Not your Traditional Availability Signs

Mistall has expanded our integrations with HTML-based matrix displays. This allows for increased use of images and other sign content, like events and emergency messaging.

Mistall lets you remotely change your sign content on the fly, and even rotate through different frames of content on a specified interval. The ability to display static and dynamic information on signs, information beyond just parking availability, is evolving.

Data Health

Is all occupancy data created equal? No! There's a big difference between a live-feed and a manual count two hours ago. So we've created "Data Health" to help determine whether your data is, umm, data-worthy. Use Data Health to help determine what you share with your parkers.

Upcoming Events

Join us at the annual [NYSPTA](#) conference, October 1-3, in Ithaca, NY. We'll be partnering with our customer [Cornell University](#) to present the benefits of developing standard occupancy-based KPI's through aggregated data from their existing parking systems. We'll take it one step further to use AI-based analytics to evaluate their park-down policies. Is it actually doing what it is intended to do?

Mistall is also exhibiting at the annual [CPA](#) conference, October 5-8, in Vancouver, BC. We are on the presentation agenda with our partner [FastPark](#) and the [City of Victoria](#), showcasing the technology and our approach to counting the Broughton (A.K.A. Mind-Bender) garage.
