Computed Occupancy

Math is hard - Mistall can help!

Some parking locations have very predictable fill patterns. By 10am you are down to 20% availability and it's usually in the back corner. Sound familiar? Save money by deploying less hardware and just count the back corner. Use our built-in math to provide you with the overall Computed Occupancy.

mCount - Field Counter, Occupancy Updater

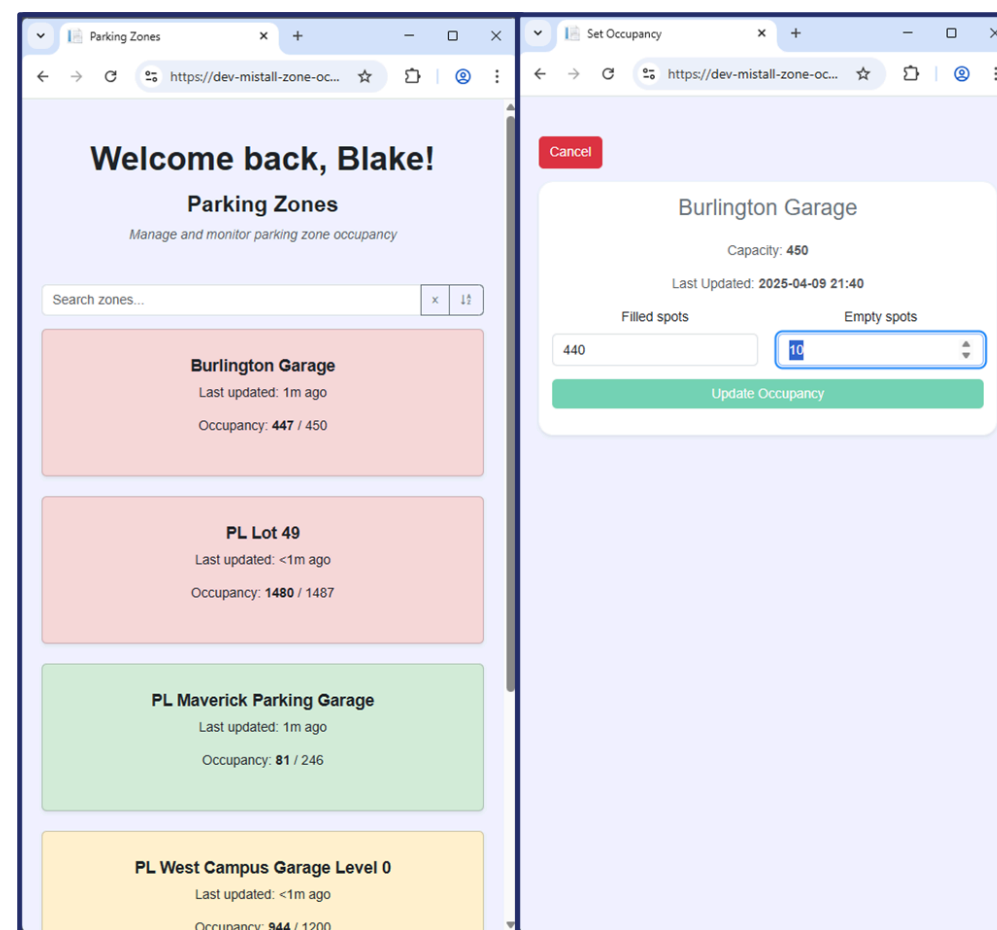

A Point in Time (PIT) count is a single occupancy number for a parking zone or location at a point in time. You may collect these field counts in your parking operation and store them in a spreadsheet, maybe even a fancy one. You might string the numbers together for trending or compare one count to a previous count to see if things have changed over time.

We now have an Web app for that! Your staff can enter counts in the field that are automatically added to your Mistall Dashboard live. The more data you collect the better it can help you.

You can also use the app to update locations that have real-time counts, such as Mistall Zone Counter. Or, use the app to count a location manually in real-time.

The data that you enter becomes part of your occupancy data and can be used with Mistall's built-in Business Intelligence data visualizations, parking guidance, and directed enforcement.

mCount is included in your Mistall subscription. [Learn more.](#)
