

# **Avian First Aid**

## AN OUNCE OF PREVENTION

It is very important when starting this discussion to emphasize that none of the information contained within substitutes for professional assistance by a qualified avian veterinarian. First aid procedures are intended to provide necessary support for a bird until this can be accomplished.

The other issue that must be discussed is the fact that the majority of "emergency" cases seen in birds are not really emergencies. They are birds that have been sick for weeks or months but have gone unnoticed until they are critical. Close observation of birds combined with regular veterinary examinations and lab evaluation will catch many problems at a time when the success of treatment will be higher and the cost of

treatment will be lower.

In addition, many of the physical injuries and poisonings that are encountered in birds can be prevented. If birds are

kept caged when unsupervised and their wings and nails are kept trimmed most of these events would not occur. Leg bands can be hazardous, especially if they do not fit well. If they are necessary, make sure they are well fitted and placed properly. Birds should be tamed and accustomed to the routines of the household. Leaving a nightlight on, especially for lutino cockatiels,

will help reduce night panics. Cage covering procedures should be consistent. Turning off ceiling fans and covering mirrors and windows when a bird is flying in the house is advisable. Birds should be separated from other animals and other types of birds as many birds will bite the toes of other birds. Birds should not be allowed access to toxic plants, painted surfaces, or other toxins. Overheating cooking oils or dry non-stick pans may emit toxic fumes. No one should ever smoke around a bird. Birds should be removed from the area when any painting or other projects are occurring.

By following these guidelines many emergencies can be avoided.

### PLAN FOR THE UNEXPECTED

The time to find an avian veterinarian is not when an emergency occurs. Establishing a relationship with an experienced avian veterinarian and a medical record for the bird are very important. The bird owner should find out the procedures for emergency care after hours. After hours care is

more expensive and some practices will refer emergencies to an emergency clinic. If these factors are known, there will be no surprises.

In the event of injury or illness, owners can improve the odds for their birds if they are prepared for immediate care. It helps to have a first aid kit available. Listed below are some measures that can be taken to stabilize a bird until medical attention can be administered. The following are general recommendations for a variety of emergency situations.

#### Avian First Aid Kit

- Towels
- Droppers or Syringes
- Sports Drink or Pedialyte
- Cloth Tape

- Self-Adhesive Flexible Bandage
- Styptic Powder
- Carrier
- Heated Cage

- Thermometer for Cage
- Scale
- Antiseptic Solution (Betadine or Chlorhexidine)

### **DETERMINING THE PROBLEM**

Bird owners should make a habit of observing their birds. While they may not have the training to interpret the results, this process can be valuable in determining when a problem is present. If it is never done until the bird is sick, it will be difficult to determine what is normal and what is not.

The bird should be examined from a distance, either on a perch or in the cage. A healthy bird should be alert, have a straight, upright posture, tight smooth plumage, and move without difficulty. The breathing should be effortless. Tail bobbing and open mouth breathing are considered

abnormal. Birds that sleep a lot, are ruffled, or have droopy wings or tail are probably very ill and require immediate veterinary attention. (Figure 1) In birds like this, great care must be taken to avoid excessive stress.

#### FIGURE 1

NORMAL BIRD Straight posture Tight plumage Bright, alert eyes

SICK BIRD Drooped wings and tail Ruffled feathers Half-closed eyes

## THINGS TO AVOID

Many recommendations published in bird books or on the internet are potentially harmful and often unsupported.

First, any ointment applied to the skin, orally, or in the cloaca should be

avoided. These oil based products can severely damage feathers and irritate the intestinal tract.

Second, force feeding birds is extremely hazardous. Trying to feed a bird with a syringe can cause the bird to inhale and aspirate the food with fatal consequences. Veterinarians force feed birds with a feeding tube and should only be done by trained professionals

Third, do not remove blood feathers. Improper removal of blood feather remnants can cause worse hemorrhage than was occurring before. The veterinarian has means of controlling this bleeding.

Fourth, do not use styptic powder on the skin or feather follicles. These products work by causing a chemical burn. This is safe for nails or beak tips, but can cause serious skin damage in other cases. Be very careful to avoid letting the bird

swallow any of the styptic as esophageal burns are serious problems.

Avian First Aid (3)

Lastly, do not give over-thecounter medications orally or in

the drinking water. These products are often ineffective and cannot be dosed properly. Products used in the drinking

water can also discourage drinking.

While home care can be lifesaving in some cases, far too often well-meaning owners cause more harm than good. Professional veterinary care should never be delayed.

### **EMERGENCIES**

Don't let the sun set on a sick bird.

While we still see healthy birds for wellness exams, we are no longer equipped to treat a sick bird. With birds' ability to mask the signs of illness, the onset of any noticeable signs may occur when the problem has reached a critical level. If your bird is

sick or injured, you need to call the University of Illinois Small Animal Clinic and Emergency Service.

It is unwise to adopt a "wait and see" approach. If you are unsure, please feel free to call our clinic.

# **Important Numbers**

• All Creatures Animal Hospital: 217-328-4143

University of Illinois Small Animal Clinic and Emergency Service: 217-333-5300

National Animal Poison Control (A consultation fee will be applied): 1-888-426-4435

Problem	Signs	Action
Aint Doin' Right	Ruffled Feathers	Call Emergency Vet ASAP
	Sleeping More	Place in Warm Cage (85F)
	Decreased Appetite	Make Food and Water Accessible
	Weight Loss	Avoid Stress
	Decreased Activity	
Bleeding	Blood Seen in Cage	Call Emergency Vet ASAP
	Blood Seen on Bird	Identify Source of Bleeding
	Blood in Droppings	Apply Pressure to Site if necessary
		Apply Styptic Power to Nail or Beak
		DO NOT Pull Blood Feather
Bite Wound	History of Fight or Attack	Call Emergency Vet ASAP
	Puncture Wounds	Apply Pressure to Wound if necessary
	Missing Feathers	Keep Warm
	Bruising	reep warm
Broken Bone	Not Using Leg	Call Emergency Vet ASAP
	Drooped Wing	Restrict Activity
	Exposed Bone	Tresurer retrivity
Abnormal Droppings	Diarrhea: Dark Portion Loose	Schedule Appointment with Vet ASAP
	Polyuria: Clear Liquid Increased	Check for Other Problems
	Green Urates: White Part is now Green	Check for other frostems
Egg Binding	Straining	Call Emergency Vet ASAP
	Sitting on Bottom of Cage	Keep Warm
	Abdominal Swelling	Provide Plenty of Fluids
	Laid Eggs Before	DO NOT Apply Ointments or Oils
Lumps, Bumps, Protrusions	Any Abnormal Tissue Swelling	If Tissue is Protruding: Call Emergency
	Tiny Honorman Hoode 5 Wenning	Vet ASAP
		Otherwise, Protect from Injury and
		Schedule Appointment with Vet ASAP
Not Eating	Food not Disappearing	Call Emergency Vet ASAP
	White, Chalky Droppings	Offer Clear Fluids by Dropper (DO NOT
	Frantic Behavior	force)
	Weakness	Provide Familiar Foods
	Wedness	Hand Feed if Baby Bird
Respiratory Disease	Wheezing	Call Emergency Vet ASAP
	Coughing	Avoid Handling
	Holding Head Back	Keep Dark, Quiet, Humid
	Passing Out	Treep Burk, Quiet, Iranna
Seizures	Twitching	Call Emergency Vet ASAP
	Loss of Consciousness	Pad Cage or Put in Box
	Wing Flapping	Keep Cool
	Spinning	Time Seizure
	Falling of Perch	
Head Trauma	Flew into Object	Keep in Cool, Dark, and Quite Room
	Various Levels of Incoordination	If No Improvement in 10-15 Minutes, <i>Call</i>
	Pupils are not the Same Size	Emergency Vet
Vomiting	Pumping of Neck	Offer Water in Small Volumes
	Mucus Matting of Head Feathers	Remove New Foods
	Pools of Vomited Material	If Occurs more than Once: Schedule
	Soft, Doughy Crop	Appointment with Vet ASAP
	bon, boughy crop	1 Appointment with vet AbAi
