

Myriad Schedule Pro is designed to fit any workflow, whether running as traditional Windows desktop software, a native cloud solution, or a hybrid of both. This flexibility is bolstered by **Myriad Anywhere**, allowing program controllers and content managers to control every aspect of their station's scheduling remotely, via any modern web browser. Whether managing a single local station or a complex multi-station network across different regions, the platform offers a unified, scalable interface that makes station-switching and cross-brand management instantaneous.

Intelligence at the Core: Key New Features

Myriad Schedule Pro introduces several "industry-first" features designed to save time and improve on-air flow:

- **Research and Analysis Pane:** A new, live-updating window that provides deep-dive history for every track, including listener voting data (via the Broadcast.Radio web play and mobile apps) and Songfacts™ integration.
- **Future Moves:** A powerful automation tool that allows music directors to "set and forget" a song's journey. For example, a track can be programmed to automatically move from the 'A-List' to the 'B-List' after two weeks, or rotate into a 'Recurrent' category after 50 plays.
- **Media Packets:** Allows multiple versions of a song or a high volume of tracks by a single artist to be "packeted" together, ensuring perfect rotation without cluttering category decks.
- **Context-Aware Links:** Jingles and links can now be set to only follow songs with specific attributes (e.g., a "90s" jingle will only ever be scheduled before a 90s track).
- **Advanced Log Management:** A professional-grade view optimized for scheduling management, allowing for multiple station logs to be opened side-by-side for comparison.

Availability

Myriad Schedule Pro is available immediately. New users can explore the software's capabilities through a standalone license or as part of the wider Myriad Cloud and Playout ecosystems.
