

MOTH DAMAGE & RUG TREATMENT INFORMATION

Understanding Moth Damage:

Moth larvae feed on wool fibers deep at the base of the rug, creating hidden structural damage that only becomes visible after professional cleaning. Shedding after cleaning is normal because the larvae have already weakened the fibers.

Our Treatment Process:

1. **Professional Rug Washing** – removes debris, eggs, cocoons, and loose fibers.
2. **Deep Freeze (2–3 weeks at –20°F)** – kills any remaining larvae and eggs.
3. **Wool Treatment Application** – helps deter future moth activity.
4. **In-House Weaver Repairs** – we can stabilize and repair damaged sections.

What to Expect After Cleaning:

- Increased shedding due to pre-existing damage.
- Hollow or weakened areas becoming more visible.
- Cleaning does **not** cause damage; it reveals destruction already present.
