

MICROSOFT CLOUD

Work securely from Stanley, Camp, the Islands or Overseas

Modern Business Technology That Scales with Your Business

Many businesses in the Falkland Islands rely on on-premise IT infrastructure, with servers and systems hosted locally in offices or server rooms. This approach carries greater risk and ongoing maintenance demands, particularly given local challenges such as sourcing replacement equipment, power outages and connectivity interruptions.

Move to the Cloud with Confidence

- At Falklands IT, we take the time to understand your business, how it operates, and the challenges you face. Rather than offering one-size-fits-all cloud solutions, we focus on where cloud technology delivers real value, improving reliability, security, and flexibility, at a pace that suits your organisation.
- Security is embedded from day one. We protect your Microsoft Cloud environment using industry best practices, strengthening user access and email security while guiding you to the right Microsoft Defender solutions. The same security-first approach extends to Azure workloads, ensuring your systems and data remain fully protected.
- We help you select and configure the right Microsoft 365 packages so your organisation benefits from built-in compliance features such as audit logs, activity tracking, and data retention. This provides clear visibility, supports audit requirements, and ensures your data is managed responsibly and transparently.

OUR SOLUTION

Falklands IT's Microsoft Cloud implementations follow a structured, proven approach that ensures all business requirements are clearly understood and met before any solution is deployed.

- » **Initial Consultation:** We begin by developing a clear understanding of your current infrastructure and the areas you want to improve. This enables us to tailor your cloud journey around your specific business goals, driving productivity and delivering measurable results.
- » **Statement of Works:** Once we understand your requirements, we provide a Statement of Works outlining the technical steps needed to move you from your current position to your desired outcome, with no unnecessary jargon or surprises.
- » **Documentation & Ongoing Support:** Once the project is complete, we provide clear documentation so your team understands the new systems and workflows. We also deliver ongoing support and optimisation to keep your cloud environment secure, reliable, and aligned with your business needs.

KEY FEATURES

SHAREPOINT

Using SharePoint gives your team secure access to files from anywhere, enables real-time collaboration, and ensures everyone is always working from the latest version, without the need for VPNs.

EXCHANGE ONLINE

Using Exchange Online gives your business secure, reliable email accessible from anywhere, with built-in protection and no reliance on on-site servers, keeping your team connected and productive.

INTUNE & AUTOPILOT

Using Microsoft Intune and Windows Autopilot, devices can be securely set up and managed from anywhere, enabling day-one productivity while maintaining consistent security and control.

DEFENDER FOR BUSINESS

Microsoft Defender for Business protects your devices with built-in threat detection and automated response, keeping your business secure without added complexity.

COPILOT

Using Microsoft Copilot helps your team work smarter by turning emails, documents, and meetings into actionable insights, saving time on everyday tasks and boosting productivity across the business.

BENEFITS

Productivity, Security & Peace of Mind

Falklands IT helps businesses work securely from anywhere using the Microsoft Cloud. With tools like SharePoint and Exchange Online, teams can collaborate in real time, access the latest versions of files, and stay connected with secure, reliable email – without relying on VPNs or on-site servers.

Scalable, Cost-Effective & Locally Supported

Microsoft Cloud services operate on a flexible subscription model, allowing businesses to scale as needed and only pay for what they use. Backed by Falklands IT's local expertise and ongoing support; businesses will benefit from enterprise-grade technology with support that understands local challenges.

Built-In Security & Compliance

Microsoft's built-in security, device management, and compliance features provide protection, visibility, and audit readiness by default. Tools such as audit logs, endpoint protection, and data controls help businesses meet UK and international compliance requirements while keeping systems and data secure.
