Consulting Civil and Structural Engineers

Project details

Discover our comprehensive civil and structural engineering services for the refurbishment and extension of a historic multi-storey building, seamlessly blending preservation with innovation. At the rear of the property, we replaced ageing structures with a modern, three-storey concrete building featuring a piled basement, designed to house countless artefacts safely and securely, the perfect solution for space constraints.

From initial demolition to conceptual design, GAP Ltd. expertly managed every civil and structural engineering aspect, including temporary works design, ensuring careful integration with the nearby listed building to enable smooth access for visitors. Throughout the project, we maintained the stability of the main museum and complex, supporting the new concrete framework and structural modifications.
