

Silent Invasion

- Lionfish were introduced by humans into local waters. The invasive lionfish have become well established in Atlantic ecosystems.

- Invaders take advantage of an overfished sea. Over-harvest of large predators that may eat lionfish or compete with lionfish for prey may have set the stage for proliferation.

- Lionfish are formidable. Their venomous spines and unique appearance may deter potential predators and make them unrecognizable as prey.

- Lionfish reproduce quickly. Lionfish are able to breed year round, as frequently as every 4 days, and mature at a young age.

- Lionfish may out-compete native predators. Native species, such as snappers and groupers, may not be able to compete with lionfish for food and habitat.

- Lionfish can decimate reefs. With their voracious appetites, lionfish can reduce populations of juvenile and small fish on coral reefs by up to 90 percent. Lionfish may indirectly affect corals by overconsuming grazing parrotfishes, which normally prevent algae from growing over corals

RED Lionfish

Pterois volitans

The red lionfish is an invasive species native to the Indo-Pacific Ocean. Their human-caused introduction and subsequent population increase are now causing negative impacts on marine ecosystems in the southeastern seaboard of the U.S. and the Caribbean Sea. Lionfish are efficient predators invading a variety of natural and artificial habitats, competing with native predator fish and consuming smaller fishes, including the young of large species. A similar species, the devil firefish, *Pterois miles*, has also been introduced in the Atlantic.

Life Cycle

How to Help

- Never release aquarium fish into the wild.
- Report lionfish sightings to your local or national marine regulatory agency.
- Participate in lionfish tournaments to reduce local lionfish populations.
- Eat more lionfish. Their white, flaky meat is delicious.
- Wear thick gloves when handling to prevent injury. Venomous spines can be removed by carefully cutting with shears, making it easier to handle the fish safely.

The Venomous Spines

Lionfish have two grooves on each spine. These grooves are filled with venom-producing tissue. After the spine punctures the skin, the glandular tissues release a potent neurotoxin that travels up the grooves into the wound. First aid for stings: Take a pain reliever and soak the wound in hot water. Consult a physician as soon as possible.

What do Lionfish Eat
