Ceramic Tiles

What are ceramic tiles? Ceramic tiles are tiles that are made of ceramics. Ceramics mainly consist of clay and sand and a tile is actually no more than baked layers of clay. In addition, tiles can be glazed to protect them from dirt and to give them a shine. The tiles are often easier to maintain than natural stone, strong and have an extremely low moisture absorption. Thanks to today's technologies, it is possible to make ceramic tiles that resemble real concrete, natural stone or wood.

Apana

Apana in an earth-gray hue, provides a unique versatility thanks to the intersection of branched veining and contrasting occasional random deposits.

Granite Surface

Granite is a light – colored igneous rock with grains large enough to be visible with the unaided eye. It forms from the slow crystallization of magma below Earth's surface. Granite is composed mainly of quartz and feldspar with minor amounts of mica, amphiboles, and other minerals. This mineral composition usually gives granite a red, pink, gray, or white color with dark mineral grains visible throughout the rock. Granite is the best known igneous rock. Many people recognize granite because it is the most common igneous rock found at Earth's surface and because granite is used to make many objects that we encounter in daily life. These include counter tops, floor tiles, paving stone, curbing, stair treads, building veneer, and cemetery monuments. Granite is used all around us – especially if you live in a city.

Black Granite

Polish

This is the most common type of polish that is very popular for reflecting light and images like a mirror. Polishing is achieved when the surface of the stone reaches its most polished state. Most of the abrasion is done on it to reach the highest brightness or the highest natural brightness. This type of polish gives the stone a beautiful effect and gives depth to the color of the stone.

Kitchen Counter

The kitchen is the heart of the house. An important part of the house that affects the beauty of other interiors of the building. This environment plays an important role in the beauty and construction of the home atmosphere, so choosing a suitable design for it is definitely very important.

Different materials can be used to build the kitchen facade, including tiles, ceramics, parquet, laminate, MDF and stone. The use of natural stones in the kitchen creates a pleasant atmosphere and gives it a special spirit and beauty. The kitchen has different

parts, each of which needs a suitable material for the display.

Granites are heat resistant and are impermeable rocks; For this reason, they are a good choice for the kitchen counter and on the table. They are also very easy to wash and do not spoil easily. Among rock types, black granite is more resistant to bleaches and acidic liquids. In addition to the counter, this stone is a good choice for use in splash and can also be used on the dining table. A dining table covered with black granite can add a stylish and special visual atmosphere to the house.

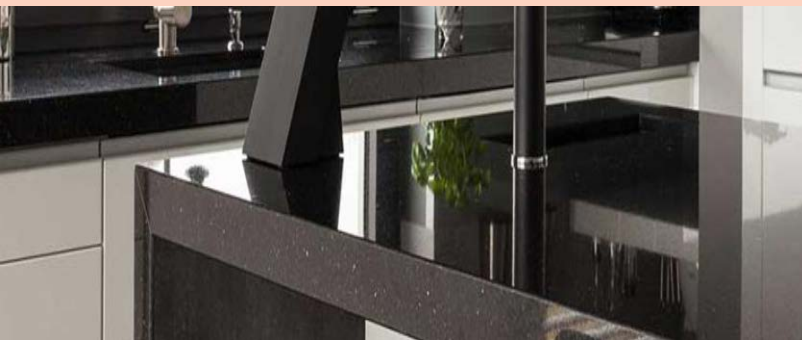

Cover

Stones such as granite, sandstone and slate can be used as veneers for various surfaces. Stone veneers add depth and coordinates to the space and can take good care of their underside in the long run.

Black granite stones are one of the best choices for cladding on busy stairs due to their durability and non-slip. Granites are impenetrable stones and are therefore a good choice for kitchen countertops and

tables. They are also very easy to wash and do not spoil easily. Among rock types, black granite is more resistant to bleaches and acidic liquids

Stones with their rustic charm warm the home environment and at the same time can keep the air of the house cool. Because when the ambient heat, they absorb heat and then gradually release the absorbed heat as the air cool.

Quartz Surfaces

Engineered quartz stone

Quartz is composed of 93 to 96% silica or quartz and 7% pigments, metal particles, and resin bonds. Silica is one of the hardest and most durable natural materials with a hardness of 7 (diamond hardness is 9). Silica is granulated as a micronized powder and a special resin is integrated into the rock during the production process. Hence, the property of silica is transferred to the quartz plate and makes the quartz stone highly resistant to abrasion and impact.

Advantages of Quartz Stone

Resistant to scratches and abrasions

Impact resistant

Waterproof

Anti – acid

Anti – bacterial

High color variation

Heat resistant up to 150° degrees Celsius
