

**Embargoed Until 7<sup>th</sup> April 2026**

## **Broadcast Radio Launches Split Voice Tracking for Myriad Payout & Automation**

***New feature enables presenters to record region-specific voice tracks for split broadcasts***

Broadcast Radio has announced **Split Voice Tracking**, a new feature coming in **Myriad Payout & Automation v6.9** that enables radio stations using split transmissions to record **separate voice tracks for individual regions or platforms**.

The new capability allows presenters to create **unique voice links for each split**, or selectively share voice tracks across multiple splits, giving stations greater flexibility when producing localised content.

Designed to integrate seamlessly with existing Myriad workflows, Split Voice Tracking introduces several tools to streamline production. These include **Split VT Placeholders within the Log**, which can contain notes or instructions for presenters, along with quick navigation tools that allow presenters to rapidly jump between Split Voice Track points in the Log.

Split Voice Tracking also assists with **maintaining consistent VT lengths between splits**, helping ensure that region-specific voice tracks remain within similar durations so that split transmission paths remain synchronised.

The feature works both **in the studio using Myriad Payout** and **remotely via Myriad Anywhere**, allowing presenters to produce split-specific links regardless of location.

Split Voice Tracking enables stations to take full advantage of split transmissions by adding **more localised presenter content**, while keeping production efficient and cost-effective for both live and automated shows.

“Split Voice Tracking gives stations a powerful new way to increase local relevance while maintaining efficient production workflows,” said Billy Billany, Sales Director at Broadcast Radio. “It allows presenters to quickly create tailored links for different regions without slowing down show preparation.”

Broadcast Radio will be showcasing Split Voice Tracking for the first time at the **NAB Show in Las Vegas**, taking place from 19th to 22nd April 2026 (with the conference opening on 18th April). Visitors to stand **C2030** will be able to see live demonstrations of the new feature and explore how it can enhance split broadcast workflows within station clusters.

A short demonstration video of the new feature is available here:
