The Game
Changer-
Boxwood Blight

12. 15. 2011

What is Boxwood Blight?

- Fungus: *Cylindrocladium buxicola*
- Sticky, heavy spores
- Movement: water, plant to plant, debris, human/equipment
- Optimal conditions: warm and wet, 65-75 F
- Sensitive to heat/cold
- Pathogen can live in ground, perhaps for years
- Spreads with water splashing

- 2) **Best Management Practices**

Air Flow is Important!

Example of rotational schedule-B

Week 1: Chlorothalonil (44 fl oz/A).

Week 3: Mancozeb + Tebuconazole (1.5 lb + 13 fl oz/A)

Week 5: Chlorothalonil (44 fl oz/A).

Week 7: Mancozeb + Trifloxystrobin (1.5 lb + 2 oz/A).

Week 9: Start back with the Week 1 rotation. If need be, there are other classes of systemic fungicides that could be substituted into the rotation.

Mulching
to slow
down/
prevent
Box Blight

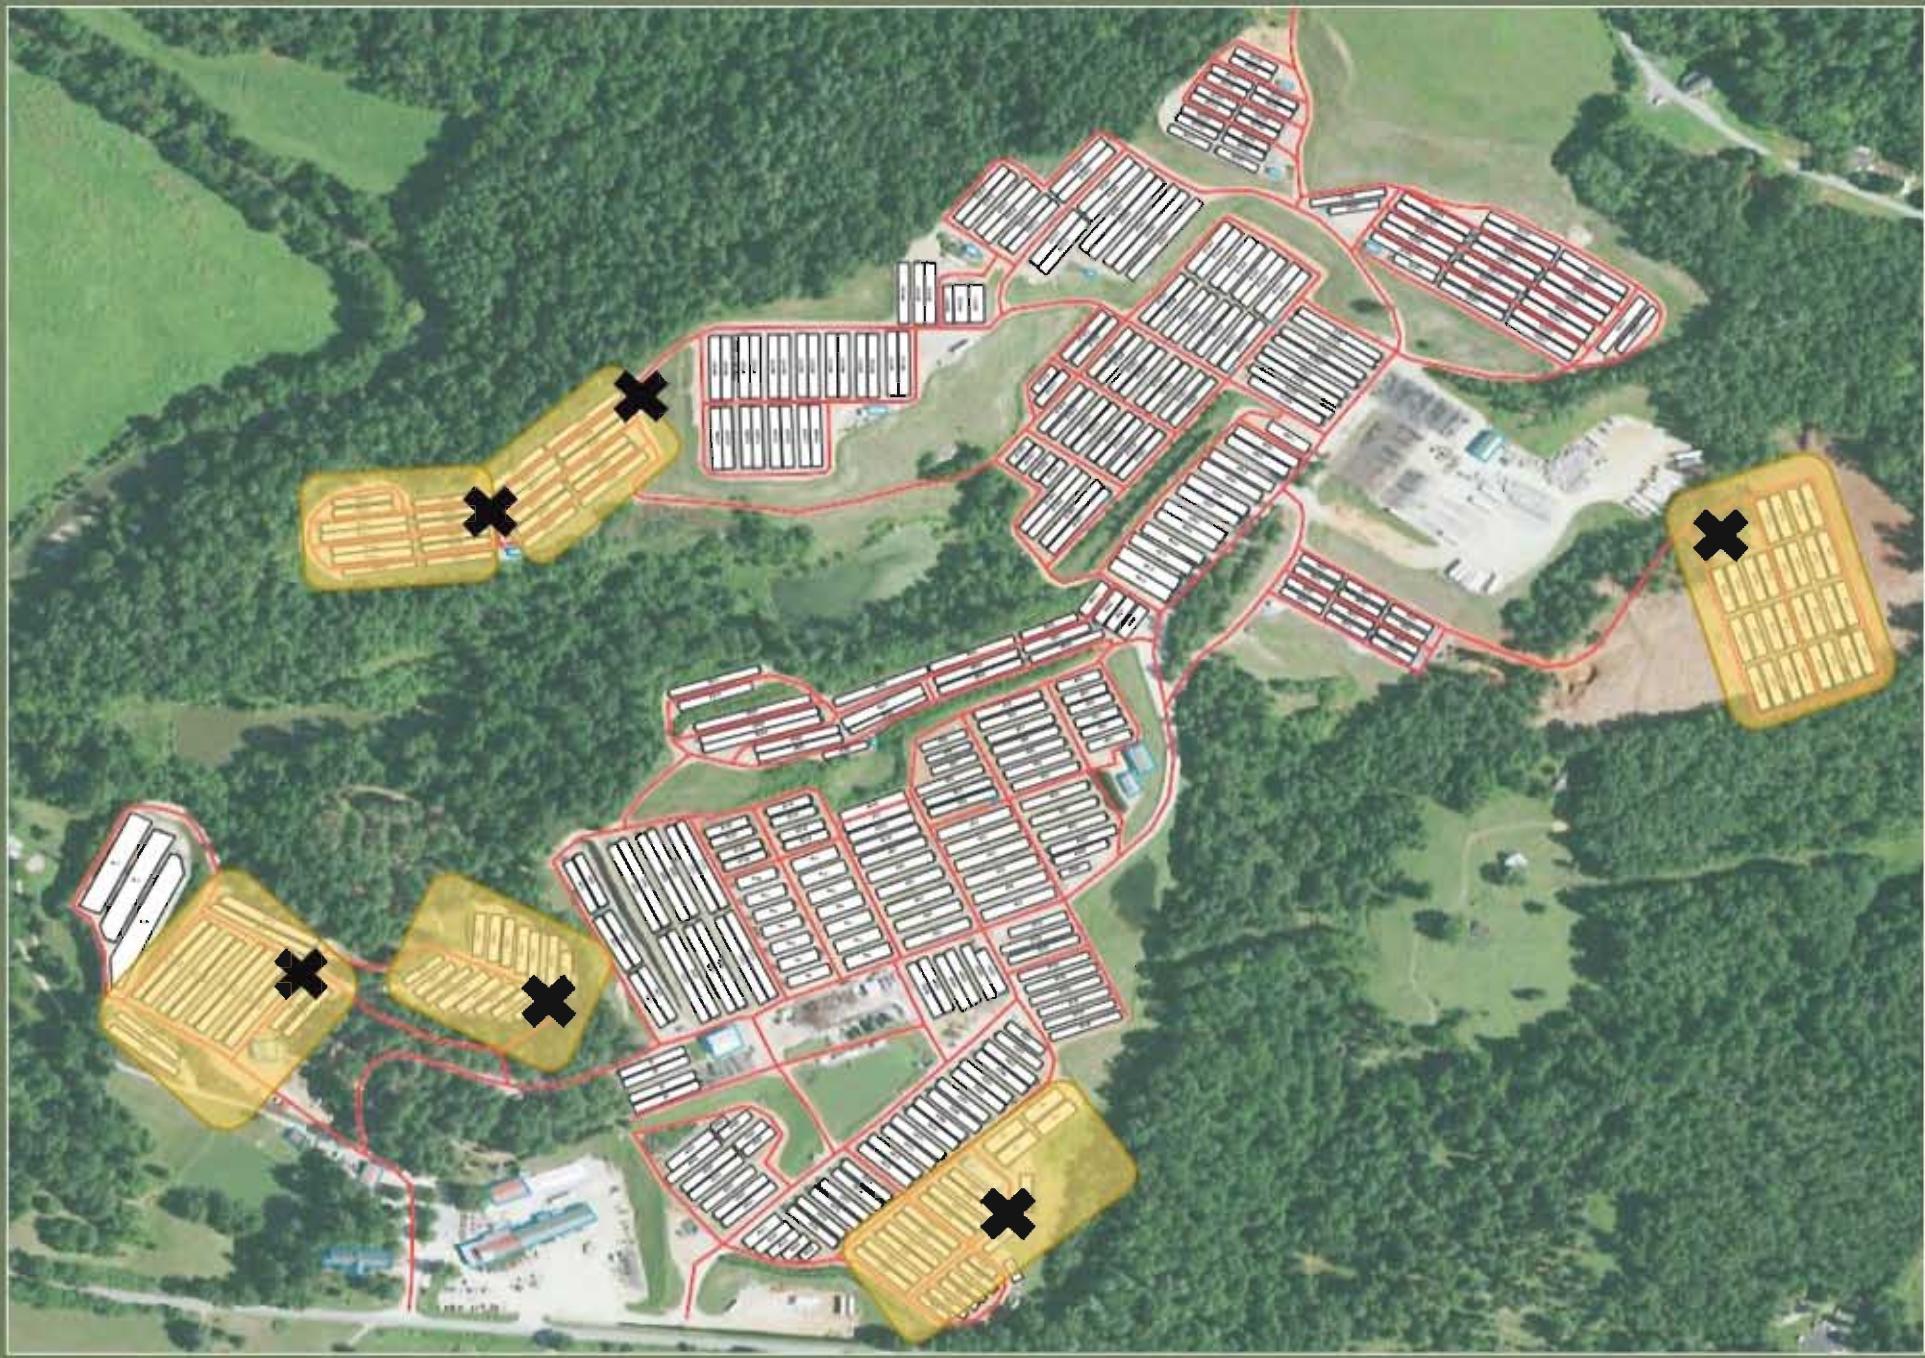

Chuan Hong Research Key Points

- Recent research showed that mulching reduced Box Blight lesions by up to 97%
- Mulching creates a barrier between fallen infected leaves and healthy leaves.
- Any type (hardwood, softwood, pine needles) of mulch should be effective.
- Add thin layer (1/2"-1") of mulch every Spring to keep this barrier.
- If Box Blight is already present in plants, before mulching
 - a.Carefully remove ALL infected foliage from ALL boxwood in area
 - b.Remove bottom 12" of limbs/ leaves of boxwood to reduce splashing on lower leaves of plants, and to promote better air flow.

The End of Suffruticosa- English Boxwood

Be Blight Smart

- Stay educated.
- Use compliant suppliers.
- Clean up between blocks.
- Minimize pruning during warm temperatures
- Avoid overhead irrigation.
- Air circulation.
- Mulch.
- More tolerant cultivars.

Take
Precautions
if Blight is
suspected

If Blight is suspected

- Take samples for testing.
- Isolate infection.
- If confirmed, carefully remove plants.
- Sanitation.
- Replanting? Mulch. Use more tolerant Varieties.
- Use BMP's published by Virginia Tech Extension.

Blight Contingency Plan

“There is no replacement for boxwood”.
