B. Knowing act: Consciously initiating the opening of a power operated door using acceptable methods including wall mounted switches such as push plates and controlled access devices such as keypads, card readers and key switches.

1.4 REFERENCE STANDARDS

A. General: Standards listed by reference, including revisions by issuing authority, form a part of this specification section to extent indicated. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referred to by issuing authority abbreviation and standard designation.

B. American Architectural Manufacturers Association (AAMA):
   1. AAMA 607.1 - Clear Anodic Finishes for Architectural Aluminum.
   2. AAMA 611 Voluntary Specification for Anodized Architectural Aluminum.

C. American Association of Automatic Door Manufacturers (AAADM).

D. American National Standards Institute (ANSI)/Builders' Hardware Manufacturers Association (BHMA):
   1. ANSI/BHMA A156.10: Standard for Power Operated Pedestrian Doors.
   2. ANSI/BHMA A156.19: Standard for Power Assist and Low Energy Power Operated Doors.

E. American Society for Testing and Materials (ASTM):
   1. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
   2. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate

F. Builders Hardware Manufacturers Association (BHMA):
   1. A156.19 Power Assist & Low Energy Power Operated Doors.

G. International Code Council (ICC):
   1. IBC: International Building Code.

H. International Standards Organization (ISO):
   1. ISO 9001 - Standard for Manufacturing Quality Management Systems.
   2. ISO 14025 – Environmental Labels and Declarations -- Type III Environmental Declarations -- Principles and Procedures.
   3. ISO14040 – Environmental Management -- Life Cycle Assessment -- Principles and Framework.
   4. ISO 14044 – Environmental Management -- Life Cycle Assessment -- Requirements and Guidelines.
   5. ISO 21930 – Sustainability in Buildings and Civil Engineering Works -- Core Rules For Environmental Product Declarations Of Construction Products And Services.

I. National Association of Architectural Metal Manufacturers (NAAMM):
   1. Metal Finishes Manual for Architectural and Metal Products.

J. National Fire Protection Association (NFPA):
   1. NFPA 101 – Life Safety Code.
   2. NFPA 70 – National Electric Code.

K. Underwriters Laboratories (UL):
   1. UL 325 – Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems.
   2. UL 10C – Positive Pressure Fire Tests of Door Assemblies.

L. United Nations Central Product Classification (UNCPC):
   1. UNCPC 4212 - Product Category Rules for Preparing an Environmental Product Declaration for Power-Operated Pedestrian Doors and Revolving Doors.

1.5 COORDINATION

A. Templates: Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing automatic door operators to comply with indicated requirements.

B. Electrical System Roughing-in: Coordinate layout and installation of automatic door operators with connections to, power supplies, remote activation devices, electric door latching hardware, and security access control system. Refer to Division 28 00 00 - Electronic Safety and Security for systems not provided under this section.

C. System Integration: Integrate automatic door operators with other systems as required for a complete working installation.

1. Provide electrical interface control capability for activation of automatic door operators by security access system on doors with electric locking.
2. Where indicated to install both knowing act and secure activation system, automatic door operators shall be configured to operate; by knowing act, after verification from secure activation system, when secured; by knowing act when not secured.
3. Where required for proper operation, provide a time delay relay to signal automatic door operator to activate only after electric lock system is released.
4. Provide electrical interface with door latching hardware to enable exterior knowing act activation device only when latching hardware is dogged.
5. Provide electrical interface to deactivate automatic door operators on activation of fire alarm system.

1.6 SUBMITTALS

A. General: Submit listed submittals in accordance with Conditions of the Contract and Section 01 30 00 – Administrative Requirements: Submittal procedures.

B. Action Submittals”
1. Shop Drawings: Include plans, elevations, sections, details, hardware mounting heights, and attachments to other work. Indicate wiring for electrical supply.
2. Color Samples for selection of factory-applied color finishes.

C. Information Submittals: Based on evaluation performed by a qualified agency, for automatic entrance door assemblies.
1. Environmental Product Declaration.
2. Evaluation Report for compliance with IBC.

D. Closeout Submittals: Provide the following with project close-out documents.
1. Owner’s Manual.
2. Warranties.

1.7 QUALITY ASSURANCE

A. Source Limitations: Obtain automatic door operators through one source from a single manufacturer.

B. Qualifications
1. Installer Qualifications: Manufacturer's authorized representative, with certificate issued by AAADM, who is trained in the installation and maintenance of units required for this Project.
2. Manufacturer Qualifications: A qualified manufacturer with a manufacturing facility compliant with ISO 9001.
3. Manufacturer shall have in place a national service dispatch center providing 24 hours a day, 7 days a week, emergency call back service.

C. Certifications:
1. Automatic door operators shall be certified by the manufacturer to meet performance design criteria in accordance with the following standards:
   a. ANSI/BHMA A156.10 and A156.19.
   b. BHMA Certified Products Directory, Listed.
   c. IBC.
   d. NFPA 101.
      UL 325 Listed.
   e. UL 10C Listed.
2. Environmental Product Declaration (EPD): EPD for automatic door operators shall be certified by the manufacturer to comply with the following:

a. Prepared under Product Category Rule (PCR) UNCPC 4212.
b. Conform to ISO standards 14025, 14040, 14044, 21930.
c. Life Cycle Assessment Basis: Cradle to Gate, minimum.

1.8 FIELD CONDITIONS

A. Field Measurements: General Contractor shall verify openings to receive automatic door operators by field measurements before fabrication and indicate measurements on Shop Drawings.

B. Mounting Surfaces: General Contractor shall verify all surfaces to be plumb, straight, and secure; substrates to be of proper dimension and material.

C. Other trades: General Contractor Advise of any inadequate conditions or equipment.

1.9 WARRANTY

A. Automatic door operators shall be free of defects in material and workmanship for a period of one (1) year from the date of substantial completion.

B. During the warranty period the Owner shall engage a factory-trained technician to perform service and affect repairs. A safety inspection shall be performed after each adjustment or repair and a completed inspection form shall be submitted to the Owner.

C. During the warranty period all warranty work, including but not limited to emergency service, shall be performed during normal working hours.

PART 2 - PRODUCTS

2.1 AUTOMATIC DOOR OPERATORS

A. Manufacturer: Stanley Access Technologies (www.stanleyaccess.com); M-Force™ Series automatic door operator.
1. Contact: Stanley Access Technologies, Russell Elkins; Phone: 985-624-5278, Fax: 985-626-9515, Email: Russell.Elkins@allegion.com

B. Substitutions: Not permitted.

C. Product Options: Drawings indicate sizes, profiles, and dimensional requirements of swinging doors equipped with automatic door operators and are based on the specific system indicated. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

2.2 PERFORMANCE / DESIGN CRITERIA

A. General: Provide automatic door operators capable of withstanding loads and thermal movements based on testing manufacturer's standard units in assemblies similar to those indicated for this Project.

B. Operating Range: Minus 30 deg F (Minus 34 deg C) to 130 deg F (54 deg C).

C. Opening-Force Requirements for Egress Doors: In the event power failure to the operator, swinging automatic entrance doors shall open with a manual force, not to exceed 30 lbf (133 N) to set door in motion, and not more than 15 lbf to fully open the door. Forces shall be applied at

1” (25 mm) from the latch edge of the door.

2.3 REGULATORY REQUIRMENTS

A. Power Operated Door Standard: ANSI/BHMA A156.19.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Emergency-Exit Door Requirements: Comply with requirements of authorities having jurisdiction for swinging automatic entrance doors serving as a required means of egress.

2.4 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
1. Headers: 6063-T6.
2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221.
3. Sheet and Plate: ASTM B 209.

2.5 COMPONENTS

A. Header Case: Header case shall not exceed 6” (152 mm) square in section and shall be fabricated from extruded aluminum with structurally integrated end caps, designed to conceal door operators and controls. The operator shall be sealed against dust, dirt, and corrosion within the header case. Access to the operator and electronic control box shall be provided by a full-length removable cover, edge rabbeted to the header to ensure a flush fit. Removable cover shall be secured to prevent unauthorized access.

B. Door Arms: A combination of door arms and linkage shall provide positive control of door through entire swing; units shall permit use of butt hung, center pivot, and offset pivot-hung doors.

C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, non-staining, non-bleeding fasteners and accessories compatible with adjacent materials.

D. Signage: Provide signage in accordance with ANSI/BHMA A156.19.

2.6 SWINGING DOOR OPERATORS

A. General: Provide door operators of size recommended by manufacturer for door size, weight, and movement; for condition of exposure; and for long-term, maintenance-free operation under normal traffic load for type of occupancy indicated.

B. Electromechanical Operators: Self-contained unit powered by a minimum 3/16 horsepower, permanent-magnet DC motor; through a high torque reduction gear system.
1. Operation: Power opening and spring closing.
2. Operator Type: Low energy; readily convertible to full energy; no tools required to change type.
3. Handing: Non-handed; no tools required to change handing.
4. Capacity: Rated for door panels weighing up to 700 lb (318 kg).
5. Mounting: Visible.
6. Features:
    a. Adjustable opening and closing speeds.
    b. Adjustable opening and closing force.

c. Adjustable back-check.
d. Adjustable hold-open time between 0 and 30 seconds.
e. Reverse on obstruction.
f. Force compensation and closed loop speed control with active braking and acceleration.
g. Power Close.
h. Slam Protection.
i. Power Assist.
j. Lock Release.
k. Stall Sensor Ignore.
l. Electronic Coordination.
m. Optional Switch to open/Switch to close operation.
n. Optional push to activate operation.
o. Fire alarm interface, configurable to safely open or close doors on signal from fire alarm system.

C. Field Adjustable Spring Closing Operation: The operator shall close the door by spring energy employing the motor, as a dynamic brake to provide closing speed control. The closing spring shall be a helical compression spring, adjustable for positive closing action. The spring shall be adjustable, without removing the operator from the header, to accommodate a wide range of field conditions.

D. Independent Adjustable Closing and Latching Speed Control: The operator shall employ a rheostat module to allow for independent field adjustment of closing and latching speeds using the motor as a dynamic brake.

E. Field Adjustable Open Stop: The operator shall provide a field adjustable open stop to accommodate opening angles from 80 to 135 degrees without the need for additional components.

F. Consistent Cycle: The operator shall deliver an even, consistent open manual push force across the entire transition from door fully closed to door fully open. Additionally, the force shall be field adjustable to accommodate a wide range of on-site conditions.

G. Quiet Performance: The operator shall be designed to output audible noise ratios less than or equal to 50dba.

H. Manual Use: The operator shall function as a manual door closer in the direction of swing with or without electrical power. The operator shall deliver an even, consistent open force across the entire transition from door fully closed to door fully open.

I. Electrical service to door operators shall be provided under Division 26 Electrical. Minimum service to be 120 VAC, 5 amps.

2.7 ELECTRICAL CONTROLS

A. Electrical Control System: Electrical control system shall include a microprocessor controller and a high-resolution position encoder. The encoder shall monitor revolutions of the operator shaft and send signals to microprocessor controller to define door position and speed.
1. The high-resolution encoder shall have a resolution of not less than 1024 counts per revolution. Systems utilizing external magnets and magnetic switches are not acceptable.
2. Electrical control system shall include a 24 VDC auxiliary output rated at 1 amp.

B. Performance Data: The microprocessor shall collect, and store performance data as follows:
1. Counter: A non-resettable counter to track operating cycles.

2. Event Reporting: Unit shall include non-volatile event and error recording including number of occurrences of events and errors, and cycle count of most recent events and errors.
3. LED Display: Display presenting the current operating state of the controller.

C. Controller Protection: The microprocessor controller shall incorporate the following features to ensure trouble free operation:
1. Automatic Reset Upon Power Up.
2. Main Fuse Protection.
3. Electronic Surge Protection.
4. Internal Power Supply Protection.
5. Resetable sensor supply fuse protection.
6. Motor Protection, over-current protection.

D. Power Close: When enabled, engages the operator to close a door that does not close completely at the end of a cycle.

E. Force Compensation: Utilizing the closed loop speed control, the operator shall maintain constant opening and closing speeds when subjected to excessive outside forces, such as positive or negative stack pressures.

F. Slam Protection: The operators speed control system prevents door from slamming at the full open or full closed position.

G. Power Assist: Operator mode that lowers opening forces when the door is used manually. Power assist is active only while pushing or pulling the door. The door will close when an opening force is no longer applied.

H. Lock Release: On doors with electric locking, operator shall include a closing function to release tension on a latch mechanism prior to opening the door.

I. Stall Sensor Ignore: Adjustable setting to disable swing side safety sensors at a specific angle.

J. Electronic Coordination: On pairs of doors, allows independent timing of opening and closing of each leaf as required for astragal coordination.

K. Soft Start/Stop: A “soft-start” “soft-stop” motor driving circuit shall be provided for smooth normal opening and recycling.

L. Obstruction Recycle: Provide system to recycle the swinging panels when an obstruction is encountered during the closing cycle.

M. Programmable Controller: Microprocessor controller shall be field programmable.
1. The following parameters may be adjusted:
   a. Operating speeds and forces as required to meet specified ANSI/BHMA standard.
   b. Adjustable and variable features specified.
2. Manual programming shall be available through local interface which has a two-digit display with a selection control including three push buttons.

N. Auxiliary Door Position Switch: An auxiliary cam actuated door position switch shall be provided which can be used to signal other devises or systems of the doors position. The switch shall include both normally open and normally closed contacts.

O. Emergency Breakout Switch: A cam actuated emergency breakout switch shall be provided to disconnect power to the motor when an in-swinging door is manually pushed in the emergency

out direction. The operator will then automatically reset, and power will be resumed.

P. Control Switch: Automatic door operators shall be equipped with a three-position function switch to control the operation of the door. Control switch shall provide three modes of operation, Automatic, Off, and Hold-Open.

Q. Power Switch: Automatic door operators shall be equipped with a two position On/Off switch to control power to the door.

2.8 ACTIVATION DEVICES

A. Secure Activation: Secure activation device provided by others as specified in Division 28 00 00 - Electronic Safety and Security.

B. Push Plates: Provide 4 1/2 inch (114 mm) square push plates with UL recognized SPDT switch. Face plates and mounting studs shall be stainless steel. Face plates shall be engraved with the international symbol for accessibility and “Push To Open”.
1. Push plates shall be wall mounted in single or double gang electrical boxes and hardwired to door operator controls.
2. Push plates shall be similar to or better than BEA 10PBS451.

C. Touchless Activation Switch: Provide touchless activation switches for primary activation of sliding automatic entrances from interior. Face plates shall be engraved with waving hand logo and “Wave To Open” text.
1. Switches shall be recess wall style, double or single gang and hardwired to door operator controls.
2. Units shall incorporate microwave frequency to detect all motion in the detection zone. Detection zone shall be adjustable from 4 inch to 24 inch (51 mm to 610 mm).
3. LED indicator for activation confirmation.
4. Relay shall be rated at 1 A at 60 VDC.
5. Relay hold time adjustable from 0.5 to 30 sec.
6. IP55 rated enclosure.
7. Touchless activation switches shall be similar to or better than BEA, MS41-D.

2.9 ALUMINUM FINISHES

A. General: Comply with NAAMM Metal Finishes Manual for Architectural and Metal Products for recommendations for applying and designing finishes. Finish designations prefixed by AA comply with system established by Aluminum Association for designing finishes.

B. Class II, Clear Anodic Finish**:** AA-M12C22A31 Mechanical Finish: as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.40 mils minimum complying with AAMA 611-98, and the following:
1. AAMA 607.1
2. Applicator must be fully compliant with all applicable environmental regulations and permits, including wastewater and heavy metal discharge.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances, header support, and other conditions affecting performance of swinging automatic entrance doors. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Do not install damaged components. Fit joints to produce hairline joints free of burrs and distortion. Rigidly secure non-movement joints.

B. Mounting: Install automatic door operators/headers plumb and true in alignment with established lines and grades. Anchor securely in place.
   1. Install surface-mounted hardware using concealed fasteners to greatest extent possible.
   2. Set headers, arms and linkages level and true to location with anchorage for permanent support.

C. Door Operators: Connect door operators to electrical power distribution system as specified in Division 26 00 00 – Electrical.

3.3 FIELD QUALITY CONTROL

A. Testing Services: Factory Trained Installer shall test and inspect each swinging automatic entrance door to determine compliance of installed systems with applicable ANSI standards.

3.4 REPAIR

A. Repair damaged finish to match original finish.

3.5 ADJUSTING

A. Adjust door operators, controls, and hardware for smooth and safe operation, for tight closure, and complying with requirements in specified ANSI/BHMA operating standard by AAADM Certified Technician.

3.6 CLEANING

A. Clean surfaces promptly after installation. Remove excess sealant compounds, dirt, and other substances.

END OF SECTION 08 71 13

SECTION 08 80 00 – GLAZING

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Insulating glass units.

B. Glazing units.

C. Glazing compounds and accessories.

1.2 RELATED REQUIREMENTS

A. Section 07 92 00 - Joint Sealants: Sealants for other than glazing purposes.

B. Section 08 11 13 - Hollow Metal Doors and Frames: Glazed lites in doors and borrowed lites.

C. Section 08 14 16 - Flush Wood Doors: Glazed lites in doors.

D. Section 08 43 13 - Aluminum-Framed Storefronts: Glazing furnished as part of storefront assembly.

E. Section 08 44 13 - Glazed Aluminum Curtain Walls: Glazing furnished as part of wall assembly.

1.3 REFERENCE STANDARDS

A. 16 CFR 1201 - Safety Standard for Architectural Glazing Materials; current edition.

B. ANSI Z97.1 - American National Standard for Safety Glazing Materials Used in Buildings, Safety Performance Specifications and Methods of Test; 2010.

C. ASCE 7 - Minimum Design Loads for Buildings and Other Structures; 2010, with 2013 Supplements and Errata.

D. ASTM C864 - Standard Specification for Dense Elastomeric Compression Seal Gaskets, Setting Blocks, and Spacers; 2005 (Reapproved 2011).

E. ASTM C920 - Standard Specification for Elastomeric Joint Sealants; 2014.

F. ASTM C1036 - Standard Specification for Flat Glass; 2011.

G. ASTM C1048 - Standard Specification for Heat-Strengthened and Fully Tempered Flat Glass; 2012.

H. ASTM C1172 - Standard Specification for Laminated Architectural Flat Glass; 2014.

I. ASTM C1193 - Standard Guide for Use of Joint Sealants; 2013.

J. ASTM C1376 - Standard Specification for Pyrolytic and Vacuum Deposition Coatings on Flat Glass; 2015.

K. ASTM E1300 - Standard Practice for Determining Load Resistance of Glass in Buildings; 2012a.

L. ASTM E2190 - Standard Specification for Insulating Glass Unit Performance and Evaluation; 2010.

M. GANA (GM) - GANA Glazing Manual; 2009.

N. GANA (SM) - GANA Sealant Manual; 2008.

O. ICC (IBC) - International Building Code; 2015.

P. IGMA TB-3001 - Guidelines for Sloped Glazing; 2001.

Q. IGMA TM-3000 - North American Glazing Guidelines for Sealed Insulating Glass Units for Commercial & Residential Use; 1990 (2004).

R. NFRC 100 - Procedure for Determining Fenestration Product U-factors; 2014.

S. NFRC 200 - Procedure for Determining Fenestration Product Solar Heat Gain Coefficient and Visible Transmittance at Normal Incidence; 2014.

T. NFRC 300 - Test Method for Determining the Solar Optical Properties of Glazing Materials and Systems; 2014.

1.4 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Meeting: Convene a preinstallation meeting one week before starting work of this section; require attendance by each of the affected installers.

B. Coordinate with installation of other components that comprise the glazing systems.

1.5 SUBMITTALS

A. A. Glazing Schedule: List glass types and thicknesses for each size opening and location. Use same designations indicated on Drawings.

B. Product Data on Insulating Glass Unit and Glazing Unit Glazing Types:
   1. Provide structural, physical and environmental characteristics, size limitations, special handling and installation requirements.
   2. Product Data on Glazing Compounds and Accessories: Provide chemical, functional, and environmental characteristics, limitations, special application requirements. Identify available colors.

D. Samples: Submit two samples 12 by 12 inch in size of glass units, showing coloration and design for Architect’s review and approval.

E. Warranty Documentation: Submit manufacturer warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.

F. Delegated-Design Submittal: For glass indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

G. Shop drawings: Indicate glass types, dimensions, edge conditions, installation methods, wind load support details.

H. Certificates of compliance for safety glazing

I. Manufacturer test reports confirming compliance with ASTM and energy requirements.

J. Preconstruction adhesion and compatibility test report.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain glass and fabricated glass products through one source from a single manufacturer for each glass type.

B. Perform Work in accordance with GANA (GM), GANA (SM), and IGMA TM-3000 for glazing installation methods.

C. Fabricator Qualifications: Company specializing in work of this section with minimum ten years of documented experience.

D. Installer Qualifications: Company specializing in performing work of the type specified and with at least three years documented experience.

E. Electrical Components: Listed and classified by UL as suitable for the purpose specified and indicated.

1.7 MOCK-UPS

A. See Section 01 40 00 - Quality Requirements, for additional mock-up requirements.

B. Provide on-site glazing mock-up with the specified glazing components for exterior insulated laminated glazing variations.

C. Mock-ups may not remain as part of the Work and will be stand-alone assemblies in conjunction with aluminum glazing systems.

1.8 FIELD CONDITIONS

A. Do not install glazing when ambient temperature is less than 40 degrees F.

B. Maintain minimum ambient temperature before, during and 24 hours after installation of glazing compounds.

1.9 WARRANTY

A. See Section 01 78 00 - Closeout Submittals, for additional warranty requirements.

B. Insulating Glass Units: Provide a five (10) year manufacturer warranty to include coverage for seal failure, interpane dusting or misting, including replacement of failed units.

C. Low-e Coating: Provide a ten (10) year warranty to include coverage for deterioration of low-e coating and replacement of same.

D. Lamination: Provide a (5) year manufacturer warranty.

E. Manufacturer's Special Warranty for Laminated Glass: Manufacturer agrees to replace laminated-glass units that deteriorate within specified warranty period. Deterioration of laminated glass is defined as defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning laminated glass contrary to manufacturer's written instructions. Defects include edge separation, delamination materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated-glass standard.

1. Warranty Period: [**Five** years from date of Substantial Completion.

F Manufacturer's Special Warranty for Insulating Glass: Manufacturer agrees to replace insulating-glass units that deteriorate within specified warranty period. Deterioration of insulating glass is defined as failure of hermetic seal under normal use that is not attributed to glass breakage or to maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture, or film on interior surfaces of glass.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Installed glazing systems shall withstand normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, or installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.

Design glass and glazing systems to resist local wind load per ASCE 7, with minimum design pressures for Houma, Louisiana (Risk Category II) based on a basic wind speed of 150 mph, Exposure C, wind borne debris region. Comply with IBC 2021 and applicable local jurisdiction amendments.

B. Delegated Design: Design glass, including comprehensive engineering analysis according to ICC's 2006 International Building Code by a qualified professional engineer, using the following design criteria:**.**

C. Provide type and thickness of exterior glazing assemblies to support assembly dead loads, and to withstand live loads caused by positive and negative wind pressure acting normal to plane of glass.

1. Comply with ASTM E1300 for design load resistance of glass type, thickness, dimensions, and maximum lateral deflection of supported glass.
2. Provide glass edge support system sufficiently stiff to limit the lateral deflection of supported glass edges to less than 1/175 of their lengths under specified design load.
3. Glass thicknesses listed are minimum.

D. Differential Shading:

Design glass units to withstand thermal stresses resulting from **non-uniform solar exposure** (e.g., partial shading from overhangs, fins, or frit) to avoid breakage or seal failure due to **thermal gradients** within a single lite.

E. Thermal Movements:

Design and detail framing systems and glazing components to accommodate thermal movements from ambient and surface temperature fluctuations.

1.Temperature Range:

Ambient Air Temperature Change: ±120°F (±49°C)

Surface (Material) Temperature Change: ±180°F (±82°C)

F. Thermal Resistance and Visible Light Transmittance of Glazing Assemblies:

Comply with NFRC 100 (U-factor), NFRC 200 (Solar Heat Gain Coefficient), and NFRC 300 (Visible Transmittance). Refer to “Insulating-Laminated Glass Types” article for specific performance values.

G. Vapor Retarder and Air Barrier Seals: Provide completed assemblies that maintain continuity of building enclosure vapor retarder and air barrier.

1. In conjunction with vapor retarder and joint sealer materials described in other sections.
2. To utilize the inner pane of multiple pane insulating glass units for the continuity of the vapor retarder and air barrier seal.

H. Thermal and Optical Performance: Provide glass products with performance properties as indicated. Performance properties are in accordance with manufacturer's published data as determined with the following procedures and/or test methods:

1. Center of Glass U-Value: Comply with NFRC 100 using Lawrence Berkeley National Laboratory (LBNL) WINDOW 6.3 computer program.
2. Center of Glass Solar Heat Gain Coefficient (SHGC): Comply with NFRC 200 using Lawrence Berkeley National Laboratory (LBNL) WINDOW 6.3 computer program.
3. Solar Optical Properties: Comply with NFRC 300 test method.

I. Provide safety glazing where required by code, including indoors, sidelites, glazing within 18 inches of the floor, and locations subject to human impact.

J. Comply with ASTM E1300 for minimum glass thickness and support conditions.

K Float Glass: Provide ultra-clear, low-iron float glass.

1. Annealed Glass: ASTM C1036, Type I – Transparent Flat Glass, Class 1 – Clear, Quality-Q3.

2. Heat-Strengthened Glass: ASTM C1048, Kind HS; minimum surface compression of 3,500 psi.

L. Fully Tempered Glass:: Provide ultra-clear, low-iron tempered glass.

1. ASTM C1048, Kind FT; minimum surface compression of 10,000 psi.

2. Complies with ANSI Z97.1 and CPSC 16 CFR 1201 (Category II) for safety glazing.

3. Permanently labeled with manufacturer's safety glazing identification.

4. Provide where required by code, where glazing is subject to human impact, or where thermal stress or wind load conditions exceed safe limits for annealed or heat-strengthened glass.

M. Laminated Glass: Provide ultra-clear, low-iron tempered glass.

1. Conform to ASTM C1172 – Laminated Architectural Flat Glass.

2. Laminated Safety Glass: Two or more plies of float glass laminated with clear polyvinyl butyral (PVB) interlayer; complies with ANSI Z97.1 and CPSC 16 CFR 1201 (Category II).

3. Provide where indicated or required for impact resistance, acoustics, or enhanced security.

2.3 INSULATING – LAMINATED LARGE MISSILE IMPACT GLASS ASSEMBLY UNITS

A Basis-of-Design Manufacturer: Subject to compliance with requirements, provide Viracon, assembly as described, or a comparable product by one of the following:

1. Trulite
2. Viracon
3. Oldcastle.

4. Guardian.
5. PPG

GIF-1

Interior: 1" overall, privacy/diffusion, STC properties

TYPE – Insulating Satin Vision Unit

Glass:

a. Clear and satin etched insulating glass unit..
b. Durability: ASTM E2190 compliant.
c. Safety: Both lites tempered.
d. Spacer: Aluminum, black or bronze.
e. Seal: Dual silicone system.

Make-up: 1/4" Clear Tempered (#2 surface); 1/2" Mill Spacer; 1/4" Satin Tempered (#3 surface, etched).

Performance requirements:

VLT ~65–70%,

U-Factor ~0.47,

SHGC ~0.65,

GT-2,

Exterior: Hurricane/impact resistant when glazed in tested system.

TYPE: Glass: Vitro Solarban 70XL Solexia with clear lite, fabricated by Trulite or approved equal, (Viracon equivalent).

Durability: Certified per ASTM E2190 for insulating glass durability.

Coated Glass: Comply with ASTM C1376 for sputter-coated low-E on flat glass.

Safety: Provide tempered / heat-strengthened glass, laminated with SentryGlas Plus interlayer; tested for impact resistance per code and compatible aluminum systems.

Metal Edge Spacers: Aluminum mill finish, bent/soldered corners.

Spacer Color: Black or dark bronze (architect approval).

Edge Seal: Dual-sealed silicone system around perimeter.

Color: Solexia tint (green solar control glass).

Gas Fill: Dry air purge, hermetically sealed.

Make-up: 1/4" Vitro Solarban 70XL Solexia, tempered (#2 surface coating); 1/2" Mill spacer (black or bronze); 1/4" Clear Heat Strengthened; 0.90" SentryGlas Plus (SGP) laminated interlayer.

Performance requirements:

VLT ~50–55%,

U-Factor ~0.28,

SHGC ~0.27,

Reflectance ~12–13%,

GT-1:

Exterior: Hurricane/impact resistant when glazed in tested system.

TYPE: Double Glazed Clear Solar Control Laminated Insulating Glass Unit [Solarban® 70 * 6mm (2) | Air 1/2" (12.7mm) | 6mmClear_090PVB_6mmClear]

Conformance: ASTM E 2190

Outdoor Lite: Clear/Acuity™ float glass as manufactured by Vitro Architectural Glass

a. Conformance: ASTM C 1036, Type 1, Class 1, Quality q3.

b. Glass Thickness: 6mm (1/4")

c. Magnetic Sputter Vacuum Deposition Coating (MSVD): ASTM C 1376.

d. Coating: Solarban® 70 on Surface # 2

e. Heat-Treatment: **[**None**] [**Heat-strengthened, ASTM C 1048, Kind HS**], [**Tempered; ASTM C 1048, Kind FT; Safety Glazing meets ANSI Z97.1 and CPSC 16CFR-1201**]**

Specifier Notes: Specify the method of heat treatment. Vitro recommends that heat strengthened glass be specified and used, except where tempered glass is mandated for safety or other purposes by code.

Interspace Content: Air 1/2" (12.7mm)

Indoor Lite: Laminate

a. Conformance: ASTM C1172 and complying with testing requirements

Outboard Lite: Laminate, Clear float glass as manufactured by Vitro Architectural Glass .

a. Conformance: ASTM C 1036, Type I, Class 1, Quality q3

b. Thickness: 6mm (1/4")

c. Heat-Treatment: **[**None**] [**Heat-strengthened, ASTM C 1048, Kind HS**] [**Tempered; ASTM C 1048, Kind FT; Safety Glazing meets ANSI Z97.1 and CPSC

16CFR-1201**]**

Specifier Notes: Specify the method of heat treatment. Vitro recommends that heat strengthened glass be specified and used, except where tempered glass is mandated for safety or other purposes by code.

Interlayer:

a. Type: PVB

b. Thickness: 0.090" (2.29 mm)

c. Color: Clear

Laminate Inboard Lite: Clear float glass as manufactured by Vitro Architectural Glass

a. Conformance: ASTM C 1036, Type I, Class 1, Quality q3

b. Thickness: 6mm (1/4")

c. Heat-Treatment: **[**None**] [**Heat-strengthened, ASTM C 1048, Kind HS**]**

[Tempered; ASTM C 1048, Kind FT; Safety Glazing meets ANSI Z97.1 and CPSC 16CFR-1201**]**

Specifier Notes: Specify the method of heat treatment. Vitro recommends that heat strengthened glass be specified and used, except where tempered glass is mandated for safety or other purposes by code.

Performance requirements:

a. Visible Light Transmittance: 62 percent minimum.

b. Winter Nighttime U-Factor: 0.28 (Btu/hr*ft^2*°F) maximum.

c. Summer daytime U-Factor: 0.26 (Btu/hr*ft^2*°F) maximum.

d. Shading Coefficient: 0.31 maximum.

e. Solar Heat Gain Coefficient: 0.27 maximum.

f. Outdoor Visible Light Reflectance: 13 percent maximum.

c. Glass Thickness: 12mm (1/2") Flat Polish all edges

Performance requirements:

a. Visible Light Transmittance: 85 percent minimum.

b. Winter Nighttime U-Factor: 0.98 (Btu/hr*ft^{2}*°F) maximum.

c. Summer daytime U-Factor: 0.89 (Btu/hr*ft^{2}*°F) maximum.

d. Shading Coefficient: 0.84 maximum.

e. Solar Heat Gain Coefficient: 0.73 maximum.

f. Outdoor Visible Light Reflectance: 8 percent maximum.

.

2.4 GLAZING UNITS – TEMPERED, CLEAR

A. Safety Glass: Back-painted on one surface and highly opaque.
   1. Manufacturer: Bendheim or approved equal
   2. Thickness as recommended by manufacturer
   1. Applications: Locations as indicated on drawings.
   2. Color by architect.

2.5 GLAZING UNITS - FIRE-RATED GLASS

A. Fire-Resistance-Rated Glazing: Type, thickness, and configuration as required to achieve indicated ratings manufactured by O'Keeffe's Inc. SAFTI Division; SAFTIFIRST or equivalent products by Technical Glass Products (TGP).
   1. Applications:
      a. Glazed lites in fire doors.
      b. Other locations as indicated on the drawings.
   2. Labeling: Provide permanent label on fire-rated glazing in compliance with ICC (IBC) and authorities having jurisdiction.
   3. Provide products listed by Underwriters Laboratories or Intertek Warnock Hersey.
   4. Safety Glazing Certification: 16 CFR 1201 Category II.
   5. Glazing Method: As required for fire rating.
   6. Markings for Fire-Rated Glazing Assemblies:

B. Fire-Protection-Rated Glazing: Specialty tempered float glass, clear.
   1. Product: O'Keeffe's Inc. SAFTI Division; SAFTIFIRST SuperLite X-90 or equivalent product by Technical Glass Products (TGP).
   2. Thickness: 3/4 inch.
   3. Weight: 9.0 lbs./sq.ft.
   4. Fire Rating: 90 minutes with hose stream.
   5. Safety Certification: 16 CFR 1201 Category I&II.
   6. IBC Fire Protection Rating: D-H-90 (including hose stream test).

2.9 GLAZING COMPOUNDS

A. Butyl Sealant: Single component; ASTM C920, Grade NS, Class 12-1/2, Uses M and A, Shore A hardness of 10 to 20; black color.

2.10 ACCESSORIES

A. Setting Blocks: Silicone, with 80 to 90 Shore A durometer hardness; ASTM C864 Option II. Length of 0.1 inch for each square foot of glazing or minimum 4 inch x width of glazing rabbet space minus 1/16 inch x height to suit glazing method and pane weight and area.

B. Setting Blocks (Fire-Rated Glazing): Hardwood or calcium silicate; glass width by 4 inches by 3/16 inch thick.

C. Spacer Shims: Neoprene, 50 to 60 Shore A durometer hardness; ASTM C864 Option II. Minimum 3 inch long x one half the height of the glazing stop x thickness to suit application, self adhesive on one face.

D. Glazing Tape, Back Bedding Mastic Type: Preformed, butyl-based, 100 percent solids compound with integral resilient spacer rod applicable to application indicated; 5 to 30 cured Shore A durometer hardness; coiled on release paper; black color.

E. **Backer Rod:**

1. Provide compressible rod stock backing for sealants in glazing joints where required to control sealant depth, support tooling, and prevent three-sided adhesion.
2. Type: Round, closed-cell polyethylene foam or open-cell polyurethane with outer skin (e.g., SofRod® basis of design), non-gassing, inert, and non-absorptive.
3. Comply with ASTM C1330 Type B (closed-cell) or Type O (open-cell with skin).
4. Sized to provide 25–50 percent compression when inserted into joint.
5. Surface Compatibility: Must be compatible with glazing sealants and not bond to sealant.
6. Temperature Range: Suitable for application temperatures from -40°F to 180°F without degrading physical properties.

2.11 FABRICATION

A. Fabricate glazing units in sizes required to glaze openings indicated for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.

B. Orient pattern and draw of glass pieces in same direction. Place waves in sheet glass parallel to floor.

C. Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites in a manner that produces square edges with slight kerfs at junctions with outdoor and indoor faces.

D. Grind smooth and polish exposed glass edges and corners.

E. Tinted Glass: Cut clean to avoid edge stress. Nipping will not be permitted.

F. Tempered and Heat Strengthened Glass: Fabricate each light before treatment. Cut to size, provide holes and cutouts required for accessories and other work that is attached to glass, finish edges.
   1. Treat heat strengthened and tempered glass by horizontal process in such a manner as to have roller distortion in a horizontal direction as installed on the building.
   2. Identify tempered glass with a permanent non-removable label.

G. Glazing Gaskets:
   1. Fabricate compression gaskets in lengths recommended by gasket manufacturer to fit openings exactly, with allowance for stretch during installation.
   2. Except for outside glazed systems, glazing gaskets are to have factory molded corners inside and out and shipped to the destination in full gasket “frames”.

PART 3 EXECUTION

3.1 VERIFICATION OF CONDITIONS

A. Verify that openings for glazing are correctly sized and within tolerances, including those for size, squareness, and offsets at corners.

B. Verify that the minimum required face and edge clearances are being provided.

C. Verify that surfaces of glazing channels or recesses are clean, free of obstructions that may impede moisture movement, weeps are clear, and support framing is ready to receive glazing system.

D. Verify that sealing between joints of glass framing members has been completed effectively.

E. Proceed with glazing system installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean contact surfaces with appropriate solvent and wipe dry within maximum of 24 hours before glazing. Remove coatings that are not tightly bonded to substrates.

B. Seal porous glazing channels or recesses with substrate compatible primer or sealer.

C. Prime surfaces scheduled to receive sealant where required for proper sealant adhesion.

3.3 INSTALLATION, GENERAL

A. Install glazing in compliance with written instructions of glass, gaskets, and other glazing material manufacturers, unless more stringent requirements are indicated, including those in glazing referenced standards.

B. Install glazing sealants in accordance with ASTM C1193, GANA (SM), and manufacturer's instructions.

C. Do not exceed edge pressures around perimeter of glass lites as stipulated by glass manufacturer.

D. Set glass lites of system with uniform pattern, draw, bow, and similar characteristics.

E. Set glass lites in proper orientation so that coatings face exterior or interior as indicated.

F. Prevent glass from contact with any contaminating substances that may be the result of construction operations such as, and not limited to the following; weld splatter, fire-safing, plastering, mortar droppings, etc.

G. Setting Blocks:
   1. Size and place in accordance with glass manufacturer’s recommendations and design calculations for each project system.
   2. Placement and profile of seting block within the glazing channel shall not inhibit drainage for each fenestration system specified.

3.4 INSTALLATION - INTERIOR FIRE-RESISTIVE GLAZING

A. Conform to manufacturer's installation instructions, recommended glazing products and requirements of referenced UL time-design rating.

3.5 INSTALLATION - GLAZING COMPONENTS

A. Install units according to manufacturer's printed instructions.

B. Install units true, plumb and level. Securely and rigidly anchor units.

C. Adjust units for proper operation.

3.6 CLEANING

A. Remove excess glazing materials from finish surfaces immediately after application using solvents or cleaners recommended by manufacturers.

B. Remove non-permanent labels immediately after glazing installation is complete.

C. Clean glass and adjacent surfaces after sealants are fully cured.

D. Clean glass on both exposed surfaces not more than 4 days prior to Date of Substantial Completion in accordance with glass manufacturer's written recommendations.

3.7 PROTECTION

A. After installation, mark pane with an 'X' by using removable plastic tape or paste; do not mark heat absorbing or reflective glass units.

B. Remove and replace glass that is damaged during construction period prior to Date of Substantial Completion.

END OF SECTION

SECTION 08 83 00 - MIRRORS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of contract, including General, Supplemental, Special Conditions and other Division 1 specification sections, apply to this section.

1.2 SUMMARY

A. This Section includes the following:
   1. Glass mirrors.
      a. Annealed float glass.
      b. Tempered safety glass.

1.3 REFERENCE STANDARDS

A. ASTM C1036 - Standard Specification for Flat Glass; 2011.

B. ASTM C1193 - Standard Guide for Use of Joint Sealants; 2013.

C. ASTM C1503 - Standard Specification for Silvered Flat Glass Mirror; 2008 (Reapproved 2013).

D. GANA (TIPS) - Mirrors: Handle with Extreme Care (Tips for the Professional on the Care and Handling of Mirrors); 2011.

1.4 ACTION SUBMITTALS

A. Product Data on Mirror Types: Submit structural, physical and environmental characteristics, size limitations, special handling and installation requirements.

1.5 INFORMATIONAL SUBMITTALS

A. Manufacturer's Certificate: Certify that full length mirrors, meets or exceeds specified requirements.

B. Warranty: Submit manufacturer warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.

1.6 QUALITY ASSURANCE

A. Fabricate, store, transport, receive, install, and clean mirrors in accordance with recommendations of GANA (TIPS).

1.7 FIELD CONDITIONS

A. Do not install mirrors when ambient temperature is less than 50 degrees F.

B. Maintain minimum ambient temperature before, during and 24 hours after installation of glazing compounds.

1.8 WARRANTY

A. Provide five year manufacturer warranty for reflective coating on mirrors and replacement of same.

PART 2 PRODUCTS

2.1 MATERIALS

A. Mirror Design Criteria: Select materials and/or provide supports as required to limit mirror material deflection to 1/200, or to the flexure limit of glass, with full recovery of glazing materials, whichever is less.

B. Mirror Glass; Annealed: ASTM C1036, Type 1 - Transparent Flat, Class 1 - Clear, Quality - Q1 (high-quality mirrors); silvering, protective coating, and quality requirements in compliance with ASTM C1503.
   1. Thickness: 1/4 inch.
   2. Size: As noted on drawings.
   3. Locations: Above lavatories where indicated on the Drawings.

C. Mirror Glass; Tempered: ASTM C1048, Type 1 - Transparent Flat, Class 1 - Clear, Quality - Q1 (high-quality mirrors); silvering, protective coating, and quality requirements in compliance with ASTM C1503.
   1. Thickness: 1/4 inch.
   2. Size: As noted on drawings.
   3. Locations: Amenity spaces; full height of wall (full length) where indicated on the Drawings.

2.2 ACCESSORIES

A. Spacer Shims: Neoprene, 50 to 60 Shore A durometer hardness.

B. Mirror Adhesive: Chemically compatible with mirror coating and wall substrate.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that openings for mirrored glazing are correctly sized and within tolerance.

B. Verify that surfaces of mirror frames or recesses are clean, free of obstructions, and ready for installation of mirrors.

3.2 PREPARATION

A. Clean contact surfaces with solvent and wipe dry.

B. Prepare installation in accordance with ASTM C1193 for solvent release sealants, and install sealant in accordance with manufacturer's instructions.

3.3 INSTALLATION

A. Install mirrors in accordance with GANA (TIPS) and manufacturers recommendations.

B. Set mirrors plumb and level, and free of optical distortion.

C. Set mirrors with edge clearance free of surrounding construction including countertops or backsplashes.

D. Frameless Mirrors: Set mirrors in proper place with adhesive, applied in accordance with adhesive manufacturer's instructions.

3.4 CLEANING

A. Remove wet glazing materials from finish surfaces.

B. Remove labels after work is complete.

C. Clean mirrors and adjacent surfaces.

END OF SECTION 08 83 00

SECTION 08 90 00 - LOUVERS AND VENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Fixed, extruded-aluminum louvers.

B. Related Sections:

1. Division 08 Section 08 11 13 "Hollow Metal Doors and Frames" for louvers in hollow-metal doors.

2. Division 23 Sections for louvers that are a part of mechanical equipment.

1.3 DEFINITIONS

A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.

B. Horizontal Louver: Louver with horizontal blades; i.e., the axes of the blades are horizontal.

C. Vertical Louver: Louver with vertical blades; i.e., the axes of the blades are vertical.

D. Drainable-Blade Louver: Louver with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.

E. Storm-Resistant Louver: Louver that provides specified wind-driven rain performance, as determined by testing according to AMCA 500-L.

1.4 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design louvers, including comprehensive engineering analysis by a qualified professional engineer, using structural performance requirements and design criteria indicated.

B. Structural Performance: Louvers shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building. Comply with ASCE 7.

1. Wind Loads: Determine loads based on conditions indicated below:
   a. Wind Speed: See structural drawings.
   b. Importance Factor: See structural drawings.
   c. Exposure: See structural drawings.

C. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes, without buckling, opening of joints, overstressing of components, failure of connections, or other detrimental effects.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

D. Louver Performance Ratings: Provide louvers complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L.

E. Windborne-Debris-Impact-Resistance Performance: Provide louvers that pass missile-impact and other wind borne debris protections requirement tests when tested according to ASTM E 1886 and testing information in ASTM E 1996 or AAMA 506.

1. Large-Missile Impact: For aluminum-framed systems located within 30 feet of grade.
2. Small-Missile Impact: For aluminum-framed systems located more than 30 feet above grade.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

1. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.

B. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.

1. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.
2. Show mullion profiles and locations.
3. Wiring Diagrams: For power, signal, and control wiring for motorized adjustable louvers.

C. Samples for Initial Selection: For units with factory-applied color finishes.

D. Samples for Verification: For each type of metal finish required.

E. Delegated-Design Submittal: For louvers indicated to comply with structural performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

F. Product Test Reports: Based on evaluation of comprehensive tests performed according to AMCA 500-L by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louver and showing compliance with performance requirements specified.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain louvers and vents from single source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

B. Welding: Qualify procedures and personnel according to the following:

1. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

C. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

D. UL and NEMA Compliance: Provide motors and related components for motor-operated louvers that are listed and labeled by UL and comply with applicable NEMA standards.

1.7 PROJECT CONDITIONS

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aluminum Extrusions: ASTM B 221, Alloy 6063-T5, T-52, or T6.

B. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.

C. Aluminum Castings: ASTM B 26/B 26M, Alloy 319.

D. Fasteners: Use types and sizes to suit unit installation conditions.

1. Use tamper-resistant screws for exposed fasteners unless otherwise indicated.
2. For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.
3. For color-finished louvers, use fasteners with heads that match color of louvers.

E. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed, for masonry, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.

F. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.2 FABRICATION, GENERAL

A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Vertical Assemblies: Where height of louver units exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates.

1. Continuous Vertical Assemblies: Fabricate units without interrupting blade-spacing pattern unless horizontal mullions are indicated.
2. Horizontal Mullions: Provide horizontal mullions at joints unless continuous vertical assemblies are indicated.

C. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.

D. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

1. Frame Type: Interior flange unless otherwise indicated.

E. Include supports, anchorages, and accessories required for complete assembly.

F. Provide vertical mullions of type and at spacings indicated, but not more than recommended by manufacturer, or 72 inches o.c., whichever is less.

1. Semirecessed Mullions: Where indicated, provide mullions partly recessed behind louver blades so louver blades appear continuous. Where length of louver exceeds fabrication and handling limitations, fabricate with interlocking split mullions and close-fitting blade splices designed to permit expansion and contraction.
2. Exterior Corners: Prefabricated corner units with mitered and welded blades and with fully recessed mullions at corners.

G. Provide subsills made of same material as louvers for recessed louvers.

H. Join frame members to each other and to fixed louver blades with fillet welds concealed from view unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

2.3 FIXED, EXTRUDED-ALUMINUM LOUVERS

A. Horizontal Storm-Resistant, Drainable-Blade Louver:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Airolite Company, LLC (The).
   b. Construction Specialties, Inc.
   c. Ruskin Company; Tomkins PLC.

2. Louver Depth: 9 inches.
3. Frame and Blade Nominal Thickness: Not less than 0.060 inch for blades and 0.080 inch for frames.
4. Louver Performance Ratings:

   a. Free Area: Not less than 6.0 sq. ft. for 48-inch- wide by 48-inch- high louver.
   b. Air Performance: Not more than 0.10-inch wg static pressure drop at 800-fpm free-area exhaust or intake velocity.
   c. Wind-Driven Rain Performance: Not less than 99 percent effectiveness when subjected to a rainfall rate of 8 inches per hour and a wind speed of 50 mph at a core-area intake velocity of 500 fpm.

5. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

B. Vertical Storm-Resistant Louver:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Airolite Company, LLC (The).
   b. Construction Specialties, Inc.
   c. Ruskin Company; Tomkins PLC.

2. Louver Depth: 12 inches.
3. Frame and Blade Nominal Thickness: Not less than 0.060 inch for blades and 0.080 inch for frames.
4. Louver Performance Ratings:

   a. Free Area: Not less than 6.0 sq. ft. for 48-inch- wide by 48-inch- high louver.
   b. Air Performance: Not more than 0.10-inch wg static pressure drop at 800-fpm free-area exhaust or intake velocity.
   c. Wind-Driven Rain Performance: Not less than 99 percent effectiveness when subjected to a rainfall rate of 8 inches per hour and a wind speed of 50 mph at a core-area intake velocity of 500 fpm.

5. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

2.4 LOUVER SCREENS

A. General: Provide screen at louvers indicated.

1. Screen Location for Fixed Louvers: Interior face.
2. Screening Type: Insect screening, unless Bird screening indicated.

B. Secure screen frames to louver frames with machine screws with heads finished to match louver, spaced a maximum of 6 inches from each corner and at 12 inches o.c.

C. Louver Screen Frames: Fabricate with mitered corners to louver sizes indicated.

1. Metal: Same kind and form of metal as indicated for louver to which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.
2. Finish: Same finish as louver frames to which louver screens are attached.
3. Type: Rewirable frames with a driven spline or insert.

D. Louver Screening for Aluminum Louvers:

1. Bird Screening: Flattened, expanded aluminum, 3/4 by 0.050 inch thick.
2. Insect Screening: Aluminum, 18-by-16 mesh, 0.012-inch wire.

2.5 BLANK-OFF PANELS

A. Insulated, Blank-Off Panels: Laminated panels consisting of insulating core surfaced on back and front with metal sheets and attached to back of louver.

1. Thickness: 2 inches.
2. Metal Facing Sheets: Aluminum sheet, not less than 0.032-inch nominal thickness.
3. Insulating Core: Rigid, glass-fiber-board insulation or extruded-polystyrene foam.
4. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard extruded-aluminum-channel frames, not less than 0.080-inch nominal thickness, with corners mitered and with same finish as panels.
5. Seal perimeter joints between panel faces and louver frames with gaskets or sealant.
6. Panel Finish: Same finish applied to louvers.
7. Attach blank-off panels with clips.

2.6 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish louvers after assembly.

C. High-Performance Organic Finish: 2-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

1. Color and Gloss: As selected by Architect from manufacturer's full range.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.3 INSTALLATION

A. Locate and place louvers and vents level, plumb, and at indicated alignment with adjacent work.

B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

C. Form closely fitted joints with exposed connections accurately located and secured.

D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

F. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Comply with Division 07 Section "Joint Sealants" for sealants applied during louver installation.

3.4 ADJUSTING AND CLEANING

A. Test operation of adjustable louvers and adjust as needed to produce fully functioning units that comply with requirements.

B. Clean exposed surfaces of louvers and vents that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

C. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

D. Restore louvers and vents damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units.

1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION 08 90 00

DIVISION

09

FINISHES

SECTION 09 21 16 - GYPSUM BOARD ASSEMBLIES

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Performance criteria for gypsum board assemblies.

B. Metal stud wall framing.

C. Metal channel ceiling framing.

D. Fire rated partitions.

E. Acoustic insulation.

F. Exterior sheathing board.

G. Cementitious backing board.

H. Gypsum wallboard.

I. Joint treatment and accessories.

J. Lead Laminated

1.2 RELATED REQUIREMENTS

A. Section 05 40 00 - Cold-Formed Metal Framing: Exterior wind-load-bearing metal stud framing.

B. Section 06 10 00 - Rough Carpentry: Wood blocking for support of wall-mounted equipment.

C. Section 07 27 26 Fluid Applied Membrane Barriers Water-resistive barrier over sheathing.

D. Section 07 84 46 Firestopping: Top-of-wall assemblies at fire rated walls.

1.3 REFERENCE STANDARDS

A. AISI S100-12 - North American Specification for the Design of Cold-Formed Steel Structural Members; American Iron and Steel Institute; 2012.

B. ANSI A108.11-SystemDeleted - American National Standard for Interior Installation of Cementitious Backer Units; 2010 (Revised).

C. ANSI A118.9-SystemDeleted - American National Standard Specifications for Test Methods and Specifications for Cementitious Backer Units; 1999 (Reaffirmed 2010).

D. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process; 2015.

E. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes; 2014.

F. ASTM C475/C475M - Standard Specification for Joint Compound and Joint Tape for Finishing Gypsum Board; 2015.

G. ASTM C635/C635M - Standard Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings; 2013a.

H. ASTM C636/C636M - Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels; 2013.

I. ASTM C645 - Standard Specification for Nonstructural Steel Framing Members; 2014.

J. ASTM C665 - Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing; 2012.

K. ASTM C754 - Standard Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products; 2015.

L. ASTM C840 - Standard Specification for Application and Finishing of Gypsum Board; 2013.

M. ASTM C954 - Standard Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs From 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness; 2015.

N. ASTM C1002 - Standard Specification for Steel Self-Piercing Tapping Screws for Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs; 2014.

O. ASTM C1047 - Standard Specification for Accessories For Gypsum Wallboard and Gypsum Veneer Base; 2014a.

P. ASTM C1177/C1177M - Standard Specification for Glass Mat Gypsum Substrate for Use as Sheathing; 2013.

Q. ASTM C1178/C1178M - Standard Specification for Coated Glass Mat Water-Resistant Gypsum Backing Panel; 2013.

R. ASTM C1278/C1278M - Standard Specification for Fiber-Reinforced Gypsum Panel; 2007a (Reapproved 2011).

S. ASTM C1325 - Specification for Non-Asbestos Fiber-Mat Reinforced Cementitious Backer Units; 2014.

T. ASTM C1396/C1396M - Standard Specification for Gypsum Board; 2014.

U. ASTM C1629/C1629M - Standard Classification for Abuse-Resistant Nondecorated Interior Gypsum Panel Products and Fiber-Reinforced Cement Panels; 2015.

V. ASTM D3273 - Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber; 2012.

W. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials; 2015a.

X. ASTM E90 - Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements; 2009.

Y. ASTM E413 - Classification for Rating Sound Insulation; 2010.

Z. GA-216 - Application and Finishing of Gypsum Board; 2013.

AA. GA-600 - Fire Resistance Design Manual; 2015.

AB. SCAQMD 1168 - South Coast Air Quality Management District Rule No.1168; current edition.

AC. ICC-ES ER-4071 - Seismic Connection Details for Gypsum Wallboard Nonbearing Partitions and Suspended Ceilings; 2005.

1.4 SUBMITTALS

A. See Section 01 33 00 - Submittal Requirements, for submittal procedures.

B. Shop Drawings: Indicate special details associated with fireproofing, acoustic seals, and sound control.

C. Product Data: Provide data on metal framing, gypsum board, glass mat faced gypsum board, accessories, and joint finishing system.

D. Product Data: Provide manufacturer's data on partition head to structure connectors, showing compliance with requirements.

E. Test Reports: For all stud framing products that do not comply with ASTM C645 or ASTM C754, provide independent laboratory reports showing maximum stud heights at required spacings and deflections.

G. Lead-Laminated Gypsum Board

1. Indicate layout of radiation-protected areas

2. Indicate lead thickness or lead equivalencies of components. Refer to partition types for lead thicknesses.

1.5 QUALITY ASSURANCE

A. Manufacturer: Company specializing in manufacturing gypsum based products of documented experience.

B. Installer Qualifications: Company specializing in performing gypsum board installation and finishing, with minimum five years of experience.

C. Radiation Protection Survey: Employ registered X-Ray physicist, certified by American Board of Radiology, for testing specified radiation protective Work and to conduct radiation protection survey of facility after radiation shielding materials are installed.

1. Take radiation measurements and indicate evaluation of measurements in report. Submit report to Architect and Owner upon completion of report.

2. Take radiation measurements in locations indicated by Architect.

D. Radiation Protection Work: Comply with National Council of Radiation Protection (NCRP) Report No. 049 – Structural Shielding Design and Evaluation for Medical Use of X-Rays and Gamma Rays of Energies up to 10 MeV.

1. Comply with requirements of local regulatory agencies where local standards and criteria exceed requirements of NCRP Report No. 049.

E. Provide Control Joints for Gypsum Wallboards per WCB (Wall and Ceiling Bureau) Technical Bulletin. May 2010)

1.6 WARRANTY

A. See Section 01 77 00 Closeout Procedures for additional warranty requirements.

B. Glass Mat Faced Gypsum Sheathing:

1. Provide 12 month manufacturer warranty against deterioration or delamination as a result of unprotected exposure.
2. Provide 5 year manufacturer warranty for product performance.

PART 2 PRODUCTS

2.1 GYPSUM BOARD ASSEMBLIES

A. Provide completed assemblies complying with ASTM C840 and GA-216.

1. See PART 3 for finishing requirements.

B. Interior Partitions, Indicated as Acoustic: Provide completed assemblies with the following characteristics:

1. Acoustic Attenuation: STC as indicated calculated in accordance with ASTM E413, based on tests conducted in accordance with ASTM E90.

C. Shaft Walls at HVAC Shafts: Provide completed assemblies with the following characteristics:
   1. Air Pressure Within Shaft: Sustained loads of 5 lbf/sq ft with maximum mid-span deflection of L/240.
   2. Acoustic Attenuation: STC of 35-39 calculated in accordance with ASTM E413, based on tests conducted in accordance with ASTM E90.

D. Shaft Walls at Elevator Shafts: Provide completed assemblies with the following characteristics:
   1. Air Pressure Within Shaft: Intermittent loads of 5 lbf/sq ft with maximum mid-span deflection of L/240.
   2. Acoustic Attenuation: STC of 35-39 calculated in accordance with ASTM E413, based on tests conducted in accordance with ASTM E90.

E. Fire Rated Assemblies: Provide completed assemblies as indicated on the drawings.

F. Lead Lined Gypsum Bd.: Definition

   1. Lead Equivalence: Thickness of lead that provides same attenuation (reduction of radiation passing through) as material in question under specified conditions. Lead equivalence specified for materials used in diagnostic X-Ray rooms is measured at 150 kV unless indicated otherwise.

2.2 METAL FRAMING MATERIALS

A. Non-Loadbearing Framing System Components: ASTM C645; G 40 galvanized sheet steel per ASTM A653/A653M, no equivalent coating allowed, with properties necessary to comply with ASTM C754 for the spacing indicated, with maximum deflection of wall framing of L/240 at 5 psf.
   1. Studs: "C" shaped with flat or formed webs with knurled faces.
      a. Stud width: Refer to drawings.
      b. Stud gauge: Limit 20-gage studs for all partition types. unless noted otherwise
   2. Runners: U shaped, sized to match studs.
   3. Ceiling Channels: ASTM C754, C shaped, roll-formed steel, 16-gage x 1-1/2 inch wide flange, minimum.
   4. Furring: Hat-shaped sections, minimum 25 gage, minimum depth of 7/8 inch.

B. Loadbearing Studs for Application of Gypsum Board: As specified in Section 05 40 00.

C. Shaft Wall Studs and Accessories: ASTM C645; galvanized sheet steel, of size and properties necessary to comply with ASTM C754 and specified performance requirements.
   1. Products:
      a. Same manufacturer as other framing materials.

D. Ceiling Hangers: Type and size as specified in ASTM C754 for spacing required.

E. Partition Head to Structure Connections: Provide mechanical anchorage devices that accommodate deflection using slotted holes, screws and anti-friction bushings, preventing rotation of studs while maintaining structural performance of partition.
   1. Structural Performance: Maintain lateral load resistance and vertical movement capacity required by applicable code, when evaluated in accordance with AISI S100-12.
   2. Material: ASTM A653/A653M steel sheet, SS Grade 50/340, with G60/Z180 hot dipped galvanized coating.
   3. Provide components UL-listed for use in UL-listed fire-rated head of partition joint systems of fire rating and movement required.

F. Firestop and Deflection Track: ASTM C645 galvanized sheet steel top runner manufactured to allow partition heads to expand and contract with movement of the structure while maintaining continuity of fire-resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs.

G. Wallboard Grid Suspension System: ASTM C645, heavy duty galvanized steel grid, direct-hung 1-1/2 inch deep interlocking cross tees and main runners; 1-1/2 inch wide face, 2 foot by 4 foot module. ASTM C635/C635M heavy duty classification.
   1. Manufacturers:
      a. Armstrong World Industries, Inc.: www.armstrong.com.
      b. Chicago Metallic Corporation: www.chicago-metallic.com.
      c. USG Corporation: www.usg.com.
      d. Substitutions: See Section 01 60 00 - Product Requirements.

2.3 BOARD MATERIALS

A. Gypsum Wallboard: Paper-faced gypsum panels as defined in ASTM C1396/C1396M; sizes to minimize joints in place; ends square cut.
   1. Application: Use for vertical surfaces and ceilings, unless otherwise indicated.
   2. At Assemblies Indicated with Fire-Rating: Use type required by indicated tested assembly; if no tested assembly is indicated, use Type X board, UL or WH listed.
   3. Thickness:
      a. Vertical Surfaces: 5/8 inch.
      b. Ceilings: 5/8 inch.
      c. Multi-Layer Assemblies: Thicknesses as indicated on drawings.
   4. Paper-Faced Products:
      a. CertainTeed Corporation; Type X Gypsum Board.
      b. Georgia-Pacific Gypsum; ToughRock Fireguard X.
      c. National Gypsum Company; Gold Bond Brand Gypsum Wallboard.
      d. USG Corporation; Sheetrock Brand Gypsum Panels.

B. High Impact-Resistant Wallboard:
   1. Application: High-traffic areas and Gymnasium as indicated on drawings.
   2. Surface Abrasion: Level 3, minimum, when tested in accordance with ASTM C1629/C1629M.
   3. Indentation: Level 1, minimum, when tested in accordance with ASTM C1629/C1629M.
   4. Soft Body Impact: Level 3, minimum, when tested in accordance with ASTM C1629/C1629M.
   5. Hard Body Impact: Level 2, minimum, when tested in accordance with ASTM C1629/C1629M.
   6. Mold Resistance: Score of 10, when tested in accordance with ASTM D3273.
   7. Paper-Faced Type: Gypsum wallboard as defined in ASTM C1396/C1396M.
   8. Type: Fire resistance rated Type X, UL or WH listed.
   9. Thickness: 5/8 inch.
   10. Edges: Tapered.
   11. Products:
      a. National Gypsum Company; Gold Bond Hi-Impact Brand XP Wallboard.
      b. USG Corporation; Fiberock Brand Panels--Mold Tough VHI Firecode Core.

C. Abuse/Moisture/Mold Resistant Wallboard: High-density paperless gypsum and cellulose reinforced wall panels, suitable for paint finish.
   1. Application: High-traffic areas requiring moisture and mold resistance.
   2. Abuse Resistance: Catagory 1, Light Duty in accordance with USG test methodology with joint treatment only.
   3. Mold Resistance: Score of 10, when tested in accordance with ASTM D3273.
   4. Water Resistance: Coated glass mat water-resistant gypsum backing panel as defined in ASTM C1178/C1178M.
   5. Unfaced Type: Interior fiber-reinforced gypsum panels as defined in ASTM C1278/C1278M.
   6. Type: Fire-resistance rated Type X, UL or WH listed.
   7. Thickness: 5/8 inch.

8. Edges: Tapered.
9. Products: USG Corporation; Fiberock Aqua-Tough Interior Panels.

D. Backing Board For Wet Areas: One of the following products:
1. Application:
   a. Surfaces behind tile in wet areas including shower surrounds, and shower ceilings.
   b. Parapet backing substrate
   c. Pool and high moisture environments
2. Mold Resistance: Score of 10, when tested in accordance with ASTM D3273.
3. ANSI Cement-Based Board: Non-gypsum-based; aggregated Portland cement panels with glass fiber mesh embedded in front and back surfaces complying with ANSI A118.9-SystemDeleted or ASTM C1325.
   a. Thickness: 5/8 inch.
   b. Products:
      1) Custom Building Products; Wonderboard: www.custombuildingproducts.com.
      2) USG Corporation; Durock Brand Cement Board: www.usg.com.
      3) National Gypsum; Permabase Cement Board: www.nationalgypsum.com

E. Backing Board For Non-Wet Areas: Water-resistant gypsum backing board as defined in ASTM C1396/C1396M; sizes to minimum joints in place; ends square cut.
1. Application: Vertical surfaces behind thinset tile, except in wet areas.
2. Mold Resistance: Score of 10, when tested in accordance with ASTM D3273.
3. Type X Thickness: 5/8 inch.
4. Edges: Tapered.
5. Products:
   a. CertainTeed Corporation; Diamondback Glassroc Tile Backer.
   b. Georgia-Pacific Gypsum; DensShield Tile Backer.
   c. National Gypsum Company; Gold Bond Brand e²XP Tile Backer Board.
   d. USG Corporation; Fiberrock Tile Backerboard Panels.

F. Ceiling Board: Special sag resistant gypsum ceiling board as defined in ASTM C1396/C1396M; sizes to minimize joints in place; ends square cut.
1. Application: Ceilings, unless otherwise indicated.
2. Thickness: 1/2 inch.
3. Edges: Tapered.
4. Products:
   a. CertainTeed Corporation; ProRoc Interior Ceiling.
   b. Georgia-Pacific Gypsum; ToughRock Span 24 Ceiling Board.
   c. National Gypsum Company; High Strength Brand Ceiling Board.
   d. USG Corporation; Sheetrock Brand Sag-Resistant Interior Gypsum Ceiling Board.

G. Exterior Sheathing Board: Sizes to minimize joints in place; ends square cut.
1. Application: Exterior sheathing, unless otherwise indicated.
2. Mold Resistance: Score of 10, when tested in accordance with ASTM D3273.
3. Glass Mat Faced Sheathing: Glass mat faced gypsum substrate as defined in ASTM C1177/C1177M.
4. Type X Thickness: 5/8 inch.
5. Edges: Square.
6. Glass Mat Faced Products:
   a. CertainTeed Corporation; GlasRoc Brand.
   b. Georgia-Pacific Gypsum; DensGlass Sheathing.
   c. USG Corporation; Securock Glass-Mat Sheathing.

H. Shaftwall and Coreboard: Type X; 1 inch thick by 24 inches wide, beveled long edges, ends square cut.

1. Paper Faced Type: Gypsum shaftliner board or gypsum coreboard as defined ASTM C1396/C1396M; water-resistant faces.
2. Products:
    a. Georgia-Pacific Gypsum; DensGlass Shaftliner (mold-resistant).
    b. National Gypsum Company; Gold Bond Fire-Shield Shaftliner XP.
    c. USG Corporation; Sheetrock Gypsum Linear Panels.

I. Lead Laminated Gypsum Board

1. Lead-Laminated Gypsum Board: Single unpierced layer of sheet lead laminated to back of gypsum board, ASTM C1396/1396M; gypsum core wall panel with additives to enhance fire resistance of core and surfaced with paper on front, back, and long edges; Type X, UL rated.

2.4 ACCESSORIES

A. Sealants and Primers - General: Provide only products having lower volatile organic compound (VOC) content than required by SCAQMD 1168.

B. Acoustic Insulation: ASTM C665; preformed glass fiber, friction fit type, unfaced. Thickness: 3-1/2 inch.
1. Flame Spread Index: 25 or less, when tested in accordance with ASTM E84.
2. Smoke Developed Index: 50 or less, when tested in accordance with ASTM E84.
3. Products:
    a. CertaPro AcoustaTherm Batts manufactured by CertainTeed Corporation: www.certainteed.com.
    b. Sound Control Batts manufactured by Johns Manville Corporation: www.jm.com.
    c. Sound Attenuation Batt manufactured by Owens Corning Corp: www.owenscorning.com.
    d. QuietTherm manufactured by Knauf Insulation: www.www.knaufusa.com.

C. Acoustic Sealant: Butyl, non-hardening, non-skinning, for use in conjunction with gypsum board.
1. Products:
    a. SC-175 Sound Sealant manufactured by Ohio Sealants, Inc.
    b. Acoustical Sealant manufactured by Tremco Manufacturing Company.
    c. BA-98 manufactured by Pecora Chemical Corporation.
    d. CC-75 manufactured by Mason Industries.

D. Fire-Rated Acoustic Sealant: Acrylic, latex based, skinning, UL classified for use in conjunction with fire-rated gypsum board assemblies.
1. Products:
    a. AC-20 FTR manufactured by Pecora Chemical Corporation.
    b. Sheetrock Acoustical Sealant manufactured by USG Corp.

E. Fire-Rated Sealant: As specified in Section 07 84 00.

F. Water-Resistive Barrier: As specified in Section 07 25 00.

G. Finishing Accessories: ASTM C1047, galvanized steel or rolled zinc, unless otherwise indicated. Plastic accessories unacceptable.
1. Special Shapes: In addition to conventional corner bead and control joints, provide U-bead at exposed panel edges.

H. Joint Materials: ASTM C475/C475M and as recommended by gypsum board manufacturer for project conditions.
1. Tape: 2 inch wide, creased paper tape for joints and corners, except as otherwise indicated.
2. Ready-mixed vinyl-based joint compound; dust-control formulation.

a. Plus 3 with Dust Control manufactured by USG.
b. ProForm Lite with Dust-Tech manufactured by National Gypsum.

I. Screws for Fastening of Gypsum Panel Products to Cold-Formed Steel Studs Less than 0.033 inch in Thickness and Wood Members: ASTM C1002; self-piercing tapping screws, corrosion resistant.

J. Screws for Fastening of Gypsum Panel Products to Steel Members from 0.033 to 0.112 inch in Thickness: ASTM C954; steel drill screws, corrosion resistant.

K. Sheetmetal Anchor Plates: ASTM A653/A653M, 16-gage, minimum width 8-inches, length to span between studs and engage equipment to be supported.

L. Aluminum Extrusions: ASTM B221, 6063-T5 alloy, 0.050-inch thickness, clear anodized AA M12 C22 A31.
1. Manufacturers:
a. Fry Reglet Corp.: www.fryreglet.com
b. Gordon, Inc.: www.gordongrid.com
c. Pittcon Industries: www.pittconindustries.com
d. Tamlyn, Xtreme Interiors: www.tamlyn.com
2. Product:
a. Reveal, 1/2 inch wide: Fry, DRM-625-50.

M. Rigid Vinyl Channel Reveal
1. PB Channel reveals manufactured by Vinyl Corp.
2. Size: As indicated on drawings.

N. Sheathing Joint Tape: Pressure sensitive tape.
1. Blueskin WP-200 by Henry Company: www.henry.com

O. Lead Sheets: 99.9 percent pure unpierced virgin lead, free from dross, oxide inclusions, scale, laminations, blisters, and cracks.
1. Sheet Lead shall meet or exceed the Federal Specification QQL-201 F Grade C and ASTM B749-03 Standard Specification for Lead and Lead Alloy Strip, Sheet, and Plate Products, see NCRP reports #33, #35 and #49.
2. Thickness: As determined by Radiation Protection Survey, or not less than 1/16 inch (1.5 mm) if not indicated.

P. Lead Strips: 2 inches (51 mm) wide, unless indicated otherwise, by same thickness as sheet lead laminated on gypsum board.

Q. Lead Discs: 3/8 inch (9.5 mm) diameter lead discs for use with screw heads.

R. Adhesive: Acceptable to radiation protection product manufacturer and capable of adhering lead sheets where required.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that project conditions are appropriate for work of this section to commence.

3.2 SHAFT WALL INSTALLATION

A. Shaft Wall Framing: Install in accordance with manufacturer's installation instructions.
1. Fasten runners to structure with short leg to finished side, using appropriate power-driven fasteners at not more than 24 inches on center.
2. Install studs at spacing required to meet performance requirements.

B. Shaft Wall Liner: Cut panels to accurate dimension and install sequentially between special friction studs.
   1. On walls over sixteen feet high, screw-attach studs to runners top and bottom.
   2. Seal perimeter of shaft wall and penetrations with fire-rated acoustical sealant.
   3. Use Coated Glass Mat Gypsum Shaftwall at shaftwalls constructed before building close-in.

3.3 FRAMING INSTALLATION

A. Metal Framing: Install in accordance with ASTM C754 and manufacturer's instructions.

B. Seismic Bracing: Laterally brace partitions tied to ceiling or greater than 6 feet in height to the building structure independent of ceiling splay bracing in accordance with ICC-ES ER-4071.

C. Studs: Space studs at 16 inches on center.
   1. Extend partition framing to structure where indicated and to ceiling in other locations.
   2. Partitions Terminating at Ceiling: Attach ceiling runner securely to ceiling track in accordance with manufacturer's instructions.
   3. Partitions Terminating at Structure: Attach top runner to structure, maintain clearance between top of studs and structure, and connect studs to track using specified mechanical devices in accordance with manufacturer's instructions; verify free movement of top of stud connections; do not leave studs unattached to track.
   4. Install firestop track assemblies in accordance with manufacturer's instructions to provide required F and T ratings. Ensure that anchoring devices, back-up material, clip supports, and other materials are consistent with tested and approved assemblies.
      a. Install firestop track at head of fire rated partitions.

D. Openings: Reinforce openings as required for weight of doors or operable panels, using not less than double studs at jambs.
   1. Openings 36-inches wide or less: Two 16-gage.
   2. Openings greater than 36-inches wide: Two 14-gage.

E. Standard Wall Furring: Install at concrete and masonry walls scheduled to receive gypsum board, not more than 4 inches from floor and ceiling lines and abutting walls. Secure in place on alternate channel flanges at maximum 24 inches on center.
   1. Orientation: Horizontal.
   2. Spacing: At 16 inches on center.

F. Furring for Fire Ratings: Install as required for fire resistance ratings indicated and to GA-600 requirements.

G. Blocking: Install treated wood blocking or sheet metal anchor plates in stud cavities. Comply with Section 06 10 00 for wood blocking. Provide support at the following:
   1. Plumbing fixtures
   2. Toilet partitions
   3. Toilet accessories
   4. Architectural woodwork
   5. Casework
   6. Equipment
   7. Lighting fixtures
   8. Wall protection
   9. Wall-supported furniture systems

3.4 CEILING FRAMING

A. Contractor's Option: Ceiling Framing System.
   1. Option No. 1: ASTM C754 using steel furring channels and hat channels.
   2. Option No. 2: Wallboard Grid Suspension System

a. Install systems according to ASTM C636/C636M to support superimposed loads with maximum permissible deflection of 1/360 and maximum surface deviation of 1/8 inch in 10 feet.

B. Level ceiling system to a tolerance of 1/360.

C. Install framing after work above ceiling or soffit is complete. Coordinate the location of hangers with other work.

D. Install framing independent of walls, columns, and above-ceiling work.

E. Securely anchor hangers to structural members or embed in structural slab. Space hangers as required to limit deflection to criteria indicated.

F. Space main carrying channels at maximum 72 inch on center, and not more than 6 inches from wall surfaces. Lap splice securely.

G. Securely fix carrying channels to hangers to prevent turning or twisting and to transmit full load to hangers.

H. Place furring channels perpendicular to carrying channels, not more than 2 inches from perimeter walls, and rigidly secure. Lap splices securely.

I. Reinforce openings in suspension system that interrupt main carrying channels or furring channels with lateral channel bracing. Extend bracing minimum 24 inches past each opening.

J. Laterally brace suspension system.

K. Install bracing as required at exterior soffit locations to resist wind uplift.

L. Sound Control Ceilings: Install ceiling suspension isolators at designated ceilings. Ensure isolators are free hanging and do not contact adjacent construction.
1. Ceiling suspension isolators,
2. Construct ceiling suspension in accordance with the above.
3. Install temporary spacers, 1/4 inch thick around perimeter of floating ceiling. Remove spacers once ceiling has been hung. Should ceiling shift and contact adjacent construction, rehang and reassembled as required to achieve free floating assembly, plumb and true.
4. Seal 1/4 inch wide perimeter joint with acoustic sealant over backer rod.

3.5 ACOUSTIC ACCESSORIES INSTALLATION

A. Acoustic Insulation: Place tightly within spaces, around cut openings, behind and around electrical and mechanical items within partitions, and tight to items passing through partitions.
1. Pack voids of opening frames to maintain continuity of sound isolation.

B. Acoustic Sealant: Install in accordance with manufacturer's instructions. Apply at partition conditions indicated as Sound-Rated. Use Fire-Rated Acoustic Sealant at fire-rated partition assemblies only.
1. Place one bead continuously at the following joint conditions:
a. Partition ends abutting other materials.
b. Partition tops abutting structure.
c. Partition bottom abutting floor.
d. Opening frame perimeter joint to abutting materials.
2. Framed Openings: Seal gypsum board terminations in door and window frames.
3. Covering: Concealed rear surface of utility (mechanical, electrical or plumbing) back box.
4. Seal around all penetrations by conduit, pipe, ducts, and rough-in boxes, except where firestopping is provided.

C. Acoustic Seal Tape: Use to close voids where finished end of gypsum board partition abuts a dissimilar material such as a metal mullion or frame. Apply continuous to the abutting surface and install the gypsum board tight against it to provide compression along its entire length. Tape to form an acoustic, vision and light barrier.

3.6 BOARD INSTALLATION

A. Comply with ASTM C840, GA-216, and manufacturer's instructions. Install to minimize butt end joints, especially in highly visible locations.

B. Single-Layer Non-Rated: Install gypsum board in most economical direction, with ends and edges occurring over firm bearing.

C. Double-Layer Non-Rated: Use gypsum board for first layer, placed parallel to framing or furring members, with ends and edges occurring over firm bearing. Use glass mat faced gypsum board at exterior walls and at other locations as indicated. Place second layer perpendicular to framing or furring members. Offset joints of second layer from joints of first layer.

D. Fire-Rated Construction: Install gypsum board in strict compliance with requirements of assembly listing.

E. Exterior Wall Sheathing: Secure with long dimension perpendicular to wall studs, with ends over firm bearing and staggered, using self-tapping screws.
   1. Apply continuous thermal bridging tape on outboard face of stud flange prior to sheathing installation.
   2. Flash penetrations through sheathing.

F. Cementitious Backing Board: Install over steel framing members and plywood substrate where indicated, in accordance with ANSI A108.11-SystemDeleted and manufacturer's instructions.
   1. Install at ceramic tile shower substrate.
   2. Install at parapet backing substrate.

G. Coated Glass Mat Backer Board:
   1. Install at toilet rooms, janitor's closets, and ceramic tile substrate.

H. Installation on Metal Framing: Use screws for attachment of gypsum board except face layer of non-rated double-layer assemblies, which may be installed by means of adhesive lamination.

3.7 INSTALLATION OF TRIM AND ACCESSORIES

A. Control Joints: Place control joints consistent with lines of building spaces and as indicated.
   1. At construction changes within plane of wall.
   2. Not more than 30 feet apart on walls and ceilings over 50 feet long.
   3. Provide full-height vertical joint each door opening, locate at outside edge, hinge side of door frame.
      a. Ceiling-height door frames shall constitute control joints.
   4. Maintain fire rated construction integrity at fire rated partitions.

B. Corner Beads: Install at external corners, using longest practical lengths.

C. Edge Trim: Install at locations where gypsum board abuts dissimilar materials.

D. Aluminum Extrusions: Where indicated. Double miters at trim intersections.

E. Plastic Accessories: Install where indicated. Secure to substrate with staples and adhesive with straight, true lines, smooth curvatures and true transitions.

3.8 INSTALLATION OF LEAD-LAMINATED GYPSUM BOARD

A. Comply with manufacturer's recommendations.

B. Adhere lead strips on face of studs at joints in lead-laminated gypsum board, including inside and outside corners. Use 2 inches (50 mm) wide strips by same thickness as sheet lead laminated on gypsum board.

C. Shim studs and other framing members as necessary to provide flat, flush finished surfaces.

D. Install lead-laminated gypsum board on framing with screws spaced not more than 8 inches (203 mm) on center along edges of board and 12 inches (305 mm) on center in field of board.

E. Adhere lead discs to fastener heads. In each case, use method that provides continuous radiation shielding

F. Where lead-laminated gypsum board is final substrate, apply joint treatment on fasteners and joints.

3.9 INSTALLATION OF PENETRATING ITEMS

A. At penetrations of lead linings; provide lead shields to maintain continuity of protection.

B. Provide lead linings, sleeves, shields, and other protection in thickness not less than that required in assembly being penetrated.

C. Cut wall penetration covers from lead sheet of equal or greater thickness than backing on adjacent wall panels. Cut wall penetration covers to size required to cover wall penetrations with laps 1 inch (25 mm) minimum wide as indicated on penetration detail drawings.

D. Adhesive-apply lead sheet penetration covers on penetrating boxes and raceways and return penetration covers to backside of lead-backed wall panels with 1 inch (25 mm) minimum laps.

1. Do not use penetrating fasteners unless indicated otherwise.

2. Outlet Boxes and Conduit: Install between studs using steel telescoping mounting brackets. Cover or line with lead sheet lapped over adjacent lead lining at least 1 inch (25 mm). Wrap conduit with lead sheet for 10 inches (250 mm) in from box.

3.10 JOINT TREATMENT

A. Glass Mat Faced Gypsum Board and Exterior Glass Mat Faced Sheathing: Use fiberglass joint tape, bedded and finished with chemical hardening type joint compound. Flash penetrations through sheathing.

B. Paperless Gypsum Board: Use paper joint tape, bedded and finished with chemical hardening type joint compound.

C. Paper Faced Gypsum Board: Use paper joint tape, bedded with ready-mixed vinyl-based joint compound and finished with ready-mixed vinyl-based joint compound.

D. Finish gypsum board in accordance with levels defined in ASTM C840, as follows:
   1. Level 5: All walls and ceilings (paper and paperless boards) to receive Level 5 Finish except as noted below.
   2. Level 4: Walls and ceilings to receive wall coverings and graphics, unless otherwise indicated by Architect.
   3. Level 3: None
   4. Level 2: In utility areas, behind cabinetry, and on backing board to receive tile finish.
   5. Level 1: Fire rated wall areas above finished ceilings, whether or not accessible in the completed construction.

E. Tape, fill, and sand exposed joints, edges, and corners to produce smooth surface ready to receive finishes.
   1. Feather coats of joint compound so that camber is maximum 1/32 inch.
   2. Taping, filling and sanding is not required at base layer of double layer applications.

F. Where Level 5 finish is indicated, spray apply high build drywall surfacer over entire surface after joints have been properly treated; achieve a flat and tool mark-free finish.

G. Fill and finish joints and corners of cementitious backing board as recommended by manufacturer.

3.11 INSTALLING TRIM ACCESSORIES

A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.

B. Control Joints: Install control joints according to ASTM C 840 and in specific locations approved by Architect for visual effect.

C. Interior Trim: Install in the following locations:

1. Cornerbead: Use at outside corner
2. LC-Bead: Use at exposed panel edges.
3. L-Bead: Use where indicated.

3.12 ALTERATIONS TO EXISTING GYPSUM BOARD

A. Butt Joints: Where new gypsum board partitions are required to align flush with existing construction in the same plane, cut existing board away in straight line centered over framing member.
   1. Use rasp or sanding block to slope edges inward at 45 degree angle. Sand existing texture to render smooth surface avoiding damage to face paper. Remove all loose surfacing material.
   2. Install abutting new board and finish as a butt joint with joint tape and compound as required for new work. Finish so there is no evidence of a joint.

B. Intersection Joints: Sand existing texture to render smooth surface avoiding damage to face paper. Install intersecting framing and board. Finish with folded joint tape and compound as required for new work.

C. Finishing: Match finish of existing adjacent gypsum board surfaces so that jointing of new to existing will not be visible in finished surface.

3.13 PARTITION MARKINGS

A. Mark fire-rated partitions and smoke barriers with 3-inch-high upper case letters with 3/8 inch stroke stenciled in red paint.

B. Place markings 6-inches above ceilings both sides of partitions as follows:
   1. Centered over doors.
   2. Maximum 30 feet on center interval and not less than 15 feet from end of partition.
   3. Lettering Copy (as applicable):
      a. "1-HOUR FIRE RATED-PROTECT ALL OPENINGS"
      b. "2-HOUR FIRE RATED-PROTECT ALL OPENINGS"
      c. "SMOKE BARRIER, _#_-HOUR FIRE RATED-PROTECT ALL OPENINGS" (with appropriate fire rating)

C. Mark point of partition type demarcation with 1 inch wide painted vertical line from ceiling line to bottom of structure at the following conditions:
   1. from rated partition type to non-rated partition type;
   2. from change in partition type rating.

3.14 TOLERANCES

A. Maximum Variation of Finished Gypsum Board Surface (not receiving millwork) from True Flatness: 1/8 inch in 10 feet in any direction.

B. Maximum Variation of Gypsum Board Surface receiving millwork per AWI standards for Premium Grade to be 1/64”

END OF SECTION

SECTION 09 22 16 - NON-STRUCTURAL METAL FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. **Drawings and general provisions** of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes non-load-bearing steel framing members for the following applications:
   1. Interior framing systems (e.g., supports for partition walls, framed soffits, furring, etc.).
   2. Interior suspension systems (e.g., supports for ceilings, suspended soffits, etc.).

B. Related Sections include the following:
   1. Division 09 Section 09 22 16 "Gypsum Board".

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

1.4 QUALITY ASSURANCE

A. Fire-Test-Response Characteristics: For fire-resistance-rated assemblies that incorporate non-load-bearing steel framing, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing agency.

B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

PART 2 - PRODUCTS

2.1 NON-LOAD-BEARING STEEL FRAMING, GENERAL

A. **Framing Members, General:** Comply with ASTM C754 for conditions indicated.

1. **Steel Sheet Components:** Comply with ASTM C645 requirements for metal, unless otherwise indicated.

2. **Protective Coating:** ASTM A653/A653M, G40 hot-dip galvanized, unless otherwise indicated.

3. **Material Thickness Requirement:** Provide *true minimum base steel thickness* as specified, before applica tion of protective coating. **Equivalent Gauge (EQ) studs are not permitted.** Studs shall not include em-

bossments, proprietary stiffening patterns, or other manufacturing modifications intended to match the performance of a heavier stud with reduced base metal thickness.

2.2 STEEL FRAMING FOR FRAMED ASSEMBLIES

A. **Steel Studs and Runners:** ASTM C645.

1. Minimum Base-Metal Thickness: 0.033 inch (20 gauge).
2. Depth: As indicated on Drawings.
3. **EQ studs are prohibited. Only traditional, true-gauge studs meeting the specified base-metal thickness are acceptable.**

B. **Flat Strap and Backing Plate:** Steel sheet for blocking and bracing in length and width indicated.

1. Minimum Base-Metal Thickness: 0.018 inch.

C. **Cold-Rolled Channel Bridging:** 0.0538-inch bare-steel thickness, with minimum 1/2-inch-wide flanges.

1. Depth: 1-1/2 inches.
2. Clip Angle: Not less than 1-1/2 by 1-1/2 inches, 0.068-inch-thick, galvanized steel.

D. **Hat-Shaped, Rigid Furring Channels:** ASTM C645.

1. Minimum Base-Metal Thickness: 0.018 inch.
2. Depth: As indicated on Drawings.

E. **Resilient Furring Channels:** 1/2-inch-deep, steel sheet members designed to reduce sound transmission.

1. Configuration: Hat-shaped.

F. **Cold-Rolled Furring Channels:** 0.0538-inch bare-steel thickness, with minimum 1/2-inch-wide flanges.

1. Depth: As indicated on Drawings.
2. Furring Brackets: Adjustable, corrugated-edge type of steel sheet with minimum bare-steel thickness of 0.0312 inch.
3. Tie Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper, 0.0625-inch-diameter wire, or double strand of 0.0475-inch-diameter wire.

G. **Z-Shaped Furring:** With slotted or nonslotted web, face flange of 1-1/4 inches, wall attachment flange of 7/8 inch, minimum bare-metal thickness of 0.0179 inch, and depth required to fit insulation thickness indicated.

2.1 AUXILIARY MATERIALS

A. General: Provide auxiliary materials that comply with referenced installation standards.
   1. Fasteners for Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance.
   1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Install non-load-bearing steel framing in accordance with ASTM C754, manufacturer's written instructions, and approved shop drawings.

B. Provide framing members that comply with the specified minimum base-metal thickness before application of protective coating.

C. Do not use Equivalent Gauge (EQ) studs. Framing members shall not include reduced base-metal thickness, embossments, proprietary stiffening patterns, or other manufacturing modifications intended to simulate the performance of a heavier gauge member.

D. Verify stud sizes, gauges, and spacing on Drawings before installation; ensure only specified true-gauge members are installed.

E. Align studs and runners accurately to required layout; plumb, level, and square. Securely attach to supporting structure to maintain position and stability.

F. Install additional studs, blocking, furring, and bracing as required to support fixtures, equipment, trim, and other applied loads.

G. Space studs as indicated on Drawings, unless otherwise approved in writing by the Architect.

H. Install bridging, bracing, and accessories in accordance with ASTM C754, manufacturer's recommendations, and as indicated on Drawings.

I. Isolate dissimilar metals to prevent galvanic corrosion.

J. Do not make field modifications that reduce member strength or coating integrity.

3.3 INSTALLING SUSPENSION SYSTEMS

A. Suspend hangers from building structure as follows:
   1. Install hangers according to spacings indicated but not greater than spacings required by referenced installation standards for assembly types
      a. 48 inches oc
   2. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.
   3. Splay hangers only where required to miss obstruction and offset resulting horizontal forces by bracing, countersplaying or other equally effective means

4. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.
    a. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced installation standards
5. Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
6. Do not connect or suspend steel framing from ducts, pipes, or conduit.

B. Installation Tolerances: Install suspension systems that are level to within 1/8 inch in 12 feet measured lengthwise on each member that will receive finishes and transversely between parallel members that will receive finishes.

END OF SECTION 09 22 16

SECTION 09 30 00 - TILING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Ceramic tile.

2. Waterproof membrane.

3. Metal edge strips.

B. Related Sections:

1. Division 07 Section "Joint Sealants" for sealing of expansion, contraction, control, and isolation joints in tile surfaces.

2. Division 09 Section "Gypsum Board" for glass-mat, water-resistant backer board.

1.3 DEFINITIONS

A. General: Definitions in the ANSI A108 series of tile installation standards and in ANSI A137.1 apply to Work of this Section unless otherwise specified.

1.4 PERFORMANCE REQUIREMENTS

A. Static Coefficient of Friction: For tile installed on walkway surfaces, provide products with the following values as determined by testing identical products per ASTM C 1028:

1. Level Surfaces: Minimum 0.6

2. Ramp Surfaces: Minimum 0.8

B. ANSI A326.3 Dynamic Coefficient of Friction (DCOF AcuTest) **with** minimum 0.42 for wet interior level surfaces.

C. A326.3 Dynamic Coefficient of Friction (DCOF AcuTest) **with minimum 0.42 for wet interior level surfaces.**

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples for Verification:

1. Full-size units of each type and composition of tile and for each color and finish required

2. Full-size units of each type of trim and accessory for each color and finish required.

3. Certificates/test reports (e.g., for DCOF, waterproof membrane compliance)

1.6 QUALITY ASSURANCE

A. Source Limitations for Tile: Obtain tile of each type and color or finish from one source or producer.

1. Obtain tile of each type and color or finish from same production run and of consistent quality in appearance and physical properties for each contiguous area.

B. Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from one manufacturer and each aggregate from one source or producer.

C. Source Limitations for Other Products: Obtain each of the following products specified in this Section from a single manufacturer for each product:

1. Crack isolation membrane.

2. Joint sealants.

3. Metal edge strips.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirements in ANSI A137.1 for labeling tile packages.

B. Store tile and cementitious materials on elevated platforms, under cover, and in a dry location.

C. Store aggregates where grading and other required characteristics can be maintained and contamination can be avoided.

D. Store liquid materials in unopened containers and protected from freezing.

E. Handle tile that has temporary protective coating on exposed surfaces to prevent coated surfaces from contacting backs or edges of other units. If coating does contact bonding surfaces of tile, remove coating from bonding surfaces before setting tile.

1.8 PROJECT CONDITIONS

A. Environmental Limitations: Do not install tile until construction in spaces is complete and ambient temperature and humidity conditions are maintained at the levels indicated in referenced standards and manufacturer's written instructions.

1.9 EXTRA MATERIALS

A. Furnish extra materials that match and are from same production runs as products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Tile and Trim Units: Furnish quantity of full-size units equal to 3 percent of amount installed for each type, composition, color, pattern, and size indicated.

2. Grout: Furnish quantity of grout equal to 3 percent of amount installed for each type, composition, and color indicated.

PART 2 - PRODUCTS

2.1 PRODUCTS, GENERAL

A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1 for types, compositions, and other characteristics indicated.

1. Provide tile complying with Standard grade requirements unless otherwise indicated.

B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI A108.02, ANSI standards referenced in other Part 2 articles, ANSI standards referenced by TCA installation methods specified in tile installation schedules, and other requirements specified.

C. Factory Blending: For tile exhibiting color variations within ranges, blend tile in factory and package so tile units taken from one package show same range in colors as those taken from other packages and match approved Samples.

2.2 TILE PRODUCTS

A. Refer to Finish List and Finish Schedule in Drawings

2.3 TILE PACKING PANELS

A. Refer to Section 09 29 00 Gypsum Board, 2.4 Tile Backing Panels.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. National Gypsum Company, Permabase.
   b. USG Corporation, Durock.
   c. Manufacturer approved by architect.

2. Cementitious Backer Units: ANSI A118.9 and ASTM C1288 or ASTM C1325, with manufacturer's standard edges.
   a. Thickness: 1/2 inch (12.7 mm).
   b. Mold Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274

2.4 SETTING MATERIALS

A. Latex-Portland Cement Mortar (Thin Set): ANSI A118.4.

1. Manufacturers: MAPEI Corporation or approved equal.

2. Provide prepackaged, dry-mortar mix combined with acrylic resin liquid-latex additive at Project site.

2.5 GROUT MATERIALS

A. Polymer-Modified Tile Grout: ANSI A118.7. Refer to sheet A2.2.7 for selection

1. Polymer Type: Acrylic resin or styrene-butadiene rubber in liquid-latex form for addition to prepackaged dry-grout mix.

a. Unsanded grout mixture for joints

2. Bond coat: Mortar Bed – ANSI A108.1.A. Portland cement paste on a mortar bed that is still workable or dry set mortar or latex Portland cement mortar on cured bed

3. Bond coat: Mortar BedA108.1.B (thinset over cured mortar beds) **for flexibility.**

2.6 WATERPROOF MEMBRANE

A. General: Manufacturer's standard product that complies with ANSI A118.10 and is recommended by the manufacturer for the application indicated. Include reinforcement and accessories recommended by manufacturer.

B. Urethane Waterproofing and Tile-Setting Adhesive: One-part, liquid-applied urethane in a consistency suitable for trowel application and intended for use as both waterproofing and tilesetting adhesive in a two-step process

1. Products: Subject to compliance with requirements, provide one of the following:

a. Bostik, Inc.; Hydroment Ultra-Set.
b. Boiardi Products Corp.; Elastiment 326

2.7 MISCELLANEOUS MATERIALS

A. Trowelable Underlayments and Patching Compounds: Latex-modified, portland cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.

B. Metal Edge Strips: Angle or L-shape, height to match tile and setting-bed thickness, metallic or combination of metal and PVC or neoprene base, designed specifically for flooring applications; stainless-steel, ASTM A 666, 300 Series exposed-edge material.

C. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.

D. Grout Sealer: Manufacturer's standard product for sealing grout joints and that does not change color or appearance of grout.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following

a. Bonsal American; an Oldcastle company; Grout Sealer.
b. Bostik, Inc.; CeramaSeal Grout & Tile Sealer
c. Custom Building Products; Grout and Tile Sealer.
d. MAPEI Corporation; KER 004, Keraseal Penetrating Sealer for Unglazed Grout and Tile.

2.8 MIXING MORTARS AND GROUT

A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers' written instructions.

B. Add materials, water, and additives in accurate proportions.

C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.

1. Verify that substrates for setting tile are firm, dry, clean, free of coatings that are incompatible with tile-setting materials including curing compounds and other substances that contain soap, wax, oil, or silicone; and comply with flatness tolerances required by ANSI A108.01 for installations indicated.

2. Verify that concrete substrates for tile floors installed with thin-set mortar comply with surface finish requirements in ANSI A108.01 for installations indicated.

    a. Verify that surfaces that received a steel trowel finish have been mechanically scarified.
    b. Verify that protrusions, bumps, and ridges have been removed by sanding or grinding.

3. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed.

4. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust joint locations in consultation with Architect.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Fill cracks, holes, and depressions in concrete substrates for tile floors installed with thin-set mortar with trowelable leveling and patching compound specifically recommended by tile-setting material manufacturer.

B. Provide substrate for tile floors installed with thin-set mortar that comply with flatness tolerances specified in referenced ANSI A108 Series of tile installation standards

1. Fill cracks, holes and depressions with trowelable leveling and patching compound according to tile-setting material manufacturer’s written instructions. Use product specifically recommended by tile-setting material manufacturer

2. Remove protrusions, bumps and ridges by sanding

C. Blending: For tile exhibiting color variations, verify that tile has been factory blended and packaged so tile units taken from one package show same range of colors as those taken from other packages and match approved Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

3.3 WATERPROOFING INSTALLATION

A. Install waterproofing to comply with ANSI A108.13 and manufacturer's written instructions to produce waterproof membrane of uniform thickness and bonded securely to substrate.

1. Extend waterproofing up perimeter, wing and partition walls a minimum of 1/2"

2. For showers (TCNA B421 extend waterproofing to height of showerhead.

B. Do not install tile or setting materials until waterproofing has cured and been tested to determine that it is watertight

3.4 TILE INSTALLATION

A. Comply with TCA's "Handbook for Ceramic Tile Installation" for TCA installation methods specified in tile installation schedules. Comply with parts of the ANSI A108 Series "Specifications for Installation of Ceramic Tile" that are referenced in TCA installation methods, specified in tile installation schedules, and apply to types of setting and grouting materials used.

B. Extend tile work into recesses and under or behind equipment and fixtures to form complete covering without interruptions unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.

1. Provide bullnose-edge tiles at transitions to paint

C. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.

D. Jointing Pattern: Lay tile in grid pattern unless otherwise indicated. Lay out tile work and center tile fields in both directions in each space or on each wall area. Lay out tile work to minimize the use of pieces that are less than half of a tile. Provide uniform joint widths unless otherwise indicated.

1. For tile mounted in sheets, make joints between tile sheets same width as joints within tile sheets so joints between sheets are not apparent in finished work.

2. Where adjoining tiles on floor, base, walls, or trim are specified or indicated to be same size, align joints.

3. Where tiles are specified or indicated to be whole integer multiples of adjoining tiles on floor, base, walls, or trim, align joints unless otherwise indicated.

E. Joint Widths: Unless otherwise indicated, install tile with the following joint widths:

1. Porcelain Tile: 1/16 inch.

2. Glazed Wall Tile: 1/16 inch.

F. Expansion Joints: Provide expansion joints and other sealant-filled joints, including control, contraction, and isolation joints, where indicated. Form joints during installation of setting materials, mortar beds, and tile. Do not saw-cut joints after installing tiles.

1. Where joints occur in concrete substrates, locate joints in tile surfaces directly above them.

2. Prepare joints and apply sealants to comply with requirements in Division 07 Section "Joint Sealants."

G. Metal Edge Strips: Install where exposed edge of tile flooring meets carpet, wood, or other flooring that finishes flush with or below top of tile and no threshold is indicated.

H. Grout Sealer: Apply grout sealer to grout joints according to grout-sealer manufacturer's written instructions. As soon as grout sealer has penetrated grout joints, remove excess sealer and sealer from tile faces by wiping with soft cloth.

I. Lippage tolerances (ANSI A108.02) for floor tile.

3.5 CLEANING AND PROTECTING

A. Cleaning: On completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter.

1. Remove latex-portland cement grout residue from tile as soon as possible.

2. Clean grout smears and haze from tile according to tile and grout manufacturer's written instructions but no sooner than 10 days after installation. Use only cleaners recommended by tile and grout manufacturers and only after determining that cleaners are safe to use by testing on samples of tile and other surfaces to be cleaned. Protect metal surfaces and plumbing fixtures from effects of cleaning. Flush surfaces with clean water before and after cleaning.

3. Remove temporary protective coating by method recommended by coating manufacturer and that is acceptable to tile and grout manufacturer. Trap and remove coating to prevent drain clogging.

B. Protect installed tile work with kraft paper or other heavy covering during construction period to prevent staining, damage, and wear. If recommended by tile manufacturer, apply coat of neutral protective cleaner to completed tile walls and floors.

C. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed.

D. Before final inspection, remove protective coverings and rinse neutral protective cleaner from tile surfaces.

END OF SECTION 09 30 00

SECTION 09 51 23 - ACOUSTICAL TILE CEILINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes acoustical tiles for ceilings and the following:

1. suspension systems.

1.3 DEFINITIONS

A. NRC: Noise Reduction Coefficient.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Maintenance Data: For finishes to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Source Limitations:

1. Acoustical Ceiling Tile: Obtain each type through one source from a single manufacturer.

2. Suspension System: Obtain each type through one source from a single manufacturer.

B. Fire-Test-Response Characteristics: Provide acoustical tile ceilings that comply with the following requirements:

1. Surface-Burning Characteristics: Provide acoustical tiles with the following surface-burning characteristics complying with ASTM E 1264 for Class A materials as determined by testing identical products per ASTM E 84:

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver acoustical tiles, suspension system components, and accessories to Project site in original, unopened packages and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.

B. Before installing acoustical tiles, permit them to reach room temperature and a stabilized moisture content.

C. Handle acoustical tiles carefully to avoid chipping edges or damaging units in any way.

1.7 COORDINATION

A. Coordinate layout and installation of acoustical tiles and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Acoustical Ceiling Units: Full-size tiles equal to 2.0 percent of quantity installed.

2. Suspension System Components: Quantity of each grid and exposed component equal to 2.0 percent of quantity installed.

PART 2 - PRODUCTS

2.1 ACOUSTICAL TILES, GENERAL

A. Acoustical Tile Standard: Provide manufacturer's standard tiles of configuration indicated that comply with ASTM E 1264 classifications as designated by types, patterns, acoustical ratings, and light reflectances, unless otherwise indicated.

1. Mounting Method for Measuring NRC: Type E-400; plenum mounting in which face of test specimen is 15-3/4 inches away from test surface per ASTM E 795.

B. Acoustical Tile Colors and Patterns: Match appearance characteristics indicated for each product type.

1. Where appearance characteristics of acoustical tiles are indicated by referencing pattern designations in ASTM E 1264 and not manufacturers' proprietary product designations, provide products selected by Architect from each manufacturer's full range that comply with requirements indicated for type, pattern, color, light reflectance, acoustical performance, edge detail, and size.

C. Broad Spectrum Antimicrobial Fungicide and Bactericide Treatment: Provide acoustical tiles treated with manufacturer's standard antimicrobial formulation that inhibits fungus, mold, mildew, and gram-positive and gram-

negative bacteria and showing no mold, mildew, or bacterial growth when tested according to ASTM D 3273 and evaluated according to ASTM D 3274 or ASTM G 21.

2.2 ACOUSTICAL TILES FOR ACOUSTICAL TILE CEILING:

A. Basis-of-Design Product: Refer to Finish Standards for Ceiling Finishes/Specs including manufacturer, size, color, location, etc and for typical details.

B. Classification: Provide acoustic ceiling tiles complying with ASTM E1264, Type III, Form 1, Pattern E (or as noted on the finish schedule).

2.3 METAL SUSPENSION SYSTEMS, GENERAL

A. Metal Suspension System Standard: Provide manufacturer's standard metal suspension systems of types, structural classifications, and finishes indicated that comply with applicable requirements in ASTM C 635.

B. Finishes and Colors, General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Provide manufacturer's standard factory-applied finish for type of system indicated.

1. High-Humidity Finish: Comply with ASTM C 635 requirements for "Coating Classification for Severe Environment Performance" where high-humidity finishes are indicated.

2. In the Natatorium provide Heavy gauge hot dipped galvanized steel wire.

C. Attachment Devices: Size for five times the design load indicated in ASTM C 635, Table 1, "Direct Hung," unless otherwise indicated. Comply with seismic design requirements.

1. Power-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hangers of type indicated, and with capability to sustain, without failure, a load equal to 10 times that imposed by ceiling construction, as determined by testing per ASTM E 1190, conducted by a qualified testing and inspecting agency.

D. Wire Hangers, Braces, and Ties: Provide wires complying with the following requirements:

1. Zinc-Coated, Carbon-Steel Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper.

2. Size: Select wire diameter so its stress at 3 times hanger design load (ASTM C 635, Table 1, "Direct Hung") will be less than yield stress of wire, but provide not less than 0.106-inchdiameter wire.

E. Hanger Rods: Mild steel, zinc coated or protected with rust-inhibitive paint.

F. Angle Hangers: Angles with legs not less than 7/8 inch wide; formed with 0.04-inch-thick, galvanized steel sheet complying with ASTM A 653/A 653M, G90 coating designation; with bolted connections and 5/16-inch-diameter bolts.

2.4 METAL SUSPENSION SYSTEM FOR ACOUSTICAL TILE CEILINGS: ACT-1 THROUGH ACT-5

A. Basis-of-Design Product: Subject to compliance with requirements, provide a 9/16-inch metal suspension system from the same manufacturer as the ceiling tiles or approved equal.

1. Color: Per Architect's direction.

2. Main and cross runners roll formed from cold-rolled steel sheet.

3. Finish: Pre-painted, electrolytically zinc coated, or hot-dip galvanized per ASTM A 653/A 653M, minimum G30 coating designation.

4. Configure system to accommodate ACT-1 through ACT-5 per ceiling layout and edge type (tegular or non-tegular).

5. Provide all components necessary for proper installation, including trim, splices, and seismic or special-use support as required.

6. Special Conditions:
   a. ACT-1 in MRI rooms: Use non-ferrous grid compatible with MRI equipment.
   b. Trim: Provide Compass trim or other manufacturer-recommended trim as indicated on drawings or required for wall abutments and special conditions.

B. Wide-Face, Capped, Double-Web, Steel Suspension System: Main and cross runners roll formed from cold-rolled steel sheet, pre-painted, electrolytically zinc coated, or hot-dipped galvanized according to ASTM A 653/A 653M, not less than 630 coating designation, with prefinished 15/16 wide metal caps on flanges.

2.4 METAL EDGE MOLDINGS AND TRIM

A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:

1. Armstrong World Industries, Inc

2. BPB USA;

3. Chicago Metallic Corporation;

4. Fry Reglet Corporation;

5. Gordon, Inc

6. USG Interiors, Inc.;

B. Roll-Formed, Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that comply with seismic design requirements; formed from sheet metal of same material, finish, and color as that used for exposed flanges of suspension system runners.

1. Provide manufacturer's standard edge moldings that fit acoustical tile edge details and suspension systems indicated and that match width and configuration of exposed runners, unless otherwise indicated.

2. For circular penetrations of ceiling, provide edge moldings fabricated to diameter required to fit penetration exactly.

C. Extruded-Aluminum Edge Moldings and Trim: Where indicated, provide manufacturer's extruded-aluminum edge moldings and trim of profile indicated or referenced by manufacturer's designations, including splice plates, corner pieces, and attachment and other clips, complying with seismic design requirements and the following:

1. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; organic coating: as specified below). Apply baked enamel complying with paint manufacturer's written instructions for cleaning, conversion coating, and painting.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, including structural framing and substrates to which acoustical tile ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of acoustical tile ceilings.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Measure each ceiling area and establish layout of acoustical tiles to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width tiles at borders, and comply with layout shown on reflected ceiling plans.

3.3 INSTALLATION, SUSPENDED ACOUSTICAL TILE CEILINGS

A. General: Install acoustical tile ceilings to comply with ASTM C 636 and seismic design requirements indicated, per manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."

B. Suspend ceiling hangers from building's structural members and as follows:

1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.

2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices.

3. Secure wire hangers to ceiling suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure and appropriate for substrate and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.

4. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, postinstalled mechanical or adhesive anchors, or power-actuated fasteners that extend through forms into concrete.

5. When steel framing does not permit installation of hanger wires at spacing required, install carrying channels or other supplemental support for attachment of hanger wires.

6. Do not attach hangers to steel deck tabs.

7. Do not attach hangers to steel roof deck. Attach hangers to structural members.

8. Space hangers not more than 48 inches o.c. along each member supported directly from hangers, unless otherwise indicated; provide hangers not more than 8 inches from ends of each member.

9. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.

C. Install edge moldings and trim of type indicated at perimeter of acoustical tile ceiling area and where necessary to conceal edges of acoustical tiles.

1. Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.

2. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter corners accurately and connect securely.

3. Do not use exposed fasteners, including pop rivets, on moldings and trim.

D. Install suspension system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.

E. Install acoustical panels with undamaged edges and fit accurately into suspension system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.

1. For square-edged panels, install panels with edges fully hidden from view by flanges of suspension system runners and moldings.

2. Paint cut edges of panel remaining exposed after installation; match color of exposed panel surfaces using coating recommended in writing for this purpose by acoustical panel manufacturer.

3.4 CLEANING

A. Clean exposed surfaces of acoustical tile ceilings, including trim and edge moldings. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage. Remove and replace tiles and other ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

END OF SECTION 09 51 23

SECTION 09 54 16 - LUMINOUS SKY-IMAGE CEILINGS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Luminous sky-image ceilings with LED backlighting.

1.2 RELATED REQUIREMENTS

A. Section 09 53 00 - Acoustical Ceiling Suspension Assemblies.

B. Section 13 09 50 RF Shielding (& Owner's CDC package)

C. Division 26 - Electrical: Power and lighting connections.

1.3 REFERENCE STANDARDS

A. ASTM C635 - Standard Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings.

B. ASTM C636 - Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels.

1.4 SUBMITTALS

A. Product Data and Shop Drawings.

B. Image tile samples and artwork for review.

C. Manufacturer’s installation and maintenance instructions.

1.5 QUALITY ASSURANCE

A. Manufacturer and Installer Qualifications: Minimum 5 years’ experience.

B. In place Mock-up for Architect’s review and approval

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver in manufacturer’s packaging. Store dry, indoors, at stable temperature.

1.7 WARRANTY

A. Provide manufacturer’s 10-year limited warranty against visible image tile fading.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Basis of Design: Sky Factory, Inc. or approved equal.

2.2 SKY-IMAGE CEILING SYSTEM

A. LED Light Boxes:

1. 6500K daylight LED, RFI-free, uniform backlighting.

2. UL & CE labeled. Mounting depth as scheduled.

B. Image Tiles:

1. UV-resistant printed media laminated between acrylic or polycarbonate.

2. Image: As Selected by Architect.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify conditions and readiness before beginning installation.

3.2 INSTALLATION

A. Install light boxes and image tiles in accordance with manufacturer’s instructions.

B. Connect to electrical systems under Division 26.

3.3 CLEANING

A. Clean finished surfaces and ensure uniform lighting.

3.4 SCHEDULE

A. Refer to drawings for artwork orientation and grid layout.

09 54 23 LINEAR METAL CEILING PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

Drawings and general conditions of Contract, including General and Supplementary Conditions and Divisions-1 Specification sections apply to work of this section.

1.2 SUMMARY

a) Section Includes:

1. Metal ceiling panels
2. Exposed grid suspension system.
3. Wire hangers, fasteners, main runners, cross tees, wall angle moldings and accessories.

b) Related Sections:

1. Section 09 51 23 - Acoustical Tile Ceiling
2. Section 09 21 16 - Gypsum Board Assemblies
3. Section 09 22 16 - Non-Structural Metal Framing

1.3 REFERENCES

a) American Society for Testing and Materials (ASTM):

18. International Code Council-Evaluation Services Report - Seismic Engineer Report

1.4 SUBMITTALS

a) **Shop Drawings**: Provide drawing of DesignFlex Ceiling Pattern Layout including panel type and components used in the assembly of the ceiling. Show locations of items that are to be coordinated with, or supported by the ceilings.

b) **Installation Instructions**: Submit manufacturer's installation instructions as referenced in Part three, Installation.

c) **Samples:** Minimum 3 inch x 5/8 inch samples of specified wood panel; 8 inch long samples of exposed wall molding and suspension system, including main runner and 4 foot cross tees.

d) **Product Data:** Submit manufacturer's technical data for each type of ceiling unit and suspension system required.

e) **Certifications:** Manufacturer's certifications that products comply with specified requirements, including laboratory reports showing compliance with specified tests and standards.

1.5 QUALITY ASSURANCE

a) Single-Source Responsibility: Provide ceiling panel units and grid components by a single manufacturer.

b) Fire Sprinklers: Ceiling systems may obstruct or Skew the planned water distribution pattern of fire sprinkler. In addition to creating a possible delaying or accelerating the activation of the sprinkler of fire detection system. Consult with a fire protection engineer for guidance

c) Fire Performance Characteristics: Identify ceiling components with appropriate markings of applicable testing and inspecting organization.

    1. Surface Burning Characteristics: As follows, tested per ASTM E 84 and complying with ASTM E 1264 for Class A products.

        i. Flame Spread: 25 or less

        ii. Smoke Developed: 50 or less

    2. Underwriter Laboratories Inc. certification and audit program as tested per ASTM E-84 tunnel test.

d) Wind Uplift Performance Characteristics: Identity ceiling components with applicable testing.

    1. Wind Uplift Characteristics: as follows, tested per UL580 with resulting test performance.

        i. Class 30, Class 60 or Class 90 Wind Uplift Classification

e) Fire Sprinklers: Ceiling systems may obstruct or Skew the planned water distribution pattern of fire sprinkler. In addition to creating a possible delaying or accelerating the activation of the sprinkler of fire detection system. Consult with a fire protection engineer for guidance.

f) Coordination of Work: Coordinate ceiling work with installers of related work including, but not limited to building insulation, gypsum board, light fixtures, mechanical systems, electrical systems, and sprinklers.

1.6 DELIVERY, STORAGE, AND HANDLING

a) Deliver acoustical ceiling units to project site in original, unopened packages and store them in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.

b) Before installing acoustical ceiling units, permit them to reach room temperature and a stabilized moisture content.

c) Handle acoustical ceiling units carefully to avoid chipping edges or damaged units in any way.

1.7 PROJECT CONDITIONS

a) Space Enclosure:

    I. HumiGuard Plus Ceilings: Building areas to receive ceilings shall be free of construction dust and debris. Products with HumiGuard Plus performance

and hot dipped galvanized steel, aluminum or stainless steel suspension systems can be installed up to 120°F (49°C) and in spaces before the building is enclosed, where HVAC systems are cycled or not operating. Cannot be used in exterior applications where standing water is present or where moisture will come in direct contact with the ceiling.

1.8 WARRANTY

a) Acoustical Panel: Submit a written warranty executed by the manufacturer, agreeing to repair or replace panels that fail within the warranty period. Failures include, but are not limited to the following:

II. 1. Acoustical Metal Panels: Sagging and warping

III. 2. Grid System: Rusting and manufacturer's defects

b) Warranty Period:

I. Acoustical Linear Metal panel System: One (1) year from date of substantial completion

c) The Warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under the requirements of the Contract Documents.

1.10 MAINTENANCE

a) Extra Materials: Deliver extra materials to Owner. Furnish extra materials described below that match products installed. Packaged with protective covering for storage and identified with appropriate labels.

1. Ceiling Units: Furnish quality of full-size units equal to 2.0 percent of amount installed.

2. Exposed Suspension System Components: Furnish quantity of each exposed suspension component equal to 1.0 percent of amount installed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

a) Basis of Design MetalWorks Linear Systems:

1. Armstrong World Industries, Inc. or approved equal meeting all performance and installation requirements.

b) Suspension Systems:

1. Armstrong World Industries, Inc.

2.2 CEILING UNITS

a) Linear Panels:

1. Surface Texture: Smooth
2. Composition: Metal
3. Colors: See
4. Edge Profile: Square with extended flange 15/16
5. Light Reflectance (LR) White Panel: ASTM E 1477; Unperforated 0.77, Micro Perforated 0.61
6. Perforation Options: Unperforated, Microperforated
7. Acoustical Performance based on Noise Reduction Coefficient ASTM C 423 (NRC)
    i. Microperforated
        1. 0.70 with fleece
        2. 0.85 with Fiberglass Infill
8. Flame Spread: Class A
9. Dimensional Stability: HumiGuard Plus.

b) Accessories: 2.2.1 SUSPENSION SYSTEMS

c) Components: All main beams and cross tees shall be commercial quality hot dipped galvanized steel as per ASTM A653. Main beams and cross tees are double-web steel construction with 9/16 inch type exposed flange design. Exposed surfaces chemically cleansed, capping prefinished galvanized steel in baked polyester paint. Main beams and cross tees shall have rotary stitching.

d) Attachment Devices: Size for five times design load indicated in ASTM C 635, Table 1, Direct Hung unless otherwise indicated.

e) Wire for Hangers and Ties: ASTM A641, Class 1 zinc coating, soft temper, pre-stretched, with a yield stress load of at least times-three design load, but not less than 12 gauge.

f) Accessories/Edge Moldings and Trim:

a. Item: 5574 Carrier Molding
b. 6” Wood Looks Trim – Color:
c. Items Varies: Axiom® Trim

PART 3 - EXECUTION

3.1 EXAMINATION

a) Do not proceed with installation until all wet work such as concrete, terrazzo, plastering and painting has been completed and thoroughly dried out.

b) Proper designs for both supply air and return air, maintenance of the HVAC filters and building interior space are essential to minimize soiling. Before starting the HVAC system, make sure supply air is properly filtered and the building interior is free of construction dust.

3.2 PREPARATION

a) Measure each ceiling area and establish layout of acoustical units to balance border widths at opposite edges of each ceiling. Avoid use of less than half width units at borders, and comply with reflected ceiling plans. Coordinate panel layout with mechanical and electrical fixtures.

3.3 INSTALLATION

a) Install suspension system and panels in compliance with ASTM C636, ASTM E580, with the approval of the authorities having jurisdiction, and in accordance with the manufacturer's MetalWorks Linear Installation Instructions

3.4 ADJUSTING AND CLEANING

a) Replace damaged and broken panels.

b) Clean exposed surfaces of ceilings panels, including trim, edge moldings, and suspension members. Comply with manufacturer's instructions for cleaning and touch up of minor finish damage.

END OF SECTION

SECTION 09 65 13 - RESILIENT BASE AND ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Resilient base.

B. Related Sections:
Division 09 Section09 65 19 "Resilient Tile Flooring" for resilient floor tile.
Division 09 Section 09 68 13 “Tile Carpeting” for tile carpeting

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples for Verification: For each type of product indicated, in manufacturer's standard-size Samples but not less than 12 inches long, of each resilient product color, texture, and pattern required.

C. Product Schedule: Refer to Finish Standards

1.4 QUALITY ASSURANCE

A. Fire-Test-Response Characteristics: As determined by testing identical products according to ASTM E 648 or NFPA 253 by a qualified testing agency.
   a. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store resilient products and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 50 deg F or more than 90 deg F.

1.6 PROJECT CONDITIONS

A. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F or more than 95 deg F in spaces to receive resilient products during the following time periods: 48 hours before installation. During installation.48 hours after installation.

B. Until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg or more than 95 deg F

C. Install resilient products after other finishing operations, including painting, have been completed.

1.7 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

B. Furnish not less than 10 linear feet for every 500 linear feet or fraction thereof, of each type, color, pattern, and size of resilient product installed.

PART 2 - PRODUCTS

2.1 RESILIENT WALL BASE

A. Resilient Wall Base: Manufacturers: Subject to compliance with requirements, provide products by the following:

1. **RB-1 – Mohawk Cove Base**
   a. Basis of Design: Mohawk, Cove Base
   b. Or approved equal

   Design
   Product Type: Rubber
   Gauge: 1/8”
   Size, profile and color" per finish standards in drawings

   Performance
   Composition: Proprietary TP Rubber formulation including pigments, stabilizers, and other functional fillers
   Critical Radiant Flux: ASTM E648 – Class I (> 0.45 W/cm²)
   Fire Resistance: ASTM E84 – Class II (26–75)
   Flame Propagation: UL 992 – < 2.0
   Resilient Wall Base Standard: ASTM F1861 – Conforms

   Service
   Warranties: Limited 10-Year Warranty

2. **RB-2 – Mohawk Straight Base**
   a. Basis of Design: Mohawk, Straight Base
   b. Or approved equal

   Design
   Product Type: Rubber
   Gauge: 1/8”
   Size, profile and color" per finish standards in drawings

   Performance
   Composition: Proprietary TP Rubber formulation including pigments, stabilizers, and other functional fill-

ers
Critical Radiant Flux: ASTM E648 – Class I (> 0.45 W/cm²)
Fire Resistance: ASTM E84 – Class II (26–75)
Flame Propagation: UL 992 – < 2.0
Resilient Wall Base Standard: ASTM F1861 – Conforms

Warranties: Limited 10-Year Warranty

3. **RB-3 – Tarkett Mandalay Base**
a. Basis of Design: Tarkett, Mandalay
b. Or approved equal

Design
Product Type: Rubber
Gauge: 1/8”
Size, profile and color" per finish standards in drawings

Performance
Composition: Proprietary TP Rubber formulation including pigments, stabilizers, and other functional fillers
Critical Radiant Flux: ASTM E648 – Class I (> 0.45 W/cm²)
Fire Resistance: ASTM E84 – Class II (26–75)
Flame Propagation: UL 992 – < 2.0
Resilient Wall Base Standard: ASTM F1861 – Conforms

Warranties: Limited 10-Year Warranty

B. Outside Corners: Job formed for all types
C. Inside Corners: Job formed for all types
D. Color: Per finish standards in drawing

2.2 INSTALLATION MATERIALS

A. Trowelable Leveling and Patching Compounds: Latex-modified, Portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated.

B. Adhesives: Water-resistant type recommended by manufacturer to suit resilient products and substrate conditions indicated. Use adhesives that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
   a. Rubber Floor Adhesives: Not more than 60 g/L.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.

B. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient products.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of resilient products.

B. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth substrate.

C. Do not install resilient products until they are same temperature as the space where they are to be installed.
Move resilient products and installation materials into spaces where they will be installed at least 48 hours in advance of installation.

D. Sweep and vacuum clean substrates to be covered by resilient products immediately before installation.

3.3 RESILIENT BASE INSTALLATION

A. Comply with manufacturer's written instructions for installing resilient base.

B. Apply resilient base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required.

C. Install resilient base in lengths as long as practicable without gaps at seams and with tops of adjacent pieces aligned.

D. Tightly adhere resilient base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.

E. Do not stretch resilient base during installation.

F. Job-Formed Corners:
   a. Outside Corners: Use straight pieces of maximum lengths possible. Form without producing discoloration (whitening) at bends.
   b. Inside Corners: Use straight pieces of maximum lengths possible.

3.4 RESILIENT ACCESSORY INSTALLATION

A. Comply with manufacturer's written instructions for installing resilient accessories.

B. Resilient Molding Accessories: Butt to adjacent materials and tightly adhere to substrates throughout length of each piece. Install reducer strips at edges of carpet and resilient floor covering that would otherwise be exposed.

3.5 CLEANING AND PROTECTION

A. Comply with manufacturer's written instructions for cleaning and protection of resilient products.

B. Perform the following operations immediately after completing resilient product installation:
   a. Remove adhesive and other blemishes from exposed surfaces.
   b. Sweep and vacuum surfaces thoroughly.
   c. Damp-mop surfaces to remove marks and soil.

C. Protect resilient products from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.

D. Cover resilient products until Substantial Completion.

END OF SECTION

SECTION 09 65 19 - RESILIENT TILE FLOORING

PART 1 – GENERAL INFORMATION

1.01 SUMMARY

A. This section deals with resilient flooring found in the drawings and schedules of the contract that meet the requirements of this section.

1.02 RELATED SECTIONS

A. Section 3 – Cement: not covered in this section.

B. Section 6 – Wood and plastic: not covered in this section.

C. Section 7 – Thermal and humidity protection: not covered in this section.

D. Section 9 – Other sections containing information related to floor finishes: not covered in this section.

1.03 REFERENCES (INDUSTRY STANDARDS)

A. ASTM F 710: Practice for Preparing Concrete Floors to Receive Resilient Flooring.

B. ASTM E 648: Test Method for Critical Radiant Flux of Floor Covering Systems Using a Radiant Heat Energy Source.

C. ASTM E 662: Test Method for Specific Optical Density of Smoke Generated by Solid Materials.

D. ASTM F 1869: Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride.

E. ASTM F 2170: Determining Relative Humidity in Concrete Floor Slabs Using in Situ Probes.

1.04 ITEMS TO DELIVER

A. Provide the product's Technical Specifications data sheet as well as all installation and maintenance instructions.

B. When required, supply floor drawings and installation plans.

C. Supply a set of samples measuring at least 3 in. (7.5 cm) by 6 in. (15 cm) of the complete range of colors and finishes chosen for the project.

D. When required, provide Mohawk Group's attestation, certified by an independent laboratory, confirming that the flooring complies with the fire standards of the following tests:

1. ASTM E 648; Critical Radiant Flux: 0.45 watts/cm^2 or more.

2. ASTM E 662; Smoke Density: 450 or less.

E. Provide Mohawk Group's Warranty Certificate.

1.05 QUALITY ASSURANCE

A. Have Mohawk Group flooring installed by an installer qualified in the installation of resilient flooring.

B. In accordance with the technical instructions in the installation instructions, use all accessories recommended by Mohawk Group when installing its flooring.

C. Follow the instructions specified in the most recent version of Mohawk Group's installation instructions.

1.06 DELIVERY, HANDLING, STORAGE

A. Deliver the flooring to the installation site in Mohawk Group's original packaging. Indicate the project name and handling instructions on the outside of the boxes.

B. Advise the carrier of any damaged material and indicate it on the packing slip.

C. Store the flooring inside, sheltered from extreme hot or cold temperatures. Place the material on a smooth level floor or where there is uniform solid support in a clean, dry, well-ventilated area. The long-term storage temperature must be maintained between 65°F (18°C) and 85°F (29°C). Protect adhesive and flooring material from freezing, extreme heat and direct sun exposure.

D. Acclimatize the subfloor, all flooring material and adhesive for 48 hours before, during and after the installation by maintaining the room temperature between 65°F (18°C) and 85°F (29°C). The pallets should be unstacked 24 hours prior to use.

E. Afterwards, maintain the room temperature between 65°F (18°C) and 85°F (29°C). Protect the material from direct sources of heat such as air vents and other types of heaters.

F. Install the flooring after all other finishing work, including painting, has been completed.

PART 2 - PRODUCTS

2.01 MANUFACTURER

Mohawk Group, 160 S. Industrial Blvd, Calhoun GA 30701 Telephone 800.241.4494.
Website: www.mohawkgroup.com
Contact: Vickie Small
504-432-3183
vickie_small@mohawkind.com

Substitutions or Equals:

1. Substitutions are allowed only if they meet the following criteria:

   a. Acceptance of alternate product(s) that are accepted as equals must be approved by parties (including, but not limited to) that have material interest in the specifications including: Designer, Architect, End-User, and Flooring Contractor.

2.02 MATERIALS

DETAILED PRODUCT CONSTRUCTION SPECIFICATIONS

Style Name	**Bolder 2.5mm (C2107)**
Collection	Hot and Heavy II
Product Type	LVT
Overall Thickness	2.5mm
Wear Layer	20 mil (0.5 mm)
Finish	M-Force™ Ultra
Size	18 in X 36 in
Emboss Overall	
Bevel	Straight Edge
Installation & Adhesive	2.5mm Glue Down
Packaging	Flex 2.5mm 12 pcs per carton / 54 sq ft per carton
Sustainability	
Country of Origin	South Korea
Mindful Materials	Participates in Mindful Materials Library
Environmental Product Declaration	Hot and Heavy LVT EPD
Beyond Carbon Neutral	-0.595

Embodied Carbon	11.9 kg CO2e/sq m2
Carbon Handprint	-12.5 kg CO2e/sq m2

Style Name	**Chromascope 2.5 C2113**
Collection	Hot and Heavy II
Product Type	Flexible LVT
Overall Thickness	2.5 mm
Wear Layer	20 mil (0.5 mm)
Finish	M-Force™ Ultra
Surface Profile	Overall
Edge Profile	Squared
Size	18” x 36”
Square Feet Per Carton	54
Pounds Per Carton	46.46
Installation Method	Glue Down
Installation	Monolithic, Brick Ashlar, Vertical Ashlar, Random
Classification	ASTM F1700, Class III, Type B - Embossed
Sustainability	
Embodied Carbon	6.43 kg CO2e/sq m2
MindClick Rating	Achiever

Style Name	**Secoya 2.5 C2103**
Collection	Hot and Heavy II
Product Type	LVT
Overall Thickness	2.5 mm
Wear Layer	20 mil (0.5 mm)
Finish	M-Force™ Ultra
Surface Profile	Embossed
Edge Profile	Micro-Beveled
Size	7” x 48”
Square Feet Per Carton	41.99
Pounds Per Carton	36
Installation Method	Glue Down
Installation	Monolithic, Brick Ashlar, Vertical Ashlar, Random
Classification	ASTM F1700, Class III, Type B - Embossed
Sustainability	
Embodied Carbon	6.43 kg CO2e/sq m2
Beyond Carbon Neutral	-0.3215
MindClick Rating	Achiever

Mohawk’s LVT is not recommended for environments where it could be exposed to oils and greases whether mineral, animal or vegetable.

Refer to the product’s Technical Specifications data sheet for detailed specifications.

Choose from any of Mohawk Group’s complete line of colors (indicate the item number).

All specifications are subject to normal manufacturing tolerances

2.03 ADHESIVE

M99 Adhesive (up to 99% in-situ RH and a pH of 12.0)
M95.0 Adhesive (up to 95% in-situ RH and a pH of 8 - 10.0)
M700 Adhesive (up to 90% in-situ RH and a pH of 7 – 9)
Total Bond Adhesive (100% in-situ RH and pH testing not required)

2.04 OTHER MATERIAL

A. Subfloor repairs: use a good-quality Portland cement-based compound modified with latex that has a minimal resistance to compression of 3500 lbs/sq. in. (246 kg/cm^2). to fill, smooth and/or level subfloor imperfections.

B. Self-levelling underlayment: use a Portland cement-based self-levelling underlayment modified with a polymer that has a minimal resistance to compression of 3500 lbs/sq. in. (246 kg/cm^2).

PART 3 – EXECUTION

3.01 SITE INSPECTION

A. Examine the subfloor before installation to ensure that the surface is clean, dry, smooth, structurally sound and free from foreign substances that may adversely affect adhesion or cause discoloration. Furthermore, ensure that the subfloor is free of paint, varnish, adhesive, oil, grease, solvent and other foreign substances, including treatment compounds, sealers and curing compounds that may adversely affect adhesion or alter the appearance or durability of the resilient flooring.

B. Verify the surface to ensure there is no powder, scaling or mold. If found remove with a mechanical sander and level with a good-quality Portland cement-based self-levelling underlayment modified with a polymer that has a minimal resistance to compression of 3500 lbs/sq. in. (246 kg/cm^2).

C. Slabs that have been either using a curing agent or a sealer will have to be treated to ensure that the adhesion has not been impaired.

D. Do not install on cement slabs that have been subjected to adhesive chemical abatement unless an approved remediation system was used afterwards.

E. Report and rectify all unsatisfactory conditions. Do not start flooring installation until all rectifications have been completed.

3.02 SUBFLOOR PREPARATION

A. Level all rough surfaces and fill cracks and marks with a Portland cement-based patching compound modified with latex.

B. Mechanically remove all surface contaminants such as paint, oil, grease, varnish, adhesive as well as various other products such as treatment compounds.

C. Measure the humidity and pH levels (in situations where pH testing is required) in compliance with the following standards before installation:

1. ASTM F 2170, Relative Humidity (RH) test using in situ probes.
2. ASTM F 710, pH levels (test procedure 5.3.1).
3. The ASTM test frequency recommendation is 3 measures for the first 1,000 sq. ft. (92.9 sq. m) and one measure for each additional 1,000 sq. ft. (92.9 sq. m).

D. Ensure Moisture, Relative Humidity and pH tests have all been conducted and measurements meet manufacturer's recommendations.

E. In case of doubt, test the adhesion on the cement subfloor or other surface that will be covered by the flooring. Do the test using the specified flooring and recommended adhesive.

3.03 RESILIENT FLOORING INSTALLATION

A. Install the flooring according to the latest version of Mohawk Group's installation instructions. Use the tools, adhesives, trowel types and procedures recommended in the instructions.

B. Acclimatize the subfloor, all flooring material and adhesive for 48 hours before, during and after the installation by maintaining the room temperature between 65°F (18°C) and 85°F (29°C). Afterwards, maintain the temperature between 65°F (18°C) and 85°F (29°C).

3.04 CLEANING AND PROTECTION

A. Remove all excess adhesive immediately after installation as recommended in Mohawk Group's installation instructions.

B. Before allowing traffic after installation, consult and follow the recommendations in Mohawk Group's installation instructions.

C. Following installation and cleanup, if the work of all other trades has not yet been completed, protect the flooring by laying sheets of non-staining brown Kraft paper and then a layer of plywood sheets (rolls of non-staining heavy cardboard material could also be used for protection).

D. Follow the instructions in Mohawk Group's Maintenance Instructions when performing initial and regular maintenance procedures.

Please note that technical website documents prevail.

END OF SECTION

SECTION 09 65 66. 13 - RESILIENT SHEET ATHLETIC FLOORING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Homogeneous rubber sheet sports flooring

B. Related Sections include the following:

1. Division 09 Sections for resilient floor coverings installed in areas other than athletic-activity spaces.
2. Division 09 Section "Resilient Base and Accessories" for wall base and accessories installed with floor coverings.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Show installation details and locations of the following:

1. Floor patterns.
2. Layout, colors, widths, and dimensions of game lines.
3. Locations of floor inserts for athletic equipment.
4. Seam locations.

C. Samples for Initial Selection: For each type of floor covering indicated.

1. Game-Line and Marker Paint: Include charts showing available colors and glosses.

D. Samples for Verification: For each type, color, and pattern of floor covering indicated, 6-inch-square Samples of same thickness and material indicated for the Work.

1. Game-Line and Marker-Paint Samples: Include sample sets showing game-line and marker-paint colors applied to floor coverings.
2. Seam Samples: For each sheet floor covering color and pattern required; with seam running lengthwise and in center of 6-by-9-inch Sample applied to a rigid backing and prepared by Installer for this Project.

E. Qualification Data: For homogenous sheet sports floor covering Installer.

F. Maintenance Data: For floor coverings to include in maintenance manuals.

1.4 QUALITY ASSURANCE

A. Sheet Installer Qualifications: An experienced installer who has completed sheet vinyl floor covering. installations using seaming methods indicated for this Project and similar in material, design, and extent to that indicated for this Project, who is acceptable to manufacturer, and whose work has resulted in installations with a record of successful in-service performance.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storing.

B. Store materials to prevent deterioration. Store rolls upright.

1.6 PROJECT CONDITIONS

A. Adhesively Applied Products:

1. Maintain temperatures within range recommended in writing by manufacturer, but not less than 70 deg F or more than 95 deg F, in spaces to receive floor coverings during the following time periods:

    a. 48 hours before installation, unless longer period is recommended in writing by manufacturer.
    b. During installation.
    c. 48 hours after installation, unless longer period is recommended in writing by manufacturer.

2. After postinstallation period, maintain temperatures within range recommended in writing by manufacturer, but not less than 55 deg F or more than 95 deg F.
3. Close spaces to traffic during floor covering installation.
4. Close spaces to traffic for 48 hours after floor covering installation, unless manufacturer recommends longer period in writing.

B. Install floor coverings after other finishing operations, including painting, have been completed.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Sheet Floor Coverings: Furnish full-width rolls of not less than 10 linear feet for each 500 linear feet or fraction thereof, of each type, color, and pattern of floor covering installed.

PART 2 - PRODUCTS

2.1 HOMOGENOUS SHEET SPORTS FLOORING

A. Basis of Design **Gerflor / Taraflex Sports Flooring** or approved equal.

B. Homogeneous sheet sports floor Covering with Backing: ASTM F 1303

1. Type (Binder Content): I, minimum binder content of 90 percent.
2. Wear-Layer Thickness: Grade 1.
3. Overall Thickness: 0.1 inches.
4. Interlayer Material: Foamed plastic.
5. Backing Class: Class B (nonfoamed plastic).

C. Installation Method: Adhered.

D. Seaming Method: Heat welded.

E. Traffic-Surface Texture: Smooth.

F. Applied Finish: Field-applied polyurethane.

G. Roll Size: Not less than 48 inches (1219 mm) wide by longest length that is practical to minimize splicing during installation.

H. Color and Pattern: As selected by Architect from manufacturer's full range.

I. Accessories:

1. Trowelable Leveling and Patching Compound: Latex-modified, hydraulic-cement-based formulation approved by floor covering manufacturer.
2. Adhesives: Water-resistant type recommended in writing by manufacturer for substrate and conditions indicated.

    a. Use adhesives that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

3. Heat-Welding Bead: Solid-strand product of floor covering manufacturer matching field color of floor.
4. Game-Line and Marker Paint: Complete system including primer, if any, compatible with floor covering and recommended in writing by floor covering and paint manufacturers for use indicated.

    a. VOC content: Provide products with VOC content not more than 150 g/L when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, with Installer present, for compliance with requirements for installation tolerances, moisture content, and other conditions affecting performance.

1. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient products.
2. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare substrates according to manufacturer's written recommendations to ensure adhesion of floor coverings.

B. Concrete Substrates: Prepare according to ASTM F 710.

1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
2. Alkalinity and Adhesion Testing: Perform tests recommended in writing by manufacturer. Proceed with installation only after substrates pass testing.
3. Moisture Testing:

    a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. in 24 hours.

        1) Perform tests so that each test area does not exceed 200 sq. ft. and perform not less than 2 tests in each installation area and with test areas evenly spaced in installation areas.

    b. Perform tests recommended in writing by manufacturer. Proceed with installation only after substrates pass testing.

C. Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended in writing by manufacturer. Do not use solvents.

D. Use trowelable leveling and patching compound to fill cracks, holes, and depressions in substrates.

E. Move floor coverings and installation materials into spaces where they will be installed at least 48 hours in advance of installation, unless manufacturer recommends a longer period in writing.

1. Do not install floor coverings until they are same temperature as space where they are to be installed.

F. Sweep and vacuum clean substrates to be covered by floor coverings immediately before installation. After cleaning, examine substrates for moisture, alkaline salts, carbonation, and dust. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 FLOOR COVERING INSTALLATION, GENERAL

A. Comply with manufacturer's written installation instructions.

B. Scribe, cut, and fit floor coverings to butt neatly and tightly to vertical surfaces, equipment anchors, floor outlets, and other interruptions of floor surface.

C. Extend floor coverings into toe spaces, door reveals, closets, and similar openings, unless otherwise indicated.

D. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating subfloor markings on floor coverings. Use nonpermanent, nonstaining marking device.

E. Adhere products to substrates using a full spread of adhesive applied to substrate to comply with adhesive and floor covering manufacturers' written instructions, including those for trowel notching, adhesive mixing, and adhesive open and working times.

1. Provide completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.

3.4 SHEET FLOOR COVERING INSTALLATION

A. Unroll sheet floor coverings and allow them to stabilize before cutting and fitting. Contractor to discard any portion of rolls which do not stabilize and remain deformed from rolling.

B. Lay out sheet floor coverings as follows:

1. Maintain uniformity of floor covering direction.
2. Minimize number of seams; place seams in inconspicuous and low-traffic areas.
3. Match edges of floor coverings for color shading at seams.
4. Avoid cross seams.

C. Seams: Prepare and finish seams to produce surfaces flush with adjoining floor covering surfaces.

1. Heat-Welded Seams: Comply with ASTM F 1516. Rout joints and use welding bead to permanently fuse sections into a seamless floor covering.

3.5 GAME LINES AND MARKERS

A. Mask floor coverings at game lines and markers, and apply paint to produce sharp edges.

1. Where cross, break minor game line at intersection; do not overlap lines.
2. Apply game lines and markers in widths and colors according to requirements indicated on Drawings.

3.6 FIELD-APPLIED FINISHES

A. Apply finish after game-line and marker paint is fully cured.

B. Apply finish according to manufacturer's written instructions to produce a sealed surface that is ready for use.

C. Do not cover floor coverings after finishing until finish reaches full cure.

3.7 CLEANING AND PROTECTING

A. Perform the following operations immediately after completing floor covering installation:

1. Remove adhesive and other blemishes from floor covering surfaces.
2. Sweep and vacuum floor coverings thoroughly.
3. Damp-mop floor coverings to remove marks and soil.

a. Do not wash floor coverings until after time period recommended in writing by manufacturer.

B. Protect floor coverings from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period. Use protection methods recommended in writing by manufacturer.

1. Do not move heavy and sharp objects directly over floor coverings. Protect floor coverings with plywood or hardboard panels to prevent damage from storing or moving objects over floor coverings.

END OF SECTION 09 65 66.13

SECTION 09 65 66.16 – POURED RESILIENT ATHLETIC FLOORING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Seamless, poured-in-place polyurethane athletic flooring system installed over a resilient rubber base mat.
2. Game-line and marking paint system.

B. Related Sections include the following:

1. Division 03 Sections for concrete substrates, tolerances, and moisture control.
2. Division 09 Section "Resilient Base and Accessories" for wall base and accessories installed with athletic flooring.
3. Division 09 Section “Painting” for striping or painting outside of athletic flooring areas.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.
B. Shop Drawings: Show installation details and locations of the following:

1. Floor patterns.
2. Layout, colors, widths, and dimensions of game lines.
3. Locations of floor inserts for athletic equipment.
4. Transition and termination details.

C. Samples for Initial Selection:

1. For each type of flooring system indicated.
2. Game-Line and Marker Paint: Include charts showing available colors and glosses.

D. Samples for Verification:

1. For each type, color, and texture of flooring system indicated, 6-inch-square samples of same thickness and composition indicated for the Work.

2. Game-Line and Marker-Paint Samples: Include sample sets showing game-line and marker-paint colors applied to flooring material.

E. Qualification Data: For manufacturer and installer.
F. Maintenance Data: For flooring systems to include in maintenance manuals.
G. Warranty Documentation: Manufacturer's and installer's warranties.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: Manufacturer with not less than 10 years' experience producing poured polyurethane athletic flooring systems.
B. Installer Qualifications: An experienced installer approved and trained by manufacturer for installation of system type indicated.
C. Mockups: Provide a minimum 100 sq. ft. sample area of the specified system for review of finish, color, and game-line marking. Approved mockup may remain as part of completed Work.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name, product identification, and directions for storage and handling.
B. Store materials to prevent deterioration. Store indoors, elevated off the floor, in dry, well-ventilated conditions.

1.6 PROJECT CONDITIONS

A. Environmental Requirements:

1. Maintain ambient and substrate temperatures between 65 and 85 deg F and relative humidity below 75 percent during installation and for not less than 48 hours before and after installation, unless otherwise recommended by manufacturer.
2. Provide adequate ventilation during installation and curing periods.
3. Do not install materials until spaces are enclosed, dry, and conditioned to the proper environmental range.
4. Close spaces to traffic during installation and for at least 48 hours after completion, or longer as recommended by manufacturer.
   B. Substrate Conditions:
5. Verify concrete substrate meets ASTM F710 requirements.
6. Moisture vapor emission rate: Maximum 3 lbs/1000 sq. ft./24 hours per ASTM F1869.
7. Relative humidity in concrete: Maximum 75 percent per ASTM F2170.
8. Substrate pH: Maximum 9.
   C. Slab Depression: **9 mm (3/8 inch)** below adjacent finished floor elevations to accommodate full system thickness.

1.7 EXTRA MATERIALS

A. Furnish extra materials before installation begins, packaged with protective covering for storage and identified with labels describing contents.

1. Flooring Repair Material: Sufficient to cover minimum 100 sq. ft. of each color and texture used.
2. Game-Line Paint: One quart of each color used.

1.8 WARRANTY

A. Manufacturer's Warranty: Provide Robbins standard 5-year system warranty covering defects in materials and workmanship.
B. Installer's Warranty: Provide one-year warranty for installation workmanship.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Basis-of-Design Product: **Pulastic® Multisport Classic 110** by Robbins Sports Surfaces.
B. Substitutions: In accordance with Division 01 requirements.

2.2 SYSTEM DESCRIPTION

A. Poured, seamless polyurethane athletic flooring system consisting of the following layers:

1. Base Mat: Prefabricated, recycled rubber mat, nominal 6 mm thick.
2. Pore Sealer: Polyurethane primer/sealer for base mat.
3. Wear Layer: Two-component polyurethane self-leveling coat, nominal 2 mm thick.
4. Topcoat: Pigmented, wear-resistant polyurethane finish.
5. Game-Line Paint: Compatible polyurethane-based marking paint.
6. Total System Thickness: Approximately 9 to 11 mm.

2.3 PERFORMANCE REQUIREMENTS

A. System shall meet or exceed the following standards:

1. Shock Absorption: 25–35% (EN 14808).
2. Ball Rebound: ≥98% (EN 12235).
3. Vertical Deformation: ≤2.3 mm (EN 14809).

4. Resistance to Indentation: ≤0.5 mm (EN 1516).
5. Slip Resistance: 80–110 Pendulum Value (EN 13036-4).
6. Fire Resistance: ASTM E648, Class 1.
7. VOC Content: ≤100 g/L per 40 CFR 59 Subpart D.

2.4 ACCESSORIES

A. Trowelable Leveling and Patching Compound: Latex-modified, hydraulic-cement-based formulation approved by flooring manufacturer.
B. Game-Line and Marker Paint: Polyurethane system compatible with flooring materials.
C. Maintenance Coating: As recommended by manufacturer.

2.5 COLOR AND FINISH

A. Color and Texture: As selected by Architect from manufacturer's full range.
B. Game-Line Colors: As indicated on Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, with Installer present, for compliance with requirements for installation tolerances, moisture content, and other conditions affecting performance.
B. Verify that substrates are free of cracks, ridges, depressions, and foreign deposits that might interfere with adhesion.
C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare substrates according to manufacturer's written recommendations to ensure adhesion of poured polyurethane system.
B. Mechanically prepare concrete surface to remove laitance, sealers, and contaminants.
C. Verify substrate moisture and pH levels meet requirements before installation.
D. Fill cracks, holes, and depressions with approved leveling compound.
E. Vacuum clean prepared substrate to remove all dust and debris immediately before installation.

3.3 INSTALLATION

A. Comply with manufacturer's written installation instructions and approved mockup.
B. Apply primer, base mat, pore sealer, wear coat, and topcoat in sequence and thicknesses recommended by manufacturer.

C. Maintain uniform color, texture, and thickness across floor area.
D. Provide seamless surface, free of ridges, voids, or imperfections.

3.4 GAME LINES AND MARKINGS

A. Mask flooring and apply game-line paint after surface has fully cured.
B. Apply lines and markers in widths and colors indicated on Drawings.
C. Apply paint evenly to produce sharp, clean edges.

3.5 FIELD-APPLIED FINISHES

A. Apply any required finish or protective coat per manufacturer's instructions.
B. Allow full cure before exposing floor to traffic or further finishing operations.

3.6 CLEANING AND PROTECTING

A. Immediately after installation, remove all excess materials and clean surfaces per manufacturer's written recommendations.
B. Protect flooring from construction traffic, moisture, and contaminants for minimum seven (7) days or until full cure has been achieved.
C. Do not move heavy or sharp objects directly over flooring. Use protective panels as required.

END OF SECTION 09 65 66.16

SECTION 09 66 23 - EPOXY TERRAZZO

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Epoxy terrazzo with divider and accessory strips.

1.02 DEFINITIONS

A. NTMA: National Terrazzo and Mosaic Association, Inc.

1.03 PREINSTALLATION MEETINGS

A. Pre installation Conference: The General Contractor shall conduct a conference at project site before Terrazzo Contractor begins installation.

1. The General Contractor shall invite Terrazzo Contractor, the Architect and representatives of the Owner.
2. Review methods and procedures related to terrazzo including, but not limited to, the following:

a. Inspect and discuss condition of substrate and other preparatory work performed by other trades.

b. Review and finalize construction schedule and verify availability of materials, installer's personnel, equipment and facilities needed to make progress and avoid delays.

c. Review terrazzo mixes and patterns.

d. Review custom terrazzo mixes, designs and patterns.

e. Coordination with the work of other installers.

1.04 ACTION SUBMITTALS

A. Product Data: Terrazzo Contractor shall submit Product Data for each type of product required for installation including:

1. Strip materials.
2. Sealer.
3. Epoxy resins

B. Shop Drawings: Terrazzo Contractor shall prepare and submit Shop Drawings that include plans, elevations, sections, component details and attachments to other work. Include terrazzo installation requirements. Show layout of the following:

1. Divider strips.
2. Expansion joint strips.
3. Terrazzo patterns.

C. Samples for Verification: Terrazzo Contractor shall prepare and submit samples for each type, material, color and pattern of terrazzo and accessory required showing the full range of color, texture and pattern variations expected.

1. Terrazzo: Minimum of 3 pieces each of Architect selected 4 inch by 4 inch samples
2. Accessories: 6 inch long Samples of each type and kind of exposed strip item required

1.05 INFORMATIONAL SUBMITTALS

A. Qualification Data: Terrazzo Contractor shall submit two copies of qualification data.

1. Include letter from NTMA with the name of the Project and name of member, stating current member status.

B. Material Certificates:

1. Epoxy Resin: For each type of resin required indicating that materials meet specification requirements, by manufacturer.
2. Aggregate: For each type of aggregate required indicating compatibility with terrazzo mix, signed by aggregate supplier.

1.06 CLOSEOUT SUBMITTALS

A. Maintenance Literature: Terrazzo Contractor shall submit two copies of maintenance recommendations from NTMA.

1.07 QUALITY ASSURANCE

A. Acceptable Epoxy Resin Manufacturer: An Associate Member of the NTMA, experienced in manufacturing epoxy resin in accordance with NTMA standards and with a record of successful in-service performance, as well as sufficient production capacity to produce required materials.

B. Acceptable Terrazzo Contractor: A Contractor Member of NTMA whose work has resulted in construction with a record of successful in-service performance.

1. Installer shall have completed terrazzo installations within the past 5 years of scale and complexity similar to the proposed installation.

C. Source Limitations for Aggregates: Terrazzo Contractor shall obtain each color, grade, type and variety of granular materials from sources with resources to provide materials of consistent quality in appearance and physical properties.

D. Mockups: Terrazzo Contractor shall construct mockup if required in bid or scope of work documents to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Build mockup as indicated on Drawings.
2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.08 DELIVERY, STORAGE AND HANDLING

A. Materials shall be delivered to Project site in supplier's original wrappings and containers, labeled with source or manufacturer's name, material or product brand name, and lot number if any.

B. Materials shall be stored in their original, undamaged packages and containers, in a location where they will not be exposed to direct sunlight.

1. Epoxy components shall be stored in a space where the ambient temperature can be maintained 60 and 90 deg. F before use.

1.09 PROJECT CONDITIONS

A. General Contractor shall provide sufficient water, temporary heat and light, and adequate electric power with suitable outlets connected and distributed for use within 100 feet of any working space.

B. General Contractor shall provide temporary enclosures and other suitable methods to protect adjacent spaces from damage during installation.

1. Maintain ambient temperatures in the area to receive terrazzo at not less than 60 deg. F.
2. Maintain adequate ventilation in the area to receive terrazzo.

C. Terrazzo Contractor shall protect other adjacent work from water and dust generated by grinding operations.

1.10 GUARANTEE

A. One year from date of substantial completion of terrazzo installation.

PART 2 - PRODUCTS

2.01 PERFORMANCE

A. Basis of Design: Barclay or approved equal.

B. Epoxy Resin:

1. Test Specimens: Mix resin materials according to manufacturer's recommendation without aggregate added and cure for 7 days at 75 degrees plus or minus 2 deg. F and 50 percent plus / minus 2 percent relative humidity.

2. Cured test specimens shall meet or exceed the following requirements:

a. Hardness: 60 to 85 per ASTM D 2240, Shore D.

b. Minimum Tensile Strength: 3000 psi per ASTM D 638 for a 2-inch specimen made using a “C” die per ASTM D 412.

c. Minimum Compressive Strength: 10,000 psi per ASTM D 695, Specimen B cylinder.

d. Chemical Resistance: No deleterious effects by contaminants listed below after seven-day immersion at room temperature per ASTM D 1308.

1) Distilled Water.

2) Mineral Water.

3) Isopropanol.

4) Ethanol.

5) Soap solution at 1 percent.

6) Sodium hydroxide at 10 percent solution.

7) Hydrochloric acid at 10 percent solution.

8) Hydrochloric acid at 30 percent solution.

9) Detergent Solution at 0.025.

10) Acetic Acid at 5 percent solution.

C. Epoxy Resin with Aggregate:

1. Test Specimens:

a. Mix epoxy resin according to manufacturer's recommendations and blend one volume of epoxy resin with 3 volumes of marble aggregate, consisting of

Barclay KR202295: Glass #0 30%, GA White #1 30%, MOP #1 40%

Barclay KR2022102: Glass #0 15%, Glass #1 15%, MOP #1 10%, Pure White #1 60%

b. Grind and grout with epoxy resin finished to a nominal 1/4 inch thickness.

c. Cure specimens 7 days at 75 deg. F plus / minus 2 deg. and 50 percent plus / minus 2 percent relative humidity.

2. Cured epoxy terrazzo specimens shall nominally meet the following requirements:

a. Flammability: Self- extinguishing, extent of burning 1/4 inch maximum according to ASTM D 635.

b. Coefficient of Linear Thermal Expansion: 0.000025 inch/inch per degree F per ASTM C531.

D. Bond Strength of Epoxy Terrazzo: 300 lb. failure according to field test method for surface soundness and adhesion as described in ACI Committee No. 403 Bulletin.

2.02 MATERIALS

A. Epoxy Resin Matrix: Two-component, high solids product complying with specified performance requirements.

1. Color: To be selected by architect from full range.

B. Primer: As recommended, manufactured and supplied by epoxy resin manufacturer.

C. Aggregates: Domestic marble chips.

1. Comply with NTMA gradation standards.
2. Abrasion and Impact Resistance: Loss of 40 percent or less when tested according to ASTM C 131 (LA Abrasion).
3. Aggregates shall contain no deleterious or foreign matter.

D. Divider Strips:

1. Material: Aluminum.
2. Strip Thickness: 1/8 inch.
3. Type: “L” strip: 3/8 inch by 1/8 inch.

2.03 MISCELLANEOUS ACCESSORIES

A. Sealer: Terrazzo Contractor shall provide a non-ambering, clear sealer that is chemically neutral; does not impair terrazzo aesthetics or physical properties; is recommended by terrazzo matrix manufacturer. Sealers shall comply with the following:

1. Comply with requirements of authorities having jurisdiction.
2. Water Based Sealer Properties: With pH factor between 7 and 10.

B. Moisture Mitigation: Two-component, high solids, moisture tolerant, high density, low odor, epoxy-based product produced by epoxy terrazzo resin manufacturer specifically recommended to reduce alkalinity levels and moisture emission to not more than 3 lbs/ per 1000 sq. ft per 24 hours.

C. Crack Suppression/Isolation Membrane: As recommended, produced and supplied by approved terrazzo resin formulator, having minimum 120 percent elongation potential per ASTM D 412. Include for 5% coverage of all epoxy terrazzo flooring areas.

2.04 MIXES

A. Terrazzo Selection: Terrazzo Contractor shall provide standard terrazzo mix(es) according to the following:

1. Custom Mix Color and Pattern: Match Architect's samples

B. Proportions for Epoxy Terrazzo Topping: Comply with resin supplier's recommendations.

C. Mixing of Terrazzo Topping: Mix epoxy components with aggregates in accordance with manufacturer's recommendations.

PART 3 - EXECUTION

3.01 EXAMINATION

A. The General Contractor and Architect shall examine substrates and areas, with Terrazzo Contractor present, for compliance with requirements for installation tolerances and other conditions affecting performance of the work.

1. Slab Flatness Tolerance: Subfloor is not to vary more than 1/4 inch from true plane in a 10 foot span.
2. Cracks: Locate cracks and joints in concrete substrates. Verify location of control joints and expansion joints in epoxy terrazzo flooring.

a. If required to prevent cracks in concrete substrates transmitting through epoxy terrazzo flooring, the Terrazzo Contractor shall make a written recommendation to install a crack suppression membrane and include specific recommendations on type and location.

B. Verify that concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to epoxy resin manufacturer's written instructions.

1. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.

2. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with application of resinous flooring only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. of slab area in 24 hours.

3. If required to prevent moisture vapor transmission in concrete substrates, the Terrazzo Contractor shall make a written recommendation to install moisture mitigation materials and include specific recommendations on type and location.

C. The General Contractor shall be responsible for correcting non-conforming concrete substrates using materials compatible with epoxy terrazzo flooring system and as approved by the Terrazzo Contractor.

1. Materials used to correct nonconforming conditions must be compatible with the selected epoxy system and be approved by the manufacturer of epoxy resin materials and Terrazzo Contractor.

D. Terrazzo Contractor shall proceed with installation only after unsatisfactory conditions; including levelness tolerances, cracking, and excessive moisture vapor transmission have been corrected.

3.02 PREPARATION

A. General Contractor shall broom clean area to receive terrazzo to remove loose chips and all foreign matter.

B. Terrazzo Contractor shall mechanically abrade concrete surface.

C. Terrazzo Contractor shall provide moisture mitigation materials according to instructions and recommendations of moisture mitigation materials manufacturer. Cost for moisture mitigation materials and installation shall be included in the original bid submission.

D. Terrazzo Contractor shall provide flexible epoxy crack isolation/suppression membrane: Cost for materials and installation for installation over not more than five percent of the floor area receiving epoxy terrazzo shall be included in the Base Bid. Cost for additional materials and installation shall be an additional cost to the Owner or General Contractor under an approved Change Order.

3.03 POURED-IN-PLACE TERRAZZO INSTALLATION

A. Strip Materials: Terrazzo Contractor shall install strip materials as follows:

1. Divider and Control-Joint Strips:

    a. Locate divider strips in locations indicated.

    b. Install control joint strips back to back in locations indicated.

    c. Install strips in epoxy adhesive without voids below strips.

B. Placing Terrazzo:

1. Prime subfloor in accordance with manufacturer's recommendations.

2. Proportion and thoroughly blend the materials.

3. Place mixture to achieve specified thickness.

C. Finishing: Terrazzo Contractor shall finish the terrazzo topping as follows:

1. Rough Grinding:

   a. Grind with 24 or finer grit stones or with comparable diamond abrasives.

   b. Follow initial grind with 80 grit stones or with comparable diamond abrasives.

2. Grouting:

   a. Clean terrazzo with clean water and rinse. Allow to dry.

   b. Apply epoxy grout per manufacturer's instructions.

   c. Allow grout to cure.

3. Fine Grinding/Polishing: Grind with 150 grit stones or with comparable diamond abrasives until all grout is removed from surface. Final polish should be a 200 grit finish.

D. Terrazzo Cleaning: Terrazzo Contractor shall clean finished terrazzo as follows:

1. Remove grinding residue from terrazzo surface.

2. Wash terrazzo surfaces immediately after final grinding of terrazzo flooring with water and allow surfaces to dry thoroughly.

E. Sealing: Terrazzo Contractor shall seal terrazzo according to sealer manufacturer’s written instructions.

3.04 REPAIR

A. Terrazzo Contractor shall repair terrazzo areas that evidence lack of bond between topping and underbed according to NTMA’s written recommendations.

3.05 PROTECTION

A. After application of the sealer, the Work shall be ready for final inspection and acceptance by the Owner or his agent.

B. The General Contractor shall protect the finished floor after the Terrazzo Contractor has completed final grinding and applied sealer to terrazzo surfaces.

END OF SECTION

SECTION 09 68 13 – CARPET TILE

PART 1 – GENERAL INFORMATION

1.01 SECTION INCLUDES:

Manufacturers
Testing Protocols
Performance Requirements
Product Specifications
Warranties
Exclusions
Installation
Maintenance
Accessories

1.02 REFERENCES (INDUSTRY STANDARDS)

A. American Association of Textile Chemists and Colorists (AATCC):

1. AATCC 16 – Test Method for Colorfastness to Light
2. AATCC 107 – Test Method for Colorfastness to Water
3. AATCC 129 – Test Method for Colorfastness to Ozone in the Atmosphere under High Humidity.
4. AATCC 134 – Test Method for Electrostatic Propensity of Carpets.
5. AATCC 165 – Test Method for Colorfastness to Crocking: Carpets – AATCC Crock Meter Method
6. AATCC 175 – Test Method for stain Resistance: Pile Floor Coverings

B. American Society for Testing and Materials (ASTM):

1. ASTM D418 – Methods for Testing Pile Yarn Floor Covering Construction
2. (Finished Pile Thickness only)
3. ASTM E648 – Test Method for Critical Radiant Flux of Floor Covering Systems
4. ASTM E662 – Test Method for Specific Optical Density of Smoke

C. International Standards Organization (ISO):

1. ISO 2551 – Test Method for Dimensional Stability (Aachen Test)

D. Carpet and Rug Institute (CRI):

1. CRI Indoor Air Quality Testing and Labeling Program

1.03 ITEMS TO DELIVER

A. Provide the product's Technical Specifications data sheet as well as all installation and maintenance instructions.

B. When required, supply floor drawings and installation plans.

C. Supply a set of samples

1. Submit standard-size carpet tile samples of each type of carpet, in each specified pattern, color and construction.
2. Any alternates to specified products must be submitted for approval by a representative of the end user or architect/design firm at least ten (10) working days prior to bid or proposal.
    a. Submit two (2) sets of samples for each carpet type.
    b. No carpet shipments are permitted until acceptance of final samples is given by representative of the end user or architect/design firm, certifying that samples are the approved color, pattern and texture.
3. Custom Color only
    a. A representative of the end user or architect/design firm, certifying that the samples are the approved color, pattern, and texture, shall sign high quality color samples.
    b. Samples submitted are assumed to be the manufacturer's best obtainable match to the color described under Materials Section.
    c. Must have federally registered Branded trademark.

D. When required, provide Mohawk Group's attestation, certified by an independent laboratory, confirming that the flooring complies with the fire standards of the following tests:

1.	Radiant Panel: ASTM E648:	>.45 watts/sq. cm: Class 1
2.	Smoke Density: ASTM E662:	450 Flaming Mode - Maximum
3.	Static Generation: AATCC 134:	3.5 KV - Maximum
4.	Lightfastness: AATCC 16E:	Min 4.0 at 40 hrs.
5.	Crocking: AATCC 165:	4.0 – Wet/Dry
6.	Cold Water Bleed: AATCC 107:	3.0 - Minimum
7.	Ozone Fade: AATCC 129:	3.0 - Minimum
8.	Soil Protection: AATCC 189:	500 PPM Min.
9.	CRI Green Label Plus Air Quality Certification:	Pass
10.	CRI Appearance Retention Rating	3.0 minimum – Heavy Traffic 3.5 minimum – Severe Traffic
11.	Aachen Test: ISO 2551	Less than .15% shrinkage or growth

12. Stain protection: AATCC 175: Equal to or greater than 8.0 on Red 40 stain test with 100 revolutions of the Taber Abrader (1,000 gram weight per H-18 wheel) then stain test in the abraded area.

Special Performance Requirements

1. Must have Soil and Stain Resist treatment
2. Fiber must have modified delta cross-section w/hollow core
3. Must be at least 24 dpf fiber
4. Must pass GSA requirements for permanent stain resistant carpet
5. Backing must pass British Spill Test and 10,000 Impact Test

E. Provide manufacturer's lifetime warranties for:

1. Wear
2. Static
3. Edge Ravel
4. Zippering
5. Delamination
6. Dimensional Stability
7. Supplemental Fiber Warranties:
    a. Lifetime Stain Warranty
    b. Lifetime Warranty against color transfer wet or dry
    c. Lifetime Warranty against wet fastness
    d. 10 Year Colorfastness to Light

e. 10 Year Colorfastness to Atmospheric contaminants

1.04 QUALITY ASSURANCE

A. Have Mohawk Group flooring installed by an installer qualified in the installation of specified flooring.

B. In accordance with the technical instructions in the installation instructions, use all accessories recommended by Mohawk Group when installing its flooring.

C. Follow the instructions specified in the most recent version of Mohawk Group's installation instructions.

D. Corporate Social Responsibility
Corporate social responsibility requirements: Manufacturer shall meet the corporate social responsibility as outlined below.

1. GRI Reporting: Manufacturer to have a corporate sustainability report (CSR) as per the GRI G4 guidelines.
2. Health and Wellness: Manufacturer to have on-site health clinics and biometric screenings, or health facilities displaying commitment towards health and wellness.
3. United Nations Sustainable Development Goals (UN SDGs):
Manufacturer must identify and commit to at least part of the UN SDGs as applicable to their organization and industry.
   a. Facility certifications: Product's manufacturing facility shall be ISO 9001 certified. Manufacturer to have at least one green building certification for their own facilities – LEED, Living Building Challenge or WELL Building Standard.

1.05 DELIVERY, HANDLING, STORAGE

A. Deliver the flooring to the installation site in Mohawk Group's original packaging. Indicate the project name and handling instructions on the outside of the boxes.

B. Advise the carrier of any damaged material and indicate it on the packing slip.

C. Store the flooring inside, sheltered from extreme hot or cold temperatures. Place the material on a smooth level floor or where there is uniform solid support in a clean, dry well-ventilated area. Unstack the pallets. The long-term storage temperature must be maintained between 65°F (18°C) and 85°F (29°C). Protect adhesive and flooring material from freezing, extreme heat and direct sun exposure.

D. Acclimatize the subfloor, all flooring material and adhesive for 48 hours before, during and after the installation by maintaining the room temperature between 65°F (18°C) and 85°F (29°C). The pallets should be unstacked 24 hours prior to use.

E. Afterwards, maintain the room temperature between 65°F (18°C) and 85°F (29°C). Protect the material from direct sources of heat such as air vents and other types of heaters.

F. Install the flooring after all other finishing work, including painting, have been completed.

2.02 CARPET TILE CONSTRUCTION

A. Characteristics

Style Name:	**Urban Field II GT446**
Collection:	Nutopia 2
Product Type:	Carpet Tile

Construction:	Tufted
Surface Texture:	Textured Patterned Loop
Gauge:	1/12” (47.00 rows per 10 cm)
Density:	8280
Stitches per Inch:	28.5 (112.2 per 10 cm)
Finished Pile Thickness:	.100” (2.54 mm)
Dye Method:	Solution Dyed
Backing Material:	EcoFlex NXT
Fiber Type:	Duracolor® Tricor Premium Nylon
Face Weight:	24.00 oz per sq. yd. (814 g/m2)
Size:	12” x 36”
Soil Release Technology:	EcoSentry Soil Protection
Installation Method:	Basket Weave, Brick Ashlar, Half Lap, Herringbone, Plank Half Lap,
Indoor Air Quality:	CRI Green Label Plus GLP 1171
Foot Traffic Recommendation TARR:	Severe
NSF 140	EcoFlex NXT - NSF 140 Gold

Style Name:	**Urban Fringe II GT445**
Collection:	Nutopia 2
Product Type:	Carpet Tile
Construction:	Tufted
Surface Texture:	Textured Patterned Loop
Gauge:	1/12” (47.00 rows per 10 cm)
Density:	7527
Stitches per Inch:	31.5 (124.02 per 10 cm)
Finished Pile Thickness:	.117” (2.97 mm)
Dye Method:	Solution Dyed
Backing Material:	EcoFlex NXT
Fiber Type:	Duracolor® Tricor Premium Nylon
Face Weight:	23.00 oz per sq. yd. (780 g/m2)
Size:	12” x 36”
Soil Release Technology:	EcoSentry Soil Protection
Installation Method:	Basket Weave, Brick Ashlar, Half Lap, Herringbone, Plank Half Lap,
Indoor Air Quality:	CRI Green Label Plus GLP 1171
Foot Traffic Recommendation TARR:	Severe
NSF 140	EcoFlex NXT - NSF 140 Gold

Style Name:	**Urban Passage II GT444**
Collection:	Nutopia 2
Product Type:	Carpet Tile
Construction:	Tufted
Surface Texture:	Textured Patterned Loop
Gauge:	1/12” (47.00 rows per 10 cm)
Density:	8280
Stitches per Inch:	30 (118.11 per 10 cm)
Finished Pile Thickness:	.120” (3.05 mm)
Dye Method:	Solution Dyed
Backing Material:	EcoFlex NXT
Fiber Type:	Duracolor® Tricor Premium Nylon
Face Weight:	23.00 oz per sq. yd. (780 g/m2)
Size:	12” x 36”
Soil Release Technology:	EcoSentry Soil Protection
Installation Method:	Basket Weave, Brick Ashlar, Half Lap, Herringbone, Plank Half Lap,

Indoor Air Quality:	CRI Green Label Plus GLP 1171
Foot Traffic Recommendation TARR:	Severe
NSF 140	EcoFlex NXT - NSF 140 Gold

Refer to the product's Technical Specifications data sheet for detailed specifications.

Choose from any of Mohawk Group's complete line of colors (indicate the item number).

This product was manufactured in a factory that has ISO 9001 and ISO 14001 certifications.

Made in the United States.

All specifications are subject to normal manufacturing tolerances

2.03 ADHESIVE

Mohawk Group requires the use of the following adhesives to maintain the product warranty:

EnPress Adhesive (up to 95% in-situ RH and a pH of 12.0)

FlexLok Tabs (No moisture testing is required, provided no signs of visual moisture is present and existing adhesive has been reduced to a minimal residue.)

2.04 OTHER MATERIAL

A. Subfloor repairs: use a good-quality Portland cement-based compound modified with latex that has a minimal resistance to compression of 3500 lbs/sq. in. (246 kg/cm^2). to fill, smooth or level subfloor imperfections.
B. Self-levelling underlayment: use a Portland cement-based self-levelling underlayment modified with a polymer that has a minimal resistance to compression of 3500 lbs/sq. in. (246 kg/cm^2).

PART 3 – EXECUTION

3.01 SITE INSPECTION

A. Examine the subfloor before installation to ensure that the surface is clean, dry, smooth, structurally sound and free from foreign substances that may adversely affect adhesion or cause discoloration. Furthermore, ensure that the subfloor is free of paint, varnish, adhesive, oil, grease, solvent and other foreign substances, including treatment compounds, sealers and curing compounds that may adversely affect adhesion or alter the appearance or durability the carpet tile.

B. Verify the surface to ensure there is no powder, scaling or mold. If there is, remove it with a mechanical sander and level with a good-quality cement-based Portland primer.

C. Slabs that have been either using a curing agent or a sealer will have to be treated to ensure that the adhesion has not been impaired.

D. Do not install on cement slabs that have been subjected to adhesive chemical abatement, unless an approved remediation system was used afterwards.

E. Report and rectify all unsatisfactory conditions. Do not start flooring installation until all rectifications have been completed.

3.02 SUBFLOOR PREPARATION

A. Level all rough surfaces and fill cracks and marks with a Portland cement-based patching compound modified with latex.

B. Mechanically remove all surface contaminants such as paint, oil, grease, varnish, adhesive as well as various other products such as treatment compounds.

C. Measure the humidity and pH levels (in situations where pH testing is required) in compliance with the following standards before installation:

1. ASTM F 2170, Relative Humidity (RH) test using in situ probes.
2. ASTM F 710, pH levels (test procedure 5.3.1).
3. The ASTM test frequency recommendation is 3 measures for the first 1,000 sq. ft. (92.9 sq. m) and one measure for each additional 1,000 sq. ft. (92.9 sq. m).

D. Ensure Moisture, Relative Humidity and pH tests have all been conducted and measurements meet manufacturer's recommendations.

E. In case of doubt, test the adhesion on the cement subfloor or other surface that will be covered by the flooring. Do the test using the specified flooring and recommended adhesive.

3.03 CARPET TILE FLOORING INSTALLATION

A. Install the flooring according to the latest version of Mohawk Group's installation instructions. Use the tools, adhesives, trowel types and procedures recommended in the instructions.

B. Acclimatize the subfloor, all flooring material and adhesive for 48 hours before, during and after the installation by maintaining the room temperature between 65°F (18°C) and 85°F (29°C). Afterwards, maintain the temperature between 65°F (18°C) and 85°F (29°C).

3.04 CLEANING AND PROTECTION

A. Remove all excess adhesive immediately after installation as recommended in Mohawk Group's installation instructions.

B. Before allowing traffic after installation, consult and follow the recommendations in Mohawk Group's installation instructions.

C. Following installation and cleanup, if the work of all other trades has not yet been completed, protect the flooring by laying sheets of non-staining brown Kraft paper, and then a layer of plywood sheets (rolls of non-staining heavy cardboard material could also be used for protection).

D. Follow the instructions in Mohawk Group's Maintenance Instructions when performing initial and regular maintenance procedures.

Please note that technical website documents prevail.

3.05 CARPET RECLAMATION – BROADLOOM CARPETING AND CARPET TILE

This specification is for carpet reclamation and is designed to manage carpet recycling for any type of used carpet or carpet pad.

A. CARPET REMOVAL – BROADLOOM

1. Remove used carpet in carpet pieces, roll tightly, and pack neatly in container. (Include carpet scrap and waste from new installation.) Immediately remove used carpet from Site. For reclamation projects coordinated by Mohawk Reclamation Department, place in Mohawk provided covered containers.
2. Deposit only clean, dry used carpets in containers. Clean shall be defined as carpet free from demotion debris or asbestos contamination, garbage, and tack strips.

B. CARPET REMOVAL – CARPET TILE

1. Remove used carpet tile and stack neatly on pallets. Neatly stack carpet tiles or repack in cardboard boxes prior to placing in container. Do not stack higher than 6 feet on pallets. (Include carpet scrap

and waste from new installation.) Immediately remove used carpet from Site. For reclamation projects coordinated by Mohawk Reclamation Department, place in Mohawk provided covered containers.

2. Deposit only clean, dry used carpets in containers. Clean shall be defined as carpet free from demotion debris or asbestos contamination, garbage, and tack strips.

C. CONTAINER HANDLING

1. Place used carpet in container supplied by Mohawk Reclamation Department. Containers are fully enclosed and shall be kept locked or supervised.
2. Broadloom carpet must be segregated in separate containers from tile carpeting.
3. Use effective packing techniques to maximize the amount of material in the container. On average the following amounts are the related container capacities.

Container Size	Broadloom Capacity	Tile Capacity
53’ Foot	4,800	3,500

D. CONTAINER REMOVAL

When container is full, contact Mohawk Reclamation Department to coordinate pickup and drop-off of replacement container if needed. If container is locked for security purposes, remove the lock prior to pick up.

The Mohawk Reclamation Department toll free number is (877) 3RE-CYCL or (877) 373-2925

E. RECLAMATION CERTIFICATE

The Mohawk Reclamation Department will issue a reclamation certificate once used carpet is removed from the job site and or dealer location and delivered to reclamation facility.

END OF SECTION

SECTION 09 83 19 – ACOUSTICAL WALL PANELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

Drawings and general conditions of Contract, including General and Supplementary Conditions and Divisions-1 Specification sections apply to work of this section.

1.2 SUMMARY

A. Section Includes:
   1. Acoustical wall panels and installation components.

B. Related Sections:
   1. Section 09 21 16 –Gypsum Board Assemblies
   2. Division 26 Sections - Electrical Work

C. Alternates
   1. Prior Approval: Refer to Division 01 for product substitution procedures.
   2. Submittals which do not provide adequate data for the product evaluation will not be considered. The proposed substitution must meet all requirements of this section, including but not necessarily limited to, the following: Single source materials suppliers (if specified in Section 1.5); Panel design, size, composition, color, and finish; installation system component profiles and sizes; Compliance with the referenced standards.

1.3 REFERENCES

A. Test Methods:
   1. ASTM C 423 Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
   2. ASTM E 84/CAN/ULC S102 Standard Test Method for Surface Burning Characteristics of Building Materials.
   3. CAN/ULC S102 Standard Test Method for Surface Burning Characteristics of Building Materials.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical data for each type of acoustical wall panel required.

B. Samples: Minimum 3 inch x 3 inch samples of specified acoustical wall substrate; minimum 4 inch long samples of attachment method including trim and decorative accents.

C. Shop Drawings: Submit shop drawings showing how panels are to be laid out on the walls, details of trim members and width of panels. Width of panels and location of vertical seams are critical.

1.5 QUALITY ASSURANCE

A. Single-Source Responsibility: Provide acoustical panel units and installation components by a single manufacturer.

B. Fire Performance Characteristics: Identify acoustical wall components with appropriate markings of applicable testing and inspecting organization.
   1. Surface Burning Characteristics: As follows, tested per ASTM E 84,
      a. Flame Spread: 25 or less
      b. Smoke Developed: 200 or less

C. Coordination of Work: Coordinate acoustical wall work with installers of related work including, but not limited to building insulation, gypsum board, light fixtures, mechanical systems, electrical systems, and sprinklers.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver acoustical wall panels to project site in original, unopened packages and store them in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.
B. Before installing acoustical wall panels, permit them to reach room temperature and a stabilized moisture content.
C. Handle acoustical wall panels carefully to avoid chipping edges or damaged units in any way.

1.7 PROJECT CONDITIONS

A. Space Enclosure:
   1. Soundsoak Fiberglass Panels: All wet work must be complete and dry prior to installation. Installation shall be carried out where the temperature is between 40 degrees F and 120 degrees F. These temperature conditions must be maintained throughout the life of the warranty.

1.8 WARRANTY

A. Acoustical Wall Panel: Submit a written warranty executed by the manufacturer, agreeing to repair or replace acoustical panels that fail within the warranty period. Failures include, but are not limited to:
   1. Acoustical Wall Panels: Manufacturer’s defects

B. Warranty Period:
   1. Acoustical wall panels: One (1) year from date of substantial completion.

C. The Warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under the requirements of the Contract Documents.

1.9 MAINTENANCE

A. Extra Materials: Deliver extra materials to Owner. Furnish extra materials described below that match products installed. Packaged with protective covering for storage and identified with appropriate labels.
   1. Acoustical Wall Panels: Furnish quantity of full-size units equal to 5.0 percent of amount installed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acoustical Wall Panels:
   1. Armstrong World Industries, Inc. – Basis of Design
      a. Soundsoak 60

2.2 ACOUSTICAL WALL PANELS

A. Acoustical Wall Panels: Type AWP-1:
   1. Surface Texture: Fabric
   2. Composition: Fiberglass with resin-hardened edges. Impact-resistant panels available.
   3. Fabric Finish:
      a. Standard - Lido, color as selected from manufacturer's standard offering.
   4. Thickness: ¾"
   5. Width: Up to 4 feet
   6. Panel Heights: Up to 10 feet
   7. Edge Profile:
      a. Standard - Fabric wrapped sqyare edges on two long panel sides.
      b. Fabric wrapped on all four sides.
      c. Kerfed on two long sides for installation with internal H splines.
   8. Noise Reduction Coefficient (NRC): ASTM C 423; A Mounting: 1 inch (0.80); 2 inch (1.05).
   9. Flame Spread: ASTM E84; with FR-701 Fabrics - composite Class A rating.
   10. Dimensional Stability: Standard – space must be enclosed with HVAC systems operating at all times.
   11. Acceptable Product: Soundsoak, as manufactured by Armstrong World Industries.

B. Acoustical Wall Panel Accessories:
   1. H spline kerf.
   2. J-molding.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Do not proceed with installation until all wet work such as concrete, terrazzo, plastering and painting has been completed and thoroughly dried out, unless expressly permitted by manufacturer's printed recommendations.

3.2 PREPARATION

A. Measure each wall area and establish layout of acoustical units to balance border widths at opposite edges of each wall. Coordinate panel layout with mechanical and electrical fixtures.

3.3 INSTALLATION

A. Install wall panels by attaching the panels to an existing wall per the manufacturer's instructions, LA-297301, and in accordance with the authorities having jurisdiction.

B. For installation instructions with internal H spline, refer to installation instructions for standard Soundsoak, LA-295818.

3.4 ADJUSTING AND CLEANING

A. Replace damaged and broken panels.

B. Routine maintenance of Soundsoak wall panels should consist of frequent vacuuming to minimize dirt accumulation. A dry or wet shampoo can be used on Soundsoak fabric. Work in with a damp sponge and vacuum to remove residue.

END OF SECTION

SECTION 09 84 00 – ACOUSTIC SOUNDPROOFING MEMBRANE

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes:
   1. Acoustic soundproofing membrane.

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract including supplements and addendums.
B. Applicable Specification Sections: Division 01 – General and Division 09 – Finishes.

1.3 REFERENCES

A. International Building Code (IBC) 2012:
   1. Section 1207 – *Sound Transmission*
B. ASTM Tests:
   1. E90 – *Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.*
   2. E413 – *Classification for Rating Sound Insulation.*
C. ASTM Specifications:
   1. C840 – *Standard Specification for Application and Finishing of Gypsum Board.*

1.4 SUBMITTALS

A. For each product indicated:
   1. Product Data Sheet: manufacturer's specifications including laboratory test summary.
   2. Installation Instructions: detailed installation procedure including jobsite condition requirements, surface preparation requirements, and approved products.

1.5 DELIVERY, STORAGE, AND HANDLING

A. All materials shall be delivered in original unopened packaging.
B. The acoustic soundproofing membrane may be stored in a wet or dry environment and may be stored outdoors for up to three months on construction sites without special tarps or covering.
   1. If stored below freezing temperatures, material may require up to 48 hours of acclimation to regain pliability.
   2. Acclimate the acoustic soundproofing membrane for a minimum of 24 hours at temperatures 60 degrees (F) or greater to reduce material stiffness when handling.
   3. If material stiffens, it may be softened more rapidly using a heat gun.

1.6 PROJECT CONDITIONS

A. The acoustic soundproofing membrane is typically installed after framing, insulation, and electrical are complete. Insulation should be installed in the wall cavity in addition for optimal performance.
B. Ensure that all applicable inspections are completed prior to installation of the acoustic soundproofing membrane.
C. The acoustic soundproofing membrane may be installed prior to "drying in" the building (prior to installation of windows and doors).
   1. Drywall should be installed within 2-4 weeks of the acoustic soundproofing membrane to prevent excessive wear.
      a. For longer delays, washers should be installed for securely fasten the material.
   2. Drywall installation permanently attaches the acoustic soundproofing membrane to the stud.

PART 2 – PRODUCTS

2.1 ACOUSTIC SOUNDPROOFING MEMBRANE

A. Manufacturer: Subject to compliance with requirements, provide products by the following:
   a. Basis of Design : Wall Blokker by Commercial Acoustics
   b. Or approved equal

B. Materials:
   1. Engineered sound reduction membrane.
   2. Flexible Ethylene Vinyl Acetate (EVA) product made from post-industrial recycled material.

C. Dimensions:
   1. Thickness: 1/8”
   2. Weight: 1 lb/sq.ft.
   3. Standard Sizes: 4’x25’ rolls; 4’x10’ and 4’x8’ sheets; custom length rolls available.
   4. Tolerances:
      a. Width: +/- 0.5”
      b. Length: +/- 1%
      c. Nominal Thickness: +/- 0.10”

D. Performance:
   1. Minimum STC = 25 (ASTM E90).
   2. UL Classified Assemblies:
      a. 300, 400, 500 Series
   3. Flammability Rating:
      a. Class 1 (ASTM E84 Rev. A)
      b. 1-Hour fire resistance wall rating (ASTM E119)
      c. 0.3 Thermal Resistance coefficient (ASTM C518)
   4. Environmental:
      a. Mold/Mildew resistant. No fungal/algae growth and no visible disfigurement (ASTM D3273 & ASTM G21).
      b. Impermeable air and moisture barrier.
      c. Non-PVC: no off-gassing.
      d. HIPPA Compliant.
      e. 100% recyclable at end of life.

PART 3 – EXECUTION

3.1 PREPARATION

A. Wall and/or stud assembly to receive the acoustic soundproofing membrane must be structurally sound prior to installation.

B. Wall must be clean and free of debris.
   1. Protrusions greater than 1/16” shall be scraped from the surface to avoid puncturing.

C. See Section 1.6 for additional project condition requirements.

3.2 INSTALLATION

A. Starting in one corner of the room, install the acoustic soundproofing membrane flush with the top of the top plate, and hang it vertically.

B. <u>Metal Studs:</u>
   1. Attach the acoustic soundproofing membrane directly to the light gauge metal studs using drywall screws.
   2. Fasten every 12” horizontally along the top.
      a. The acoustic soundproofing membrane installed on walls greater than 15’ in height shall be secured with washers along the top to prevent the fasteners from tearing the material.

b. Fasteners shall be used on intermediate studs (in addition to exterior studs) every 12' vertically.

3. Straighten the acoustic soundproofing membrane from the top down so that it is flush against the studs.
4. Attach the acoustic soundproofing membrane to the center of each vertical stud using drywall screws.
5. Fasten every 36" vertically along the center of each stud.

3.3 PROCEDURE

A. Install the acoustic soundproofing membrane as indicated.
B. Keep fasteners as flush as possible to prevent protrusion into the finished wallboard.
   1. Fasteners shall not protrude more than 1/16" from the acoustic soundproofing membrane surface.
C. Do NOT overlap the seams of separate sheets.
   1. Tightly butt the side of the next sheet of the acoustic soundproofing membrane to the edge of the existing attached sheet.
D. For seams that do not fall on a stud, tape with "Seam-Seal" or equivalent.
   1. If seams fall on the stud with gaps greater than 1/8", then taping is also required.
   2. Ensure that there are no bubbles or wrinkles in the tape. Commercial tape alternatives include commercial duct tape.
   3. The tape is semi-permanent and will be permanently sealed in position when drywall is installed. Drywall installation will seal the acoustic soundproofing membrane against the existing studs.
E. Cut the acoustic soundproofing membrane to fit around irregular objects and penetrations including outlets, switches, and junction boxes.
   1. Gaps shall be less than 1/8".
   2. Gaps greater than 1/8" shall be sealed with acoustical or non-hardening caulk.
   3. Gaps greater than 1/4" may be filled with backer rod or fiber batting.
   4. Putty pads should be installed on the back of all electrical boxes.
F. Caulk the bottom of the floor plate at the floor line with acoustical sealant.
G. Install drywall per normal technique (ASTM C840).
   1. The acoustic soundproofing membrane will be fastened permanently when the gypsum board is installed.

END OF SECTION

SECTION 09 84 33 – ACOUSTICAL CEILING BAFFLES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes acoustical ceiling baffles for suspended ceiling applications.

B. Products:

1. BLADE BAFL Acoustical Ceiling Baffle by Fräsch, or approved equal meeting all material, fire, and acoustic performance criteria.

C. Baffles shall be sized, spaced, and oriented to achieve maximum acoustic performance as indicated on drawings or per manufacturer's recommendations.

1.3 REFERENCES

A. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building MaterialsB. ASTM C423 – Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.

1.4 SUBMITTALS

A. Product Data: Manufacturer's data sheets including:

1. Acoustic performance (NRC values).
2. Fire rating.
3. Material content and sustainability attributes.
4. Manufacturer and product specifications.
   B. Shop Drawings: Indicate layout, spacing, suspension details, and installation methods.
   C. Samples: Minimum 12 x 12 inch sample showing material, thickness, color, and finish.
   D. Warranty: Manufacturer's warranty documentation.
   E. Substitution Requests: For approved equal products, submit data demonstrating equivalency to BLADE BAFL at least 10 days prior to bid, including:
5. Product data
6. Acoustic and fire test reports
7. Sample panels

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain acoustical ceiling baffles from a single manufacturer or approved equal meeting all performance requirements.

B. Fire Performance: Class A surface burning characteristics per ASTM E84.

C. Acoustic Performance: NRC and absorption coefficients must meet or exceed the specified BLADE BAFL values.

D. Dimensional Requirements: Baffles must maintain manufacturer-recommended width, height, and spacing to achieve maximum acoustic performance.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original, unopened packaging.

B. Store materials flat, in a dry area, and protected from damage.

1.7 WARRANTY

A. Manufacturer's Warranty: 2 years covering defects in material and workmanship.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Fräsch, 682.200.3005, www.frasch.com – BLADE BAFL

B. Approved Equal: Products from other manufacturers meeting all material, fire, and acoustic performance criteria may be considered upon submission and approval by the Architect.

2.2 ACOUSTICAL CEILING BAFFLES

A. Product: BLADE BAFL Acoustical Ceiling Baffle

B. Material: 9 mm thick, 100% PET felt with minimum 55% post-consumer recycled content

1. Low VOC
2. 100% recyclable

C. Fire Rating: Class A per ASTM E84 (based on 9 mm white)

D. Acoustic Performance (per ASTM C423):

Frequency	NRC	Absorption (Sabins/m²)
250 Hz	0.57	4.45
500 Hz	0.90	7.05
1000 Hz	1.36	10.62
2000 Hz	1.61	12.61

Overall NRC: 1.10

E. Dimensional and Spacing Requirements:

1. Width, height, and spacing must comply with manufacturer's guidelines for maximum acoustic performance.

2. Adjust layout for room geometry as indicated on reflected ceiling plans.

2.3 HARDWARE

A. Standard Suspension:

1. Aircraft Cable / Threaded Rod
2. Flat Bracket
3. Grip Lock

B. Optional Unistrut Suspension:

1. Aircraft Cable / Threaded Rod
2. Flat Bracket
3. Grip Lock
4. Coupler Nut
5. Nylon Cone Nut

C. Drop Ceiling Suspension:

1. Aircraft Cable / Threaded Rod
2. Flat Bracket
3. Grip Lock
4. Coupler Nut
5. T-Grid Caddy Clip

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verify substrates and structural supports are acceptable for installation of acoustical ceiling baffles.

B. Do not proceed until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Assemble PET panels with suspension hardware with minimal field modifications.

C. Adjust mounting point positions as required for alignment, design intent, and to maintain maximum acoustic performance.

3.3 CLEANING

A. Clean exposed surfaces with a clean, damp cloth after installation.

B. Remove and replace products that cannot be cleaned to the satisfaction of the Architect.

3.4 PROTECTION

A. Protect installed products from damage until Substantial Completion.

SECTION 09 91 23 - INTERIOR,AND EXTERIOR PAINTS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Interior paint and coating systems including surface preparation.

1.2 RELATED SECTIONS

A. Section 03 30 00 - Cast-in-Place Concrete.

B. Section 04 20 00 - Unit Masonry: Concrete Masonry Units (CMU) and brick.

C. Section 05 12 16 - Fabricated Fireproofed Steel Columns.

D. Section 05 50 00 - Metal Fabrications.

E. Section 06 20 00 - Finish Carpentry.

F. Section 06 40 00 - Architectural Woodwork.

G. Section 08 11 13.16 - Custom Hollow Metal Doors and Frames.

H. Section 09 21 16.23 - Gypsum Board Shaft Wall Assemblies.

I. Section 23 05 00 - Common Work Results for HVAC.

J. Section 26 05 00 - Common Work Results for Electrical.

1.3 REFERENCES

A. Steel Structures Painting Council (SSPC):
   1. SSPC-SP 1 - Solvent Cleaning.
   2. SSPC-SP 2 - Hand Tool Cleaning.
   3. SSPC-SP 3 - Power Tool Cleaning.
   4. SSPC-SP5/NACE No. 1, White Metal Blast Cleaning.
   5. SSPC-SP6/NACE No. 3, Commercial Blast Cleaning.
   6. SSPC-SP7/NACE No. 4, Brush-Off Blast Cleaning.
   7. SSPC-SP10/NACE No. 2, Near-White Blast Cleaning.
   8. SSPC-SP11, Power Tool Cleaning to Bare Metal.
   9. SSPC-SP12/NACE No. 5, Surface Preparation and Cleaning of Metals by Waterjetting Prior to Recoating.
   10. SSPC-SP 13 / NACE No. 6 Surface Preparation for Concrete.

B. Material Safety Data Sheets / Environmental Data Sheets: Per manufacturer's MSDS/EDS for specific VOCs (calculated per 40 CFR 59.406). VOCs may vary by base and sheen.

C. California Department of Public Health (CDPH):
   1. CDPH v1.1-2010 and V1.2-2017

1.4 SUBMITTALS

A. Submit under provisions of Section 01 30 00 - Administrative Requirements.

B. Product Data: For each paint system indicated, including.
   1. Product characteristics.
   2. Surface preparation instructions and recommendations.
   3. Primer requirements and finish specification.
   4. Storage and handling requirements and recommendations.
   5. Application methods.
   6. Cautions for storage, handling and installation.

C. Selection Samples: Submit a complete set of color chips that represent the full range of manufacturer's products, colors, and sheens available.

D. Verification Samples: For each finished product specified, submit samples that represent the actual product, color, and sheen.

E. Coating Maintenance Manual: Upon conclusion of project, the Contractor or paint manufacturer/supplier shall furnish a coating maintenance manual, such as Sherwin-Williams, "Custodian Project Color and Product Information" report or equal. Manual shall include an Area Summary with finish schedule, Area Detail designating where each product/color/finish was used, product data pages, Material Safety Data Sheets, care and cleaning instructions, touch-up procedures, and color samples of each color and finish used.

F. Only submit complying products based on project requirements (i.e. LEED). One must also comply with the regulations regarding VOCs (CARB, OTC, SCAQMD, LADCO). To ensure compliance with district regulations and other rules, businesses that perform coating activities should contact the local district in each area where the coating will be used.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: A firm or individual experienced in applying paints and coatings similar in material, design, and extent to those indicated for this Project, whose work has resulted in applications with a record of successful in-service performance.

B. Paint exposed surfaces. If a color of finish, or a surface is not specifically mentioned, Architect will select from standard products, colors, and sheens available.

C. Do not paint prefinished items, concealed surfaces, finished metal surfaces, operating parts, and labels unless indicated.

D. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
   1. Finish surfaces for verification of products, colors, and sheens.
   2. Finish area designated by Architect.
   3. Provide samples that designate primer and finish coats.
   4. Compatibility and Adhesion: Check after one week of drying and curing by testing in accordance with ASTM D3359; Adhesion by tape test. If the coating system is incompatible, additional surface preparation up to and including complete removal may be required.
   5. Do not proceed with remaining work until the Architect approves the mock-up.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver manufacturer's unopened containers to the work site. Packaging shall bear the manufacturer's name, label, and the following list of information.
   1. Product name, and type (description).

2. Application and use instructions.
3. Surface preparation.
4. VOC content.
5. Environmental handling.
6. Batch date.
7. Color number.

B. Storage: Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

C. Store materials in an area that is within the acceptable temperature range, per manufacturer's instructions. Protect from freezing.

D. Handling: Maintain a clean, dry storage area, to prevent contamination or damage to the coatings.

1.7 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's recommended limits.

1.8 EXTRA MATERIALS

A. Furnish extra paint materials from the same production run as the materials applied and, in the quantities, described below. Package with protective covering for storage and identify with labels describing contents. Deliver extra materials to Owner.

B. Furnish Owner with an additional one percent of each material and color, but not less than 1 gal (3.8 l) or 1 case, as appropriate.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer: Sherwin-Williams, which is located at: 101 Prospect Ave.; Cleveland, OH 44115; ASD Toll Free Tel: 800-524-5979; Tel: 216-566-2000; Fax: 440-826-1989; Email: request infospecifications@sherwin.com; Web:www.swspecs.com.
   a. Contact: Shane Crawford – Architectural Account Executive.; shane.a.crawford1@sherwin.com, Phone: 479-601-2982.

B. Requests for substitutions will be considered in accordance with the provisions of Section 01 60 00 - Product Requirements.

2.2 APPLICATIONS/SCOPE

A. Interior Paint and Coating Systems:
   1. Metal: Structural steel, joists, trusses, beams, partitions, and similar items.
   2. Drywall: Drywall board, Gypsum board.

2.3 PAINT MATERIALS - GENERAL

A. Paints and Coatings:
   1. Unless otherwise indicated, provide factory-mixed coatings. When required, mix coatings to correct consistency in accordance with manufacturer's instructions before application. Do not reduce, thin, or dilute coatings or add materials to coatings unless such procedure is specifically described in manufacturer's product instructions.

2. For opaque finishes, tint each coat including primer coat and intermediate coats, one-half shade lighter than succeeding coat, with final finish coat as base color. Or follow manufactures product instructions for optimal color conformance.

B. Primers: Where the manufacturer offers options on primers for a particular substrate, use a primer categorized as "best" by the manufacturer.

C. Coating Application Accessories: Provide all primers, sealers, cleaning agents, cleaning cloths, sanding materials, and clean-up materials required, per manufacturer's specifications.

D. Color: Refer to Finish Schedule for paint colors, and as selected.

2.4 INTERIOR PAINT AND COATING SYSTEMS

A. Metal: Access Metal Panels, Diffusers, Hollow Metal Door Frames and similar items..
1. Latex Systems:
a. Semi-Gloss Finish High Performance:
1) 1st Coat: S-W Pro Industrial Pro-Cryl Universal Primer, B66-1310 Series (5.0 mils. wet, 2.0 mils. dry per coat).
2) 2nd Coat: S-W Pro Industrial Acrylic Semi-Gloss, B66-650 Series.
3) 3rd Coat: S-W Pro Industrial Acrylic Semi-Gloss, B66-650 Series (2.0-4.0 mils. dry per coat).
b. Eg-Shel / Satin Finish High Performance:
1) 1st Coat: S-W Pro Industrial Pro-Cryl Universal Primer, B66-1310 Series (5.0 mils. wet, 2.0 mils. dry per coat).
2) 2nd Coat: S-W Pro Industrial Acrylic Eg-Shel, B66-660 Series.
3) 3rd Coat: S-W Pro Industrial Acrylic Eg-Shel, B66-660 Series (2.0-4.0 mils. dry per coat).

B. Drywall: Walls, Ceilings, Gypsum Board, and similar items.
1. Latex Systems:
a. Semi-Gloss Finish Scuff Resistant Waterbased Enamel:
1) 1st Coat: S-W ProMar200 Zero VOC Interior Latex Primer, B28W2600 (4 mils. wet, 1.5 mils. dry per coat).
2) 2nd Coat: Sherwin-Williams Scuff Tuff Int. Waterbased Enamel, Semi-Gloss, S26-150 Series.
3) 3rd Coat: Sherwin-Williams Scuff Tuff Int. Waterbased Enamel, Semi-Gloss, S26-150 Series (4 mils. wet, 1.2 mils. dry per coat).
b. Eg-Shel Finish Scuff Resistant Waterbase Enamel:
1) 1st Coat: Sherwin-Williams ProMar 200 Zero VOC Interior Latex Primer, B28W2600 (4 mils. wet, 1.5 mils. dry per coat).
2) 2nd Coat: Sherwin-Williams Scuff Tuff Int. Waterbased Enamel, Eg-Shel, S24-150 Series.
3) 3rd Coat: Sherwin-Williams Scuff Tuff Int. Waterbased Enamel, Eg-Shel, S24-150 Series (4 mils. wet, 1.2 mils. dry per coat).

PART 3 EXECUTION

3.1 EXAMINATION

A. Do not begin installation until the substrates have been properly prepared; notify Architect of unsatisfactory conditions before proceeding. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

B. Proceed with work only after conditions have been corrected and approved by all parties,

otherwise application of coatings will be considered as an acceptance of surface conditions.

C. Previously Painted Surfaces: Verify that existing painted surfaces do not contain lead based paints, notify Architect immediately if lead based paints are encountered.

3.2 SURFACE PREPARATION

A. General: Surfaces shall be dry and in sound condition. Remove oil, dust, dirt, loose rust, peeling paint, or other contamination to ensure good adhesion.
   1. Prior to attempting to remove mildew, it is recommended to test any cleaner on a small, inconspicuous area prior to use. Bleach and bleaching type cleaners may damage or discolor existing paint films. Bleach alternative cleaning solutions are advised.
   2. Remove mildew before painting by washing with a solution of 1 part liquid household bleach and 3 parts of warm water. Apply solution and scrub the mildewed area. Allow solution to remain on the surface for 10 minutes. Rinse thoroughly with clean water and allow the surface to dry before painting. Wear protective glasses or goggles, waterproof gloves, and protective clothing. Quickly wash off any of the mixture that comes in contact with your skin. Do not add detergents or ammonia to the bleach/water solution.
   3. Remove items including but not limited to thermostats, electrical outlets, switch covers and similar items prior to painting. After completing painting operations in each space or area, reinstall items removed using workers skilled in the trades involved.
   4. No exterior painting should be done immediately after a rain, during foggy weather, when rain is predicted, or when the temperature is below 50 degrees F (10 degrees C), unless products are designed specifically for these conditions. On large expanses of metal siding, the air, surface, and material temperatures must be 50 degrees F (10 degrees F) or higher to use low temperature products.

B. Aluminum: Remove all oil, grease, dirt, oxide, and other foreign material by cleaning per SSPC-SP1, Solvent Cleaning.

C. Block (Cinder and Concrete): Remove all loose mortar and foreign material. Surface must be free of laitance, concrete dust, dirt, form release agents, moisture curing membranes, loose cement, and hardeners. Concrete and mortar must be cured at least 30 days at 75 degrees F (24 degrees C). The pH of the surface should be between 6 and 9 unless the products are designed to be used in high pH environments. On tilt-up and poured-in-place concrete, commercial detergents and abrasive blasting may be necessary to prepare the surface. Fill bug holes, air pockets, and other voids with a cement patching compound.

D. Concrete, SSPC-SP13 or NACE 6: This standard gives requirements for surface preparation of concrete by mechanical, chemical, or thermal methods prior to the application of bonded protective coating or lining systems. The requirements of this standard are applicable to all types of cementitious surfaces including cast-in-place concrete floors and walls, precast slabs, masonry walls, and shotcrete surfaces. An acceptable prepared concrete surface should be free of contaminants, laitance, loosely adhering concrete, and dust, and should provide a sound, uniform substrate suitable for the application of protective coating or lining systems.

E. Cement Composition Siding/Panels: Remove all surface contamination by washing with an appropriate cleaner, rinse thoroughly and allow to dry. Existing peeled or checked paint should be scraped and sanded to a sound surface. Pressure clean, if needed, with a minimum of 2100 psi pressure to remove all dirt, dust, grease, oil, loose particles, laitance, foreign material, and peeling or defective coatings. Allow the surface to dry thoroughly. The pH of the surface should be between 6 and 9 unless the products are designed to be used in high pH environments.

F. Copper and Stainless Steel: Remove all oil, grease, dirt, oxide, and other foreign material by cleaning per SSPC-SP 2, Hand Tool Cleaning.

G. Exterior Composition Board (Hardboard): Some composition boards may exude a waxy material that must be removed with a solvent prior to coating. Whether factory primed or unprimed, exterior composition board siding (hardboard) must be cleaned thoroughly and primed with an alkyd primer.

H. Drywall - Exterior: Must be clean and dry. All nail heads must be set and spackled. Joints must be taped and covered with a joint compound. Spackled nail heads and tape joints must be sanded smooth, and all dust removed prior to painting. Exterior surfaces must be spackled with exterior grade compounds.

I. Drywall - Interior: Must be clean and dry. All nail heads must be set and spackled. Joints must be taped and covered with a joint compound. Spackled nail heads and tape joints must be sanded smooth, and all dust removed prior to painting.

J. Galvanized Metal: Clean per SSPC-SP1 using detergent and water or a degreasing cleaner to remove greases and oils. Apply to a test area, priming as required. Allow the coating to dry at least one week before testing. If adhesion is poor, Brush Blast per SSPC-SP16 is necessary to remove these treatments.

K. Plaster: Must be allowed to dry thoroughly for at least 30 days before painting unless the products are designed to be used in high pH environments. Room must be ventilated while drying; in cold, damp weather, rooms must be heated. Damaged areas must be repaired with appropriate patching material. Bare plaster must be cured and hard. Textured, soft, porous, or powdery plaster should be treated with a solution of 1 pint household vinegar to 1 gallon of water. Repeat until the surface is hard, rinse with clear water and allow to dry.

L. Steel: Structural, Plate, And Similar Items: Should be cleaned by one or more of the surface preparations described below. These methods are used throughout the world for describing methods for cleaning structural steel. Visual standards are available through the Society of Protective Coatings. A brief description of these standards together with numbers by which they can be specified follow.
   1. Solvent Cleaning, SSPC-SP1: Solvent cleaning is a method for removing all visible oil, grease, soil, drawing and cutting compounds, and other soluble contaminants. Solvent cleaning does not remove rust or mill scale. Change rags and cleaning solution frequently so that deposits of oil and grease are not spread over additional areas in the cleaning process. Be sure to allow adequate ventilation.
   2. Hand Tool Cleaning, SSPC-SP2: Hand Tool Cleaning removes all loose mill scale, loose rust, and other detrimental foreign matter. It is not intended that adherent mill scale, rust, and paint be removed by this process. Beforehand tool cleaning, remove visible oil, grease, soluble welding residues, and salts by the methods outlined in SSPC-SP1.
   3. Power Tool Cleaning, SSPC-SP3: Power Tool Cleaning removes all loose mill scale, loose rust, and other detrimental foreign matter. It is not intended that adherent mill scale, rust, and paint be removed by this process. Before power tool cleaning, remove visible oil, grease, soluble welding residues, and salts by the methods outlined in SSPC-SP1.
   4. White Metal Blast Cleaning, SSPC-SP5 or NACE 1: A White Metal Blast Cleaned surface, when viewed without magnification, shall be free of all visible oil, grease, dirt, dust, mill scale, rust, paint, oxides, corrosion products, and other foreign matter. Before blast cleaning, visible deposits of oil or grease shall be removed by any of the methods specified in SSPC-SP1 or other agreed upon methods.
   5. Commercial Blast Cleaning, SSPC-SP6 or NACE 3: A Commercial Blast Cleaned surface, when viewed without magnification, shall be free of all visible oil, grease, dirt,

dust, mill scale, rust, paint, oxides, corrosion products, and other foreign matter, except for staining. Staining shall be limited to no more than 33 percent of each square inch of surface area and may consist of light shadows, slight streaks, or minor discoloration caused by stains of rust, stains of mill scale, or stains of previously applied paint. Before blast cleaning, visible deposits of oil or grease shall be removed by any of the methods specified in SSPC-SP1 or other agreed upon methods.

6. Brush-Off Blast Cleaning, SSPC-SP7 or NACE 4: A Brush-Off Blast Cleaned surface, when viewed without magnification, shall be free of all visible oil, grease, dirt, dust, loose mill scale, loose rust, and loose paint. Tightly adherent mill scale, rust, and paint may remain on the surface. Before blast cleaning, visible deposits of oil or grease shall be removed by any of the methods specified in SSPC-SP 1 or other agreed upon methods.
7. Power Tool Cleaning to Bare Metal, SSPC-SP11: Metallic surfaces that are prepared according to this specification, when viewed without magnification, shall be free of all visible oil, grease, dirt, dust, mill scale, rust, paint, oxide corrosion products, and other foreign matter. Slight residues of rust and paint may be left in the lower portions of pits if the original surface is pitted. Prior to power tool surface preparation, remove visible deposits of oil or grease by any of the methods specified in SSPC-SP1, Solvent Cleaning, or other agreed upon methods.
8. Near-White Blast Cleaning, SSPC-SP10 or NACE 2: A Near White Blast Cleaned surface, when viewed without magnification, shall be free of all visible oil, grease, dirt, dust, mill scale, rust, paint, oxides, corrosion products, and other foreign matter, except for staining. Staining shall be limited to no more than 5 percent of each square inch of surface area and may consist of light shadows, slight streaks, or minor discoloration caused by stains of rust, stains of mill scale, or stains of previously applied paint. Before blast cleaning, visible deposits of oil or grease shall be removed by any of the methods specified in SSPC-SP1 or other agreed upon methods.
9. High- and Ultra-High Pressure Water Jetting for Steel and Other Hard Materials: SSPC-SP12 or NACE 5: This standard provides requirements for the use of high- and ultra-high pressure water jetting to achieve various degrees of surface cleanliness. This standard is limited in scope to the use of water only without the addition of solid particles in the stream.
10. Water Blasting, SSPC-SP12/NACE No. 5: Removal of oil grease dirt, loose rust, loose mill scale, and loose paint by water at pressures of 2,000 to 2,500 psi at a flow of 4 to 14 gallons per minute.

M. Vinyl Siding, Architectural Plastics, EIFS and Fiberglass: Clean vinyl siding thoroughly by scrubbing with a warm, soapy water solution. Rinse thoroughly. Do not paint vinyl siding with any color darker than the original color unless the paint system features Sherwin-Williams VinylSafe technology. Painting with darker colors that are not Sherwin-Williams VinylSafe may cause siding to warp. Follow all painting guidelines of the vinyl manufacturer when painting. Only paint properly installed vinyl siding. Deviating from the manufacturer's painting guidelines may cause the warranty to be voided.

N. Stucco: Must be clean and free of any loose stucco. If recommended procedures for applying stucco are followed, and normal drying conditions prevail, the surface may be painted in 30 days. The pH of the surface should be between 6 and 9 unless the products are designed to be used in high pH environments such as Loxon.

O. Wood: Must be clean and dry. Prime and paint as soon as possible. Knots and pitch streaks must be scraped, sanded, and spot primed before a full priming coat is applied. Patch all nail holes and imperfections with a wood filler or putty and sand smooth.

3.3 INSTALLATION

A. Apply all coatings and materials with the manufacturer's specifications in mind. Mix and thin coatings according to manufacturer's recommendations.

B. Do not apply it to wet or damp surfaces. Wait at least 30 days before applying to new concrete or masonry. Or follow manufacturer's procedures to apply appropriate coatings prior to 30 days. Test new concrete for moisture content. Wait until wood is fully dry after rain or morning fog or dew.

C. Apply coatings using methods recommended by manufacturer.

D. Uniformly apply coatings without runs, drips, or sags, without brush marks, and with consistent sheen.

E. Apply coatings at spreading rate required to achieve the manufacturers recommended dry film thickness.

F. Regardless of the number of coats specified, apply as many coats as necessary for complete hide, and uniform appearance.

G. Inspection: The coated surface must be inspected and approved by the Architect just prior to the application of each coat.

3.4 PROTECTION

A. Protect finished coatings from damage until completion of project.

B. Touch-up damaged coatings after substantial completion, following manufacturer's recommendation for touch up or repair of damaged coatings. Repair any defects that will hinder the performance of the coatings.

END OF SECTION

SECTION 09 96 00 – HIGH PERFORMANCE COATING

GENERAL

1.1 SECTION INCLUDES

A. Interior and exterior coatings as specified herein.

1.2 RELATED SECTIONS

A. Section 0512000 – Structural Steel Framing

B. Section 07 81 00 - Applied Fireproofing

1.3 REFERENCES

A. Occupational Safety and Health Act (OSHA) - Safety Standards.

B. American National Standards Institute (ANSI) - Performance Standards.

C. Paint Decorating Contractors of America (PDCA) - Application Standard.

D. National Paint and Coatings Association (NPCA) - Gloss Standard.

E. American Society for Testing Materials (ASTM) - Testing Methods.

F. Master Paint Institute (MPI #) - Established paint categories and standards.

G. Ozone Transmission Commission (OTC) - Established levels of Volatile Organic Compounds.

H. SCAQMD 1168 - South Coast Air Quality Management District Rule #1168; October 3, 2003.

I. SSPC (PM1) - Steel Structures Painting Manual, Vol. 1, Good Painting Practice; Society for Protective Coatings; 1993, Third Edition.

J. SSPC (PM2) - Steel Structures Painting Manual, Vol. 2, Systems and Specifications; Society for Protective Coatings; 1995, Seventh Edition.

K. 40 CFR 59, Subpart D - National Volatile Organic Compound Emission Standards for Architectural Coatings; U.S. Environmental Protection Agency; current edition.

1.4 DEFINITIONS

A. Commercial as used in this Section refers to a product well suited for a commercial application.

B. DFT as used in this Section refers to the Dry Film Thickness of the coating.

C. Enamel refers to any acrylic or alkyd (oil) base paint which dries leaving an eggshell, pearl, satin, semi-gloss or high gloss enamel finish.

D. DTM as used in this Section refers to paint that is applied Direct To Metal.

E. OTC as used in this Section refers to the Ozone Transmission Commission. OTC has established the following VOC levels for the Northeastern United States. Products shall meet

the following OTC limits for VOC's.

1. Interior flat paints: 100 grams per liter or less, per gallon.
2. Interior enamels: 150 grams per liter or less, per gallon.
3. Interior stains: 250 grams per liter or less, per gallon.
4. Interior primers: 200 grams per liter or less, per gallon.
5. Rust preventive coatings: 400 grams per liter or less, per gallon.
6. Dry fog coatings: 400 grams per liter or less, per gallon.
7. Floor coatings: 250 grams per liter or less, per gallon.

F. Premium as used in this Section refers to the best quality product "top of the line".

G. VOC as used in this Section refers to Volatile Organic Compounds found in primers, paints, sealers and stains. The level of VOCs appears after each product listed in the Schedule in grams per liter (g/L).

H. Paints are available in a wide range of sheens or glosses, as measured by a gloss meter from a 60 and/or 85 degree angle from vertical, as a percentage of the amount of light that is reflected. The following terms are used to describe the gloss of our products. The list below is provided for general guidance; refer to the technical data sheet for the actual gloss/sheen level for each product.

1. Flat - Less than 5 Percent.
2. Eggshell - 5 - 20 Percent.
3. Satin - 20 - 35 Percent.
4. Semi-Gloss - 30 - 65 Percent.
5. Gloss - Over 65 Percent.

1.5 SUBMITTALS

A. Submit under provisions of Section 013300 – Submittal Procedures.

B. Product Data: Provide a complete list of all products to be used, with the following information for each:

1. Manufacturer's name, product name and/or catalog number, and general product category.
2. Cross-reference to specified paint system(s) that the product is to be used in; include description of each system.

C. Samples: Submit three paper samples, 5 inches by 7 inches (127mm x 178mm) in size, illustrating selected colors for each color and system selected with specified coats cascaded.

D. Manufacturer's Instructions: Indicate special surface preparation procedures.

E. Maintenance Data: Submit data on cleaning, touch-up, and repair of painted and coated surfaces.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: All primary products specified in this section will be supplied by a single manufacturer with a minimum of ten years experience.

B. Installer Qualifications: All products listed in this section are to be applied by a Painting Contractor with a minimum of five years demonstrated experience in surface preparation and field application of the same type and scope as specified.

C. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and

application workmanship.

1. Mock-up areas designated by Architect.
2. Do not proceed with remaining work until workmanship, color, and sheen are approved by Architect.
3. Approved mock-up areas will serve as the standard for remaining Work.
4. Refinish mock-up area as required to produce acceptable Work.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging until ready for installation.

B. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

C. Disposal:
1. Never pour leftover coating down any sink or drain. Use up material on the job or seal can and store safely for future use.
2. Do not incinerate closed containers.
3. For specific disposal or recycle guidelines, contact the local waste management agency or district. Recycle whenever possible.

1.8 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's recommended limits.

1.9 WARRANTY

A. Inspection of all surfaces to be coated must be done by the manufacturer's representative to insure proper preparation prior to application. All thinners, fillers, primers and finish coatings shall be from the same manufacturer to support a product warranty. Products other than those submitted shall be accompanied by a letter stating its fitness for use and compatibility.

B. At project closeout, provide to the Owner or owner's representative an executed copy of the Manufacturer's standard form outlining the terms and conditions of and any exclusions to their Limited Warranty against Manufacturing Defect.

1.10 EXTRA MATERIALS

A. At project closeout, supply the Owner or owner's representative one gallon of each product for touch-up purposes. Cans shall be clearly marked with color name, number and type of paint.

B. At project closeout, provide the color mixture name and code to the Owner or owner's representative for accurate future color matching.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Tnemec Company: Basis of Design

B. Sherwin Williams

C. Substitutions:
   1. Approved Equal.

2.2 MATERIALS - GENERAL

A. Volatile Organic Compound (VOC) Content:
   1. Provide coatings that comply with the most stringent requirements specified in the following:
      a. 40 CFR 59, Subpart D-National Volatile Organic Compound Emission Standards for Architectural Coatings.
      b. Determination of VOC Content: Testing and calculation in accordance with 40 CFR 59, Subpart D (EPA Method 24), exclusive of colorants added to a tint base and water added at project site; or other method acceptable to authorities having jurisdiction.

B. Compatibility: Provide materials that are compatible with one another and the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.

2.3 MIXING AND TINTING

A. Except where specifically noted in this section, all paint shall be ready-mixed and pre-tinted. Agitate all paint prior to and during application to ensure uniform color, gloss, and consistency.

B. Thinner addition shall not exceed manufacturer's printed recommendations. Do not use kerosene or other organic solvents to thin water-based paints.

2.4 HIGH PERFORMANCE PAINT SPECIFICATION

A. INTERIOR EXPOSED AND CONCEALED STEEL **- NOT IN NATATURIUM**

SEE DRAWINGS (Includes Structural Steel Columns, Joists, Trusses, Beams, Miscellaneous and Ornamental Iron, Structural Iron, Ferrous Metal, etc).

Shop Surface Preparation: Abrasive blast in accordance with SSPC-SP6 Commercial Blast Cleaning.

Field Touch-up Surface Preparation: Spot power tool clean in accordance with SSPC-SP11 Power Tool Clean to Bare Metal. Feather-edges.

1) 1st Coat (Shop & Field Touch-Up) Tnemec Series 90G-1K97 Tneme-Zinc 2.5-3.5 dry mils
2) 2nd Coat: Tnemec Series 66 Epoxoline 4.0-6.0 dry mils
3) 3rd Coat: Tnemec Series 66 Epoxoline 4.0-6.0 dry mils

B. EXPOSED AND CONCEALED STEEL - IN NATATORIUM AND IN ADJACENT AREAS SUBJECT TO HIGH HUMIDITY, ELEVATED TEMPERATURES OR CHLORINE/CHLORAMINE EXPOSURE.
   1. See drawings for limits of this area
   2. Fire and steel protection to be by one manufacturer, see spec section 07 81 00 Applied fireproofing.

C. WALLS IN NATATORIUM

D. INTERIOR STAIRS (Adjacent to Pool Equipment Room)

Shop Surface Preparation: Abrasive blast in accordance with SSPC-SP6 Commercial Blast Cleaning.

Field Touch-up Surface Preparation: Spot power tool clean in accordance with SSPC-SP11 Power Tool Clean to Bare Metal. Feather-edges.

1) 1st Coat (Shop & Field Touch-Up) Tnemec Series 90G-1K97 Tneme-Zinc 2.5-3.5 dry mils
2) 2nd Coat: Tnemec Series 66 Epoxoline 4.0-6.0 dry mils
3) 3rd Coat: Tnemec Series 290 CRU 2.0-3.0 dry mils

E. CMU BLOCK IN MAINTENANCE SHOP

Surface Preparation: Allow mortar to cure for 14 days. Level protrusions and mortar spatter.

1) 1st Coat Tnemec Series 130 Envirofill at 60-80 Sq ft/Gal
2) 2nd Coat: Tnemec Series 66 Epoxoline 2.0-3.0 dry mils
3) 3rd Coat: Tnemec Series 66 Epoxoline 2.0-3.0 dry mils

F. CMU BLOCK, RAILING & LADDER IN POOL EQUIPMENT ROOM

Surface Preparation: Allow mortar to cure for 14 days. Level protrusions and mortar spatter.

1) 1st Coat Tnemec Series 130 Envirofill at 60-80 Sq ft/Gal
2) 2nd Coat: Tnemec Series 66 Epoxoline 4.0-6.0 dry mils
3) 3rd Coat: Tnemec Series 290 CRU 2.0-3.0 dry mils

G. OVERHEAD STEEL IN MAINTENANCE SHOP

1) Shop Surface Preparation: Power Tool Clean in accordance with SSPC-SP3.
2) Field Touch-up Surface Preparation: Spot power tool clean in accordance with SSPC-SP3 Power Tool Clean.. Feather-edges.

1) 1st Coat (Shop & Field Touch-Up) Tnemec Series 10-99W (white) 2.5-3.5 dry mils
2) 2nd Coat: Tnemec Series 115 Unibond 3.0-4.0 dry mils

H. OVERHEAD DECKING IN MAINTENANCE SHOP

Shop Surface Preparation: In accordance with manufacturer’s instructions.

1) 1st Coat Tnemec Series 115 Unibond 3.0-4.0 dry mils

I. EXTERIOR STEEL PLATFORM FOR COOLING TOWER

Shop Surface Preparation: Abrasive blast in accordance with SSPC-SP6 Commercial Blast Cleaning.

Field Touch-up Surface Preparation: Spot power tool clean in accordance with SSPC-SP11 Power Tool Clean to Bare Metal. Feather-edges.

1) 1st Coat (Shop & Field Touch-Up) Tnemec Series 90G-1K97 Tneme-Zinc 2.5-3.5 dry mils
2) 2nd Coat: Tnemec Series 66 Epoxoline 4.0-6.0 dry mils

3) 3rd Coat: Tnemec Series 1095 Endura-Shield 2.0-3.0 dry mils

J. CONCRETE FLOORS IN POOL EQUIPMENT ROOM – SEE FLOORING SEPCIFICATION

K. LOCKER ROOMS, SEE DRAWINGS.

L. Reference drawings and legends for other areas requiring high performance coatings.

PART 3 EXECUTION

3.1 EXAMINATION

A. The Contractor shall review the product manufacturer's special instructions for surface preparation, application, temperature, re-coat times, and product limitations.

B. The Contractor shall review product health and safety precautions listed by the manufacturer.

C. The Contractor shall be responsible for enforcing on site health and safety requirements associated with the Work.

D. Do not begin installation until substrates have been properly prepared.

E. Ensure that surfaces to receive paint are dry immediately prior to application.

F. Ensure that moisture-retaining substrates to receive paint have moisture content within tolerances allowed by coating manufacturer. Where exceeding the following values, promptly notify Architect and obtain direction before beginning work.
1. Concrete and Masonry: 3-5 percent. Allow new concrete to cure a minimum of 28 days.
2. Exterior Wood: 17 percent.
3. Interior Wood: 15 percent.
4. Interior Finish Detail Woodwork, Including Trim, and Casework: 10 percent.
5. Plaster and Gypsum: 15 percent.
6. Concrete Slab-On-Grade: Perform calcium chloride test over 24 hour period or other acceptable test to manufacturer. Verify acceptable moisture transmission and pH levels.

G. Examine surfaces to receive coatings for surface imperfections and contaminants that could impair performance or appearance of coatings, including but not limited to, loose primer, rust, scale, oil, grease, mildew, algae, or fungus, stains or marks, cracks, indentations, or abrasions.

H. Correct conditions that could impair performance or appearance of coatings in accordance with specified surface preparation procedures before proceeding with coating application.

3.2 PREPARATION - GENERAL

A. Clean surfaces thoroughly prior to coating application.

B. Do not start work until surfaces to be finished are in proper condition to produce finished surfaces of uniform, satisfactory appearance.

C. Stains and Marks: Remove completely, if possible, using materials and methods recommended by coating manufacturer; cover stains and marks which cannot be completely

removed with isolating primer or sealer recommended by coating manufacturer to prevent bleed-through.

D. Remove Mildew, Algae, and Fungus using materials and methods recommended by coating manufacturer.

E. Remove dust and loose particulate matter from surfaces to receive coatings immediately prior to coating application.

F. Remove or protect adjacent hardware, electrical equipment plates, mechanical grilles and louvers, lighting fixture trim, and other items not indicated to receive coatings.

G. Move or protect equipment and fixtures adjacent to surfaces indicated to receive coatings to allow application of coatings.

H. Protect adjacent surfaces not indicated to receive coatings.

I. Prepare surfaces in accordance with manufacturer's instructions for specified coatings and indicated materials, using only methods and materials recommended by coating manufacturer.

3.3 APPLICATION - GENERAL

A. Application of primers, paints, stains or coatings, by the Contractor, will serve as acceptance that surfaces were properly prepared in accordance with the manufacturer's recommendation.

B. Apply each coat to uniform coating thickness in accordance with manufacturer's instructions, not exceeding manufacturer's specified maximum spread rate for indicated surface; thins, brush marks, roller marks, orange-peel, or other application imperfections are not permitted.

C. Allow manufacturer's specified drying time, and ensure correct coating adhesion, for each coat before applying next coat.

D. Inspect each coat before applying next coat; touch-up surface imperfections with coating material, feathering, and sanding if required; touch-up areas to achieve flat, uniform surface without surface defects visible from 5 feet (1.5 m).

E. Remove dust and other foreign materials from substrate immediately prior to applying each coat.

F. Where paint application abuts other materials or other coating color, terminate coating with a clean sharp termination line without coating overlap.

G. Where color changes occur between adjoining spaces, through framed openings that are of same color as adjoining surfaces, change color at outside stop corner nearest to face of closed door.

H. Re-prepare and re-coat unsatisfactory finishes; refinish entire area to corners or other natural terminations.

I. Apply all coatings in accordance with manufacturer’s written sinstructions.

3.4 CLEANING

A. Clean excess coating materials, and coating materials deposited on surfaces not indicated to receive coatings, as construction activities of this section progress; do not allow to dry.

B. Re-install hardware, electrical equipment plates, mechanical grilles and louvers, lighting fixture trim, and other items that have been removed to protect from contact with coatings.

C. Reconnect equipment adjacent to surfaces indicated to receive coatings.

D. Relocate to original position equipment and fixtures that have been moved to allow application of coatings.

E. Remove protective materials.

3.5 PROTECTION AND REPAIR

A. Protect completed coating applications from damage by subsequent construction activities until completion of painting project.

B. Touch-up coatings damaged by subsequent construction activities.

END OF SECTION 099600

DIVISION

10

SPECIALTIES

SECTION 10 11 00 – GLASSBOARDS

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes tempered safety glass writing boards and accessories for wall-mounted installations.
B. Types include:

1. Clarus Glass Wall2Wall panels.
2. ColorDrop™ glassboards.

1.2 REFERENCES

A. ASTM C1048 – Standard Specification for Heat-Strengthened and Fully Tempered Flat Glass.
B. ANSI Z97.1 – Safety Glazing Materials Used in Buildings – Safety Performance Specifications and Methods of Test.
C. ASTM E84 – Surface Burning Characteristics of Building Materials.
D. NFPA 101 – Life Safety Code.

1.3 SUBMITTALS

A. Product Data: Manufacturer's technical data, fabrication details, installation instructions, and maintenance recommendations.
B. Shop Drawings: Indicate sizes, mounting details, locations of cutouts, holes, and notches.
C. Color and Finish Samples: Submit manufacturer's standard glass color samples D. Warranty Documentation.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: Clarus, or approved equal, with minimum 10 years' experience manufacturing glass visual display systems.
B. Installer Qualifications: Experienced in installation of architectural glass wall systems.
C. Mock-Up: Provide 24 by 24 inch sample for evaluation of appearance and mounting.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in manufacturer's original packaging, labeled for identification.
B. Store glass units vertically on cushioned supports, in a clean, dry area protected from damage and moisture.
C. Handle glass carefully to prevent edge damage and surface scratching.

1.6 WARRANTY

A. Provide manufacturer's **20-year warranty** covering defects in materials, workmanship, staining, and ghosting.
B. Warranty includes lifetime performance of the writing surface.

PART 2 – PRODUCTS

2.1 MANUFACTURER

A. Basis of Design: **Clarus Glassboards**, Clarus, Fort Worth, Texas.
Website: www.clarus.com or approved equal
B. Substitutions: Comply with Division 01 requirements for substitutions.

2.2 MATERIALS

A. **Glass Panel:**

1. 1/4 inch (6 mm) Clarus tempered safety glass, conforming to ASTM C1048, Kind FT, Condition A.
2. Low-iron, optically clear glass for superior color fidelity and clarity.
3. Clarus Opti-Clear™ polished edges with eased corners for safety.
4. Non-porous, non-staining surface compatible with all markers, including permanent.
5. Bacteria-resistant and scratch-resistant surface.
6. Class A flame spread rating; Zone 4 earthquake compliant.
7. Dimensions: See drawings.

B. **Colors and Printing:**

1. Colors: Architect to select color from full range of manufacturer's colors.
2. Printing: ColorDrop™ proprietary direct-to-glass UV printing for custom graphics, logos, and patterns.
    - Guaranteed not to fade or discolor.
3. Finish Options: Magnetic and non-magnetic glass surfaces.

C. **Mounting System:**

1. Clarus TruMount™ patented, multi-directional, micro-adjustable hardware system.
2. Supports up to 6,500 pounds without structural blocking or reinforcement.
3. Channel and trim included for clean installation.

2.3 ACCESSORIES

A. Mounting channels, trims, and all fasteners required for complete installation.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verify wall surfaces are flat, plumb, smooth, and prepared for mounting.
B. Do not begin installation until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install glassboards in accordance with manufacturer's written instructions and approved shop drawings.
B. Secure TruMount™ hardware to substrate per manufacturer's requirements.
C. Set glass panels accurately, level, plumb, and true with uniform joints.
D. Protect exposed edges from damage during installation.

3.3 CLEANING AND PROTECTION

A. Clean glass and metal surfaces immediately after installation using manufacturer-approved cleaners.
B. Protect installed glassboards from damage until project completion.

END OF SECTION 10 11 00

SECTION 10 22 26 OPERABLE PARTITIONS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Electrically operated, continuously hinged partitions.
B. Related Sections include the following:
   1. Division 03 30 00 Section for concrete tolerances required.
   2. Division 05 Section 05 12 00 for primary structural support, including pre-punching of support members by structural steel supplier per operable partition supplier's template.
   3. Division 06 Section 06 10 00 for wood framing & supports, and all blocking at head and jambs as required.
   4. Division 09 Section 09 22 16 for wall and ceiling framing at head and jambs.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who is certified in writing by the operable partition manufacturer, as qualified to install the manufacturer's partition systems for work similar in material, design, and extent to that indicated for this Project.
B. Acoustical Performance: Test operable partitions in an independent acoustical laboratory in accordance with ASTM E90 test procedure and classified in accordance with ASTM E413 to attain no less than the STC rating specified. Provide a complete and unedited written test report by the testing laboratory upon request.
C. Preparation of the opening shall conform to the criteria set forth per ASTM E557 *Standard Practice for Architectural Application and Installation of Operable Partitions.*
D. The operable wall must be manufactured by a certified ISO-9001-2015 company or an equivalent quality control system.

1.4 REFERENCE STANDARDS

A. ASTM International
   1. ASTM E557 Standard Practice for Architectural Application and Installation of Operable Partitions.
   2. ASTM E90 - Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.
   3. ASTM C1036 - Standard Specification for Flat Glass.
   4. ASTM C1048 - Heat-Treated Flat Glass—Kind HS, Kind FT Coated and Uncoated Glass.
   5. ASTM E84 - Surface Burning Characteristics of Building Materials.
   6. ASTM E413 - Classification for Rating Sound Insulation
B. Health Product Declaration Collaborative
   1. Health Product Declaration Open Standard v2.1
C. International Standards Organization
   1. ISO 14021 - Environmental Labels and Declarations - Self-Declared Environmental Claims (Type II Environmental Labeling).
   2. ISO 14025:2011-10, Environmental Labels and Declarations - Type III Environmental Declarations - Principles and Procedures.
   3. ISO 14040:2009-11, Environmental Management - Life Cycle Assessment - Principles and Framework.
   4. ISO 14044:2006-10, Environmental Management - Life Cycle Assessment - Requirements and Guidelines.

5. ISO 21930 – Sustainability in Buildings and Civil Engineering Works — Core Rules for Environmental Product Declarations of Construction Products and Services.

D. Other Standards
   1. ADA – Americans with Disabilities Act.
   2. UL 508A – Standard for Industrial Control Panels
   3. NFPA 70 – National Electrical Code
   4. ANSI Z97.1 - Safety Glazing Materials Used in Buildings.
   5. CPSC 16 CFR 1201 - Safety Standard for Architectural Glazing Materials.
   6. NEMA LD3 - High Pressure Decorative Laminates.

1.5 SUBMITTALS

A. Product Data: Material descriptions, construction details, finishes, installation details, and operating instructions for each type of operable partition, component, and accessory specified.
B. Shop Drawings: Show location and extent of operable partitions. Include plans, elevations, sections, details, attachments to other construction, and accessories. Indicate dimensions, weights, conditions at openings, and at storage areas, and required installation, storage, and operating clearances. Indicate location and installation requirements for hardware and track, including floor tolerances required and direction of travel. Indicate blocking to be provided by others.
C. Setting Drawings: Show imbedded items and cutouts required in other work, including support beam punching template.
D. Samples: Color samples demonstrating full range of finishes available by architect. Verification samples will be available in same thickness and material indicated for the work.
E. Reports: Provide a complete and unedited written sound test report indicating test specimen matches product as submitted.
F. Create spaces that are healthy for occupants.
   1. Furnish products and materials with Health Product Declaration (HPD), Manufacturer Inventory, or other material health disclosure documentation. Products without an HPD or other disclosure documentation are not acceptable.
G. Furnish materials that generate the least amount of pollution.
   1. Furnish products and materials that have third party verified environmental product declarations (EPD's). Consider products and materials that have optimized environmental performance (reduced life cycle impacts). Products without an EPD or other disclosure documentation are not acceptable.
H. Buy American: Folding door to be manufactured in the United States in compliance with applicable U.S. Federal Trade Commission (FTC) and U.S. Customs Service and Border Protections regulations and be labeled "Made in America".

1.6 DELIVERY, STORAGE, AND HANDLING

A. Clearly mark packages and panels with numbering systems used on Shop Drawings. Do not use permanent markings on panels.
B. Protect panels during delivery, storage, and handling to comply with manufacturer's direction and as required to prevent damage.

1.7 WARRANTY

A. Provide written warranty by manufacturer of operable partitions agreeing to repair or replace any components with manufacturing defects.
B. Warranty period: Two (2) years.
C. Suspension System Warranty:
   1. OP-01: Ten (10) years.

PART 2 – PRODUCTS

2.1 MANUFACTURERS, PRODUCTS, AND OPERATION

A. Manufacturers: Subject to compliance with requirements, provide product by the following:
   1. Modernfold, Inc.or approved equal.
B. Doors to be manufactured in the U.S.A.
C. Products: Subject to compliance with the requirements, provide the following product:
   1. OP-01: Acousti-Seal Legacy - Electric Panel: Electrically operated continuously hinged operable partition.

2.2 OPERATION

A. OP-01: Acousti-Seal Legacy - Electric Panel: Series of continuously hinged flat panels, electrically operated, top supported with operable floor seals.
B. Final Closure:
   1. OP-01: Side Jamb with overlapping trail panel with "Modernfold Presto Automation Package". (For complete specification see Presto Package brochure Form #2514)
C. Partition shall be operated by:
   1. OP-01: Modernfold Presto ® Automation Package with Touch Screen Operator Control Station by Modernfold, Inc.
D. Electric motor shall consist of:
   1. OP-01: A 208-volt, 3-phase

2.3 PANEL CONSTRUCTION

A. OP-01: Nominal 3-inch (76mm) thick panels in manufacturer's standard 48-inch (1220mm) widths. All panel horizontal and vertical framing members fabricated from minimum 16-gage formed steel with overlapped and welded corners for rigidity. Top channel is reinforced to support suspension system components. Frame is designed so that full vertical edges of panels are of formed steel and provide concealed protection of the edges of the panel skin.
B. Panel skin shall be:
   1. OP-01: Roll-formed steel wrapping around panel edge. Panel skins shall be lock formed and welded directly to the frame for unitized construction. Acoustical ratings of panels with this construction minimum:
      a. 52 STC
C. Hinges for Panels, Closure Panels, Pass Doors, and Pocket Doors shall be:
   1. OP-01: Full leaf butt hinges, attached directly to the panel frame with welded hinge anchor plates within panel to further support hinge mounting to frame. Lifetime warranty on hinges. Hinges mounted into panel edge or vertical astragal are not acceptable.
D. Panel Trim: No vertical trim required or allowed on edges of panels; minimal groove appearance at panel joints.
E. Panel Weights:
   1. OP-01: 52 STC - 11 lbs./square foot

2.4 PANEL FINISH

A. Panel finish shall be:
   1. OP-01: Wall covering and upholstery fabric with surface treatment to resist stains.
B. Panel Trim: Exposed panel trim of one consistent color:
   1. OP-01: by Architect.

2.5 SOUND SEALS

A. Vertical Interlocking Sound Seals between panels: Roll-formed steel astragals, with reversible tongue and groove configuration in each panel edge for universal panel operation. Rigid plastic or aluminum astragals or astragals in only one panel edge are not acceptable.

B. Horizontal Top Seals: Continuous contact extruded vinyl bulb shape with pairs of non-contacting vinyl fingers to prevent distortion without the need for mechanically operated parts.
C. Horizontal bottom floor seals shall be:
   1. OP-01: Modernfold IA2 Bottom seal. Automatic operable seals providing nominal 2-inch (51mm) operating clearance with an operating range of +0.50-inch (13mm) to -1.50-inch (38mm) which automatically drop as panels are positioned, without the need for tools or cranks.

2.6 SUSPENSION SYSTEM

A. OP-01: #14 Suspension System
   1. Suspension Tracks: Minimum 7-gauge, 0.18-inch (4.57mm) roll formed steel. Static loading of track with brackets at 48-inch (1220mm) centers shall show no failure of track or brackets at 5,000 pounds (2550kg) point loading at mid-span. Track shall be supported by adjustable steel hanger brackets connected to structural support pairs of 0.50-inch (13mm) diameter threaded rods. Brackets must support the load bearing surface of the track.
      a. Exposed track soffit: Steel, removable for service and maintenance, attached to track bracket without exposed fasteners, and pre-painted off-white.

2.7 OPTIONS

A. "Presto" Safety Components:
   1. OP-01: Presto Safety Nose (wireless) – High sensitivity pressure leading edge requiring no more than 2.2 lb. of pressure to stop partition movement in case of obstruction. Lead sensors requiring hard wiring through partition system or requiring more than 2.2 lb. of pressure for activation are not acceptable. Sensing edge to be housed in fluid resistant housing and set in snap in channel for easy maintenance and be provided with 4-lead fail-safe wiring.
   2. OP-01: Presto Safety Mats – Located at panel storage area. Personnel sensing switch mat shall activate with the presence of a minimum 22 lb. obstruction in the stack area and prevent panels from stacking until the personnel/obstruction is removed. Mats shall be provided with 4-lead fail-safe wiring.
   3. OP-01: Presto Vision (PIR/Microwave Detector) – Wall or ceiling mounted motion sensors covering the travel area of the automated partition shall automatically stop the movement of the panels in the presence of unauthorized movement or obstruction. Detector can detect motion in an area up to 300 ft. (91M) long by 7.5 ft. (2.3M) wide and 10 ft. (3M) high.
   4. OP-01: Modernfold Presto ® Automation Package (see supplement specification "Modernfold Presto ® Automation Package For Acousti-Seal Encore Automated Wall System"
B. Available accessories/options:
   1. OP-01: Pocket Doors: Acousti-Seal Pocket Doors by Modernfold, Inc. Equipped with electric interlock system. (see supplement specification)
      a.

PART 3 – EXECUTION

3.1 INSTALLATION

A. General: Comply with ASTM E557, operable partition manufacturer's written installation instructions, Drawings and approved Shop Drawings.
B. Install operable partitions and accessories after other finishing operations, including painting have been completed.
C. Match operable partitions by installing panels from marked packages in numbered sequence indicated on Shop Drawings.
D. Broken, cracked, chipped, deformed or unmatched panels are not acceptable.

3.2 CLEANING AND PROTECTION

A. Clean partition surfaces upon completing installation of operable partitions to remove dust, dirt, adhesives, and other foreign materials according to manufacturer’s written instructions.
B. Provide final protection and maintain conditions in a manner acceptable to the manufacturer and Installer that ensure operable partitions are without damage or deterioration at time of Substantial Completion.

3.3 ADJUSTING

A. Adjust operable partitions to operate smoothly, easily, and quietly, free from binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Lubricate hardware and other moving parts.

3.4 EXAMINATION

A. Examine flooring, structural support, and opening, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of operable partitions. Proceed with installation only after unsatisfactory conditions have been corrected.

3.5 DEMONSTRATION

A. Demonstrate proper operation and maintenance procedures to Owner's representative.
B. Provide Operation and Maintenance Manual to Owner's representative.

SECTION 10 28 00 – TOILET ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Patient and Staff washroom accessories.
2. Patient shower room accessories.
3. Under lavatory guards.

B. Owner-Furnished Material: Soap dispensers, towel dispensers, waste receptacle and shower curtain

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include the following:

1. Construction details and dimensions.
2. Anchoring and mounting requirements, including requirements for cutouts in other work and substrate preparation.
3. Material and finish descriptions.
4. Features that will be included for Project.

B. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.

1. Identify locations using room designations indicated.
2. Identify products using designations indicated.

C. Maintenance Data: For toilet and bath accessories to include in maintenance manuals.

D. Warranty: Sample of special warranty.

1.4 QUALITY ASSURANCE

A. Source Limitations: For products listed together in the same Part 2 articles, obtain products from single source from single manufacturer.

1.5 COORDINATION

A. Coordinate accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of accessories.

B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

1.6 WARRANTY

A. Special Mirror Warranty: Manufacturer's standard form in which manufacturer agrees to replace mirrors that develop visible silver spoilage defects and that fail in materials or workmanship within specified warranty period.

1. Warranty Period: 15 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Stainless Steel: ASTM A 666, Type 304, 0.031-inch (0.8-mm) minimum nominal thickness unless otherwise indicated.

B. Brass: ASTM B 19, flat products; ASTM B 16/B 16M, rods, shapes, forgings, and flat products with finished edges; or ASTM B 30, castings.

C. Steel Sheet: ASTM A 1008/A 1008M, Designation CS (cold rolled, commercial steel), 0.036-inch (0.9-mm) minimum nominal thickness.

D. Galvanized-Steel Sheet: ASTM A 653/A 653M, with G60 (Z180) hot-dip zinc coating.

E. Galvanized-Steel Mounting Devices: ASTM A 153/A 153M, hot-dip galvanized after fabrication.

F. Fasteners: Screws, bolts, and other devices of same material as accessory unit and tamper-and-theft resistant where exposed, and of galvanized steel where concealed.

G. Chrome Plating: ASTM B 456, Service Condition Number SC 2 (moderate service).

H. Mirrors: ASTM C 1503, Mirror Glazing Quality, clear-glass mirrors, nominal 6.0 mm thick.

I. ABS Plastic: Acrylonitrile-butadiene-styrene resin formulation.

2.2 PATIENT AND STAFF WASHROOM ACCESSORIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following

B. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Bobrick Washroom Equipment, Inc.
2. A & J Washroom Accessories, Inc.
3. American Specialties, Inc.
4. Bradley Corporation.

C. Standard Grab Bar

1. Basis of Design Product: Bobrick B-6806 99 x 36", 48" and 18"
2. Mounting: Flanges with concealed fasteners
3. Material: Stainless Steel 0.05 inch thick
   a. Finish: Smooth No 4 finish (satin) on ends and slip resistant texture in grip area
4. Outside diameter: 1-1/2: inches
5. Configuration and length: As indicated on drawings

D. Bariatric Grab: Custom fabrication as indicated on drawings and as follows:

1. Location: Bariatric Toilet Room 241
2. Mounting: flanges with concealed fasteners
3. Material: Stainless steel 0.05 inch thick
   a. Finish: Smooth No 4 finish (satin) on ends and slip resistant texture in grip area
4. Outside diameter: 1-1/2: inches
5. Configuration and length: As indicated on drawings

E. Mirror

1. Basis of Design Product: Bobrick B-290
2. Welded frame.
3. Hangers: Produce rigid, tamper-and theft-resistant installation, using method indicated below
   a. One-piece, galvanized steel, wall hanger device with spring action locking mechanism to hold mirror unit in position with no exposed screws or bolts
   b. Wall bracket of galvanized steel, equipped with concealed locking devices requiring a special tool to remove
4. Size: 24"W x 36"H

F. Sanitary Napkin Disposal

1. Basis of Design: Bobrick B-270
2. Size: 7-1/2" x 10" x 3-13/16"
3. Material: 22-gauge, type-304 stainless steel with satin finish; all-welded construction

2.3 PATIENT SHOWER ROOM ACCESSORIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following

B. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Bobrick Washroom Equipment, Inc.

2. A & J Washroom Accessories, Inc.
3. American Specialties, Inc.
4. Bradley Corporation.

C. Shower Curtain Rod

1. Description: 1-inch (25.4-mm) OD; fabricated from nominal 0.0375-inch- (0.95-mm-) thick stainless steel
2. Location: Patient Shower & Toilet Room 319
3. Mounting Flanges: Stainless-steel flanges designed for exposed fasteners
4. Finish: No. 4 (satin)

D. Folding Shower Seat

1. Basis-of-Design Product: Bobrick B5191
2. Configuration: Compact design
3. Seat: Phenolic or polymeric composite of slat-type or one-piece construction in color as selected by Architect]
4. Location: Patient Shower & Toilet Room 324A
5. Mounting Mechanism: Stainless steel, No. 4 finish (satin)]
6. Dimensions: 18”W x 16”D, 5-1/2” from wall when in folded position, mounting height between 17”-19”

2.4 OTHER ACCESSORIES

A. Recessed Specimen Pass-Through Cabinet

1. Basis of Design: B-50516.
2. Size: 10”x12”.
3. Location: Patient Toilet Room 207A
4. Mounting Height: Refer to drawings.
5. Materials: 20 gauge, type 304 satin stainless steel all-welded construction

B. Specimen Shelf

1. Basis of Design: Bobrick B-295
2. Size: 16” x 5”
3. Location: Patient Toilet Room 207A
4. Mounting Height: Refer to drawings.
5. Material: 18-gauge, type 304 satin stainless steel.
6. Edges: ¾” return edges.
7. Blocking: Provide in-wall wood blocking per manufacturer’s instructions.

2.5 UNDERLAVATORY GUARDS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following

B. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:

1. Plumberex Specialty Products, Inc.
2. Truebro by IPS Corporation.

C. Under Lavatory Guard

1. Retain "Basis-of-Design Product" Subparagraph below if applicable. Coordinate with specification method retained above.

2. Description: Insulating pipe covering for supply and drain piping assemblies that prevent direct contact with and burns from piping; allow service access without removing coverings.
3. Material and Finish: Antimicrobial, molded plastic, white.

2.6 FABRICATION

A. General: Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full-length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.

B. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six (6) keys to Owner's representative.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.

B. Standard Grab Bars: Install to withstand a downward load of at least 250 lbf (1112 N), when tested according to ASTM F 446.

3.2 ADJUSTING AND CLEANING

A. Adjust accessories for unencumbered, smooth operation. Replace damaged or defective items.

B. Remove temporary labels and protective coatings.

C. Clean and polish exposed surfaces according to manufacturer's written recommendations.

END OF SECTION

SECTION 104413 - FIRE EXTINGUISHER CABINETS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Fire protection cabinets for the following:

a. Portable fire extinguishers.

B. Related Sections:
1. Division 10 Section 10 44 16 "Fire Extinguishers."

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for fire protection cabinets.

1. Fire Protection Cabinets: Include roughing-in dimensions, details showing mounting methods, relationships of box and trim to surrounding construction, door hardware, cabinet type, trim style, and panel style.

B. Product Schedule: For fire protection cabinets. Coordinate final fire protection cabinet schedule with fire extinguisher schedule to ensure proper fit and function.

1.4 QUALITY ASSURANCE

A. Fire-Rated, Fire Protection Cabinets: Listed and labeled to comply with requirements in ASTM E 814 for fire-resistance rating of walls where they are installed.

1.5 COORDINATION

A. Coordinate size of fire protection cabinets to ensure that type and capacity of fire extinguishers indicated are accommodated.

B. Coordinate sizes and locations of fire protection cabinets with wall depths.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.

B. Stainless-Steel Sheet: ASTM A 666, Type 304.

C. Transparent Acrylic Sheet: ASTM D 4802, Category A-1 (cell-cast sheet), 3 mm thick, with Finish 1 (smooth or polished)

2.2 FIRE PROTECTION CABINET

A. Cabinet Type:

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following]:

   a. No SS2409- R3 by Larsen's Manufacturing Company;
   b. No 7052-DV by Potter Roemer LLC;

B. Cabinet Construction: Nonrated and rated if applicable

1. Fire-Rated Cabinets: Construct fire-rated cabinets with double walls fabricated from 0.0428-inch- (1.1-mm-) thick, cold-rolled steel sheet lined with minimum 5/8-inch- (16-mm-) thick, fire-barrier material. Provide factory-drilled mounting holes.

C. Cabinet Material: Aluminum sheet.

1. Shelf: Same metal and finish as cabinet.

D. Recessed Cabinet: Cabinet box recessed in walls of sufficient depth to suit style of trim indicated; with one-piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (backbend). Provide where walls are of insufficient depth for recessed cabinets but are of sufficient depth to accommodate semirecessed cabinet installation.

1. Rolled-Edge Trim: 4-inch (102-mm backbend depth.

E. Door Material: Aluminum sheet

F. Door Style: Full panel.

G. Door Glazing:

1. Clear tempered safety glass. .

H. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.

1. Provide recessed door pull and friction latch

2. Door Lock: Cam lock that allows door to be opened during emergency by pulling sharply on door handle
3. Provide concealed hinge of same material permitting door to open 180 degrees.

I. Accessories:

1. Mounting Bracket: Manufacturer's standard steel, designed to secure fire extinguisher to fire protection cabinet, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.
2. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location.

a. Identify fire extinguisher in fire protection cabinet with the words "FIRE EXTINGUISHER"

1) Location: Applied to cabinet door
2) Application Process: Die cut
3) Lettering Color: White.
4) Orientation: Vertical

J. Finishes:
1. Baked enamel, red.

2.3 FABRICATION

A. Fire Protection Cabinets: Provide manufacturer's standard box (tub) with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated.

1. Weld joints and grind smooth.
2. Provide factory-drilled mounting holes.
3. Prepare doors and frames to receive locks.
4. Install door locks at factory.

B. Cabinet Doors: Fabricate doors according to manufacturer's standards, from materials indicated and coordinated with cabinet types and trim styles selected.

1. Fabricate door frames with tubular stiles and rails and hollow-metal design, minimum 1/2 inch (13 mm) thick.
2. Fabricate door frames of one-piece construction with edges flanged.
3. Miter and weld perimeter door frames.

C. Cabinet Trim: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.

2.4 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces of fire protection cabinets from damage by applying a strippable, temporary protective covering before shipping.

C. Finish fire protection cabinets after assembly.

D. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.5 STAINLESS-STEEL FINISHES

A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.

B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.

1. Run grain of directional finishes with long dimension of each piece.
2. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
3. Directional Satin Finish: No. 4.
4. Dull Satin Finish: No. 6.
5. Reflective, Directional Polish: No. 7.
6. Mirrorlike Reflective, Nondirectional Polish: No. 8.

C. Bright, Cold-Rolled, Unpolished Finish: No. 2B.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for hose and cabinets to verify actual locations of piping connections before cabinet installation.

B. Examine walls and partitions for suitable framing depth and blocking where recessed cabinets will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare recesses for recessed fire protection cabinets as required by type and size of cabinet and trim style.

3.3 INSTALLATION

A. General: Install fire protection cabinets in locations and at mounting heights indicated or, if not indicated, at heights indicated below

1. Fire Protection Cabinets: 54 inches (1372 mm) above finished floor to top of cabinet.

3.4 ADJUSTING AND CLEANING

A. Remove temporary protective coverings and strippable films, if any, as fire protection cabinets are installed unless otherwise indicated in manufacturer's written installation instructions.

B. Adjust fire protection cabinet doors to operate easily without binding. Verify that integral locking devices operate properly.

C. On completion of fire protection cabinet installation, clean interior and exterior surfaces as recommended by manufacturer.

D. Touch up marred finishes, or replace fire protection cabinets that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by fire protection cabinet and mounting bracket manufacturers.

E. Replace fire protection cabinets that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

SECTION 10 44 16 - FIRE EXTINGUISHERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes portable, hand-carried fire extinguishers.

B. Related Sections:
   1. Division 10 Section "Fire Extinguisher Cabinets."

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include rating and classification, material descriptions, dimensions of individual components and profiles, and finishes for fire extinguisher.

B. Product Schedule: For fire extinguishers. Coordinate final fire extinguisher schedule with fire protection cabinet schedule to ensure proper fit and function.

C. Operation and Maintenance Data: For fire extinguishers to include in maintenance manuals.

D. Warranty: Sample of special warranty.

1.4 QUALITY ASSURANCE

A. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."

B. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.
   1. Provide fire extinguishers approved, listed, and labeled by FMG.

1.5 COORDINATION

A. Coordinate type and capacity of fire extinguishers with fire protection cabinets to ensure fit and function.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace fire extinguishers that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Failure of hydrostatic test according to NFPA 10.

b. Faulty operation of valves or release levers.

2. Warranty Period: Six years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PORTABLE, HAND-CARRIED FIRE EXTINGUISHERS

A. Fire Extinguishers: 10lb ABC Extinguisher

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Amerex Corporation.
   b. Ansul Incorporated; Tyco International Ltd.
   c. Badger Fire Protection; a Kidde company.
   d. Buckeye Fire Equipment Company.
   e. Fire End & Croker Corporation.
   f. J. L. Industries, Inc.; a division of Activar Construction Products Group.
   g. Kidde Residential and Commercial Division; Subsidiary of Kidde plc.
   h. Larsen's Manufacturing Company.
   i. Moon-American.
   j. Pem All Fire Extinguisher Corp.; a division of PEM Systems, Inc.
   k. Potter Roemer LLC.
   l. Pyro-Chem; Tyco Safety Products.
2. Valves: Manufacturer's standard.
3. Handles and Levers: Manufacturer's standard.
4. Instruction Labels: Include pictorial marking system complying with NFPA 10, Appendix B and bar coding for documenting fire extinguisher location, inspections, maintenance, and recharging.

B. Portable fire extinguisher in the Pool Mechanical Room.

1. In accordance with the requirements of NFPA 10, manual firefighting equipment in the form of portable water fire extinguishers of water hose reel stations shall be provided. The placement and use of multipurpose dry chemical extinguishers (Class A:B:C) is specifically prohibited in areas where oxidizers that can release chlorine are stored. The reaction between chlorine-containing oxidizers and the ammonium salts in the fire extinguishing agent may produce an explosive compound (NCl_3). Carbon dioxide or other agents that depend on their smothering action for effective use will be of no value in extinguishing fire involving oxidizers. Halon extinguishers should not be used on fires involving oxidizers because they may react with the oxidizer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine fire extinguishers for proper charging and tagging.

1. Remove and replace damaged, defective, or undercharged fire extinguishers.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install fire extinguishers in locations indicated and in compliance with requirements of authorities having jurisdiction.

END OF SECTION

SECTION 10 56 13 - METAL STORAGE SHELVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Four-post metal storage shelving.

B. Owner-Provided, Contractor-Installed Materials: Loose and miscellaneous storage items.

C. Related Sections:

1. Division 11 Section "Foodservice Equipment" for metal shelving in kitchen, pantry, and refrigerated spaces.
2. Division 11 Section "Library Stack Systems" for library shelving systems including cantilever-bracket shelving supported by wall-mounted standards.
3. Division 12 Section "Laboratory Casework" for metal shelving in laboratories.

1.3 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design metal storage shelving, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Structural Performance for Four-Post Metal Storage Shelving: Capable of withstanding the loads indicated according to MH 28.1.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, construction details, material descriptions, dimensions of individual components and profiles, and finishes for metal storage shelving.

B. Shop Drawings: For customized metal storage shelving. Include plans, elevations, sections, details, and attachments to other work. Include installation details of connectors, lateral bracing, and special bracing.

C. Samples for Initial Selection: For units with factory-applied color finishes. Include similar Samples of accessories involving color selection.

D. Samples for Verification: For the following components, of size indicated below:

1. Vertical Posts: 12 inches tall.
2. Shelves: Full size, but not more than 24 inches wide by 12 inches deep.
3. Connectors for Shelf to Post: Full size.
4. Shelf-Label Holders: Full size.

E. Product Schedule: For metal storage shelving.

F. Delegated-Design Submittal: For metal storage shelving indicated to comply with performance requirements, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

G. Qualification Data: For qualified Installer.

H. Product Certificates: For each type of metal storage shelving from manufacturer.

I. Maintenance Data: For metal storage shelving to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Source Limitations: Obtain metal storage shelving from single source from single manufacturer.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install metal storage shelving until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.7 COORDINATION

A. Coordinate sizes and locations of blocking and backing required for installation of metal storage shelving attached to wall and ceiling assemblies.

B. Coordinate locations and installation of metal storage shelving that may interfere with ceiling systems including lighting, HVAC, speakers, sprinklers, access panels, electrical switches or outlets, and floor drains.

1.8 EXTRA MATERIALS

A. Furnish extra materials from same production run that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Shelves: Full-size units equal to 5 percent of amount installed for each type indicated, but no fewer than five shelves.
2. Shelf-to-Post Connectors: Full-size units equal to 5 percent of amount installed for each type indicated, but no fewer than 10 connectors.
3. Shelf-Label Holders: Full-size units equal to 5 percent of amount installed for each type indicated, but no fewer than 10 holders.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.

B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.

C. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with **G60** zinc (galvanized) or **A60** zinc-iron-alloy (galvannealed) coating.

D. Steel Tubing: ASTM A 513, Type 2.

E. Steel Wire: ASTM A 899.

F. Floor Anchors: Galvanized-steel, post-installed expansion anchors, power-actuated fasteners or threaded concrete screws. Provide number per unit recommended by manufacturer unless additional anchors are indicated in calculations.

G. Wall Anchors: Manufacturer's standard, galvanized-steel anchors designed to secure metal storage shelving to adjacent wall. Provide one per shelving unit for each shelving unit adjacent to a wall unless additional anchors are indicated in calculations.

2.2 FOUR-POST METAL STORAGE SHELVING

A. Open Four-Post Metal Storage Shelving: Factory-formed, field-assembled, freestanding system, designed for shelves to span between and be supported by corner posts, with shelves adjustable over the height of shelving unit. Fabricate initial shelving unit with a post at each corner. Fabricate additional shelving units as add-on units, designed to share two corner posts with initial shelving unit. Provide fixed top and bottom shelves, adjustable intermediate shelves, and accessories indicated.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Hallowell; Division of List Industries, Inc.
    b. Lyon Workspace Products, LLC.
    c. Penco Products, Inc.

2. Load-Carrying Capacity per Shelf: 700 lb.
3. Posts: Fabricated from hot-rolled steel; in box shape; with perforations at 1-1/2 inches o.c. to receive shelf-to-post connectors.

    a. Steel Thickness, Nominal: 0.075 inch and as required for load-carrying capacity per shelf and number of shelves.
    b. Add-On Shelf Posts: Fabricated from hot-rolled steel, manufacturer's standard shape; perforated to match main posts and of same thickness.
    c. Post Base: Bolt leveler.

4. Bracing: Manufacturer's standard, single diagonal cross bracing at back; as required for stability, load-carrying capacity of shelves, and number of shelves.
5. Framed-Type Wire Shelves: Steel wire; with shelf frame fabricated from same material and with same finish as posts.
6. Shelf Quantity: Six shelves per shelving unit in addition to top and bottom shelf.
7. Shelf-to-Post Connectors: Adjustable compression clips.
8. Base: Open, with exposed post legs.
9. Overall Unit Width: 30 inches, unless otherwise indicated. Or, in lengths not evenly divisible by the above width, and roughly divisible by another standard width, use the appropriate width to fill the run.
10. Overall Unit Depth: 12 inches at all administration, classroom and front-of-house applications, 18 inches at all athletic applications, and 24 inches for all back-of-house and janitorial applications.
11. Overall Unit Height: 72 inches at all administration and classroom applications, 96 inches at all janitorial and back-of-house applications.
12. Accessories:

    a. Shelf Dividers: Fabricated from same material and with same finish as shelves; removable, sliding type. Provide at all office and administration applications.

b. Removable Bins: Fabricated from same material and with same finish as shelves; provide at all janitorial applications, at bottom shelf and sized to fit.
c. Shelf-Label Holders: Colored plastic, designed to clip onto front edge of shelf. At all administration and office applications.

13. Finish: Baked enamel or powder coat.

a. Color and Gloss: As selected by Architect from manufacturer's full range.

2.3 FABRICATION

A. Shop Fabrication: Prefabricate shelving components in shop to greatest extent possible to minimize field fabrication; temporarily preassemble shelving components where necessary to ensure that field-assembled components fit together properly. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

B. Fabricate metal storage shelving square and rigid, with posts plumb and true and shelves flat and free of dents or distortion. Fabricate connections to form a rigid structure, free of buckling and warping.

1. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges.
2. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Locate joints where least conspicuous.
3. Build in straps, plates, brackets, and other reinforcements as needed to support shelf loading.
4. Cut, reinforce, drill, and tap metal fabrications to receive hardware, fasteners, and similar items.

C. Form metal in maximum lengths to minimize joints. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.

D. Form edges and corners free of sharp edges or rough areas. Fold back and crimp exposed edges of unsupported sheet metal to form a 1/2-inch- wide hem on the concealed side; ease edges of metal plate to radius of approximately 1/32 inch. Shear and punch metals cleanly and accurately. Remove burrs.

E. Weld corners and seams continuously to develop strength, minimize distortion, and maintain the corrosion resistance of base metals. At exposed locations, finish welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface. Weld before finishing components to greatest extent possible. Remove weld spatter and welding oxides from exposed surfaces before finishing.

2.4 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.5 STEEL FINISHES

A. Surface Preparation: Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning" or SSPC-SP 8, "Pickling."

B. Baked-Enamel or Powder-Coat Finish: Manufacturer's standard baked-on finish consisting of prime coat and thermosetting topcoat. Comply with coating manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry thickness.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine floors for suitable conditions where metal storage shelving will be installed.

C. Examine walls and ceilings to which metal storage shelving will be attached for properly located blocking, grounds, or other solid backing for attachment of support fasteners.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Vacuum finished floor and wet mop resilient flooring over which metal storage shelving is to be installed.

3.3 INSTALLATION

A. Install metal storage shelving level, plumb, square, rigid, true, and with shelves flat and free of dents or distortion. Make connections to form a rigid structure, free of buckling and warping.

1. Install exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible.
2. Install braces, straps, plates, brackets, and other reinforcements as needed to support shelf loading and as required for stability.
3. Adjust post-base bolt leveler to achieve level and plumb installation.
4. Anchor shelving units to floor with floor anchors through floor plate. Shim floor plate to achieve level and plumb installation.
5. Connect side-to-side and back-to-back shelving units together.
6. Install shelves in each shelving unit at spacing indicated on Drawings or, if not indicated, at equal spacing.

    a. Four-Post Metal Storage Shelving: Install four clips, one at each post, for support of each shelf; with clips fully engaged in post perforations.

B. Accessories:

1. Shelf Dividers: Install full-height dividers per shelf.
2. Bins: Install two per bottom shelf in all janitorial applications.
3. Shelf-Label Holders: Install one on each shelf, vertically aligned within each shelving unit.

3.4 ERECTION TOLERANCES

A. Erect four-post metal storage shelving to a maximum tolerance from vertical of **1/2 inch** in up to **10 feet** of height, not exceeding **1 inch** for heights taller than **10 feet**.

3.5 ADJUSTING

A. Adjust metal storage shelving so that connectors and other components engage accurately and securely.

B. Adjust and lubricate operable components to operate smoothly and easily, without binding or warping. Check and readjust operating hardware.

C. Touch up marred finishes or replace metal storage shelving that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by metal storage shelving manufacturer.

D. Replace metal storage shelving that has been damaged or has deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION 10 56 13

SECTION 107113: EXTERIOR SUN CONTROL DEVICES

GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section covers Kawneer Aluminum Sunshade Systems, including accessories, mountings, and shims. Sunshades are anchored directly to the vertical and/or horizontal mullions.

B. Types of Kawneer Sunshades include:
   1. Versoleil® SunShade Horizontal Single Blade System compatible with:
      a. 1600 Wall System®1 Curtain Wall System

1.3 DEFINITIONS

A. For fenestration industry standard terminology and definitions, refer to the Fenestration & Glazing Industry Alliance (FGIA) Glossary (AAMA AG-13).

1.4 PERFORMANCE REQUIREMENTS

A. Structural Performance:
   1. Combined load on sunshade configurations to be determined in accordance with ASCE 7 or applicable code requirements. Combined load consists of wind, snow and ice loads.
   2. Design sunshade configurations to withstand stresses due to combined load. Stresses resulting from thermal expansion/contraction, shall not cause permanent deformation of sunshade assemblies or disengagement from the glazed system.
   3. The assembled sunshade shall be capable of supporting the specified combined load without damage, permanent deformation, or disengagement from the glazed system mullion.
   4. Blade deflection shall not exceed L/120 of span length.
   5. Submit test reports verifying compliance with each test requirement required by the project.

B. Shading Performance:
   1. Design pressures shall comply with ASCE 7-16 for Risk Category III (if applicable), Exposure C, and a basic wind speed of 140 mph, in accordance with IBC as adopted by the Louisiana State Uniform Construction Code Council for Houma, LA.
   2. Attachment to curtain wall mullions must not compromise the integrity of the hurricane-impact-resistant curtain wall system.

C. Thermal Movements: Allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures.
   1. Temperature Change (Range): 120 deg F (49 deg C), ambient; 180 deg F (82 deg C), material surfaces.

D. Environmental Product Declaration (EPD): Shall have a Type III Product-Specific EPD.

1.5 SUBMITTALS

A. Product Data:
   1. For each type of product indicated, include:
      a. Construction details
      b. Material descriptions
      c. Dimensions of individual components and profiles
      d. Finishes
      e. Provide documentation that aluminum has a minimum of 50% mixed pre- and post-consumer recycled content.

B. Shop Drawings:
   1. Plans
   2. Elevations
   3. Sections
   4. Blade angles
   5. Blade spacing
   6. Attachments to other compatible systems work

C. Samples for Initial Selection:
   1. Provide samples for units with factory-applied color finishes.
   2. Provide samples of hardware and accessories involving color selection.

D. Samples for Verification:
   1. Provide a verification sample for each type of exposed finish required, in manufacturer's standard sizes.
   2. Optimize Energy Performance: Provide information confirming that products contribute to increasing levels of energy performance above the baseline in the prerequisite standard to reduce environmental and economic impacts associated with excessive energy use.
   3. Daylighting 75 percent of Spaces: Provide information confirming that products provide the building occupants a connection between indoor spaces and the outdoors through the introduction of daylight and views into the regularly occupied areas of the building.

1.6 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Installer must have successfully installed the same or similar systemsrequired for the project and other projects of similar size and scope.

B. Manufacturer Qualifications:

C. Source Limitations:
   1. Obtain aluminum exterior sunshades and glazed aluminum curtain walls and storefront system through one source from a single manufacturer.

D. Product Options:
   1. Information on drawings and in specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction.
   2. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

E. Mockups:
   1. Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

F. Pre-installation Conference:
   1. Conduct conference at project site to comply with requirements in Division 01 Project Management and Coordination Section.

1.7 PROJECT CONDITIONS

A. Field Measurements:
   1. Verify actual locations of structural supports for sunshades by field measurements before fabrication.
   2. Indicate measurements on shop drawings.

1.8 WARRANTY

A. Submit manufacturer's standard warranty for owner's acceptance.

B. Warranty Period:
   1. Two years from Date of Substantial Completion of the project provided however that in no event shall the Limited Warranty begin later than six months from date of shipment by manufacturer.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product:
   1. Kawneer Company, Inc.
      a. Versoleil® Single Blade Horizontal Sunshade or approved equal

2.2 MATERIALS

A. Aluminum Extrusions:
   1. Alloy and temper recommended by glazed aluminum curtain wall and storefront manufacturer for strength, corrosion resistance, and application of required finish
   2. Not less than 0.070" (1.8 mm) wall thickness at any location for the main frame
   3. Complying with ASTM B221: 6063-T6 alloy and temper

B. Thermal Barrier:
   1. When applied on a thermally broken captured system, sunshade shall be thermally isolated from the interior aluminum mullions by a nominal 0.25" (6.3) thick low conductance material.

C. Aluminum Sheet Alloy:
   1. Shall meet the requirements of ASTM B209.

D. Sealant:
   1. For sealants required within fabricated sunshade system, provide permanently elastic, non-shrinking, and non-migrating type recommended by sealant manufacturer for joint size and movement.

E. Tolerances:
   1. References to tolerances for wall thickness and other cross-sectional dimensions of glazed curtain wall and storefront members are nominal and in compliance with AA Aluminum Standards and Data.

2.3 SUNSHADES

A. Sunshade Members:
   1. Manufacturer's standard extruded or formed-aluminum framing members of thickness and reinforced as required to support imposed loads.

B. Fasteners and Accessories:
   1. Nonmagnetic stainless steel to be non-corrosive and compatible with aluminum members, anchors, and other components.

C. Perimeter Anchors:
   1. When steel anchors are used, provide insulation between steel material and aluminum material to prevent galvanic action.

D. Packing, Shipping, Handling, and Unloading:
   1. Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.

E. Storage and Protection:
   1. Store materials so that they are protected from exposure to harmful weather conditions.
   2. Handle material and components to avoid damage.
   3. Protect material against damage from elements, construction activities, and other hazards before, during, and after installation.

2.4 ACCESSORY MATERIALS

A. Bituminous Paint:
   1. Cold-applied asphalt-mastic paint
   2. Complies with SSPC-Paint 12 requirements except containing no asbestos
   3. Formulated for 30-mil (0.762 mm) thickness per coat

2.5 FABRICATION

A. Extrude or form aluminum shapes before finishing.

B. Fabricate components that, when assembled, have the following characteristics:
   1. Profiles that are sharp, straight, and free of defects or deformations
   2. Accurately fitted joints that are flush, hairline, and weatherproof
   3. Physical and thermal isolation of glazing from framing members
   4. Accommodations for thermal and mechanical movements of glazing and framing that maintain required glazing edge clearances
   5. Fasteners, anchors, and connection devices that are concealed from view to the greatest extent possible

C. Sunshade:
   1. Fabricate components for assembly using manufacturer’s standard installation instructions.

D. After fabrication, clearly mark components to identify their locations in project according to shop drawings.

2.6 ALUMINUM FINISHES

A. Finish designations that are prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.

B. Factory Finishing:
   1. Finish for sunshades shall be **anodized aluminum, Class I clear (AA-M10C21A41 / AAMA 611)** to match curtain wall frame as shown in detail.
   2. All sunshade assemblies shall be finished to match Kawneer Permanodic® Color #14 Clear, unless otherwise noted.

PART 3 EXECUTION

3.1 EXAMINATION

A. With installer present, examine areas for compliance with requirements for installation tolerances and other conditions affecting performance of the work.

B. Proceed with installation only after correcting unsatisfactory conditions.

3.2 INSTALLATION

A. General:
   1. Comply with manufacturer's written instructions. Refer to installation instructions of the compatible curtain wall or storefront system.
   2. Do not install damaged components.
   3. Fit joints to produce hairline joints free of burrs and distortion.
   4. Rigidly secure non-movement joints.

5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.
6. Weld components in concealed locations to minimize distortion or discoloration of finish. Protect glazing surfaces from welding.
7. Seal joints watertight where shown on approved shop drawings and/or manufacturer's standard installation instructions.

B. Metal Protection:
1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape or installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Install components plumb and true in alignment with established lines and grades.

D. Separate aluminum and other corrodible surfaces from sources of corrosion or electrolytic action at points of contact with other materials.

E. Coordinate exact sunshade alignment with glass and curtain wall layout as shown in architectural elevations and detail drawings.

F. Ensure alignment with adjacent sunshades mounted on metal panels to maintain continuous visual datum

3.3 ADJUSTING, CLEANING, AND PROTECTION

A. Adjusting: Not applicable.

B. Protection:
1. Protect installed product’s finish surfaces from damage during construction.
2. Protect aluminum sunshade system from damage from grinding and polishing compounds, plaster, lime, acid, cement, or other harmful contaminants

C. Cleaning:
1. Repair or replace damaged installed products.
2. Clean installed products in accordance with manufacturer’s instructions prior to owner’s acceptance.
3. Remove and replace glass that has been broken, chipped, cracked, abraded, or damaged during the construction period.
4. Remove construction debris from project site and legally dispose of debris.

END OF SECTION 107113

DIVISION

11

EQUIPMENT

SECTION 11 66 23 - GYMNASIUM EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following gymnasium equipment:

1. Basketball equipment.
2. Volleyball equipment.
3. Safety pads.

B. Related Sections include the following:

1. Division 03 Section 03 30 00 "Cast-in-Place Concrete" for installation of floor insert sleeves to be cast in concrete slabs and footings.
2. Division 05 Section 05 12 00 "Structural Steel Framing" for basketball goal supports.

1.3 morotDEFINITIONS

A. FIBA: International Basketball Federation (Federation Internationale de Basketball Amateur).

B. FIVB: International Volleyball Federation (Federation Internationale de Volleyball).

C. IBF: International Badminton Federation.

D. NAGWS: The National Association for Girls and Women in Sport.

E. NCAA: The National Collegiate Athletic Association.

F. NFHS: The National Federation of State High School Associations.

G. USAV: USA Volleyball.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

1. If applicable, include assembly, disassembly, and storage instructions for removable equipment.

B. Shop Drawings: For gymnasium equipment. Include plans, elevations, sections, details, attachments to other work, and the following:

1. Method of field assembly for removable equipment, connections, installation details, mountings, floor inserts, attachments to other work, and operational clearances.
2. Transport and storage accessories for removable equipment.

C. Structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation including loads, point reactions, and locations for attachment of gymnasium equipment to structure.

D. Coordination Drawings: Court layout plans, drawn to scale, and coordinating floor inserts, game lines, and markers applied to finished flooring.

E. Samples for Initial Selection: For each type of gymnasium equipment indicated.

F. Samples for Verification: For the following products:

1. Basketball and volleyball Net: Full size.
2. Volleyball Floor Insert: Full-size unit.
3. Volleyball Post Standard: Full-size unit with net tensioner.
4. Pad Fabric: Not less than 3 inches square, with specified treatments applied. Mark face of material.

G. Product Certificates: For each type of gymnasium equipment, signed by product manufacturer.

H. Qualification Data: For Installer and professional engineer.

I. Operation and Maintenance Data: For gymnasium equipment to include in emergency, operation, and maintenance manuals.

J. Warranty: Special warranty specified in this Section.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Fabricator of products .

B. Source Limitations: Obtain each type of gymnasium equipment through one source from a single manufacturer.

C. Composite Wood Products: Made without urea formaldehyde.

D. All welding to be performed by personnel having passed Welder Qualification testing in accordance with American Welding Society (AWS) code D1.1 or higher. Manufacturer to provide certification and test results upon request.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not install gymnasium equipment until spaces are enclosed and weatherproof, wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

B. Field Measurements: Verify position and elevation of floor inserts and layout for gymnasium equipment.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Provide volleyball floor sleeves, covers and floor inserts in accordance with requirements of related trades that are responsible for installation. Do not deliver balance of athletic equipment until building is enclosed and other construction within gymnasium is substantially complete.

1.8 COORDINATION

A. Coordinate installation of floor inserts with structural floors and finish flooring installation and with court layout and game lines and markers on finish flooring.

B. Coordinate layout and installation of overhead-supported gymnasium equipment and suspension system components with other construction including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

1.9 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of gymnasium equipment which fail in materials or workmanship within specified warranty period.

1. Warranty Period: 10 years from date of Substantial Completion, unless specifically stated in product descriptions.

B. Basketball Goal Warranty: Backstop support structures including clamps, fittings and tube.

1. Warranty Period: 25 years form date of Substantial Completion.

C. Basketball Backboard Warranty: Mounted on proprietary fittings.

1. Warranty Period: Lifetime of Building.

D. Goal Warranty:

1. Warranty Period: Three years

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

1. Extruded Bars, Profiles, and Tubes: ASTM B 221.
2. Cast Aluminum: ASTM B 179.
3. Flat Sheet: ASTM B 209.

B. Steel: Comply with the following:

1. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
2. Steel Tubing: ASTM A 500 or ASTM A 513, cold formed.
3. Steel Sheet: ASTM A 1011/A 1011M.

C. Support Cable: Manufacturer's standard galvanized steel aircraft cable with a breaking strength of 7000 lb. Provide fittings complying with cable manufacturer's written instructions for size, number, and method of installation.

D. Support Chain and Fittings: Grade 80 hardened alloy steel chain rated for overhead lifting, ASTM A 391/A 391M, with commercial-quality, hot-dip galvanized steel connectors and hangars.

E. Castings and Hangers: Malleable iron, ASTM A 47/A 47M, grade required for structural loading.

F. Softwood Plywood: DOC PS 1, exterior.

G. Particleboard: ANSI A208.1, made with adhesive containing no urea formaldehyde.

H. Equipment Wall-Mounting Board: Wood, transparent painted finish, size, and quantity as required to mount gymnasium equipment according to manufacturer's written instructions.

I. Anchors, Fasteners, Fittings and Hardware: Manufacturer's standard corrosion-resistant or noncorrodible units; concealed; tamperproof, vandal- and theft-resistant design.

J. Grout: Nonshrink, nonmetallic, premixed, factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107 with minimum strength recommended in writing by gymnasium equipment manufacturer.

2.2 BASKETBALL EQUIPMENT

A. Basis-of-Design Product: Subject to compliance with requirements, provide products by Draper Inc./Hahn Enterprises or a comparable product by one of the following:

1. Arizona Courtlines, Inc.
2. Institutional Products, Inc.
3. Jaypro Sports, LLC.
4. Porter Athletic Equipment Company.

B. General: Provide equipment complying with requirements in FIBA's "FIBA Basketball Rule Book**."**

C. Protruding fasteners or exposed bolt heads on front face of backboards are not permitted.

2.3 BASKETBALL BACKSTOPS

A. Basis-of-Design: Draper EZ FOLD Model TF-20-B, ceiling-suspended and forward folding. All proprietary names reference Draper, Inc. and the above mentioned product.

B. Description: Galvanized steel backstop with galvanized steel tube frame support structure.

C. Support Structure: Tetrahedral triangle support structure ~~with hinge for retraction of backboard~~ and goal not more than 15-inches from ceiling, and with side braces laterally bracing main stem connecting no higher than 4-feet 6-inches above goal.

1. Main Stem: Minimum 6-inches OD, 11-ga.
2. Stem Cross-Member: Minimum 4-inches OD, 11-ga.
3. Side Braces: 2-1/4 inches
4. Hinge: Minimum 1-1/4 inches solid steel pin turning in minimum ½-inch steel plate hangars.

    a. Design Load: 25,000-lbs
    b. Safety Factor: 55:1

D. Backstop: Rectangular frame of 1-1/2 inches OD galvanized steel tubing with galvanized steel cross-bracing matching main members, tied to roof via 4-inch OD 11 ga. steel tubing anchor to roof with heavy steel support hangers; hanger supports to be rated for 20,000 lbs. The superstructure shall be designed with a minimum attachment point safety factor of 75:1.

E. Rear Brace: Folding, jackknife type, fully adjustable and telescoping, self-locking in the down position and constructed of 2-1/4 inches OD 14-ga. steel tubing nested in 2-1/2 inches OD 13-ga. steel tubing.

F. Finish: Baked enamel or powder coat.

1. Color: As selected by Architect from Manufacturer's full range.

    a. sa

2. Fabrication: Mitered ends of the frame extrusions fit with a flush, plated steel gusset type mounting bracket on all four corners.

    a. Incorporate keyhole slots for mounting the backboard to the support structure at standard mounting centers.

3. Goal-Mounting Structure: Heavy-duty, formed steel assembly, secured to the lower horizontal frame member with minimal connection to the glass section; provide rigid thru-connection between front and back mounting plates, unitizing structure. Provide neoprene cushion between mounting plate and glass. Provide mounting holes for goal and braces as per NCAA rules (BR-73, D-5).

G. Safety Padding: Steel track-reinforced mold formed foam, bolted on to back-board edge; mold forming process should form external protective skin.

1. Basis-of-Design: Model 5032--; Bolt-on, by Draper, Inc. All proprietary names reference the above mentioned product.
2. Color: As selected by Architect from manufacturer's full line.

H. Goal: 18-inches diameter, breakaway rim of 5/8-inches diameter steel rod, conforming with NCAA specifications, rigidly braced with die-cut steel welded to underside of rim, positioned 6-inches from face of backstop.

1. Basis-of-Design: Model A0576 breakaway goal by Draper, Inc. All proprietary names reference the above mentioned product.
2. Breakaway Rim: Goal shall be designed to withstand shock loads due to player interface. The rim shall deflect down when a static load of 230 pounds is applied, returning to the playing position once removed. Goal shall be set at factory for proper flex and rebound requirements.
3. Mounting: With zinc-plated, heavy-duty steel mounting plate with mounting holes centered to match conventional 5-inches x 5-inches or 5-inches x 4-inches backboard mounting holes.
4. Net Mounting: Twelve "no tie" net attachment clips, welded to rim.
5. Finish: Baked enamel or powder-coat.

    a. Color: As selected by Architect from Manufacturer's full range.

2.4 VOLLEYBALL EQUIPMENT

A. General: Provide ~~2~~ 1 complete systems with nets.

B. General: Provide equipment complying with requirements in FIVB's "Official Volleyball Rules."

C. Basis-of-Design Product: Subject to compliance with requirements, provide Model 500001 PVS-01 by Draper, Inc. All model numbers and propriety names key into the manufacturer of the basis for design. Alternatively, provide a comparable product by one of the following:

1. Arizona Courtlines, Inc.
2. Institutional Products, Inc.
3. Porter Athletic Equipment Company.
4. Schelde.
5. Sports Import/Senoh.

D. General: Provide equipment complying with requirements in FIVB's "Official Volleyball Rules and NAGWS's "NAGWS Volleyball Rulebook.

E. Description: Standards of schedule 80 aluminum pipe, fitted telescope fashion and adjustable, complying FIVB, USVBA, NCAA and NFSHSA requirements.

1. Standards: 2-7/8 inches OD in 3-½ inches OD, with wall thicknesses of .276-inches and .300-inches respectively. Assemble to allow extension between 73-inches and 100-inches, in one-inch increments.
2. Tensioning: 4-inch pulley at each post, with power winch and matching adjustable cable anchor collar on opposite poles. Winch to be furnished with heavy-duty, self-locking worm gear mechanism, collapsing handle, and 2-inches nylon strapping.

F. Net: 32 feet long and as follows; 1 per pair of paired post standards:

1. Width and Mesh: 36 inches with 4-1/2-inch-square mesh made of black polyester string.

a. Hem Band Edges: White, 2-inch- wide top binding; black, 1-inch- wide bottom and side bindings; tie offs at top and bottom of each side end of net; and 1/4-inch-diameter rope, at least 42 feet long, threaded through top hem of binding.

2. Dowels: Not less than 1/2-inch-diameter fiberglass or 1-inch-diameter wood. Provide two dowels per net threaded through each side hem sleeve for straightening net side edges.
3. Net Antennas: 3/8-inch-diameter, high-tensile-strength, extruded fiberglass or plastic rods, 72 inches long, extending above top hem band of net, with alternating white and red bands according to competition rules. Provide two antennas per net.

a. Clamps: Designed to secure antenna to top and bottom of net.

4. Boundary Tape Markers: 2-inch- wide white strip with sleeve for securing net antenna, secured to net top and bottom with hook-and-loop attachment. Provide two tape markers per net for marking court boundaries.

G. Floor Insert: Aluminum floor plate; and steel pipe sleeve, concealed by floor plate, with capped bottom end, sized with ID to fit post standards, not less than 9 inches long to securely anchor pipe sleeve below finished floor in concrete footing; with anchors designed for securing floor insert to floor substrate indicated; one per post standard.

1. Floor Plate: Self-locking, hinged access cover, designed to be flush with adjacent flooring. Provide two tool(s) for unlocking access covers.

H. Storage Cart: Manufacturer's standard wheeled unit designed for transporting and storing volleyball equipment and passing through 36-inch- wide or wider door openings. Fabricate units of welded steel tubing with heavy-duty casters, including not less than two swivel casters. Fabricate wheels from materials that will not damage or mark floors; number of units as required to provide transport and storage for specified equipment.

I. Judges' Stands: Provide manufacturer's standard adjustable-height units designed to be freestanding, folding for storage. Fabricate units of welded steel tubing with finish and color to match post standards.

J. Safety Pads: Comply with NCAA and NFHS requirements. Provide pads consisting of not less than 1-inch-thick, manufacturer's standard foam filler covered by , manufacturer's standard Insert other fabric cover; with fire-test-response characteristics indicated, and lined with fire-retardant liner. Provide pads with hook-and-loop closure or attachments for the following components:

1. Post Standards: Wraparound style, designed to totally enclose each standard to a height of not less than 66 inches; 1 per post.
2. Net Lines: Four per net.
3. Fabric Cover Flame-Resistance Ratings: Passes NFPA 701.
4. Fabric Color: As selected by Architect from manufacturer's full range.

2.5 WALL SAFETY PADS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Arizona Courtlines, Inc.
2. Draper Inc.
3. Institutional Products, Inc.
4. Jaypro Sports, LLC.
5. Porter Athletic Equipment Company.

B. Safety Pad Surface-Burning Characteristics: ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 450 or less.

C. Pad Coverings: Provide safety pad fabric covering fabricated from puncture- and tear-resistant, not less than 14-oz./sq. yd PVC-coated polyester or nylon-reinforced PVC fabric treated with fungicide for mildew resistance; with surface-burning characteristics indicated, and lined with fire-retardant liner.

D. Wall Safety Pads: Padded wall wainscot panels designed to be attached in a continuous row; each panel section consisting of fill laminated to backer board with visible surfaces fully covered by seamless fabric covering, free of sag and wrinkles and firmly attached to back of backer board.

1. Backer Board: Not less than 3/8-inch- thick plywood, mat formed, or composite panel.
2. Fill: Multiple-impact-resistant foam not less than 2-inch- thick bonded polyurethane, 6.0-lb/cu. ft. density.
3. Size: Each panel section, 24 inches wide by not less than 72 inches long.
4. Number of Panel Sections: As indicated modular panel sections.
5. Installation Method: 1-inch top and bottom fabric attachment flange with exposed fasteners.
6. Fabric Covering Color(s): As selected by Architect from manufacturer's full range for two color(s).
7. Graphics: Custom graphics as indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for play court layout, alignment of mounting substrates, installation tolerances, and other conditions affecting performance.

1. Verify critical dimensions.
2. Examine supporting structure and subgrades, subfloors and footings below finished floor.
3. Examine wall assemblies, where reinforced to receive anchors and fasteners, to verify that locations of concealed reinforcements have been clearly marked. Locate reinforcements and mark locations.
4. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. General: Comply with manufacturer's written installation instructions and competition rules indicated for each type of gymnasium equipment. Complete equipment field assembly, where required.

B. Unless otherwise indicated, install gymnasium equipment after other finishing operations, including painting, have been completed.

C. Permanently Placed Gymnasium Equipment and Components: Rigid, level, plumb, square, and true; anchored securely to supporting structure; positioned at locations and elevations indicated on Shop Drawings; in proper relation to adjacent construction; and aligned with court layout.

1. Floor Insert Location: Coordinate location with application of game lines and markers, and core drill floor for inserts after game lines have been applied.
2. Floor Insert Elevation: Coordinate installed heights of floor insert with installation and field finishing of finish flooring and type of floor plate.
3. Operating Gymnasium Equipment: Verify clearances for movable components of gymnasium equipment throughout entire range of operation and for access to operating components.

D. Floor Insert Setting: Position sleeve in oversized, recessed voids in concrete slabs. Clean voids of debris. Fill void around sleeves with grout, mixed and placed to comply with grout manufacturer's written instructions. Protect portion of sleeve above subfloor and footing from splatter. Verify that sleeves are set plumb, aligned, and at correct height and spacing; hold in position during placement and finishing operations until grout is sufficiently cured. Set insert so top surface of completed unit is flush with finished flooring surface.

E. Wall Safety Pads: Mount with bottom edge at 4 inches above finished floor.

F. Anchoring to In-Place Construction: Use anchors and fasteners where necessary for securing built-in and permanently placed gymnasium equipment to structural support and for properly transferring load to in-place construction.

G. Removable Gymnasium Equipment and Components: Assemble in place to verify that equipment and components are complete and in proper working order. Instruct Owner's designated personnel in properly handling, assembling, adjusting, disassembling, transporting, storing, and maintaining units. Disassemble removable gymnasium equipment after assembled configuration has been approved by Owner, and store units in location indicated on Drawings.

3.3 ADJUSTING

A. Adjust movable components of gymnasium equipment to operate safely, smoothly, easily, and quietly, free from binding, warp, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Lubricate hardware and moving parts.

3.4 CLEANING

A. After completing gymnasium equipment installation, inspect components. Remove spots, dirt, and debris and touch up damaged shop-applied finishes according to manufacturer's written instructions.

B. Replace gymnasium equipment and finishes that cannot be cleaned and repaired, in a manner approved by Architect, before time of Substantial Completion.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain gymnasium equipment. Refer to Division 01 Section 01 79 00 "Demonstration and Training."

END OF SECTION 11 66 23

DIVISION

12

FURNISHINGS

SECTION 12 25 13 – WINDOW ROLLER SHADES

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Roller shades, motorized operation and accessories.
   1. Intelligent encoded electronic drive system.
   2. Motor controls, interfaces, and accessories.
   3. PoE motorized, sunscreen and blackout roller shades as applicable. Work includes local, group and master control systems for shade operation with addressable, DC motors, IP motor hubs, wall controllers, sensors, IP gateways, SAC Shade Controllers and associated software system.

B. Shade fabric.

1.2 RELATED SECTIONS

A. Section 06 10 00 - Rough Carpentry: Wood blocking and grounds for mounting roller shades and accessories.

B. Section 09 21 16 - Gypsum Board Assemblies: Coordination with gypsum board assemblies for installation of shade pockets, closures and related accessories.

C. Division 26 - Electrical: Electric service for motor controls. Electrical and low voltage requirements, internal communication, data transfer, and connection to the Internet and local PoE switches as required.

1.3 REFERENCES

A. ASTM International (ASTM):
   1. ASTM G21 and E 2180 - Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi.

B. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.
   2. NFPA 701 - Standard Methods of Fire Tests for Flame Propagation of Textiles and Films.

C. Underwriters Laboratories (UL):
   1. UL 325 - Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems; Current Edition, Including All Revisions.

D. Window Covering Manufacturers Association (WCMA):
   1. WCMA A100.1 - Safety of Window Covering Products; 2018.

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Where motorized shades are to be controlled by control systems provided under other sections, coordinate the work with other trades to provide compatible products.
2. Coordinate the work with other trades to provide rough-in of electrical wiring as required for installation of hardwired motorized shades.

B. Preinstallation Meeting: One week prior to commencing work related to this section. Require attendance of all affected installers.

C. Sequencing:
1. Do not fabricate shades until field dimensions for each opening have been taken with finished conditions in place. "Hold to" dimensions are not acceptable.
2. Do not install shades until final surface finishes and painting are complete.

1.5 SUBMITTALS

A. See Section 01 33 00 - for submittal procedures.

B. Bid Submittal: Information Required with Submittal of Bid: In order to evaluate proposals for integrated lighting control and window shade systems, the Architect requires the following information be submitted prior to the award of the system.
1. Bid proposal shall be accompanied with a document that notes all deviations from these specifications on a line-by-line basis.
2. If using PoE motors, bid shall confirm that PoE motor roller shade and all related controls shall be integrated into a compatible control system as specified herein.
3. If integrating into BAS/BMS system, bid shall include separate line items listing the control/interface components required for building automation systems and building management systems (BAS/BMS), daylighting, audiovisual, and/or central integration systems. Roller shade controls manufacturer shall list all components included in their bid and shall include a letter stating that they shall be financially responsible for any change orders and/or back charges required by the BAS/BMS, audiovisual, or lighting control systems contractors to interface with the motorized roller shade system.

C. Product Data: Manufacturer's catalog pages and data sheets for products specified including materials, finishes, dimensions, profiles, mountings, and accessories.
1. Preparation instructions and recommendations.
2. Styles, material descriptions, dimensions of individual components, profiles, features, finishes , accessories, and operating instructions.
3. Storage and handling requirements and recommendations.
4. Mounting details and installation methods.
5. Manufacturer's Instructions: Include storage, handling, protection, examination, preparation, and installation.
6. Project Record Documents: Record actual locations of control system components and show interconnecting wiring.
7. Motorized Shades: Power requirements. Typical wiring diagrams including integration of EDU controllers with building management system, audiovisual and lighting control systems as applicable.
    a. If using PoE motors, include integration of PoE motor hubs, shade motors, wall controllers, software programming, ability to integrate with building management system, audiovisual and lighting control systems as applicable.

D. Shop Drawings: Plans, elevations, sections, product details, installation details, operational clearances, wiring diagrams and relationship to adjacent work.

1. Prepare shop drawings using base sheets provided electronically by the Architect.
2. Prepare control wiring diagrams based on zones, switching and operational requirements provided by the Architect in electronic format.
3. Include one-line diagrams, wire counts, coverage patterns, and physical dimensions of each item.
4. Provide location plan showing all motor locations, switch locations and control zones as per the performance requirements of the specifications. All switches, sensors and other control accessories must clearly be shown and called out in a bill of materials.
5. Provide elevation drawings showing shade band layout. Indicate any necessary seam or batten locations and align with horizontal mullions where possible.

A. Window Treatment Schedule: For all roller shades. Use same room designations as indicated on the Drawings and include opening sizes and key to typical mounting details.

B. Verification Samples: For each finish product specified, one complete set of shade components, unassembled, demonstrating compliance with specified requirements.
6. Shadecloth Sample: Mark face of material to indicate interior faces.
   a. Test reports indicating compliance with specified fabric properties.
   b. Verification Samples: 6 inches (150 mm) square, representing actual materials, color and pattern.

C. Warranty: Provide manufacturer's warranty documents as specified in this Section.

1.6 QUALITY ASSURANCE

A. Product Listing Organization Qualifications: An organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

B. Manufacturer Qualifications: Obtain roller shades system through one source from a single manufacturer with a minimum of ten years experience and minimum of five projects of similar scope and size in manufacturing products comparable to those specified in this section.

C. Installer for Roller Shade System - Qualifications: Installer trained and certified by the manufacturer with a minimum of ten years experience in installing products comparable to those specified in this section.
1. Requirements for Roller Shade Installer/Contractor:
   a. Roller Shade Hardware, shade fabric, motor, and all related controls shall be furnished and installed as a complete two-way communicating system and assembly.
   b. Roller Shade Installer/Contractor shall list all components and systems included in their bid, including but not limited to, the prime manufacturer of the motor control and automated equipment and shall be financially responsible for any change orders and/or back charges required by the BMS, AV, or Lighting Control Systems contractors to interface with the automatic solar tracking system and the motorized roller shade system.
   c. If using PoE motors, installer for roller shade system shall be trained and certified by all manufacturers involved including IP gateway, PoE motor hubs, COAP protocol wall controllers, EnOcean enabled keypads and sensors, UPoE+ switch and be capable of complete deployment of controls, software and hardware.

D. Product Listing Organization Qualifications: Organization recognized by OSHA as a Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

E. Fire-Test-Response Characteristics: Passes NFPA 701 small and large-scale vertical burn. Materials tested shall be identical to products proposed for use.

F. Electrical Components: NFPA Article 100 listed and labeled by either UL or ETL or other testing agency acceptable to authorities having jurisdiction, marked for intended use, and tested as a system. Individual testing of components will not be acceptable in lieu of system testing.

G. Requirements for Electronic Hardware, Controls, and Switches: Roller shade hardware, shade fabric, EDU (Electronic Drive Unit), and all related controls shall be furnished and installed as a complete two-way communicating system and assembly.
   1. If using PoE motors, roller shade hardware, shade fabric, PoE motor hub, DC shade motor, software and all related controls shall be furnished and installed as a complete two-way communicating system and assembly.

H. ShadeCloth Anti-Microbial Characteristics: 'No Growth' per ASTM G 21 results for fungi ATCC9642, ATCC9644 and ATCC9645, and E2180.

I. ShadeCloth Cleanability and Disinfecting: ShadeCloth must meet cleanability and disinfecting requirements via 3rd party testing to comply with BIFMA HCF 8.1-2014 standards using chemical solutions compliant with EPA guidelines for use against COVID-19.

J. Environmental Certification: Submit written certification from the manufacturer, including third party evaluation, recycling characteristics, and perpetual use certification as specified. Initial submittals, which do not include the Environmental Certification will be rejected. Materials that are simply 'PVC free' without identifying their inputs shall not qualify as meeting the intent of this specification and shall be rejected.

K. Third Party Evaluation: Provide documentation stating the shade cloth has undergone third party evaluation for all chemical inputs, down to a scale of 100 parts per million, that have been evaluated for human and environmental safety. Identify any and all inputs, which are known to be carcinogenic, mutagenic, teratogenic, reproductively toxic, or endocrine disrupting. Also identify items that are toxic to aquatic systems, contain heavy metals, or organohalogens. The material shall contain no inputs that are known problems to human or environmental health per the above major criteria, except for an input that is required to meet local fire codes.

L. Recycling Characteristics: Provide documentation that the shade cloth can, and is part of a closed loop of perpetual use and not be required to be down cycled, incinerated or otherwise thrown away. Scrap material can be sent back to the mill for reprocessing and recycling into the same quality yarn and woven into new material, without down cycling. Certify that this process is currently underway and will be utilized for this project.

M. Perpetual Use Certification: Certify that at the end of the useful life of the shade cloth, that the material can be sent back to the manufacturer for recapture as part of a closed loop of perpetual use and that the material can and will be reconstituted into new yarn, for weaving into new shade cloth. Provide information on each shade band indicating that the shade band can be sent back to the manufacturer for this purpose.

N. Turn-Key Single-Source Responsibility for Wiring Motorized Interior Roller Shades: To control the responsibility for performance of motorized roller shade systems, assign the design, engineering, and installation of motorized roller shade systems, motors, controls, and low voltage electrical control wiring specified in this Section to a single manufacturer and their authorized installer/dealer. The Architect will not produce a set of electrical drawings for the installation of control wiring for the motors, or motor controllers of the motorized roller shades. Power wiring (line voltage), shall be provided by the general contractor ("GC"), not roller shade installer/dealer (Window Coverings Subcontractor or "WC"), in accordance with the requirements provided by the manufacturer. Coordinate the following with the roller shade installer/dealer:
   1. GC shall provide power panels and circuits of sufficient size to accommodate roller shade manufacturer's requirements, as indicated on the mechanical and electrical drawings.
   2. GC shall coordinate with requirements of WC, before inaccessible areas are constructed.
   3. GC shall run line voltage as dedicated home runs (of sufficient quantity, in sufficient capacity as required) terminating in junction boxes in locations designated by WC.
   4. GC shall provide and run all line voltage (from the terminating points) to the motor controllers. WC shall wire all roller shade motors to the motor controllers, and provide and run low voltage control wiring from motor controllers to switch/ control locations designated by the Architect. All above-ceiling and concealed wiring shall be plenum-rated, or installed in conduit (provided by Electrical Subcontractor), as required by the electrical code having jurisdiction.
   5. GC shall provide conduit with pull wire in all areas, which might not be accessible to roller shade contractor due to building design, equipment location or schedule.
   6. GC shall provide wiring and labor cost difference between power requirements for AC and DC motor options in overall cost comparison of AC and DC motorized shades.

1.7 MOCK-UP

A. Provide a mock-up of one roller shade assembly for evaluation of mounting, appearance and accessories.
   1. Locate mock-up in window designated by Architect.
   2. Mockup Size: Full size.
   3. Mockup Size (WxH): 3 x 3 feet (0.94 x 0.94 m) minimum.
   4. Intent of mock-up is to demonstrate quality of workmanship and visual appearance.
   5. If mock-up is not acceptable, rebuild mock-up until satisfactory results are achieved.
   6. Do not proceed with remaining work until, mock-up is accepted by Architect.
   7. Retain mock-up during construction as a standard for comparison with completed work.
   8. Do not alter or remove mock-up until work is completed or removal is authorized.
   9. Full-sized mock-up may become part of the final installation.
   10. Full-sized mock-up will become the property of the Owner to be used for spare parts.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver in factory-labeled packages, marked with manufacturer and product name, fire-test-response characteristics, and location of installation using same room designations indicated on Drawings and in Window Treatment Schedule.

B. Store and handle products per manufacturer's recommendations.

1.9 PROJECT CONDITIONS

A. Environmental Limitations: Install roller shades after finish work including painting is complete and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

B. Power and control wiring shall be complete and certified, fully operational with uninterrupted communication on the lines and minimal noise certified by a commissioning agent specified in other sections.
   1. 485, ICON, Lonmark and Dry Contract Network: Noise on the line not to exceed shade manufacturer's limits.

1.10 WARRANTY

A. Roller Shade Hardware Warranty: Manufacturer's standard non-depreciating, transferrable warranty for interior shading.
   1. Shade Hardware - 10 years unless otherwise indicated:
      a. ElectroShade with ThermoVeil, EuroTwill, Soho, Equinox, Midnite, Chelsea, or Classic Blackout shade fabric: 25-years.
   2. All Mecho Shadecloth: Manufacturer's standard 25-year warranty.
   3. Roller Shade Motors, Motor Control Systems, and Accessories: Manufacturer's standard non-depreciating 10-year warranty for AC motors and controls and 10-year warranty for DC motors, power panels and controls. Roller shade low voltage PoE motor and associated wall controller, IDF, plenum located PoE hubs and associated control systems must have manufacturer’s minimum, non-depreciating 10-year warranty. Somfy motors and controls standard 5-year warranty. NuLEDs SpiceBox, keypads, sensors and associated lighting products standard 5-year warranty.
   4. Roller Shade Installation: One year from date of Substantial Completion, not including scaffolding, lifts or other means to reach inaccessible areas, which are deemed owners responsibility.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer for Window Shade Control System as basis of design, performance and warranty: Mecho, which is located at: 42-03 35th St.; Long Island City, NY 11101; ASD Tel: 718-729-2020; Fax: 718-729-2941; Email: marketing@mechoshade.com; Web: www.mechoshade.com. For your local Mecho rep: https://www.mechoshade.com/find-a-rep/

B. Requests for substitutions will be considered in accordance with provisions of Section 01600.

2.2 APPLICATIONS/SCOPE

A. Roller Shade Schedule:
   1. Shade Type 9: C-Channel Fixed or Fixed Frame sunscreen with room darkening opaque or sunscreen shade cloth, and related frame or channel mounting systems and accessories as indicated on drawings.
   2. ADA Compliance: All spaces requiring full ADA compliance to be motorized with an accessible wall switch.

2.3 ROLLER SHADES, MOTORIZED OPERATION AND ACCESSORIES

A. Shade System; General:
   1. Motorized Shades: Comply with NFPA 70.
   2. Components capable of being removed or adjusted without removing mounted shade brackets or cassette support channel.
   3. Operates smoothly when raising or lowering shades.
   4. Cradle-to-Cradle certified and listed in C2C (DIR).
   5. Electrical Components: Listed, classified, and labeled as suitable for intended purpose. Test as total system. Individual component testing is acceptable.
      a. Components: FCC compliant where applicable.

B. Basis of Design: ElectroShade with WhisperShade IQ2 EDU. As manufactured by MechoShade Systems LLC. Motor operated fabric window shade system complete with mounting brackets, roller tubes, hembars, hardware, and accessories.
   1. Voltage: 120 VAC
   2. Voltage: 24 VDC
      a. Optional PoE
   3. Description: Single roller.
   4. Drop Position: Regular roll.
   5. Mounting: Ceiling mounted.
   6. Mounting: Recess mounted in ceiling pocket.
   7. Mounting: Wall mounted.
   8. Mounting: Window jamb mounted.
   9. Mounting: _____.
   10. Size: (WxH): _____.
   11. Size: As indicated on drawings.
   12. Fabric: As indicated under Shade Fabric article.
   13. Brackets and Mounting Hardware: As recommended by manufacturer for mounting indicated and to accommodate shade fabric roll-up size and weight.
      a. Material: Provide shade hardware constructed of minimum 1/8-inch (3.18 mm) thick plated steel, or heavier, thicker, as required to support 150 percent of the full weight of each shade. Plastic components without use of steel angle construction do not meet the intent of this specification and shall not be accepted. Styrene based plastics, and /or polyester, or reinforced polyester shall not be accepted.
      b. Provide shade hardware system that allows for field adjustment of motor or replacement of any operable hardware component without requiring removal of brackets, regardless of mounting position (inside, or outside mount).
      c. Provide shade hardware system that allows for operation of multiple shade bands offset by a maximum of 8-45 degrees from motor axis between shade bands (4-22.5 degrees) on each side of the radial line, by a single shade motor (multi-banded shade, subject to manufacturer's design criteria).
      d. All bands within a single motor group shall be aligned within ¼ inch.
      e. Multiple Shade Operation: Provide hardware as necessary to operate more than one shade using a single motor.
   14. Roller Tubes:
      a. Material: Extruded aluminum.
      b. Size: As recommended by manufacturer; selected for suitability for installation conditions, span, and weight of shades.
      c. Fabric Attachment: Utilize extruded channel in tube to accept vinyl spline welded to fabric edge. Shade band to be removable and replaceable without

removing roller tube from brackets or inserting spline from the side of the roller tube.

15. Hembars: Designed to maintain bottom of shade straight and flat.
    a. Style: Full wrap fabric covered bottom bar, flat profile with heat sealed closed ends.
    b. Room-Darkening Shades: Provide a slot in bottom bar with wool-pile light seal.
16. Accessories:
    a. Fascia: Removable extruded aluminum fascia, size as required to conceal shade mounting, attachable to brackets without exposed fasteners.
        1) Finish: Baked enamel.
        2) Capable of installation across two or more shade bands in one piece.
        3) Color: White.
        4) Profile: Square.
        5) Configuration: Captured, fascia stops at captured bracket end.
        6) Designed to accommodate installation of motor control and wiring accessories within pocket including, but not limited to, line voltage disconnect modular connector, MechoNet Wireless Controller, IQ2 Dual Splitter, and non-plenum rated daisy chain wiring.

2.4 INTELLIGENT ENCODED ELECTRONIC DRIVE SYSTEM

A. Electronic Drive Unit (EDU) System General Requirements:
1. A UL 325 listed solution.
    a. Component certification in lieu of system testing is not acceptable.
2. Listing Label and Motor Rating: To be visible for inspection without dismounting of shade assembly to remove motor or EDU from shade roller tube.
3. Size and Configuration: As recommended by manufacturer for type, size, and arrangement of shades.
4. Conceal EDU inside shade roller tube.
5. EDU Rated Speed: The same nominal speed for shades in the same room.
6. Hanging Weight of Shade Band: 80 percent of rated lifting capacity of shade EDU and tube assembly.
7. Capable of upgrading firmware from anywhere on network without touching the motor.

B. Low Voltage EDU (24 VDC):
1. Basis of Design: MechoShade Systems LLC; WhisperShade IQ2-DC System. Tubular, asynchronous, integral DC motor. 24 VDC; temperature Class B, thermally-protected, totally enclosed, maintenance-free. Powered by low voltage power supply connection equipped with disconnect plug assembly furnished with EDU.
2. Audible Noise: 38 dBA measured 3 ft (914 mm) from motor unit, depending on motor torque.
3. Nominal Speed: 10 to 28 RPM. Configurable. Speed managed such that it does not vary due to load/lift capacity.
4. Low voltage power supply for powering external accessories connected to either the dry contact or network port.
    a. Products that require accessories to be powered by a plug-in or externally-supplied power supply are not acceptable.
5. Wireless Controls: Optional built-in two-way wireless EnOcean controls through iQ3-DC-RF motor.
6. Override Mode: Place motor into Override Mode when local switch commands shade to new position.
    a. Local switch command sources:

1) Keypad connected to EDU dry contact inputs.
2) Third-party system connected to EDU dry contact inputs.
3) Network keypad or other device that serially communicates with EDU and configured to issue override commands as if it were a local switch connected to EDU dry contact inputs.

b. Entering Override Mode: Monitor and log positioning commands from automation devices. Do not act until exiting Override Mode.
c. Return from Override Mode: Position shade to last commanded position in log.
d. Automated Return from Override Mode:
1) Override Return Timer: When Override Mode is entered by changing shade position with local switch as described above, Enable override return timer to make these changes temporary such that automation can regain control of shade after configurable time duration (default of 60 minutes).
2) Pocket temperature sensor integral to EDU to track pocket temperature.
a) When shade is in Override Mode and Heat Gain Sensing is Enabled: Sensor determines when direct sunlight and associated solar heat gain has left the window.
1) When this condition occurs, after the shade has been overridden to cover the window, EDU to return from Override Mode if Override Return Timer has not done so already in order for automation controllers to once again optimize shade position for exposure to daylight.

7. Preventative Maintenance:
a. Internally monitor important operating parameters to ensure motor and its shade assembly are functioning properly.
b. Performance Degradation: Provide visual indication via feedback LED and communicate warnings on repetitive basis through its serial port.
c. Warning Conditions: Logged and queryable. Allow sending of multiple warnings until condition is acknowledged.
d. Stop shade rotation for parameters of critical concern until reset by trained technician after being serviced.
e. Devices capable of receiving warnings include SolarTrac automated solar-evaluation control system.
f. Tracked Parameters to include:
1) Operating life (cycles, hours).
2) Pocket temperature.
3) Internal motor temperature.
4) Vibration.
5) Stall.
6) Power reset.
7) Maintenance Mode.
8) Speed regulation.
9) Position targeting.
10) Movement without command.
11) One Bus availability.
g. Detectable Potential Warning Conditions to Include:
1) Assembly vibration/bearing wear warning.
2) Tube/shade assembly drop.
3) Fabric hung-up/telescoping.
4) Motor mount warning.
5) Lifecycle replacement warning.

6) Brake/limit failure.
7) Network warning.
8) Motor internal temperature warning.
9) Pocket temperature warning.

C. Low Voltage EDU by Mecho to operate on Power Over Ethernet (PoE).
1. Intelligent motors controlled and monitored via IP digital network
2. IP Gateway must be supplied to work with overall control system
3. All power delivered to motor directly from UPoE+ switch with minimum of 90 watt output on every port (switch supplied and supported by others)
4. UPoE+ (90W) Shade Controller and MechoNet Hub • Supports IEEE 802.3af, 802.3at, 802.3bt Type 3 or Type 4 PoE Network Switches with LLDP. (PoE, PoE+, UPoE, UPoE+ compliant.
5. PoE port power ratios by supporting simultaneous group control of multiple IQ2-DC motors over 1 PoE hub.
6. Single network solution across the building for windows of all sizes using both AC and DC motorized shades. PoE Hub controls unlimited line voltage AC-powered WhisperShade IQ2 and IQ2+ motorized shades.
7. PoE Hub provides access to MechoNet Wireless sensors and keypads through MechoNet MWC+ controllers.
8. Cisco DNA / Smart Building Solutions Partner - Employs CoAP (Constrained Application Protocol) messaging and MUD (Manufacturer Usage Description) for secure, open communication across sub-systems.
9. SolarTrac 4.0 compliant for industry leading automation strategy efficacy and flexibile
10. DC motor according to standards ISO3741 NF 31022 in dBA ref 1pW at nominal Torque without end product < 38 dBA
11. Maximum current draw for each shade LV DC Motor of 1.5 Amps at 24VDC.
12. PoE LV DC motor rated speed is 10-25rpm Adjustable
13. Temperature Working Range 32°F to 140°F (0°C to 60°C) (Interior use only)
14. Insulation Class: Class 111
15. Wiring to be all low voltage cat6 to IP Hub from UPoE switch
16. Index Protection Rating: IP 20 (interior)
17. UL Listed FCC and CE compliant

D. PoE LV DC Motor System: (software, two-way communication): Specifications and design are based on Intelligent PoE motor control system from Mecho. PoE performance criteria:
1. PoE LV DC Motor shall support two methods of control
   a. Local override wall control for in room manipulation
      1) Controller to work on COAP protocol
      2) User interface via GUI to manage controllers to shades
   b. Network Control
      1) PoE Motor shall be equipped with a bi-directional IP network communication capability to support operation of individual or groups of shades over a common IP network via an API.
2. Upper and lower stopping points (operating limits) of shade bands shall be programmed into PoE LV DC motors using either a handheld removable program module or MechoNet Programming software.
3. Alignment Positions: Each PoE LV DC motor shall support a minimum of 133 repeatable and precisely aligned shade positions (including limits and presets).
   a. All shades on the same switch circuit or with the same network group address with the same opening height shall align at each limit or preset (intermediate stopping position) when traveling from any position, up or down.

b. Shades of differing heights shall have capability for custom, aligned intermediate stop positions when traveling from any position, up or down.
c. Alignment of shades mechanically aligned on the same PoE LV DC motor shall not exceed +/- 0.125 inches (3.175mm) when commanded to the same alignment position.
d. Alignment of shades on adjacent PoE LV DC motors shall not exceed +/- 0.25" inches (6.35mm) when commanded to the same alignment position.
e. Local on wall controller:
    1) Upon setting the limits for the shade, PoE LV DC motor preset positions shall be capable of IP control to default to 25%, 50% and 75% of the shade travel in addition to standard up and down
    2) These positions shall be capable of being customized.
f. Network Presets: A minimum of 10 customizable preset positions shall be accessible via network commands.
    1) Upon setting the limits PoE LV DC motor these preset positions shall automatically default to the lower limit unless customized elsewhere.
    2) These positions shall be capable of being customized and grouped using the control software.

4. PoE LV DC Motor Wiring
    a. One unshielded Twisted CAT-6 or higher from every motor hub location to floor IDF / IT room or as per wiring diagram to plenum rated Cisco switch in zone.
    b. Each wire to meet TIA-568B Standard with Plastic RJ-45 Connectors
    c. Wire to be plenum rated where required by code
    d. Every wire to be machine labeled at each end with a unique identifier.
    e. LV DC Shade motor end to have 12" whip rolled up to allow for shade installation
    f. Closet end to be punched down into patch panel (rack location and style to be coordinated in field by GC or end user)
    g. Every wire to be certified using Fluke DSX cable analyzer or comparable equipment.
    h. Max Distance from Switch to PoE Motor Hub is 225' with 2x14AWG/3x22AWG cable.

E. Modes of Operation:
1. Uniform Mode: Shades move to defined intermediate stop positions in order to maintain aesthetic uniformity.
2. Normal Mode: Shades move to defined intermediate stop positions and any position between defined upper and lower limits.
3. Maintenance Mode: Prevents shade from moving via dry contact or network control commands mode has been cleared/disabled.

F. Control Methods: Local isolated dry contact input and network control.
1. Local Isolated Dry Contact Inputs:
    a. Local switch control, third party system integration without separate interface.
    b. Moving EDU/shade to upper and lower limits and local switch preset positions.
    c. Configuration of upper and lower limits, custom presets, and key modes of operation without a PC or microprocessor-based tools.
    d. Configuration under protected sequences to prevent changes by casual user.
    e. Switch Personalities: Configuration of dry contact control port over network such that any type of dry contact keypad/third-party interface and actuation

methodology (maintained and/or momentary actuation) can be used to operate shade.

f. Dry Contact Control Connection Options to Include:
   1) One-button.
   2) Two-button.
   3) Three-button. Able to support configuring limits, presets, and key operating modes (default).
   4) Three-button. No configuration capability to prevent accidental changes in settings.

2. Network Control:
   a. Bi-directional network communication to enable commanding operation of large groups of shades over a common backbone.
   b. Each EDU:
      1) Support eight network addresses capable of being employed for various levels of group control.
      2) Dry Contact Ports: Assigned its own local switch address which can be matched by other EDUs within eight network addresses in order to support group control when dry contact commands are received.
         a) The EDU receiving dry contact commands may or may not be configured to operate based on commands coming through its own dry contact input port.
      3) To have an independent unique identifier address (UID) enabling EDU to be independently controlled and configured over network via handheld configurator and/or PC controller.
   c. Network Communication Card: Integral with tubular EDU assembly.
   d. Support configuration of upper and lower limits using either a handheld removable program module/configurator or a local switch.
   e. Support configuration of addresses using a handheld removable program module/configurator.

G. Alignment Positions:
   1. Repeatable and precisely aligned shade positions and limits.
      a. Support positioning commands from 0 to 100 percent in 1 percent increments.
      b. Customizable Presets: 32.
      c. Include three intermediate dry contact presets
   2. Shades on same switch circuit or same network group address with same opening height, to align at each intermediate stopping position when traveling from any position, up or down.
   3. Shades of differing heights: Capable of custom, aligned intermediate stop positions when traveling from any position, up or down.
   4. Alignment of shade bands mechanically aligned on same EDU: Plus or minus 0.125 inch (3 mm).
   5. Alignment of standard shades on adjacent EDUs: Plus or minus 0.25 inch (6 mm) when commanded to same alignment position.

H. Local Switch Presets:
   1. Minimum of three customizable preset positions accessible over the local dry contact control inputs and over the network connection.
   2. Preset positions: Customizable to any position between and including defined upper and lower limits (initially defaults to 25, 50, and 75 percent of shade travel).
   3. Configuration of Custom Preset Positions: A handheld removable program module/configurator or a local switch.

I. Network Presets:
   1. Minimum of 32 customizable preset positions (including the three local switch presets) accessible via network commands.
   2. Preset positions: Customizable to any position between and including defined upper and lower limits (initially defaults to defined lower limit).
   3. Configuration of Custom Preset Positions: A handheld removable program module/configurator or a local switch.

2.5 MOTOR CONTROLS, INTERFACES, AND ACCESSORIES

A. Unless indicated to be excluded, provide required equipment as necessary for a complete operating system providing the control intent specified. Provide components and connections necessary to interface with other systems as indicated.

B. Digital Network Controls:
   1. Basis of Design: MechoShade Systems LLC; MechoNet. Low-voltage network utilizes standard Category 5/6 UTP cable; maximum of 4,000 feet (1,219 m), 250 nodes.
   2. Reprogram control without requiring wiring modifications.
   3. Ten-year non-volatile power failure memory for system configuration settings.
   4. Network Interface Components:
      a. MechoNet Network Interface; MNI Series: Four configurable motor/EDU ports (models available for RJ45 or terminal block wiring); four configurable switch ports; one infrared (IR) remote control port; one configurable serial port for RS232/RS485 communication.
      b. IQ2 Dual Splitter: Two motor/EDU ports; two switch ports.
      c. IQ/MLC2 Motor Group Controller: Four ports for line-voltage standard (non-intelligent) motors (120 or 230 VAC; 600 W, 1/4 HP maximum).
      d. IQ Gateway; one for each floor where controlling across multiple floors.

C. MechoNet User App Kit – App-Based Motor Control Accessory
   1. Description**:** Provide and install the MechoNet™ User App Kit for app-based control of Mecho ElectroShade® iQ™ motorized shading systems. This kit shall integrate MechoNet+ motors into a unified control platform utilizing the Bond Bridge Pro and MechoNet™ Motor Hub.
   2. Components**:**
      a. Bond Bridge Pro Wi-Fi/Ethernet device
      b. MechoNet™ Motor Hub with Ethernet-to-MechoNet+ routing
      c. MechoNet+ Terminator and RJ45 T-Connector
      d. Low-voltage MechoNet+ cables (24" and 30"
      e. Optional Sidekick remote for additional wireless control
   3. Functional Requirements:
      a. Provide app-based setup and configuration using the Bond Home app on iOS or Android.
      b. Enable control of up to 50 MechoNet+ motors per kit (multiple kits required for larger groups).
      c. Support scheduling (including astronomical), preset positions, scene-based control, and group shade movement.
      d. Enable seamless communication via secure protocols for integration with building control systems.
      e. Include LED indicators for real-time status and installation feedback.
      f. Provide support for ElectroShade® iQ2+, iQ2-DC, iQ3-DC, and iQ3-DC-RF motors.

g. Mounting hardware to support wall, ceiling, or backing board installations as required.

4. Connectivity Requirements:
   a. Bond Bridge Pro must connect to a 2.4 GHz Wi-Fi network.
   b. Device and smartphone must be on the same network during setup.
   c. Not compatible with WPA-Enterprise or captive portal networks.
   d. Confirm SSID and network readiness with client prior to installation.
5. Notes:
   a. Kit must comply with UL4200A safety standards.
   b. Handle components using proper electrostatic discharge (ESD) precautions.
   c. Installer to coordinate motor addressing and app configuration using MPS prior to commissioning.

2.6 ROLLER SHADE FABRICATION

A. Field measure finished openings prior to ordering or fabrication.

B. Dimensional Tolerances: Fabricate shades to fit openings within specified tolerances.
1. Vertical Dimensions: Fill Opening from Head to Sill: 1/2 inch (13 mm) space between bottom bar and window sill.
2. Vertical Dimensions: Fill Opening from Head to Sill: 1/2 inch (13 mm) space between bottom bar and finished floor.
3. Vertical Dimensions: Fill Opening from Head to Sill: 1/2 inch (13 mm) space between bottom bar and _____.
4. Vertical Dimensions: Fill Opening from Head to Sill (inch/mm): _____space between bottom bar and window sill.
5. Vertical Dimensions: Fill Opening from Head to Sill (inch/mm): _____space between bottom bar and finished floor.
6. Vertical Dimensions: Fill Opening from Head to Sill (inch/mm): _____space between bottom bar and _____.
7. Horizontal Dimensions: Inside Mounting.
   a. Fill openings from jamb to jamb. No light gap.
   b. Symmetrical Light Gaps on Both Sides of Shade: 3/4 inch (19.05 mm) total.
   c. Symmetrical Light Gaps on Both Sides of Shade (inch/mm): _____ total.
   d. Symmetrical Light Gaps on Both Sides of Shade (inch/mm): As detailed on the Drawings.
8. Horizontal Dimensions: Outside mounting.
   a. Cover window frames, trim, and casings completely.
   b. Extend shades beyond jambs on each side: 2 inches (50 mm).
   c. Extend shades beyond jambs on each side (inch/mm): _____.
   d. Extend shades beyond jambs on each side (inch/mm): As detailed on the Drawings.

C. Openings Requiring Continuous Multiple Shade Units with Separate Rollers: Locate roller joints at window mullion centers; butt rollers end-to-end.

2.7 SHADE FABRIC

A. Basis of Design: Shade fabric as manufactured by MechoShade Systems LLC.
1. Solar Shadecloths:
   a. Fabric: Soho: 1100 series. 1 percent open. 2 x 2 basket-weave pattern of fine yarn PVC and polyester blend, also 126 inches (3200 mm) wide.
      1) NRC Rating: 0.60.

2) SAA Rating: 0.64.
3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

b. Fabric: Soho: 1600 series. 3 percent open. 2 x 2 basket-weave pattern of fine yarn PVC and polyester blend, also 126 inches (3200 mm) wide.
1) NRC Rating: 0.25.
2) SAA Rating: 0.29.
3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

c. Fabric: Soho: 1900 series. 5 percent open. 2 x 2 basket-weave pattern of fine yarn, PVC and polyester blend, also 126 inches (3200 mm) wide.
1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
2) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
3) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

d. Fabric: Soho Elavate: 1180 series. 1 percent open. 2 x 2 basket-weave pattern of fine yarn PVC and polyester blend with ProTX2, also 126 inches (3200 mm) wide.
1) EPA Registered Claims:
a) Kills 99.99% of bacteria in 10 minutes, such as Staphylococcus aureus and Psudomonas aeruginosa, on a continuous basis.
b) Reduces risk of cross-contamination from bacteria between treated surfaces.
c) Effective against 99.99% Gram-Negative and Gram-Positive bacteria.
d) Continuously self-disinfecting, bacteriostatic, hypoallergenic, self-cleaning, eliminates 99.99% of germs.
e) Inhibits the growth of odor on the fabric caused by bacteria.
f) Non-leaching.
g) Has a 5-log kill rate in 10 minutes.
2) NRC Rating: 0.40.
3) SAA Rating: 0.44.
4) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
5) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.

6) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

e. Fabric: Soho Elavate: 1680 series. 3 percent open. 2 x 2 basket-weave pattern of fine yarn PVC and polyester blend with ProTX2, also 126 inches (3200 mm) wide.
   1) EPA Registered Claims:
      a) Kills 99.99% of bacteria in 10 minutes, such as Staphylococcus aureus and Psudomonas aeruginosa, on a continuous basis.
      b) Reduces risk of cross-contamination from bacteria between treated surfaces.
      c) Effective against 99.99% Gram-Negative and Gram-Positive bacteria.
      d) Continuously self-disinfecting, bacteriostatic, hypoallergenic, self-cleaning, eliminates 99.99% of germs.
      e) Inhibits the growth of odor on the fabric caused by bacteria.
      f) Non-leaching.
      g) Has a 5-log kill rate in 10 minutes.
   2) NRC Rating: 0.30.
   3) SAA Rating: 0.31.
   4) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   5) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   6) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

f. Fabric: ThermoVeil: 0900 series. 0 to 1 percent visually translucent extra-dense linear weave pattern.
   1) NRC Rating: 0.30.
   2) SAA Rating: 0.32.
   3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

g. Fabric: ThermoVeil: 1000 series. 2 to 3 percent open, dense linear-weave pattern.
   1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   2) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.

h. Fabric: ThermoVeil: 1300 series. 5 percent open, 2 by 2 dense basket-weave pattern, also 126 inches (3200 mm) wide.
   1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).

2) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
3) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

i. Fabric: ThermoVeil: 1500 series. 3 percent open 2 by 2 dense basket-weave pattern, also 126 inches (3200 mm) wide.
1) NRC Rating: 0.25.
2) SAA Rating: 0.28.
3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

j. Fabric: ThermoVeil: 1700 series. 1 percent open, 2 by 2 dense basket-weave pattern, also 126 inches (3200 mm) wide.
1) NRC Rating: 0.65
2) SAA Rating: 0.65.
3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

k. Fabric: ThermoVeil: 2100 series. 10 percent open 2 by 2 open basket-weave pattern.
1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
2) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
3) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

l. Fabric: EcoVeil: 1350 series. TPO Cradle to Cradle Certified, fabric, non-PVC, 1 X 1, basket-weave pattern at 5 percent open, also 126 inches (3200 mm) wide.
1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
2) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
3) Cradle to Cradle Material Health Certificate:
a) Achievement Level: Bronze.
4) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment

(LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

m. Fabric: EcoVeil: 1550 series. TPO fabric, Cradle to Cradle Certified, non-PVC, 1 X 1, basket-weave pattern at 3 percent open, also 126 inches (3200 mm) wide.
   1) NRC Rating: 0.35.
   2) SAA Rating: 0.38.
   3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   5) Cradle to Cradle Material Health Certificate:
      a) Achievement Level: Bronze.
   6) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

n. Fabric: EcoVeil: 1750 series. TPO fabric, Cradle to Cradle Certified, non-PVC, 1 X 1, basket-weave pattern at 1 percent open, also 126 inches (3200 mm) wide.
   1) NRC Rating: 0.65.
   2) SAA Rating: 0.67.
   3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   5) Cradle to Cradle Material Health Certificate:
      a) Achievement Level: Bronze.
   6) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

o. Fabric: EcoSheer: 6750 series. Cradle to Cradle Certified, woven 100 percent polyester, PVC-free, reversible face, (3 percent open). The first shadecloth to pass NFPA 701 flame tests without added chemical flame retardants.
   1) NRC Rating: 0.15.
   2) SAA Rating: 0.19.
   3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   5) Cradle to Cradle Material Health Certificate:
      a) Achievement Level: Bronze.
   6) Declare label.
   7) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

p. Fabric: EcoSheer: 6850 series. Cradle to Cradle Certified, woven 100 percent polyester, PVC-free, reversible face, (1 percent open). The first shadecloth to pass NFPA 701 flame tests without added chemical flame retardants.
   1) NRC Rating: 0.50.

2) SAA Rating: 0.53.
3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
5) Cradle to Cradle Material Health Certificate:
   a) Achievement Level: Bronze.
6) Declare label.
7) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

q. Fabric: EcoGlass: 2800 series. Cradle-to-Cradle certified, 100% Glass Yarn, 1x1 weave, fully recycleable, 0-1 percent open, PVC-Free, up to 126" wide, passes NFPA 701 flame tests without added chemical flame retardants.
   1) NRC Rating: 0.20.
   2) SAA Rating: 0.22.
   3) Cradle to Cradel Material Health Certifiicate:
      a) Achievement Level: Bronze.

r. Fabric: Acoustiveil: 0890 series. 0-1 percent open. PVC-Free.
   1) NRC Rating: 0.60.
   2) SAA Rating: 0.64.
   3) Cradle to Cradle Material Health Certificate:
      a) Achievement Level: Bronze.
   4) Declare label.
   5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

s. Fabric: EuroTwill: 6000 series. Finely woven. 3 percent open. Reverse side can be used facing interior if specified.
   1) NRC Rating: 0.10.
   2) SAA Rating: 0.14.
   3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

t. Fabric: EuroTwill: 6200 series. Distinctive, tightly woven twill design, comprised of fine polyester with PVC coating. 1 percent open. Reverse side can be used facing interior if specified.
   1) NRC Rating: 0.30.
   2) SAA Rating: 0.33.
   3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment

(LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

u. Fabric: EuroTwill: 6450 series. A broke twill-weave design comprised of fine polyester with PVC coating. 3 percent open. Reverse side can be used facing interior if specified.
   1) NRC Rating: 0.15.
   2) SAA Rating: 0.18.
   3) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   4) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
   5) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

v. Color: Selected from manufacturer's standard colors.

2. Blackout Shadecloths:
   a. Fabric: Equinox Blackout: 0100 series. Opaque. PVC-Free.
      1) NRC Rating: 0.05.
      2) SAA Rating: 0.05.
      3) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.
   b. Fabric: Distinctive Blackout: 0800 series. Opaque.
      1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
      2) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.
   c. Fabric: Chelsea: 0250 series. Opaque. Solid graphite-colored backing. PVC-Free.
      1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
      2) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
      3) Cradle to Cradle Material Health Certificate:
         a) Achievement Level: Silver.
      4) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.
   d. Fabric: Chelsea: 0270 series. Opaque. Solid white-colored backing.
      1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
      2) Health Product Declaration (HPD): Published declaration with full disclosure of known hazards.
      3) Cradle to Cradle Material Health Certificate:
         a) Achievement Level: Silver.
      4) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment

(LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

e. Fabric: Classic Blackout: 0700 series. Opaque. Vinyl coated fabric blackout material same color reverse side (for exterior).
   1) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   2) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

f. Fabric: EcoGlass Blackout: 2820 series. Red-List Free, Cradle-to-Cradle certified, 100% Glass Yarn, PVC-Free, fully recyclable, up to 126" wide
   1) Cradle to Cradle Material Health Certificate:
      a) Achievement Level: Bronze
   2) Low-Emitting Material Certification: Greenguard Gold certified and listed in UL (GGG).
   3) Declare Label: Red List Free
   4) Environmental Product Declaration (EPD): Published disclosure of product's environmental impacts based on a full Life Cycle Assessment (LCA). Manufacturer must have EPD certification by independent 3rd party evaluation service.

g.

h. Color: Selected from manufacturer's standard colors.

3. Performance Requirements:
   a. Flammability per NFPA 701: Pass. Large or small scale test.
   b. Fungal Resistance: No growth when tested per ASTM G21.
   c. Cleanability and Disinfecting: ShadeCloth must meet cleanability and disinfecting requirements via 3rd party testing to comply with BIFMA HCF 8.1-2014 standards using chemical solutions compliant with EPA guidelines for use against COVID-19.
4. Fabrication:
   a. Fabric Orientation: Railroaded, fabric is turned 90 degrees off the roll.
   b. Battens: Manufacturer's standard material, full width of shade, and enclosed in welded shade fabric pocket; locate as indicated on drawings.
   c. Seams for Railroaded Fabric: Manufacturer's standard seam; locate as indicated on drawings.
   d. Welded Zipper Edge: Full height on both sides of fabric ensuring smooth operation within ShadeLoc channels.

PART 3 EXECUTION

3.1 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

C. Start of installation shall be considered acceptance of substrates.

3.2 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using methods recommended by manufacturer for achieving best result for substrate under the project conditions.

C. Coordinate with window installation and placement of concealed blocking to support shades.

3.3 SYSTEM STARTUP

A. Motorized Shade System: Provide services of a manufacturer's authorized representative to perform system startup.

B. Turn-Key Single-Source Responsibility for Motorized Interior Roller Shades: Design, engineering, and installation of motorized roller shade systems, motors, controls, and low voltage electrical control wiring specified is to be performed by a single manufacturer and their authorized installer/dealer.
   1. The Architect will not provide a set of electrical drawings for installation of control wiring for motors, or motor controllers of motorized roller shades.
   2. General Contractor (GC) To Provide the Following:
      a. Power Panels and Circuits: Size to accommodate roller shade manufacturer's requirements, as indicated on mechanical and electrical drawings.
      b. Coordinate with requirements of roller shade installer/dealer, before inaccessible areas are constructed.
      c. Line voltage as dedicated home runs, of sufficient quantity, and capacity as required. Terminate in junction boxes at locations designated by roller shade installer/dealer.
      d. Run line voltage from terminating points to motor controllers. Wire roller shade motors to motor controllers.
         1) Above-ceiling and concealed wiring to be plenum-rated, or in conduit, as required by the electrical code having jurisdiction.
      e. Use conduit with pull wire in areas, not accessible to roller shade contractor due to building design, equipment location or schedule.
      f. Verify that wiring conditions, which have been previously installed under other sections or at a previous time, are acceptable for product installation in accordance with manufacturer’s instructions.
      g. Comply with manufacturer’s current product data, including shop drawings, technical bulletins, product catalog installation instructions, and product carton instructions for installation.
      h. Protect installed product and finished surfaces from damage during all phases of installation including preparation, testing, and cleanup.
      i. Be responsible for all other required electrical work including but not limited to roof penetrations, conduits, fireproofing, etc.
      j. Provide conduit with pull wire in all areas, which might not be accessible to subcontractor due to building design, equipment location or schedule.
   3. Window Covering Subcontractor (WC) responsibilities:
      a. Shade Control Subcontractor shall furnish, install and fully program shade controllers, interfaces, splitters, coupler, sensors, switches, etc. mounted on the wall, in the ceiling, in shade pocket, etc.. Locations for all visible devices to be coordinated with Architect. The shade control subcontractor shall inspect all material included in this contract prior to installation. Manufacturer shall be notified of unacceptable material prior to installation.
      b. Run low voltage control wiring from motor controllers to switch/control locations designated by Architect.
         1) Above-ceiling and concealed wiring to be plenum-rated, or in conduit, as required by the electrical code having jurisdiction.

C. Integration with 3RD Party Systems:
   1. Main contractor shall coordinate and provide for others to furnish, install or program any interfaces or wiring to integrate 3rd party systems to the roller shade control system as specified herein. Integration to shade control network can be accomplished locally through IP via UPoE switch with minimum of 60w output per port.

3.4 INSTALLATION

A. Contractor Furnish and Install Responsibilities:
   1. Window Covering Contractor (WC) shall provide an on site, Project Manager, and shall be present for all related jobsite scheduling meetings.
   2. WC shall supervise the roller shade installation, and setting of intermediate stops of all shades to assure the alignment of the shade bands within a single EDU group, which shall not exceed +/- 0.125 inches (3.175mm), and to assure the alignment between shade groups, which shall not exceed +/- 0.25” inches (6.35mm).
   3. WC shall be responsible for field inspection on an area-by- area and floor-by-floor basis during construction to confirm proper mounting conditions per approved shop drawings.
   4. Verification of Conditions: examine the areas to receive the work and the conditions under which the work would be performed and notify General Contractor and Owner of conditions detrimental to the proper and timely completion of the work. Do not proceed until unsatisfactory conditions have been corrected. Commencement of installation shall constitute acceptance of substrate conditions by the installer.
   5. WC shall provide accurate to 0.0625” inch (1.5875mm); field measurements for custom shade fabrication on the Roller Shades manufacturers input forms.
   6. WC Installer shall install roller shades level, plumb, square, and true according to manufacturer’s written instructions, and as specified here in. Blocking for roller shades furnished and installed under the contract of the interior General Contractor shall be installed plumb, level, and fitted to window mullion as per interior architect’s design documents and in accordance with industry standard tolerances. The horizontal surface of the shade pocket shall not be out-of-level more than 0.625” (15.875mm) over 20 linear feet (6.096 meters)
   7. Shades shall be located so the shade band is not closer than 2 inches (50 mm) to the interior face of the glass. Allow proper clearances for window operation hardware.
   8. Adjust, align and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.
   9. Installer shall set Upper, Lower and up to 3 intermediate stop positions of all motorized shade bands, and assure alignment in accordance with the above requirements.
   10. WC shall certify the operation of all motorized shades and turn over each floor for preliminary acceptance.
   11. The WC shall participate and cooperate with the electrical, low voltage and commissioning agent to verify and certify the installation is in full conformance with the specifications and is fully operational. This work to occur during the commissioning stage and is in addition to preliminary acceptance required for each floor.
   12. Clean roller shade surfaces after installation, according to manufacturer’s written instructions.
   13. WC shall train Owner’s maintenance personnel to adjust, operate and maintain roller shade systems.
      a. Use operation and maintenance manual as a reference, supplemented with additional training materials as required.

3.5 PROTECTION AND CLEANING

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.
   1. Clean soiled shades and exposed components as recommended by manufacturer.
   2. Replace shades that cannot be cleaned to "like new" condition.

3.6 MAINTENANCE

A. Provide Owner a proposal as an alternate add to the base bid, a separate renewable maintenance contract for service and maintenance of motorized shade system.
   1. Include a complete description of preventive maintenance, systematic examination, adjustment, parts and labor, cleaning, and testing, with a detailed schedule.
      a. Contract Duration: One year from date of Substantial Completion.
      b. Contract Duration: Two year from date of Substantial Completion.
      c. Contract Duration: _____ from date of Substantial Completion.

END OF SECTION 12 25 13

DIVISION

13

SPECIAL CONSTRUCTION

SECTION 13 09 50 - RADIO FREQUENCY SHIELDING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes.

1. Radio Frequency Shielding.
2. Radio Frequency Door(s) and Window(s).
3. Radio Frequency Mechanical Penetration Waveguides.
4. Radio Frequency Electrical Filters.
5. Radio Frequency penetrations required by the magnetic equipment manufacturer.

B. Work coordinated through this Section, but provided by other Sections, shall include the following:

1. Construction work in preparation for shielding installation including foundations, floor, walls, and overhead structures, and door, window, and magnet access apertures.
2. All external connections to shield or shield components by other trades, including those of a structural, electrical, mechanical, or MRI system nature.
3. All internal connections to shield or shield components by other trades, including furring, finishes, electrical, mechanical, and MRI system related items.

C. Work required by this Section, but provided by other Sections, shall include the following:

1. Site access and delivery path for shielding materials.
2. Staging area adjacent to MRI exam room with forklift access.
3. Three electrical convenience outlets.
4. All conventional construction work enveloping and internal to the shielding system, including concrete work, structural and partition walls, ceilings, floors, finishes, etc.
5. All electrical and communications work and materials including inside and outside enclosure connections to electrical filters provided and mounted by the shielding vendor.
6. All mechanical work and materials including inside and outside enclosure connections to duct and pipe penetrations provided and mounted by the shielding vendor.
7. Installation, mounting, or anchoring of MRI equipment vendor's materials or equipment.

1.3 PREINSTALLATION MEETINGS

A. Pre-installation Conference: Participate in a pre-installation teleconference if requested by the Owner or General Contractor.

B.

1.4 ACTION SUBMITTALS

A. Shop Drawings:

1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include details that disclose methods for attaching or connecting items to the shielding or its penetrations.
4. Clearly indicate what materials and labor is provided by others.

1.5 CLOSEOUT SUBMITTALS

A. Performance Test Report: A copy of all test reports shall be provided to the Owner. Report must show date and time of test, personnel present, specific test methodology, equipment and calibration data, measurements taken and results obtained.

B. Operation and Maintenance data

C. Manufacturer’s Warranty.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Fabricator of products.

B. Performance testing shall be in strict accordance with MRI equipment vendor requirements. Refer to MRI equipment vendor requirements and documents for specifics. Test enclosure in accordance with IEE-299 modified for MRI system installation.

1.7 PROJECT CONDITIONS

A. MRI exam room and staging area shall be weatherproofed, dry (non-condensing), and temperature controlled between 60^{o} F and 80^{o} F. MRI Exam room shall be free of clutter and debris and the floor broom-swept. Verify conditions before shielding contractor delivers RF shielding components to the site.

1.8 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of RF Shielding that fail(s) in materials or workmanship within specified warranty period.

1. Warranty Period: 5 year(s) from date of Substantial Completion for: shielding system materials (walls, floor, and ceiling elements) and passive penetrations (waveguides and screened apertures).
2. Warranty Period: 1 year from date of Substantial Completion for doors and active penetrations (electrical filters, switches, etc.).

B.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the following:

1. PDC Facilities, Inc.
2. 700 Walnut Ridge Drive
3. Hartland, WI 53029-0900
4. (262) 367-7700
5. (262) 367-7744 Fax

2.2 RF SHIELD DESCRIPTION

A. Shield Type: Nickel/Copper polyester non-woven shielding fabric manufactured by Laird Technologies.

B. Walls and Ceiling: Fastening hardware or structural components that contact any element of the shielding system must be made of stainless steel. These shielding elements must be fashioned in such a way that they will accept standard furring and finishes without compromise to RF integrity.

C. Floor: As above. Additionally, the floor must be electrically isolated from the concrete below, preferably with a layer of dielectric epoxy or rigid plastic sheet, not film or paper. Floor underlayment design must be adequate to protect RF shield from damage due to magnet positioning or moisture resulting from normal use and maintenance. Underlayment must accept standard finish flooring methods.

D. Panel systems are not acceptable.

2.3 RF SHIELDING COMPONENTS

A. RF Door:

1. Door shall be manufactured out of aluminum with an unfinished wood veneer insert on both faces. All exposed aluminum shall be polished prior to installation.
2. Door frame shall be manufactured utilizing an aluminum extrusion. The door frame shall be polished before installation.
3. Door frame shall provide integral RF pass thru wave guide for IV tubing if noted in door schedule.
4. Provide factory mortised, fit and hung door dimensioned as indicated in the Drawings.
5. Door must be self-sealing and fit with conventional hospital grade hardware and lockset. Hinges must be ball bearing type and number three (3) per door.
6. Minimum Size: 48 inches wide by 84 inches high.
7. Door Hardware:
    a. Lockset: Sergeant Part Number is SC-11G37 LB 26D. Heavy-Duty Classroom Style Door Lock, L-style Rose and B-Style Lever.
    b. Interlock Switch: Manufacturer’s standard.
    c. Pneumatic Latch Assembly with air delivery system, push plates, and keyed power control.
    d. RF gasketing must be fabric-over-foam type. RF finger stock may not be used. RF sealing shall not be made by use of air. Retractable RF seals are not acceptable.
    e. Threshold must rise no more than 3/8-inch from finish floor.

B. RF Windows:

1. Provide factory-fabricated window unit, ready to mount in shield wall, dimensioned as indicated in Drawings.

2. 3/16 inch tempered safety glass each side of window, with two (2) layers electrically-bonded metal mesh, free of Morie pattern, and coated to eliminate specular reflection and enhance contrast and light transmission.
3. Frame: Plated copper with soldered corners.

C. Ventilation Penetrations:

1. Provide tubular waveguides with integral mounting flange and external dielectric break.
2. Honeycomb type waveguides are only acceptable in areas where tubular types will not fit.
3. Coordinate number and sizes with HVAC consultant.

D. Pipe Penetrations:

1. Provide tubular waveguides with integral mounting flange. Dielectric break provided by others
2. Coordinate number and sizes with mechanical consultant.

E. Electrical and Communication Penetrations:

1. Provide filters for all electrical conductors passing through the RF shield.
2. Power filters are to be UL/CSA rated devices.
3. Coordinate number and sizes with electrical, communications and MRI equipment consultants.

F. Cryogenic Gas Exhaust Vent Wave Guide:

1. Wave guide below cutoff type, size as required by MRI equipment manufacturer.
2. Wave-guide constructed of suitable material to maintain shielding effectiveness equal to that of the shielded enclosure, and to resist failure during a magnet quench event.
3. Provide dielectric connection to the exterior side of the cryogen vent of suitable material to maintain 1000-ohm minimum resistance to earth ground.

G. MRI Equipment Penetrations:

1. Provide mounting aperture and necessary mounting hardware for the MRI equipment filter panel(s) and other equipment-related penetrations as identified by the MRI equipment vendor.
2. Penetrations must meet the minimum attenuation requirements of the RF Shield.

H. Grounding:

1. Provide a ground buss bar per the MRI equipment vendor’s requirements.
2. In the absence of a specific requirement, mount the bar adjacent to the MRI equipment filter panel.
3. Provide 1000-ohm minimum electrical isolation between primary support structure and earth ground.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Verify on-site conditions affecting the work of this section. Coordinate any discrepancies with Design Architect, General Contractor, and MRI equipment vendor.

B. Start of shielding installation indicates that site conditions are acceptable to shielding contractor.

C. Install materials by, and under supervision, of qualified employees of shielding contractor.

D. Install materials consistent with industry construction standards and in accordance with any special requirements of MRI equipment vendor.

E. At completion of installation, shielding contractor's supervisor shall make final review with General Contractor before leaving the job site of proper procedures and details required by other subcontractors who shall provide work in diagnostic room.

F. If the MRI Magnet is not delivered while the RF contractor is on site, an employee of the shielding contractor must return to open and reseal the magnet access panel when magnet delivery occurs.

3.2 FIELD QUALITY CONTROL

A. During shielding construction, ground isolation shall be monitored at all times using "continuity" indicator.

B. Performance testing will be in strict accordance with MRI equipment vendor requirements and IEE-299. Refer to MRI vendor documentation for specifics. In the absence of MRI vendor requirements, testing will be as follows:

1. Acceptance Test: At the completion of the shield installation, prior to the installation of the MRI equipment vendor's penetrations and magnet, and prior to application of internal walls, ceiling, and finishes, and prior to making any external connections to the shield, the RF contractor will test the enclosure for ground isolation and shielding effectiveness. Ground isolation resistance in ohms will be conducted using calibrated ohmmeter.
2. Ground isolation test must be performed before equipment or power systems are connected.

END OF SECTION 13096

SECTION 13 11 00 - SWIMMING POOLS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. The BIDDING REQUIREMENTS, CONTRACT FORMS, AND CONDITIONS OF THE CONTRACT and applicable parts of DIVISION 1 - GENERAL REQUIREMENTS, as listed in the Table of Contents, be included in, and made a part of this Section.

1.2 SUMMARY OF WORK *(for general guidance-not inclusive*)

A. Introduction
   1. Provide labor, materials, equipment, and services necessary to construct the pool(s) and spa. This work must include the structure(s) and installation of pool finishes as well as products listed in Part 2 of Section 13 11 00.

B. Work included in this section:
   1. It is the intent of this section to place the entire responsibility for the construction of the pool(s) (including the construction of the pool shell(s)) under one vested Contractor. Under this section the Contractor will provide but is not necessarily limited to the following:
      a. Provide equipment and services required for erection and delivery onto the premises the equipment or apparatus provided. Remove equipment from premises when no longer required.
      b. Layout, excavate, remove from the construction site, replace, and grade materials as required beyond the limits of excavation of the pool shell(s) to complete the work described in this section. Reference Division 31 - Earthwork.
      c. Grade and replace load bearing or high plasticity index soil, pump and dewater as necessary to keep excavations free from water during construction. Reference Division 31 - Earthwork.
      d. Provide and maintain proper shoring and bracing for existing utilities, sewers and building foundations where required for related excavations. Reference Division 31 - Earthwork.
      e. Provide electrical conduit, wiring, junction boxes etc. to low voltage pool equipment within pool filter/chemical rooms per Division 26 - Electrical. (Low voltage is considered less than 110 V.)
      f. Coordinate for required bonding and grounding of the pool shell, fittings, and equipment.
      g. Provide necessary piping and valving as shown on the drawings and specified herein.
      h. Provide individually sized housekeeping pads for each pool pump. Provide housekeeping pads for pool equipment as required in the drawings.
      i. Provide the main drain hydrostatic relief system and a sight sump as shown on the drawings. Reference Division 31 - Earthwork.
      j. Construct the cast in place or pneumatically applied concrete pool shell(s) and cast in place surge tank(s) as described in these specifications and detailed on the drawings, including reinforcement steel, inserts, fittings, fiberglass main drain sumps and embedded items (piping, anchors, etc.) for the pool(s) and spa.

Reference Division 3 - Concrete and Structural. Before commencing the placement of concrete, verify electrical bonding of the pool and spa embedded items and reinforcing steel. Also, coordinate and arrange required electrical, plumbing and or building inspections.

k. Provide a proprietary aggregate cementitious finish finish in the pool(s) with a slip resistant surface with a vertical tile band. Provide specialty tile for the perimeter tile deck band, gutter nosing, wall targets, recessed steps, toe ledge, floor lane markings, depth markings and warning, construction joint installation bands and other tile installation within the pool structures. Provide a fully tiled finish in the Spa. Reference Section 13 11 03 - Swimming Pool Tile - including the tolerance requirements for the concrete substrate.

l. Provide fully assembled cleaning and maintenance equipment for the pool(s) as specified herein.

m. Provide for the storage of pool related equipment, materials, and systems. Items are the responsibility of the Contractor until accepted by the owner.

n. Obtain final acceptance by jurisdictional health department(s).

o. Start, test, calibrate and adjust mechanical equipment, electrical equipment, recirculation, chemical, and other supplied systems including deck, loose, maintenance, and safety equipment. Instruct the Owner's representative in the systems operation and maintenance as described herein.

p. Provide the heating system for the pool(s) and spa. Include piping, heaters, heat exchangers, booster pumps, controls, gauges, thermostats, control valves and wiring required to draw water from the recirculation line, heat the water and return it back to the recirculation line and interlock with pool recirculation pumps.

C. Related work specified in other sections:

1. Section 13 11 04 – Swimming Pool Cementitious Finish
2. Section 13 11 03 – Swimming Pool Tile
3. Section 13 11 06 – Swimming Pool Timing System
4. The following work related to the swimming pools must be completed by other trades.
   a. Provide, erect, and maintain necessary barricades, signs, lights, and flares for pool construction to protect workers and the public.
   b. Provide and maintain proper shoring and bracing for existing utilities, sewers and building foundations where required for swimming pool related excavations. Reference Division 31 - Earthwork.
   c. Provide sub-surface drainage beneath the pump pit and backwash pit where may be required by Geotechnical Report. Reference Division 31 - Earthwork.
   d. Construct pump pit and backwash pit including reinforcement, inserts, wall sleeves, anchors, access hatches, and fittings. Reference Division 3 - Concrete.
   e. Layout, excavate, remove from the construction site, replace, and grade materials as required beyond the limits of excavation of the pool shell(s) to complete the work described in this section. Reference Division 31 - Earthwork.
   f. Prior to concrete pours, verify electrical bonding of the pool embedded items. Coordinate and arrange required electrical, plumbing and or building inspections that must be performed on embedded items. Reference Division 26 - Electrical.
   g. Provide sanitary sewer and storm drain connections. Reference Division 22 - Plumbing.
   h. Provide deck finish beyond perimeter tile band. Reference Division 9 - Finishes.
   i. Provide rules and regulations signage as required by code. Reference Division 1 - General Requirements.
   j. Provide chlorine resistant caulking (sealant) and backer rod on pool decks. Reference Division 7 - Thermal and Moisture Protection.

D. Related work specified in Plumbing section. Reference Division 22 - Plumbing. Work that must be completed by others.
   1. Provide trench drains and/or area drains on pool deck.
   2. Provide sanitary sewer piping in the pool mechanical room including floor drains, sumps, and sump pump.
   3. Provide water service to hose bibbs, flush hydrant boxes and auto-fill bypass to air gap above fill funnel(s). Install the slow closing solenoid valve(s) in the bypass auto-fill piping.
   4. Provide water meter on the fresh water supply line upstream of the manual fill valve and the install the slow closing solenoid valve.

E. Related work specified in Mechanical section. Reference Division 23 –HVAC. Work that must be completed by others.
   1. Provide related systems for supplemental pool water heating.
   2. Provide air recirculation systems for pool related spaces.

F. Related work specified in Electrical sections. Reference Division 26 – Electrical. Work that must be completed by others.
   1. Provide power to the exhaust fans for the chemical rooms.
   2. Provide motor starters, auxiliary contacts, magnetic relays, emergency stops and other electrical control devices necessary for the complete operation of the pool systems. Provide power to Variable Frequency Drive pool pump starters and power from VFD to the pool pump motor.
   3. Ground and bond pool structures, fittings, and equipment in accordance with Article 680 of the N.E.C. Test and verify that the system electrical ground is true and solid. Provide certification to this effort.
   4. Obtain permits, inspections, and approvals of wiring including grounding and bonding of metal components associated with the pool in accordance with Local, State and National Electrical Codes.
   5. Provide power, conduits, electrical boxes, and wiring for the Contractor provided electronic timing and scoreboard system with multi-sport capability for race swimming and pace clock.
   6. Provide power, conduits, electrical boxes, and wiring for the underwater lights and junction boxes.
   7. Confirm electrical conduits that penetrate the pool shell are watertight and installed per N.E.C. Article 680.

1.3 QUALITY ASSURANCE

A. The specifications and drawings illustrate and detail three (3) swimming pool systems that are utilized for both competitive and recreational use. Certain technical aspects of the design are common only to pool systems planned for public use. Understanding these aspects, their functions and interaction through experience is vital to completing a successful operating system. It is a mandatory requirement that the Contractor have achieved such experience as a prerequisite for bidding on this project.
   1. The Swimming Pool Contractor to refer to section 00 21 13 – Instructions to Bidders for bonding requirements.
   2. The Swimming Pool Contractor must include a bid bond from an approved surety company registered in the State of Louisiana certifying that the Swimming Pool Contractor has adequate bonding capacity to provide a bid for this project. The Swimming Pool Contractor must submit a copy of the bid bond for review prior to the Swimming Pool Contractor’s selection.

3. If the Contractor has not received prior written approval for this project or has not been included in the pre-approved list of Contractors, they must submit a list of projects meeting the aforementioned qualifications, including contact information of the General Contractor must be submitted for review and approval at least 10 days prior to bidding of the project. The Contractor must have completed at least five (5) public-use pools with individual water surface areas in excess of 4500 square feet and a depth of 11'-6" or more within the past 10 years.
4. The Contractor must submit prior to the start of construction the name of the on-site Project Superintendent including their relevant experience. The Contractor's on-site Project Superintendent must have completed at least five (5) public-use pools with individual water surface areas in excess of 4500 square feet and a depth of 11'-6" or more within the past 10 years. A list of projects meeting the aforementioned qualifications, including contact information of the General Contractor as well as Owner must be included with the experience submittal. Project Superintendent on the project cannot change unless written authorization has been provided by the Architect and Owner.
5. The Owner reserves the right to reject a bid if the evidence submitted by, or investigation of, the Contractor fails to satisfy the Owner that the Contractor is properly qualified to carry out the obligation of the contract and to complete the work described or if the Contractor does not have the qualifications stated herein. Subject to compliance with item 2 above on this specification.
6. The following Contractors have been pre-approved. The Contractor must meet the requirements listed above.

Acapulco Pools/Gall Construction Bernie Gall, John Robb 11811 North Tatum Boulevard Suite 3031 Phoenix, Arizona 85028 p: 602.354.1181 e: bernie@acapulcopools.com	Sunbelt Pools Rob Morgan, Phil Collins 10555 Plano Rd Dallas, Texas 75238 p: 214.343.1133 e: philc@sunbeltpools.com

1.4 REGULATORY AGENCY REQUIREMENTS AND ENGINEERING SERVICES

A. The system must comply with necessary pre-construction approvals.

B. Give necessary notices, obtain permits, and pay government fees, and other costs in connection with his work, including the filing of necessary as-built drawings, prepare

documents (including any amendments to the approved construction documents) and obtain necessary approvals of governmental departments having jurisdiction over their work. Obtain required certificates of inspection for his work and deliver copies to the Owner and Architect before requesting acceptance and final payment for the work.

C. Include in the work, without extra cost to the Owner, labor, materials, services, apparatus, or drawings in order to comply with applicable laws, ordinances, rules, and regulations, whether or not shown on drawings and/or specified.

1.5 COORDINATION AND CLARIFICATION

A. Coordinate with other trades' work relating to this section.

B. Must establish with other trades, having related work in this section, that work necessary to complete the pool(s) as shown on the drawings and in the specifications is included in the base bid and alternates to the Owner.

C. If in doubt regarding the responsibility for work covered in this section and/or discovery of errors or omissions in the bidding documents, notify the Architect through channels established by the specifications and request a clarification ten (10) days prior to the bid date.

1.6 ALTERNATES

A. Review the description of the alternates in Division 1 and on the drawings for possible effect upon work in this section. Alternates related to the work in this section are described in this division and on the bid proposal form.

B. Pool Alternates
1. N/A

1.7 CONTRACTOR'S ALTERNATE PROPOSAL

A. Submit bid to the owner based on materials, equipment and methods as specified in this Section. No substitution of material will be allowed.

B. It is the intent of the contract documents to encourage competition. The base proposal must include the construction methods and equipment as specified and detailed. Proposed system substitutions must have prior written approval by the Architect.

C. If there is a deviation from the basis of design equipment, confirm that engineering criteria are appropriate for the substituted equipment.

D. Substitutions of specified construction methods and equipment must include a complete submittal as required by these specifications and drawings of appropriate scale incorporating required changes. Provide a list of at least ten (10) satisfactory installations comparable to this project that have been manufactured and installed under the manufacturer's current legal name. Submit a list of such projects with the name, address and current telephone number of the Owner's Operator and Architect of Record to the Architect on the bid date.

E. Changes or modifications to the Contract Documents that are not authorized by the architect are the sole responsibility of the Contractor.

1.8 SUBMITTALS

A. Submittals must be made in accordance with the requirements of Division 1 - General Requirements and in strict compliance with the following procedures and guidelines.

B. One (1) set of shop drawings and engineering data must be tabbed, indexed, and referenced to the specifications, compiled into an electronic submittal, and submitted in two stages. The first stage must include items for the pool shell(s), reference swimming pool structural specifications. The second stage must be for remaining items. Each section of items must be prefaced by a cover sheet listing the items submitted within the section. Electronic submittals must be organized, numbered, and submitted in the same format and order as the project specifications. Only complete sets will be reviewed.
   1. Engineering data covering systems, equipment, structures, and fabricated materials, which will become a permanent part of the work under this contract, must be submitted for review. This data must include drawings and descriptive information in sufficient detail and scale to show the kind, size, arrangement, and operation of component materials and devices; the external connections, anchorage and supports required; performance characteristics; fabrication and dimensions needed for installation and correlation with other materials and equipment. A certification, in writing, must be provided indicating that equipment will fit in the space allotted and as shown on the drawings.
   2. Submittals regardless of origin must be stamped with the approval of the Contractor and identified with the name and number of this contract, Contractor's name, and references to applicable specification paragraphs and contract drawings. Each submittal must indicate the intended use of the item in the work. When catalog pages are submitted, applicable items must be clearly identified. The current revision, issue number, and date must be indicated on drawings and other descriptive data.
   3. The submittals will not be accepted from anyone but the Contractor. Submittals must be consecutively numbered in direct sequence of submittal and without division by subcontracts or trades.
   4. The Contractor's stamp of approval is a representation that the Contractor accepts full responsibility for determining and verifying quantities, dimensions, field construction criteria, materials, catalog numbers and similar data, and that he has reviewed or coordinated each submittal with the requirements of the work and the contract documents.
   5. Each submittal must include a statement prepared by the originator of the drawings and data, certifying compliance with the contract documents except for deviations, which are specifically identified.
   6. Deviations from the contract documents must be identified on each submittal and must be tabulated in the Contractor's letter of transmittal. Such submittals must, as pertinent to the deviation, indicate essential details of changes by the Contractor (including modifications to other facilities that may be a result of the deviation) and required piping and wiring diagrams.
   7. The Contractor must accept full responsibility for the completeness of each submission, and, in the case of a resubmission, must verify that exceptions previously noted have been considered.
   8. The need for more than one resubmission, or a delay in obtaining review of submittals, will not entitle the Contractor to an extension of the contract time unless the delay of the work is directly caused by a change in the work authorized by a change order.
   9. Review of drawings and data submitted by Contractor will cover only general conformity to the drawings and specifications, external connections and dimensions that affect the layout. Review does not indicate a thorough review of dimensions, quantities, and details of the material, equipment, device, or item shown. Review of

submittals does not relieve Contractor from responsibility for errors, omissions, or deviations, or responsibility for compliance with the contract documents.

10. When the drawings and data are returned marked REJECTED, REVISE AND RESUBMIT or SUBMIT SPECIFIED ITEM, the corrections must be made as noted thereon and as instructed and six corrected copies (or one copy and one corrected reproducible copy) resubmitted.
11. Resubmittals must bear the number of the first submittal followed by a letter (A, B, etc.) to indicate the sequence of the resubmittal. Resubmittals must be indexed, tabbed, referenced to the specifications, and bound in a three-ring binder and submitted at one time.
12. When corrected copies are resubmitted, the Contractor must, in writing, direct specific attention to revisions and must list separately revisions made other than those called for on previous submissions.
13. When the drawings and data are returned marked NO EXCEPTIONS TAKEN or MAKE CORRECTIONS NOTED, no additional copies are to be provided unless specifically requested to do so for record.

C. Permits, Receipts and Test Reports
   1. Provide the Architect with copies of permits and receipts for fee payments.
   2. Submit a sample format for each test report intended for use. Submit test reports required herein only on approved forms.

D. Include complete product data indexed, tabbed, and referenced to specifications with 8 ½" x 11" cover sheet covering:
   1. Paragraph 2.01 - Overflow System
   2. Paragraph 2.02 - Pumping Equipment
   3. Paragraph 2.03 - Filtration Equipment
   4. Paragraph 2.04 - Recirculation Fittings
   5. Paragraph 2.05 - Piping Systems
   6. Paragraph 2.06 - Chemical Treatment Systems
   7. Paragraph 2.07 - Chemistry Monitoring and Control Systems
   8. Paragraph 2.08 - Flow Meters
   9. Paragraph 2.09 - Water Level Controllers
   10. Paragraph 2.10 - Deck Equipment
   11. Paragraph 2.11 - Loose Equipment
   12. Paragraph 2.12 - Maintenance Equipment
   13. Paragraph 2.13 - Safety Equipment
   14. Paragraph 2.14 - Thermometers
   15. Paragraph 2.15 - Swimming Pool Finishes
   16. Paragraph 2.16 - Waterproofing
   17. Paragraph 2.17 - Sealants
   18. Paragraph 2.18 - Underwater Lights
   19. Paragraph 2.19 - Water Features and Support Equipment
   20. Paragraph 2.20 - Pool Heaters

E. Include engineering/construction drawings for the pool structure.
   1. Reference Division 3 - Concrete.

F. Include engineering construction drawings for pool piping.

G. Include separate submittal for all color selections required to be made by the Owner/Architect. Physical samples and/or mock ups must be provided as requested and submitted for review. The following items must be included:

1. Gutter Grating
2. Sight Sump Frame and Cover
3. Starting Blocks
4. Pool Lift
5. Competition Floating Lane Ropes
6. Backstroke Flags
7. Swimming Pool Cementitious Finish – Reference Section 13 11 04
8. Swimming Pool Tile - Reference Section 13 11 03
9. Sealants

H. Reference Section 13 11 04 - Swimming Pool Cementitious Finish

I. Reference Section 13 11 03 - Swimming Pool Tile

J. Reference Section 13 11 06 - Swimming Pool Timing System

1.9 TESTING REPORTS

A. Provide all testing reports as described in the specifications. Testing report(s) and any additional documentation of the test(s) must be submitted to the Architect within seven (7) days of the commencement of the test(s) unless otherwise noted. The following testing report(s) must be submitted for review/record:
   1. The pool piping must be capped and hydrostatically pressure tested prior to backfilling. Hydrostatic pressure tests must be performed by the Contractor and witnessed by the Owner, or a representative designated by the Owner.
   2. The pool(s), gutter(s), surge tanks(s), and spa must be tested for water tightness prior to the application of any finishes. The water tightness test must be performed by the Contractor and witnessed by the Owner, or a representative designated by the Owner.
   3. The domestic water must be analyzed prior to filling the pool(s) after the application of the plaster finish. The Contractor must provide a domestic water analysis by a water testing agency to determine types and quantities of chemicals required to ensure calcium-balanced water immediately upon the completion of filling the pool(s). Refer to specification 13 11 04.
   4. The slump of the plaster finish must be tested should a plastering machine be used. The Contractor to perform slump test to ensure slump does not exceed 2.5” when tested using a 2" by 4" by 6" high slump cone. Refer to specification 13 11 04.
   5. The spa tile finish must be visually inspected and sound tested prior to filling the pool. The visual inspection and sound testing of the tile finish must be performed by the Contractor and witnessed by the Owner, or a representative designated by the Owner. Refer to specification 13 11 03.
   6. Concrete test panels/cylinders must be tested for compressive strength. The Contractor to produce test panels/cylinders to be tested by a third-party testing agency provided by the Owner. Refer to Division 3 – Concrete

1.10 OPERATION AND MAINTENANCE MANUALS AND CLOSE-OUT SUBMITTALS

A. Detailed operation and maintenance information must be supplied for equipment requiring maintenance or other attention. The equipment supplier and/or the Contractor must prepare an operation and maintenance manual for equipment. Parts lists and operating, and maintenance instructions must be provided.

B. Each operation and maintenance manual must include the following:

1. Equipment function and calibration, normal operating characteristics, and limiting conditions.
2. Assembly, installation, alignment, adjustment and checking instructions.
3. Operating instructions for startup, routine and normal operation, regulation, and control, shut down and emergency conditions.
4. One (1) copy of instructional videos.
5. One (1) copy of Safety Data Sheet forms for all pool chemicals provided.
6. Operating cycles must be specifically described in outline format and in referenced detail. A wall-mounted color-coded piping flow diagram must be provided in the pool equipment room. The diagram must be engraved on laminated plastic with color-coded piping to match the color of coding on piping, and including valves identified with number on tags. The minimum size is 11-inch x 17 inch.
7. Include manufacturer recommended maintenance schedule, parts lists, piping diagram (to agree with wall mounted diagram) and trouble-shooting information for pool mechanical equipment.
8. Using reference to keyed valves and wall diagram, include specific written instructions for procedures that must be followed for the following:
   a. Emptying and refilling the pool(s) including de-watering during the period that the pool(s) will be empty.
   b. Water level control adjustment and chemical control operation.
   c. Normal surge tank operation and balancing.
   d. Filter operation and backwashing; and
   e. Super chlorination.
9. Lubrication and maintenance instructions.
10. Guide to “troubleshooting.”
11. Parts list and predicted life of parts subject to wear.
12. Outline, cross section, and assembly drawings; engineering data and wiring diagrams.
13. Test data and performance curves, where applicable.
14. Specific written instructions for procedure for emptying and refilling the pool(s) including de-watering during the period that the pool will be empty. Provide a yellow warning sign 8-1/2 in. x 11 in., that must be mounted in the pool mechanical room, that reads:

    WARNING
    Prior to emptying Pool
    Consult O & M Manuals for Procedures

    Add another sign that reads:

    Keep Caps, Plugs and Tops Tight Fitting to Prevent Escape of Fumes.
15. Additionally, provide the following signs mounted on the chemical room doors:
    a. NFPA Hazard Diamond for each chemical stored in room.
    b. Warning: Authorized Personnel Only Beyond This Point
    c. Signage indicating location of associated Safety Data Sheet forms for all chemicals stored in room.
16. One set of applicable submittals must be included in each manual.

C. The operation and maintenance manuals must be in addition to instructions or parts lists packed with or attached to the equipment when delivered, or which may be required by the Contractor.

D. Manuals and other data must be printed on heavy, first quality paper, 8-1/2 x 11-inch size with standard 3-hole punching and inserted in plastic covers. Drawings and diagrams must

be reduced to 8-1/2 x 11 inches or 11 x 17 inches. Where reduction is not practical, larger drawings must be folded separately and placed in envelopes that are bound into the manuals. Each envelope must bear suitable identification on the outside.

E. Six (6) bound volumes of each manual must be submitted. Parts lists and information must be assembled in substantial manuals and permanent, three-ring or three-post binders. Material must be assembled and bound in the same order as specified, and each volume must have a table of contents and suitable index tabs.

F. Material must be marked with project identification. Non-applicable information must be marked out or deleted.

G. Shipment of equipment will not be considered complete until the required manuals and data have been received.

H. The Contractor must provide, assemble, and inventory all deck, loose, safety, and maintenance equipment including any loose mechanical equipment prior to the Owner taking possession of the pool(s). The Contractor must provide a checklist that has been signed by the Owner verifying receipt of all items listed in Part 2 - Products.

1.11 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver material in manufacturer's original, unopened containers and crates with labels intact and legible.

B. Deliver materials in sufficient time and quantity to allow continuity of work and compliance with approved construction schedule.

C. Handle materials in a manner to prevent damage.

D. Store materials on clean raised platforms with weather protective coverings. Provide continuous protection of materials against damage or deterioration.

E. Remove damaged materials from site.

1.12 WARRANTIES

A. The Contractor warrants to the Owner and Architect that materials and equipment provided under the contract will be of good quality and new unless otherwise required or permitted by the contract documents, that the work will be free from defects not inherent in the quality required or permitted, and that the work will conform with the requirements of the contract documents. Work not conforming to these requirements, including substitutions not properly approved and authorized will be considered defective. The Contractor’s warranty will exclude remedies for damage or defect caused by abuse, improper or insufficient maintenance, improper operations, modifications not executed by the Contractor or improper wear and tear under normal use. If required by the Architect, provide satisfactory evidence as to the kind and quality of materials and equipment.

B. The Contractor must agree to repair or replace defective or non-complying work at no cost to the Owner upon written notification from the Owner within the warranty period. Pro-rated warranties are not acceptable.

C. Warranties must be for a period of one year from the date of substantial completion or the owner begins using the pool unless otherwise specified. Submit warranties covering, but not limited to the following:

1. Defects in material or workmanship of the pool and surge tank structure(s) causing a loss of water for a period of three (3) years.
2. Defects in material, manufacture and installation of the filtration, backwash, chlorination, pH adjustments and cleaning systems, including controls for a period of one (1) year.
3. Defects in material, manufacture or installation of the recirculating overflow system and interior coating of the gutters for a period of one (1) year.
4. Manufacturer's minimum ten (10) year warranty against defective materials, components, and workmanship in the pool gutter grating system.
5. Defects in material, workmanship, and installation of the pool pumps for a period of one (1) year.
6. Manufacturer's minimum eighteen (18) month warranty against defective materials, components, and workmanship in the variable frequency drive system.
7. Manufacturer's minimum fifteen (15) year warranty on the filter tank against defective materials or workmanship of the tank and components. (Additional warranty time may be purchased from the manufacturer.) Prorated warranties are not acceptable.
8. Defects in material, workmanship, and installation of the pool piping system and recirculation fittings for a period of three (3) years.
9. Manufacturer's minimum one (1) year warranty against defective materials, components, and workmanship in the sanitizing feed system.
10. Manufacturer's minimum one (1) year warranty against defective materials, components, and workmanship in the pH buffer feed system.
11. Manufacturer's minimum one (1) year warranty against defective materials, components, and workmanship in the ultraviolet sanitizing system (excluding the UV lamps, quartz, and seals). Medium pressure ultraviolet bulbs must be warranted for a period of 8,000 hours. Intermittently operated lamps (≥ 1 on/off cycle per day) will be replaced free of charge should failure occur prior to 4,000 hours and replacement will be prorated between 4,000 and 8,000 hours.
12. Manufacturer’s minimum three (3) year warranty against defective materials, components, and workmanship in the Clear-Flow Electronic Flocculation System (EFS).
13. Manufacturer's minimum five (5) year warranty against defective materials, components, and workmanship in the pool chemical controller. ORP, pH, flow and temperature sensors must be covered by a standard two (2) year warranty. Other sensors and flow cell components must be covered by a standard one (1) year warranty.
14. Manufacturer's minimum one (1) year warranty against defective materials, components, and workmanship in the pool water level control system.
15. Defects in material, workmanship, and installation of loose, deck, maintenance, and safety equipment including deck anchors for a minimum period of one (1) year.
16. Defects in material, workmanship, and installation of the pool cementitious finish against cracking and delamination for a period of three (3) years.
17. Defects in material, workmanship, and installation of the tile finish against cracking and delamination for a period of five (5) years.
18. Manufacturer's minimum fifteen (15) year systems warranty against defective materials, components and workmanship in the pool tile setting materials.
19. Defects in material, workmanship and installation of the surge tank, gutter, and backwash pit waterproofing finish against delamination for a period of one (1) year.
20. Manufacturer’s minimum two (2) year warranty against defective materials, components, and workmanship in the pool underwater lights.
21. Manufacturer's minimum five (5) year warranty on the complete heat exchanger assembly for the Lap Pool and Wellness Pool heaters. Manufacturer's minimum three (3) year warranty on the complete heat exchanger assembly for the Spa heater.

1.13 SYSTEM TRAINING

A. A qualified representative of the Contractor performing work under this section must put the equipment into operation and instruct the Owner's representatives in the operation of this equipment to the Owner's satisfaction immediately after project's substantial completion.

B. The Contractor's training representative must have completed the equipment/system's manufacturer's training requirements and be certified, by the manufacturer, to provide and teach system training.

C. The representative from the Contractor must be either a CPO (Certified Pool Operator) or have an AFO (Aquatic Facility Operator) certification.

D. Training periods to consist of 32 hours of on-site training and scheduled as follows:
   1. 16 hours of initial training on the complete swimming pool system. The 16 hours of initial training must be comprised of at least 4 hours of training on water chemistry analysis and adjustment. The water chemistry training will include in-depth review of the use of the Langlier index and its computation.
   2. The initial 16 hours of training must include information on the care, operation, adjustment, and maintenance of items provided by the Contractor under the "Part 2 – Products" section of this specification.
   3. 16 hours of training after the Owner's staff has had experience operating the system. This time may be requested after the pool has been placed in operation within a period of one (1) year from the time the pool was accepted by the Owner. The additional training must contain at least 2 hours of review of water chemistry.
   4. Provide a project specific video recording instruction manual in addition to the training sessions. The video instructions must be project specific and must include information on the care, operation, adjustment, and maintenance of items provided by the Contractor under the "Part 2 – Products" section of this specification. This video recording must be done separate from the Owner training.
   5. The Contractor must include one (1) copy of video recording instructions in each Operations and Maintenance Manual.

1.14 POOL FILL WATER QUALITY

A. The Owner is to bear the cost of the water required for one (1) complete filling of the pools and spa (the final filling). Removal of iron or copper (if in excess of .3 ppm) will be required for the final fill to avoid staining of the pool finish. Subsequent fillings or partial fillings (more than 25%) of the pool is by the Contractor, at its own expense.

B. Provide the necessary plant equipment so that the temperature of fill water will be within plus or minus 10 degrees of the ambient air and/or the pool structure at the time of filling. Extreme caution is urged if the temperature variance is greater than 10-degree F.

C. Provide the necessary chemicals and to adjust and balance the water chemistry in the pools to the following levels:

pH	7.4 - 7.6
Calcium Hardness	200 - 400 PPM
Total Alkalinity (Calcium Hypochlorite)	60 - 80 PPM
Langelier saturation index	-0.3 - +0.3
Total Dissolved Solids (TDS)	not to exceed 1,500 PPM

1.15 START-UP CHEMICALS

A. The Contractor must maintain the chemical balance of the pool water (including the cost of chemicals required) until the pool and mechanical system(s) are fully operational and accepted by the Architect and the Owner.

B. Provide the Owner with sufficient quantities of the necessary chemicals to maintain the pool operation after the owner begins using the pool.
   1. The Contractor is required to provide chemical quantities as shown on the drawings for the following chemicals:
      a. Calcium Hypochlorite
      b. Muriatic Acid
   2. The Contractor is required to provide chemical quantities as shown on the drawings for the following balancing chemicals:
      a. Sodium Bicarbonate
      b. Calcium Carbonate
      c. Sodium Thiosulfate

C. Chemicals must be provided to the Owner must include those required by the chemical feed systems provided.

1.16 RECORD DRAWINGS

A. Provide a complete set of record drawings of the entire pool system(s) including sub-systems. Record drawings must be prepared in accordance with the requirements of Section 01 78 39 and must be a complete, stand-alone set. The Contractor is permitted to obtain original documents and copy them for this purpose only. Provide a digital record set (latest version of AutoCAD or compatible software).

PART 2 PART 2 - PRODUCTS

2.1 OVERFLOW SYSTEM

A. It is the intent of the specifications that the perimeter overflow system and surface cleaning be maintained under conditions of normal operation and that no water be discharged to waste except when cleaning the filters or emptying the pool.

B. Concrete Perimeter Overflow System
   1. A perimeter overflow system consisting of a continuous concrete and tile overflow channel must be provided as detailed and shown on the drawings for the pool(s). The bottom of the trough must be level throughout.
   2. The complete gutter trough interior must be coated with epoxy paint.
   3. Grating corner installations must be prefabricated thermo-welded corner sections provided by the grating manufacturer and installed with adequate support per manufacturer recommendations. Butting grating sections together at corners is not permitted.
   4. The grating must be formed of molded PVC sections. Modular, interlocking pieces of UV stabilized PVC grating. The top surface must have a raised, diamond ridge design to create good friction, wet or dry and be 11/16” wide with an outside depth of 1.0” and a middle depth of 1-3/8” for extra strength. The space between pieces must not exceed 3/8”. Each piece of grate must have a slotted hole at the ends for insertion of a stainless-steel fastener clip and anchor screws every 5 feet and must be easily removable. Grating surface bars must run parallel to the pool wall and with the gap, provide at least 35% open space per foot for unrestricted water flow. The color of the grate must be selected

by the Owner/Architect. The width of the grating must allow the insertion of the touchpad holding brackets between the grating and the gutter lip.

a. Basis of Design: Grating must be manufactured by Daldorado, Lawson Aquatics supplied by Neptune-Benson, or approved equal.

5. Materials, anchors, and fasteners must be 316L stainless-steel.

C. Skimmer Overflow System

1. Provide skimming system consisting of units as shown on the drawings. Skimmers must be located to ensure maximum skimming action.
   a. Basis of Design: Spa skimmers must be Admiral SC-20 by Pentair Products or approved equal.
2. The piping and other pertinent components of skimming equipment must be designed for a total capacity of the required filter flow of the recirculation system, and no skimmer can be designed for a flow-through rate of less than 30 gallons per minute or 5 gallons per minute per lineal inch of weir.
3. The skimmer weirs must be automatically adjustable and must operate freely with continuous action to variations in water level over a range of at least 4 inches. The weirs must operate at flow variations. The weir must be of such buoyancy and design so as to develop an effective velocity.
4. An easily removable and cleanable basket or screen through which overflow water passes must be provided to trap large solids.
5. The skimmer equalizer fitting at the base must be capped.
6. The skimmer must be of sturdy, corrosion-resistant materials.
7. Each skimmer must be equipped with a variable orifice trimming device to allow balancing of flow.
8. Skimmers must be NSF approved.
9. Provide a solid aluminum or fiberglass lintel plate spanning the top of each skimmer throat opening in the pool wall to support the pool coping. Lintel to have dimensions of 7-3/4” by 2’-0” and be 3/8” thick. Aluminum lintel plates require bonding in accordance with NEC Article 680. Fiberglass lintel plates must be of rigid design with factory finished or field sealed edges to prevent exposed jagged surfaces and moisture intrusion into the fiberglass material.

2.2 PUMPING EQUIPMENT

A. Proposed substitutions must include a mechanical drawing incorporating required changes in layout, piping, and valves. The cost of such changes must be included in the price of the substitute. Confirm correct pump motor voltage prior to ordering pump. Motors must be capable of continuously running without overloading at points on the characteristic curve of the pump without overload or damage. Confirm by 1/4-inch scale shop drawing that the pumps provided will fit within the available space and can be reasonably removed for servicing.

1. Pumps must be certified by the National Sanitation Foundation (NSF) and bear the certification mark.
2. If the pump is powered with a VFD, the impeller must be trimmed to a maximum diameter based on the most limiting condition of either the diameter of the maximum non-overloading rated motor horsepower at the design point or a diameter resulting in 10% greater head than the specified head.
3. The pump motor must be totally enclosed, fan cooled (TEFC) and premium efficiency of the horsepower and speed specified. A pump requiring larger horsepower is not acceptable unless submitted as a substitute and approved by the engineer, in which case necessary electrical revisions must be coordinated and provided.

4. Provide an emergency shutoff switch for the pool(s) and spa pump(s). One (1) switch must be provided for each complete pool and spa system, including all recirculation and feature pump(s). The system must include a clearly labeled emergency shutoff switch for pool and spa pump(s) per Article 680-38 of the NEC. Emergency switch must include tamper-resistant/weather-resistant cover and audible alarm. Architect to approve the location of the switch(es) no less than 5'-0" from the pool or spa wall and within sight of pool or spa users. The wiring must be done per Division 26 and coordinated with the pool wiring.
    a. Basis of Design: STI SS2202PO-EN with cover or approved equal.
5. Provide a 15-minute spa timer for each hydrotherapy pump. Architect to approve the location of the timer(s). The wiring must be done per Division 26 and coordinated with the pool wiring. Basis of design: Intermatic DPST #FD415M or equal.
6. The entire pumping unit must be mounted on a base using cap screws to preserve the back-pull-out feature of the pump. Pumps must not be secured with floor studs or "all-thread." The pump base must be coated with the same epoxy coating as the pump. An OSHA approved guard must protect coupling and exposed rotating components of the pump and motor where required.
7. Recirculation and Feature Pumps – Metallic Components
    a. Provide horizontally mounted centrifugal pumps as shown on the drawings and described in these specifications. Each pump must be of a straight centrifugal, end suction, bronze fitted, close coupled type.
    b. Pumps manufactured by Paco, Griswold, Aurora, or Herborner are considered equal, provided they meet the requirements.
    c. Pump casing must be cast iron fitted with a replaceable bronze case wear ring. Mechanical seals must be provided specific for a chlorinated water application. Pump impeller must be enclosed type of cast bronze or 316L stainless-steel, statically, and dynamically balanced, and trimmed for the specified design conditions. If a VFD is used in conjunction with a pump, the impeller must be trimmed to the maximum diameter based on the rated motor horsepower. Bronze materials must be suitable for use in a chlorinated environment. Suction and discharge flanges must be provided and tapped for gauge connections. Provide steel or cast-iron bases with equivalent epoxy coating for corrosion protection.
    d. Provide a fusion-bonded epoxy coating on wetted parts to protect pump internals from corrosion, including pump volute interior and complete pump impeller (bronze impellers only). Sandblast to bare, white metal. The thickness must be 8 to 12 mils (heavy film). Verify thickness by non-destructive testing. Coat parts as recommended by the manufacturer, including preheating parts to 400 degrees and electrostatic deposition or fluidized bed technique. Provide primers if required to resist chlorinated water <10 ppm. The coating must be Scotchkote 134 manufactured by Fusecote or approved equal.
    e. Provide a hair and lint strainer, for each pump, of fiberglass or epoxy coated stainless-steel construction with a clear observation top in the sizes (or pipe sizes) indicated on the drawings. Provide hair and lint strainers with perforations no greater than 1/16" for feature pumps as indicated on the drawings. Verify and coordinate pipe and pump suction sizes in the field. Strainer must be of a low pressure drop full-open or a tapered eccentric reducing type. Straight reducing type strainers will not be acceptable without the addition of an approved tapered eccentric reducer between the strainer and the pump (in which case, sufficient space in the pump pit must be verified). Provide a stainless-steel basket with at least four (4) times the free open area as the inlet pipe, and one spare basket with each strainer.

1) Basis of Design: As manufactured by MerMade Filter Inc., or Neptune/Benson Inc., or Fluidtrol Process Technologies, Inc.

f. Recirculation pumps must be provided by the same manufacturer. Confirm voltages prior to ordering pumps.

8. Recirculation and Feature Pumps – Composite Components
   a. Provide horizontally mounted, self-priming, centrifugal pumps as shown on the drawings and described in these specifications. The pumps must be of a straight centrifugal, end suction, non-corrosive PPO Resin material construction, closed coupled type, with integral hair and lint strainer.
   b. The pump body, seal plate, and attached hair and lint strainer must be constructed of non-corrosive PPO Resin materials, and close-coupled to an electric motor by means of an adaptor of the same material.
   c. The pump must have a PPO Resin diffuser to aid in priming and it must contain a replaceable bronze wear ring for the impeller. The impeller must be of the closed type and PPO Resin, non-overloading at points on the performance curve. The mechanical shaft seal must be constructed of ceramic and carbon seal faces, with stainless-steel, brass, and Buna N materials in the spring bellows portion. The impeller must be secured to the motor shaft by means of a stainless-steel key and locking screw into the end of the motor shaft. The pump must be capable of operating at up to 50 psi, 104° F continuous water temperature.
   d. The electric motor coupled to the pump must be of the NEMA Rated series JM construction with stainless-steel shaft inside a removable shaft sleeve of 300 series stainless-steel. Motors must be continuous duty rated at 40° C (or realign better) ambient and be suitable for outdoor installation.
   e. Pumps must meet Department of Energy (DOE) minimum efficiency standards for dedicated-purpose pool pump (DPPP) motors.
   f. The pump strainer must consist of a PPO Resin body, Polycarbonate Resin Thermoplastic cover with O-ring seal, and Cam and Ramp Lid, and a strainer basket of mineral reinforced polypropylene material.
   g. The strainer basket must be securely positioned below the suction inlet of the trap, with access for inspection and cleaning through a removable trap body lid. The trap body lid must be secured by means of a locking ring. Provide one spare basket for each strainer.
9. Other System Pumps and Motors
   a. Provide one (1) portable utility pump(s). The pump(s) must be a 1 HP, 3600 RPM, 115/230-volt, 1 phase, 60 cycle unit capable of 60 GPM at 25 ft. TDH.
      1) Basis of Design: Pump must be a Godwin GSP10 or approved equal.

B. Variable Frequency Drive Starters
1. Provide variable frequency drive starters (VFD) for the pool pumps as indicated on the drawings. VFDs must be Eco-Flow-C by H2Flow Controls, AcuDrive by Pentair, GreenDrive by Neptune Benson, or approved equal.
   a. Basis of Design: Eco-Flow-C by H2Flow Controls
2. Ensure that equipment is provided with the correct operating voltage and that interconnected electrical and electronic equipment must adequately communicate and operate the specified pumping equipment. Equipment installations must meet or exceed the requirements of the National Electric Code and other local and state regulations.
3. Variable Frequency Drive Base Requirements
   a. Provide complete VFD as specified herein or in the equipment schedule for loads designated that must be variable speed or variable flow.

b. The VFD must convert incoming fixed frequency three-phase AC power into a variable frequency and voltage for controlling the speed of three-phase AC induction motors. The VFD must be a six or twelve pulse input design, and the input voltage rectifier must employ a full wave diode bridge. The output waveform must closely approximate a sine wave. The VFD must be of a PWM output design utilizing current IGBT inverter technology and voltage vector control of the output PWM waveform.
c. Indoor Applications: VFD must be fully enclosed in a corrosion resistant NEMA 12/IP54 UL listed enclosure.
d. VFD and required options will be incorporated by the VFD manufacturer into an integrated package, with a single input feed and main disconnect.
e. VFD must have a fused disconnect and battery back-up, for the purpose of maintaining programming in the event of a power outage, or properly rated circuit breaker.
f. The VFD must produce an output waveform capable of handling maximum motor cable distances of up to 1,000 ft. (unshielded) without tripping or derating.
g. The VFD selected must be able to source the motor's full load nameplate amperage (fundamental RMS) on a continuous basis and be capable of running the motor at its nameplate RPM, voltage, current, and slip.
h. The VFD will be capable of running variable torque loads. The VFD must be able to provide its full-rate output current continuously and 110% of rated current for 60 seconds.
i. VFD must offer a motor spinning test that will allow the user to determine if the motor is running in the correct direction.
j. Switching of the input power to the VFD must be possible without interlocks or damage to the VFD at a minimum interval of 2 minutes.
k. Switching of power on the output side between the VFD and the motor must be possible with no limitation or damage to the VFD and must require no additional interlocks.
l. Cooling must be via an aluminum heat sink and must prevent the introduction of ambient air to the electronics for cooling. With the exception of the water-resistant heat sink fan, electronics must be fully sealed within the enclosure.
m. The VFD must have temperature-controlled cooling fans for quiet operation, minimized internal losses, and greatly increased fan life.
n. VFD must provide full torque to the motor, given input voltage fluctuations of up to +10% to -10% of the rated input voltage.
o. The VFD must include additional contacts for interface with a remote start/stop panel and the emergency stop function. When the VFD is supplied for a spa hydrotherapy pump, the drive must also interface with a remote timer switch to control pump operation via a preset timed duration (15-minute timer switch).

4. Harmonics:
   a. The VFD must provide internal DC link reactors to minimize power line harmonics and to provide near unity power factor.
   b. The VFD must be provided with line-side harmonic reduction, as required, to ensure that the current distortion limits, as defined in table 10.3 of IEEE 519-1992, are met.
   c. Harmonic solutions must be capable of withstanding up to 2% ambient voltage distortion with the maximum Current Distortion not to exceed 12% at 100% load.
5. Protective Features:
   a. VFD must have input surge protection.

b. VFD must include circuitry to detect phase imbalance and phase loss on the input side of the VFD.
c. Printed Circuit boards must be conformal coated to reduce the corrosion effect from environmental gases and other conditions. The conformal coating must meet IEC 61721-3-3, Class 3C2 as standard.
d. Dry-pump detection must be available to detect if the pump has run dry. If this condition occurs, the drive will be safely stopped. A timer must be included to prevent nuisance tripping.
e. VFD must include two current sensors on output phases to detect and report phase loss to the motor. The VFD will identify which of the output phases is low or lost.

6. Interface Features:
   a. VFD must provide an alphanumeric backlit display keypad (LCP) which may be remotely mounted using a standard 9-pin cable. VFD may be operated with keypad disconnected or removed entirely. Keypad may be disconnected during normal operation without the need to stop the motor or disconnect power to the VFD.
   b. VFD Display must have the ability to display parameters pertaining to the VFD or the load including the following: current, speed, DC bus voltage, output voltage, input signal in mA, or other values from a list of user-selectable parameters.
   c. LED lights must be provided. These indications must be visible both on the keypad and on the VFD when the keypad is removed.
   d. Two-level password protection must be provided to prevent unauthorized changes to the programming of the VFD.
   e. VFD must offer as standard an internal clock. The internal clock can be used for: Timed Actions, Energy Meter, Trend Analysis, date/time stamps on alarms, Logged data, Preventive maintenance, or other uses.
   f. A battery back-up must be provided to maintain internal clock operation during power interruptions.
   g. Inputs and outputs must be optically isolated.
   h. The VFD must have at least two analog signal inputs. Inputs must be programmable for either 0 -10V or 0/4-20 mA.
   i. At least one programmable analog output must be provided for indication of the drive status. This output must be programmable for output speed, voltage, frequency, motor current and output power. The analog output signal must be 0/4-20 mA.
   j. The VFD must be capable of sending an output signal as a start command to actuate external equipment before allowing the VFD to start.
   k. The VFD must be equipped with a standard RS-485 serial communications network connection.
7. Adjustments:
   a. The VFD must have selectable output switching frequencies to mitigate motor noise.
   b. Multiple complete programming parameter setups must be provided, which can be locally selected through the keypad or remotely selected via digital input(s), allowing the VFD to program for up to four alternate control scenarios without requiring parameter changes.
   c. In each programming setup, independent acceleration and deceleration ramps must be provided. Acceleration and deceleration time must be adjustable over the range from 0 to 3,600 seconds to base speed.

d. The VFD must have four programmable “Bypass frequencies” with adjustable bandwidths to prevent the driven equipment from running at a mechanically resonant frequency. The feature must offer a Semi-Automatic program to simplify the set-up.
e. VFD must include an automatic acceleration and deceleration ramp-time function to prevent nuisance tripping and simplify start-up.
f. The VFD will include a user-selectable Reset function, which enables the selection of between zero and multiple restart attempts after a self-clearing fault condition (under-voltage, over-voltage, current limit, inverter overload, and motor overload). The time between restart attempts must be adjustable from 0 through 600 seconds.
g. The VFD will include a user-selectable Auto-Restart function that enables the VFD to power up in a running condition after a power loss, to prevent the need to manually reset and restart the VFD.

8. Bypass
   a. Provide a manual bypass in conjunction with the VFD for the recirculation pump(s) and feature pump(s) consisting of a door interlocked main pad lockable disconnect in the off position, a built-in motor starter and a facility for allowing DRIVE/OFF/BYPASS/TEST switching by three contactor control.
9. Individual VFD options such as bypass, motor selection contactors, etc. must be incorporated by the manufacturer onto a single panel with a single input feed and main disconnect function. Enclosures must be UL listed and fully assembled by the VFD manufacturer.
10. Service Conditions:
    a. The ambient operating temperature of the VFD must be -10ºC to 40ºC (14 to 104°F).
    b. Elevation to 3,300 feet (1000 meters) without derating.
    c. VFD’s must be rated for line voltage of 525 to 690VAC, 380 to 480VAC, or 200 to 240VAC; with +10% to -10% variations. Line frequency variation of ± 2% is acceptable.

C. Pump Gauges
1. Pressure gauges must be provided on the discharge of the pumps.
2. Compound gauges must be provided at the intake port of the pumps, after the hair and lint strainer.
3. Gauges must be liquid filled, 316L stainless-steel bourdon tube type with a minimum 2-1/2-inch diameter dial, high impact polypropylene or stainless-steel case, corrosion resistant white scale with black divisions and numerals, 300 Series stainless-steel heavy duty rotary bushed movement, black enameled balanced Micrometer pointer.
   a. Basis of Design: Gauges must be manufactured by Weksler Instrument Corporation or approved equal.
4. Scale ranges must be selected to indicate the normal system operating pressure of each system or location within the system. Pressure ranges must be calibrated in psig (0-60 psi) and compound gauge must be calibrated in inches of mercury (0-30 in Hg / 0-60 psi).
5. A stainless-steel filter type pressure snubber must be provided for each pressure gauge consisting of a 3/8-inch diameter by 1/8-inch-thick micro metallic stainless-steel filter and placed in the line just before the pressure gauge. Provide isolation brass valves or brass gauge cocks at each gauge for easy replacement and maintenance.

D. Pump Hoist Beam Trolley: Provide CM Series 632 close radius trolley by CM Industrial must be mounted on hoist I-beam at pool pump pit (refer to structural). Trolley must be sized

adequately to provide hoist capabilities for pump/motor combinations located in the pump pit. Provide with double row ball bearing wheel design, bearings pre-packed with lifetime lubricant. Confirm trolley size is compatible with beam configuration. Minimum rated capacity of 2 tons.

2.3 FILTRATION EQUIPMENT

A. The filter system must consist of high-rate pressure sand filter tanks as shown on the drawings. Every aspect and component of the filter system must be certified by the National Sanitation Foundation (NSF) and bear the certification mark. The filter must have an engraved metal data plate permanently affixed on the face of the system that describes operational data and instructions and indicates startup date.

B. It is the intent of these specifications to describe a filtration system complete in every respect with accessory items and supplied and warranted by one manufacturer.

C. Horizontally Oriented Fiberglass Tanks
   1. The filter tanks must be horizontally oriented single cell fiberglass tanks, minimum 48 inches in diameter. The filter system must be listed as approved by the National Sanitation Foundation prior to bid date.
      a. Basis of Design: Fiberglass filters must be the product of Stark/Pentair, Waterco, or Neptune Benson provided they meet the specifications and layout. System design is based upon Neptune-Benson. Valves must be provided to backwash one filter at a time.
   2. Filter tanks must incorporate components and features as described in this section.
   3. Two (2) saddle style bases must be provided for tank support. Systems that incorporate stacked tanks must include similar bases and mounting saddles for the upper vessel. Tank supports and connections must be seismic rated to support the filter tank(s) for the appropriate seismic zone where the project is located. Access to the tank must be provided by a 14" x 18" manhole with two (2) curved yokes. Manhole seal must be complete with a one-piece 1/4" neoprene gasket and positioned so that internal pressure from the filter will augment the seal. No additional hardware or through bolts will be allowed.
   4. Each filter tank must be equipped with the necessary flanges and connections for the internal and external piping. Connections must be comprised of fiberglass flanges and schedule 80 PVC flanges.
   5. Tank connections 2 inches and smaller must be 150 lb. Type 316L stainless-steel threaded full couplings. Tank connections 3 inches and larger must be heavy steel bosses drilled and tapped on both sides to receive standard flanged fittings or Sch. 40 Type 316L stainless-steel nipples.
   6. The discharge from the automatic air release valve must be hard piped to waste. Each filter tank must have a means of releasing air. Each coupling or orifice must be provided with a slotted PVC sand retainer or stainless-steel strainer. An automatic air release system must be provided for each tank.
   7. The drain system must consist of a 3/4-inch 316L stainless-steel coupling mounted at the lowest point in the bottom head. This drain must be valved and piped to the nearest floor drain or backwash pit.
   8. Filter Piping - Internal
      a. The lower internal distribution system must be a horizontal header/lateral arrangement. The header must be Schedule 80 PVC construction, capped on one end and flanged or threaded at the other end for field connection. Lateral connections must be spaced no more than 6 inches on centers and must be 1-1/2-inch FPT connections. Attachments to header must be solvent welded and thermo-welded to ensure integrity of connection.

b. Under drain system must be factory installed and constructed of extra heavy Schedule 80 high impact PVC. Multiple PVC main headers must be tapped and threaded to receive laterals.
c. Laterals must consist of 1-1/2-inch Schedule 80 PVC pipe with openings as required. Each lateral must be fabricated complete with socket cap on one end and male adapter on the other end. Both fittings must be solvent welded to the slotted pipe. Laterals must be designed and sized at the factory, so they are installed in the field and over the entire cross sections area of the filter.
d. The upper distributor must consist of PVC piping Schedule 80 and/or deflector plate per manufacturer standard design.
e. Each filter must be supplied with a pressure equalizing upper internal distribution system consisting of a horizontal header/lateral arrangement. The header piping must be constructed of Schedule 80 PVC. The header/lateral piping and connections must be designed and sized to provide uniform distribution and unrestricted flow during the filtration and backwash cycles.
f. Upper laterals must be constructed of Schedule 80 PVC pipe with machine slotted openings or orifices. Machined slots or orifices must be clean, de-burred and free of obstructions that would not permit the free flow of water through the opening. Details of the lateral attachment to the header must be submitted for review and approval.
g. The lower and upper distribution systems must be properly supported and anchored. Hardware in wetted areas must be Type 316L stainless-steel or non-metallic. Tank interiors must be inspected prior to the media being placed in the filters.

9. Filter Piping - External (Face)
a. External face piping must be Schedule 80 PVC pipe and fittings. Flanges must be located so as to allow for easy dismantling of face piping. Fittings must be solvent cemented.
b. Piping must be drilled and tapped where necessary to accommodate gauge tubing connectors.
c. Valves 3" and larger must be constructed with cast aluminum S12A alloy (as defined by ASTM B275) housing and fully coated with Rilsan on interior and exterior surfaces. Internal components include EPDM resilient lining, Rilsan coated ductile iron disc and 316L stainless-steel shaft. Valves must be rated for 150 psi bubble tight shutoff. Unless otherwise specified, nuts and bolts must be stainless-steel with stainless-steel washers and used when secured to PVC flanges. Systems incorporating solenoid, pneumatic, pressure amplified, hydraulic or multi-directional valves are not acceptable.
d. Standard accessory items must include sight glass rated for 50 psi with polycarbonate glass, remote mounted gauge panel with two 4½" diameter pressure gauges, ¼" petcocks, ¼" poly vent tubing with PVC compression adapters.

10. Backwash Control
a. The filter manifold face piping must be designed to allow for one (1) filter tank to backwash at a time while the recirculation system is operating. A manual backwashing system must be provided with the filter system.
b. Manual Backwash System
1) The manual backwash system must be equipped with a face piping configuration such that the operator must manually control and operate both the time and sequencing of the backwash cycle. Valving on the filter face piping must be a mechanical linkage device allowing the operator to

simultaneously move two (2) valves at once. Mechanical linkage components must be PVC or Type 316L Stainless-steel.

11. Automatic Air Relief Valve
    a. A 1” valve must be provided to automatically and continuously release air in the filter. The valve must be fabricated of plastic with Buna-N seals. A plumbing kit must be provided with two (2) PVC ball valves to allow manual air relief and isolation of the automatic valve. Valves fabricated of cast iron, bronze or stainless-steel valves will not be accepted.
12. Filter Media
    a. Filter media must be a carefully selected grade of hard uniformly graded silica material. Media must be milled angular shaped particles of silica quartz. The filter sand must have a particle size between 0.45 mm and 0.55 mm and have a uniformity coefficient not to exceed 1.53. Specific gravity must not be less than 2.5 with a pH of 7.0.
    b. Media (sand) must be cleaned and free from clay or limestone deposits. The bottom layer of support media must be placed by hand to avoid damage to the under-drain system and leveled before the addition of the upper layer of filter media.
    c. Media must be delivered after approval by the manufacturer of the filter and stored in 100-pound bags for ease of handling and elimination of possible contamination.
    d. Media must be supplied by the filter manufacturer and approved by the filter manufacturer prior to shipping.
13. Support Media
    a. A Gravel support media of a hard-coarse aggregate with a sub-angular grain shape with a particle size of 1/8" x 1/4" must be used on the inside of the bottom head to the elevation where the filter media commences. The specific gravity must not be less than 2.5. Support media must be placed by hand to avoid damage to the underdrain system and leveled before the addition of the upper layer of filter media. Concrete under fill is not recommended. Support gravel must be delivered and stored in 100-pound bags (approximately one cubic foot) for ease of handling and elimination of possible contamination. Media must be free from minerals which can precipitate onto pool surfaces.
    b. Sand must be a carefully selected grade of hard, uniformly graded silica material. Media must be naturally rounded particles of silica or milled angularly shaped particles of silica quartz. Sand must have a particle size between 0.45mm and 0.55 mm (#20). No more than 1.5% is allowed to pass through a #40 sieve (.0164”). Uniformity coefficient must not exceed 1.53. Specific gravity must be not less than 2.5. The filter must contain a minimum bed depth as recommended by the manufacturer. Systems which do not provide a minimum bed depth will not be accepted. Sand must be delivered and stored in 100-pound bags (approximately one cubic foot) for ease of handling and elimination of possible contamination. Media must be free from minerals which can precipitate onto pool surfaces.

2.4 RECIRCULATION FITTINGS

A. Main drains must be PVC/Fiberglass box with PVC grating as sized on the drawings. Grate openings must not exceed 11/32 inch in width, providing an open flow area to allow water velocity not to exceed 1.5 fps. The grate must be PVC and fit closely and flush with top surface of frame and secured to frame with vandal proof fasteners. Provide a no-leak seal flange at the midpoint of the boxes. The exposed edges of main outlets must be rounded

and smooth, free of burrs and sharp edges. Main drain covers must comply with the Virginia Graeme Baker Act and ANSI/APSP-16 2017. Project specific shop drawings detailing piping port locations and sizes on each side of the main drain sump must be provided for each sump. Shop drawings must show port locations with caps/flanges to allow for testing.

B. Provide a water bonding fitting PB-SK-20 manufactured by Perma-cast Swimming Pool Products or approved equal. Bonding fitting must be installed at the lowest point of the main drains.

C. Provide hydrostatic relief valves consisting of a 2” cycolac relief valve connected to an FPT commercial style Schedule 80 PVC collector tube. The collection tube must have seepage holes, 3/8 inch in diameter, and must be screwed securely to the valve body. The hydrostatic relief valve must be designed to seal with minimum pressure and must have a non-plugging, self-cleaning raised valve seat. The hydrostatic relief valve must be Hayward model #SP1056 with collector tube model #SP1055, Aquastar model #HVC101 or approved equal.

D. Concrete dropout boxes (converters) must be concrete sumps with 12-gauge 316L stainless-steel frame and sized as shown on the plans. Provide a no-leak seal flange at the midpoint of the boxes.

E. Wall inlet fittings must be cycolac directional inlet Hayward model #SP-1419-D (3/4” opening) mounted in model #SP-1022S, Aquastar model #3301B (3/4” opening) or approved equal from Sta-Rite.

F. Adjustable floor inlet fittings must be provided each consisting of an ABS plastic body and adjusting top plate with a positive locking device. A spanner wrench must be provided to facilitate flow adjustment. The inlet body must be provided with a 2-inch cycolac solvent weld connection and internal NPT threads to facilitate line pressure testing. Floor inlet fittings must be Sta-Rite model #8417-0000-white/#8417-0100-gray/#8417-0200-black, Aquastar model #4DIV101(white)/ #4DIV102(black)/ #4DIV103 (gray) or approved equal.

G. The sight sump frame and cover must provide access to the vertical sight sump standpipe as indicated in the plans. Frame and cover must be provided as a pan-filled, removable access lid that can receive the surrounding deck finish. Lids must be model #SQ201 PAL (Tan), #SQ201 PAL (Gray) or #SQ201 PAL (Frosted) manufactured by Pour-A-Lid or approved equal. Refer to the Owner/Architect for color selection.

H. Valve Box
   1. Valve box cover(s) that are not specified on the drawings or specifically identified as another size or material must be a solid HDPE lid(s) by Daldorado or approved equal. Access covers must be sized as shown on the drawings and be constructed of 1” thick marine grade HDPE with a slip resistant surface. Valve box must be provided with a 3” x 3” x ¼” FRP I-beam across the center of the opening as shown on the drawings. The valve box cover must come with corrosion resistant hardware to secure the hatch. The access cover must have an identification plate with 1.5” high font identifying the contents below the cover. Refer to the Owner/Architect for color selection.

I. Anti-vortex plates must be provided at the suction points of the main recirculation pump(s) in the surge tank(s). Each plate must be connected to the suction pipe via a PVC flange and must be ½ in. thick with minimum dimension of at least 2.5 times the connecting pipe diameter. The plate must be located 4 inches above the finished floor of the surge tank. Four (4) 3/4 in. stainless-steel threaded rods, nuts, anchor bolts and washers must be used to fix the offset

distance and provide a secure base for the suction pipe. Manufactured fiberglass or PVC anti-vortex plates by Daldorado, Neptune-Benson or approved equal.

J. Hydrotherapy inlet fittings must be provided consisting of a cast bronze or cycolac venturi body with 1-1/2-inch water inlet pipe connections and 1/2-inch air intake connection. A 1/8-inch IPS thread must be provided in the inlet throat to permit hydrostatic pressure testing of the piping system. The inlet must be designed to operate at 20 GPM at a working pressure of 15 PSI and installed as shown on the drawings. Jet Body must be Waterway model #210-5950 with Waterway Adjustable Fitting model #210-8750 or approved equal. Provide fitting adjustment tool from Waterway, model #210-1770A, or approved equal.

2.5 PIPING SYSTEMS

A. General
1. Provide recirculating piping between the pool(s) and the pool mechanical room, fill funnel and all interconnecting piping to and from the chemical feed systems and chemical controller.
2. Provide necessary pipe supports and support systems required to support associated piping and valves.
3. Provide other tubing, conduit or piping associated with equipment specified herein. Coordinate with other trades.

B. Pipes
1. Pipe routing as shown and detailed on the contract drawings is diagrammatic only and is not intended to show minor details or exact locations of piping systems. Installation is required and must be adjusted to accommodate interference and adjustments anticipated and encountered. Pipe sizes on plans refer to the nominal inside diameter of the pipe.
2. PVC swimming pool piping must be NSF approved and conform to the requirements of ASTM D-1785.
3. PVC pipes must be the product of one manufacturer. Approved manufacturers of PVC piping are Eslon, Harvel, and Chemtrol or approved equal.
4. The swimming pool piping above and below the floor in the pool mechanical room must be Schedule 80 PVC.
5. The swimming pool piping under the pool floor must be NSF approved, Schedule 40 PVC and concrete encased. Transitions between Schedule 40 and Schedule 80 must be encased in concrete.
6. Below grade swimming pool piping not located beneath the pool floor must be Schedule 80 PVC backfilled with native granular material free of ice, clay, debris, organic matter, and rocks larger than 4" across their greatest dimension, and per recommendations indicated in the project geotechnical report.
7. The influent and effluent lines to the heat source unit must be CPVC. Connections between metallic piping and/or equipment and PVC must be flanged.
8. PVC and CPVC fittings must be the product of one manufacturer. Molded fittings must be manufactured by Ipex, Chemtrol, Harvel, Spears, and Lasco/Westlake or acceptable substitutes. Fabricated fittings must be manufactured by Harrison Machine, Spears, or an acceptable substitute.
9. Vertical sight sump piping must be NSF approved, Schedule 40 PVC. Horizontal sight sump piping must be NSF approved, Schedule 40 PVC that is perforated and wrapped with fabric and has 3/8” diameter holes located top and bottom on 4 inch or 6-inch centers. Horizontal sight sump piping must extend 1 foot minimum beyond the main drain.

10. Chemical feed lines from chemical feeders to recirculation piping must be Schedule 80 PVC piping. Piping must be hard piped into the recirculation piping via tee or saddle per the drawings. Required valves must be of PVC construction.
11. Splash collar(s) for the fill funnel(s) must be clear Schedule 80 PVC and manufactured from a Type I, Grade I PVC compound with a Cell Classification of 12454 per ASTM D1784. The pipe must be manufactured in compliance with ASTM D1785.
12. Y-strainers for piping sized 4” or smaller must be Hayward YS Series strainers with FPM O-rings or approved equal. Y-Strainers for piping sized 6” or larger must be Fluidtrol WYE Series strainers with EPDM gaskets or approved equal. Provide an extra perforated screen with each strainer.
13. Flanged plumbing connection hardware must be stainless-steel.
14. Materials must be installed by workmen thoroughly skilled in their trades and work must present a neat and mechanical appearance when complete. At no additional expense to the Owner, replace or correct work not judged acceptable by the Architect, Engineer, or Owner’s representation.
15. Support hardware, brackets, fasteners, hangers, etc. furnished and installed in the surge tank must be 316L stainless-steel.
16. No installation allowed that will provide a cross-connection or interconnection between a distributing supply for drinking purposes and the swimming pool, or between the pool and a sanitary or storm water sewer system that will permit a backflow of water into the pool water system.
17. Piping must be hydrostatically (water) pressure tested for leaks before and after backfilling to guarantee water tightness. Pneumatic (air) pressure test is not allowed.
18. Provide water seals for watertight penetrations of concrete walls and floor slabs.
    a. Pool Concrete: Water seals must be coupling or sleeve type with a thermo welded or molded flange and the O.D. must be sized to 150% of the O.D. of the pipe. The thermo-welded type must be welded from both sides. Water seals must be located at the centerline of the wall or slab being penetrated prior to placing the concrete to assure a watertight seal. Manufactured fiberglass and PVC water seal fittings by A.S.A. Manufacturing, Aqualogic or approved equal.
    b. Pump Pit: Link seals must be provided in the sizes and quantities shown on the drawings and installed to provide flexible watertight penetration. Metal parts must be made of 316L stainless-steel. Links must form a continuous rubber seal that is tightened with a series of stainless-steel bolts to form a watertight seal. Link seals must be manufactured by GPT, Calpico Inc. or an approved equal. Xypex Patch’n Plug or approved equal must be used to seal pipe penetration. Link seals must be installed with either a cored hole or a Century Line pipe sleeve.
    c. Surge Tank: Water seals must be coupling type with a thermo welded or molded flange and the O.D. must be sized to 150% of the O.D. of the pipe. The thermo-welded type must be welded from both sides. Water seals must be located at the centerline of the wall or slab being penetrated prior to placing the concrete to assure a watertight seal. Manufactured fiberglass and PVC water seal fittings by A.S.A. Manufacturing, Aqualogic or approved equal. Link seals are also acceptable with a cored hole or a Century Line pipe sleeve.
19. Adhere to the applicable provisions in Division 22 - Plumbing, "General Provisions" and "Basic Materials and Methods" for installation of piping system.
20. Mechanical equipment must be connected into the recirculation piping system must be connected utilizing flanged or union connections.
21. Provisions must be made to purge pipes in the system.
22. Concentric reducers must be fiberglass by MerMade Filter, Inc., or equivalent reducers of schedule 80 PVC construction.

C. Pipe Hangers and Supports
   1. Manufacturer
      a. Subject to compliance with these specifications, pipe hanger and support systems must be manufactured by Cooper B-line (basis of design), Inc, TOLCO, and Anvil International or approved equal.
   2. Hangers
      a. Pipes 2 inches and smaller
         1) Adjustable steel clevis hanger, B-Line models B3100 or B3104.
         2) Adjustable steel swivel ring (band type) hanger, B-Line model B3170.
      b. Pipes 2-1/2 inches and larger
         1) Adjustable steel clevis hanger, B-Line model B3100.
         2) Adjustable steel yoke pipe roll, B-Line model B3114.
   3. Multiple or Trapeze Hangers
      a. Trapeze hangers must be constructed from 12-gauge roll formed ASTM A1011 SS, Grade 33 structural steel channel, 1-5/8 by 1-5/8-inch minimum, B-Line B22 strut or stronger as required.
      b. Mount pipes to trapeze with 2-piece pipe straps sized for outside diameter of pipe, B-Line B-2000 series.
   4. Wall Supports
      a. Pipes 2-1/2 inches and smaller
         1) Steel offset “J” hook hanger, B-Line model B3600.
      b. Pipes 3 inches and larger
         1) Welded strut bracket and pipe straps, B-Line models B3064 and B2000 series.
         2) Welded steel bracket B-Line model B3066 or B3067 with roller chair or adjustable steel yoke pipe roll. B-Line model B3120 or B3110.
   5. Floor Supports
      a. Electroplated carbon steel adjustable pipe saddle and nipple attached to steel base stand sized for pipe elevation. B-Line model B3092 and B3088T or B3090 and B8088. Pipe saddle must be screwed or welded to an appropriate base stand.
   6. Vertical Supports
      a. Steel riser clamp sized to outside diameter of pipe, B-Line model B3373.
   7. Plastic Pipe Supports
      a. V-Bottom clevis hangers with galvanized 18-gauge continuous support channel, B-Line models B3106 and B3106V, to form a continuous support system for plastic pipes smaller than 1 inch or flexible tubing.
      b. A vented and sloped continuous PVC Schedule 40 pipe no smaller than 1-1/2 inch outside diameter will be used to route flexible tubing with the appropriate pipe supports.
   8. Supplementary Structural Supports - Design and fabricate supports using structural quality steel bolted framing materials. Channels must be roll formed, 12-gauge ASTM A1011 SS Grade 33 steel, 1-5/8 inch or greater as required by loading conditions. Submit design for pipe tunnels, pipe galleries etc. for approval. Use clamps and fittings designed for use with the strut system.

D. Hanger Attachments
   1. Upper Attachments
      a. Beam Clamps
         1) Beam clamps must be used where piping must be suspended from building steel. Clamp type must be selected on the basis of load supported and load configuration.

2) C-Clamps must be locknuts and cup point set screws similar to B-Line model B351L or B3036L. Top flange c-clamps must be used when attaching a hanger rod to the flange of structural steel, B-Line model B3034 or B3033 or approved equal. Refer to manufacturer's recommendations for set screw torque. Retaining straps must be used to maintain the clamp position on the beam where required.
3) Center load beam clamps must be used where specified. The steel clamps must be B-Line models B3050 or B3055. Forged steel beam clamps with cross bolt must be B-Line B3291-B3297 series or approved equal as required to fit beams.

b. Concrete Inserts
1) Cast in place spot concrete inserts must be used applicable, either steel or malleable iron body, B-line B2500 or B3014 or approved equal. Spot inserts must allow for lateral adjustment and have means for attachment to forms. Select inserts to suit threaded hanger rods sizes, B-line models N2500 or B3014N series.
2) Continuous concrete inserts must be used where applicable. Channels must be 12 gauge, ASTM A1011 Grade 33 structural quality carbon steel, complete with Styrofoam inserts and end caps with nail holes for attachment to forms. The continuous concrete insert must have a load rating of 2,000 lbs/ft. in concrete, B-Line models B22I, 32I, or 52I or approved equal. Select channel nuts suitable for strut and rod sizes.

E. Hanger Accessories
1. Hanger rods must be threaded on both ends or continuously threaded rods of circular cross section. Use adjustable lock nuts at upper attachments and hangers. No wire, chain, or perforated straps are allowed.

F. Hanger Finish
1. Indoor Finishes
a. Hangers must be zinc plated in accordance with ASTM B633 or must have an electro-deposited green epoxy finish.
b. Strut channels must be pre-galvanized in accordance with ASTM A653 SS Grade 33 G90 or must have an electro-deposited green epoxy finish.
c. Zinc Plated hardware is not acceptable for use in chemical rooms.

G. Valves
1. Valves 3 inches and larger must be butterfly type valves, with PVC body, 150# SWP with stainless-steel shaft, PVC or polypropylene disc and replaceable resilient seat bonded to a rigid shaft and guaranteed for bubble tight shutoff from 27-inch vacuum to 150 PSI. Extended neck 2 inches beyond flanges for insulated piping must be provided with handle for manual operation. Valve components must be suitable for swimming pool chlorinated water service. Butterfly valves must be Georg Fischer Type 567, Asahi/America Type SP Pool-Pro, Chemtrol Model-B, Simtech VP series, Colonial Valve 411 Series, or approved equal.
2. Valves smaller than 3 inches must be PVC true union ball valves, full port, three-piece construction, blowout-proof stem, Viton seal with socket end connectors.
3. Check valves must be a quick closing non-slam type, either self-aligning wafer or flanged type, of corrosion resistant materials suitable for use in a swimming pool environment. Provide check valves in accordance with the manufacturer's recommendations. Locate check valves at least 5 pipe diameters from pumps and fittings. Check valves must be Technocheck Corp., model 5050, with epoxy coated cast

iron body and bronze swing plates on a stainless-steel spring, Colonial Valve model 601N or 601NP PVC valve with EPDM O-ring and stainless-steel spring or approved equal, for installation between 150 lb. flanges.

4. Modulating float valve in the surge tank(s) must have PVC body and stainless-steel wafer disc. Hardware must be non-corrodible. The float-operated valves must be provided horizontally on the main drain lines in the surge tank(s). A valve must consist of non-corrosion components including shaft, float arm, pins, and floats. Valve must be suitable for mounting on a 125E class standard PVC flange. The float arm leverage weight and pivot lengths must be adjustable to obtain desired ratio of surge tank level change to pool gutter overflow level change. Two floats and a stabilizer required. Valve must be model FV-D XWB (Extra Weight Ball) as manufactured by MerMade Filter, Inc. or approved equal manufactured by Neptune-Benson, EPD, or Fluidtrol Process Technologies, Inc.
5. Submerged valves up to 3 inches must be PVC true union ball valves. Submerged valves over 3 inches must be PVC bodied, wafer type, butterfly valves with stainless-steel handle extensions as required. Valves must be by approved manufacturers listed above. Submerged valves must be provided with stainless-steel connectors. The stem housing extensions must be properly supported and braced.
6. Butterfly type valves 8 inches and larger must be fitted with a watertight gear operator.
7. Valves located 7 feet or greater off the floor must be fitted with a chain operator.
8. Submerged valves, valves buried below grade, or valves not readily accessible, must be provided with a stainless-steel reach rod and handle.
9. Valve hardware must be 316L stainless-steel and meet ANSI hardware installation guidelines.

H. Pipe and Valve Identification

1. Exposed pool piping must be equipped with color coded flow directional arrows at thirty (30) inch intervals per local and state swimming pool health code. Verify that pool piping identification is in accordance with local and state health regulations.
2. Valves must be identified with minimum 1-1/2-inch diameter plastic laminate engraved tags with minimum 1/2-inch-high numbers. Tags must be fastened to valves with a nylon attachment (zip tie). Valves must be described as to their function and referenced in the operating instruction manual and wall mounted piping diagram that must be prepared.

2.6 CHEMICAL TREATMENT SYSTEMS

A. Calcium Hypochlorite (Chlorine Tablets)

1. Shop drawings complete with a piping diagram depicting the location in which the dry chlorination feeder is connected to the system must be provided and approved prior to installation. Installation of the system must be as specified in the manufacturer’s directions with no exceptions taken. Provide either of the calcium hypochlorite systems specified in this section that meets the capacity requirements shown on the drawings.
2. A factory-authorized representative must provide training to the owner and the training must be video recorded.
3. Accu-Tab PowerBase
   a. General Description
      1) The system must be designed to feed low concentrations of calcium hypochlorite in solution intermittently or continuously as required for pool applications. The system must be a single pre-assembled, package unit with a welded aluminum frame consisting of chlorinator, electrical box, centrifugal pump, and solution tank for ease of installation and operation.

The system must be the Accu-Tab PowerBase. Only Accu-Tab Blue SI calcium hypochlorite tablets must be used, the patented blue colorant added for safety (to help prevent accidental mixing with other chemicals).

2) The system must use an NSF Standard 50 listed erosion feeder and tablet combination and must be capable of meeting the requirements of the Health Department having jurisdiction over the installation.

b. System Features
   1) A maximum chlorine solution level of 0.05% (500 ppm) must be maintained to prevent calcification in system components. Systems producing chlorine concentrations higher than 0.05% are not acceptable.
   2) Delivery must be by erosion feed technology to control accurate and consistent concentration limits in the chlorine treatment solution. Soaking type, spray, and/or vortex technology systems are not acceptable.
   3) The chlorinator must automatically and continuously feed a limited quantity of chlorine in solution as needed; when the system is not running, no more chlorine than that amount which can be fed in one minute or less must be left in the tank to prevent dilution. Batch systems preparing excess quantities of solution for delivery over an extended period are not acceptable.
   4) A centrifugal pump wired to the system electrical box must feed freshly mixed chlorine treatment solution only as required for maximum efficiency. Batch systems requiring the use of a metering pump or pumps to feed pre-prepared standing solution are not acceptable.
   5) Piping in the chlorinator unit must be Schedule 40 PVC. Systems with flexible tubing are not acceptable.

c. System Components
   1) Accu-Tab PowerBase chlorinators are designed exclusively for Accu-Tab Blue SI calcium hypochlorite tablets. Tablets are placed on a sieve plate inside the chlorinator; as water flows across the sieve plate, the tablets erode at a rate proportional to the flow rate.
   2) Inlet Water Supply Connection.
      a) Model 1030: 1.5” (water supply of 10 GPM required)
   3) Inlet Water Filter: A filter to protect chlorinator components from start-up debris and sand from broken filter laterals.
   4) Flow Meter:
      a) A rotameter flow meter, measuring the flow of the water-eroding stream to the chlorinator. (For models 1030, 3070AT, 3140AT)
      b) Clamp-on flow meter, measuring the flow of the water-dissolving stream to the chlorinator. (For model 3500)
   5) Solution Tank: PowerBase 3500 made of HDPE; others made of PVC.
   6) Capacities:
      a) Model 1030: 7 gallons
   7) Primary Solution Tank Level Control: Made from Schedule 80 PVC and 316L stainless-steel. The float valve opens to maintain the pump rate as it is manually throttled.
   8) Overflow Protection: Two (2) level switches in the upper portion of the solution tank will run the pump from high to lower level to prevent system overflow.
   9) Solution Delivery Pump: Delivers chlorinated solution to the return line. A single-stage centrifugal pump is provided for systems with pressures up to 20 PSIG.

10) Primary Backflow Prevention: A PVC swing check valve prevents reverse flow of water into the system.
11) Discharge Control Valve (manual): PVC gate valve allows operator to adjust flow of solution to the system.
12) Outlet Connection:
    a) Model 1030: 1”
13) Aluminum Frame: Type 6061-T.
14) NEMA 4X Electrical Enclosure

4. Pulsar System
   a. The sanitization system for the pool(s) must be a Pulsar system and must operate in a non-pressurized manner to ensure optimum safety and ease of operation.
   b. A post filter recirculation loop will be added to the main pool recirculation system to supply the chlorination system. The recirculation loop will provide the inlet water supply to the chlorinator as well as the vacuum to evacuate the chlorinated solution.
   c. The sanitization system must be N.S.F. listed.
   d. The sanitization system must incorporate the principle of High-Capacity Erosion (HCE) technology. Water must rise through the grid of briquette basket from the force of an upward facing nozzle contacting the Pulsar Plus Dry Chlorinator Briquettes. The briquettes must be in contact with the water for a period of time creating a chlorinated solution which will exit the dissolving bowl at a specific height and fall into the discharge tank by gravity. The chlorinated solution must be drawn by the vacuum from the discharge tank and introduced into the recirculation system. The output must operate with a vacuum range between 5” and 29” Hg.
   e. The vacuum is created by a Mazzei venturi, model 1585X, which is installed in the post filter recirculation loop driven by a Pulsar booster pump. The venturi is installed on the discharge side of the Pulsar pump creating a flow though the venturi, which provides suction on the discharge valve evacuating the discharge tank. An emergency overflow switch must ensure that water flow to the spray manifold is shut off in the unlikely event that the discharge tank has not emptied properly.
   f. Pulsar Precision: The system will operate with an inlet water pressure of 25-45 psig. The inlet water is supplied from the Pulsar booster pump. Pulsar Precision 30: The system will operate with an inlet water pressure of 5 psi.
   g. The briquette tank must have a capacity of:
      1) Pulsar Precision 30: Thirty (30) pounds of Pulsar Plus Dry Chlorinator Briquettes
      2) Pulsar Precision: Seventy (70) pounds of Pulsar Plus Dry Chlorinator Briquettes
      3) Pulsar Precision (Duo): One hundred forty (140) pounds Pulsar Plus Dry Chlorinator Briquettes
   h. The chlorine output must be controlled by the chemical controller. The timer has eight settings and will be controlled by PCB/HMI.
      1) Pulsar Precision 30: The timer will allow a minimum available chlorine (AvCl) output of 2 lbs/day and 2.5 lbs/day for spas and will allow a maximum available chlorine (AvCl) output of 36 lbs/day and 42 lbs/day for spas.
      2) Pulsar Precision: The timer will allow a minimum available chlorine (AvCl) output of 3 lbs/day and will allow a maximum available chlorine (AvCl) output of 165 lbs/day and 141 lbs/day for spas.

3) Pulsar Precision (Duo): The timer will allow a minimum available chlorine (AvCl) output of 6 lbs/day and will allow a maximum available chlorine (AvCl) output of 330 lbs/day and 282 lbs/day for spas.

i. The sanitization system must be capable of functioning in temperatures between 40° F. and 95° F.

j. The sanitization system must operate with Pulsar Plus Dry Chlorinator Briquettes having 65% minimum available chlorine with a 0.4 to 0.6% scale inhibitor (by weight).

k. The system must incorporate a dustless loading feature to capture the dust from the briquettes while replenishing the hopper contents.

l. The sanitization system must be installed per manufacturer's recommendations.

B. pH Buffering System (Muriatic Acid)

1. Chemical feeders for muriatic acid must be peristaltic type pumps. Chemical feed pump(s) must be provided and connected to the filtered water return lines to the pool(s) as shown on the pool plans. The pump(s) must be capable of feeding a solution to the pool(s) to maintain pH level against the back pressure involved and must be fully adjustable while in operation.
2. Chemical feeders must be manufactured by LMI, ProMinent, G. H. Stenner & Co., or approved equal.
3. The pump(s) must be provided complete with fractional horsepower motor for 120V 60 Hz current, plastic feed lines, and fitting necessary for connections to pool system piping.
4. The chemical pump(s) must be electrically connected to and operated by the water chemistry controllers.
5. The acid pump(s) must be affixed with a metallic stamped label indicating the chemical being pumped and the pool to which it is connected.
6. Provide non-metallic wall mounted shelf support for the chemical feeder(s).
7. Acid Drum/Carboys
   a. Provide four (4) fifteen (15) gallon acid drums.
   b. Provide two (2) two drum modular spill platform. Platform must be molded high-density polyethylene with removable polyethylene grating. Platform must be 26.25" x 51.5" x 6.5" with a spill capacity of 30 gallons and a load capacity of 5,000 pounds. Platform must be an Eagle two drum modular spill platform model #1632 or approved equal.
   c. Provide one (1) low profile ramp. The ramp must be molded with high-density polyethylene. The ramp must be an Eagle low profile ramp model #1689 or approved equal.
8. Provide "Vapor Shield" vent check valve for the acid drum/tank which seals container while allowing the liquid to remove via pump. The Vapor-Shield must prevent an internal vacuum and collapse of a sealed container and must also prevent the pump from developing a vacuum-lock while attempting to remove the liquid from the sealed container. The Vapor-Shield must prevent the release of acid vapors. The Vapor-Shield body must be constructed entirely from schedule 80 PVC with 3/8" polypropylene tube fittings and factory-installed acid resistant viton sealant on threaded connections. The diaphragm and O-rings must be constructed of acid resistant viton. Metallic or materials not rated appropriate for use with acid should not be used. The Vapor-Shield must be fitted with a ¾" male NPT threaded fitting to allow for the installation onto common five (5) through fifty-two (52) gallon acid shipping container caps and lids. The unit must be supplied with no less than fifteen (15) feet of 3/8" polyethylene tubing. Vapor Shield must be Recreonics #52-095 or approved

equal. An Acid Fume Scrubber, part #7747090, with refill reagent kit, #7747091, manufactured by ProMinent is an equal.

C. Ultraviolet Dechloramination and Disinfection System
1. Medium Pressure UV
a. Ultraviolet Disinfection Equipment: Must operate within the UVC electromagnetic spectrum emitting wavelengths in the range of 200nm to 400nm. This required wavelength will provide constant disinfection/inactivation of bacteria, algae, molds, viruses, and destruction of Monochloramines, Trichloramines, and Dichloramines. Ultraviolet Lamp/Chamber and Spectra Touch Control Panel by Evoqua Technologies Ltd. or approved equal. Deviations/exceptions must be provided in writing to and approved by the designer prior to the bid date.
1) Ultraviolet disinfection equipment by Aquionics and Prominent are approved equals.
b. The UV System must have a MET or equivalent (ETL, CSA, or UL) listing, be NSF-50 2016 certified including Section 14.18 (crypto inactivation) and 3rd party validated to the USEPA UVDGM 2006 Guidelines.
1) Equipment General Description: The Ultraviolet System must be provided in a complete package to include a stainless-steel chamber, Spectra Control System located in NEMA 12 (IP52) rated panel, Medium Pressure Bulb(s) designed to emit wavelengths within the UVC electromagnetic spectrum, automatic wiper system, and Project Commissioning by a Certified Ultraviolet Technician.
c. Wafer (WF) Units: Ultraviolet manufacturer to offer unit capability of a horizontal OR vertical installation application using state of art design and direct flow through characteristics. Unit must be a medium pressure system with 94% UVT at the indicated design flow rate. Systems validated or designed for flows based on 98% UVT are not acceptable. Chamber and Control Cabinet must be as indicated on the drawings.
d. Ultraviolet Lamp
1) Ultraviolet lamp must be medium pressure high intensity. Lamp must be designed to emit continuous Ultraviolet wavelengths in the range of 200nm to 400nm. This will provide optimal disinfection benefits and destruction of the Monochloramine, Dichloramine, and Trichloramine compounds. The lamp(s) must remain unaffected by temperature variance of 0 degrees F (-17 C) to 200 degrees Fahrenheit (93 degrees Celsius).
2) The lamp system must provide a constant dose of not less than 60 mJ/cm2 until the end of the lamp life for indoor applications and not less than 40 mJ/cm2 for outdoor disinfection and this must be based on constantly monitoring the full recirculating flow rate, not on a side stream treatment. The system must be equipped with infinitely variable power control of the lamp intensity & dose. Power stepping not acceptable. The lamps must be capable of turndown to 30% of the nominal rated power.
3) The lamp must be connected via means of a plug connector and must have a mechanical interlock to prevent lamp removal when lit for safety reasons.
e. Ultraviolet Reactor
1) The unit must be constructed of 316L stainless-steel electropolished and passivated to prevent corrosion within the harsh pool environment.
2) The Ultraviolet chamber must come complete with the following equipment: Ultraviolet intensity monitor factory calibrated to provide

intensity in mWcm2, monitors providing percentage of lamp output not acceptable. It must include a built-in alarm system to notify the operator when the output level drops below the required level of 60 mJ/cm2 for indoor pools or 40mJ/cm2 for outdoor pools (or operator set dosing levels).

3) UV Reactor will be a validated system with third party testing to a recognized international standard such as the USEPA DGM.
4) Ultraviolet temperature monitoring system must be provided to maintain system integrity in the event of flow interruptions to the chamber.
5) Ultraviolet chamber must come complete with annealed quartz sleeve with “O” ring seals for water tightness. The system must be complete with advanced seal arrangement to reduce the risk of quartz over-compression on the seal face.

f. Automatic Wiper System
1) An automatic cleaning system must be provided for cleaning of quartz sleeve and Ultraviolet monitor probe. The system must travel the entire length of the quartz sleeve twice per desired cleaning cycle. Precision molded wiper rings must be provided to ensure thorough quartz tube cleaning and quartz tube protection. The wiper cycle must be user selectable and adjustable within a range of 5 minutes to 24 hours depending on anticipated application and deposit build-up.
2) The wiper system must have the following characteristics:
a) The system must utilize direct drive with square faced coupling and acme threaded shaft to prevent slippage and pin shearing. Systems utilizing shear pins or complicated gear boxes will be unacceptable.
b) The wiper power supply must be 24-volt DC for improved safety. Higher voltage not acceptable.
c) System must incorporate Direct Shaft Encoding for positional location. Systems relying on external limit switches or internally located magnets will be unacceptable.
d) The wiper interval must be operator selectable with optional override switch.
e) Wiper faults must be indicated on the control system display.
f) Wiper System to utilize “Intelligent Operation” for automatic start-up commissioning.
3) Records wiper position at chamber ends. Position must be fixed and not dependent on a timed interval or component striking end of chamber.
4) Establish a travel run without using limit switches to ensure system integrity and longevity.

g. UV Strainer
1) The UV system must be provided with a downstream strainer to protect against the possibility of lamp/quartz breakage traveling downstream.
2) Pressure gauges must be provided on each side of the strainer. Gauges must be liquid filled, 316L stainless-steel bourdon tube type with a minimum 2-1/2-inch diameter dial, high impact polypropylene or stainless-steel case, corrosion resistant white scale with black divisions and numerals, 300 Series stainless-steel heavy duty rotary bushed movement, black enameled balanced Micrometer pointer. Pressure ranges must be calibrated in psig (0-60 psi). Basis of Design: Gauges must be manufactured by Weksler Instrument Corporation or approved equal.

3) A stainless-steel filter type pressure snubber must be provided for each pressure gauge consisting of a 3/8-inch diameter by 1/8-inch-thick micro metallic stainless-steel filter and placed in the line just before the pressure gauge. Provide isolation brass valves or brass gauge cocks at each gauge for easy replacement and maintenance.

h. Ultraviolet Control System
   1) The control cabinet must be a SPECTRA control unit and or pre-approved equal.
   2) The power must be controllable to provide full power, half power and infinite variable power based on real time interface with changes in UVT, Flow Rate or Combined Chloramines. The power panel must house the electronic ballasts required to ignite and power the lamps.
   3) Three levels of operation must be provided to meet the needs of the operator and pool environment: Simple Control (start, stop and reset), Full Parameter Display, and Customized Operator Configuration.
   4) Modes of operation must be password protected to secure system critical setup functions. Touch Control system must have clearly identifiable start, stop, and reset icons (suitable for gloved operation) with Running and Fault LCD indicators.
   5) The display must include the following:
      a) Ultraviolet calculated dose
      b) Ultraviolet intensity (as a percentage and mW/cm2)
      c) Lamp Current
      d) Flow rate (as gallons per minute or m3/hour)
      e) Chamber Temperature
      f) Operation hour meter
      g) Fault indicators to include Lamp fault, low UV & temperature alarm, ground fault trip, wiper fault.
      h) Alarm functions must have a simple text message display to assist in fault finding.

i. Ultraviolet Control System Interface
   1) The Control system must have a minimum of the following system interface control:
      a) Remote operation
      b) Process interrupt features (from valves & flow meters)
      c) Low UV dose
      d) Flow meter input.
      e) Auto-Restrike.
      f) Half to full power UV setting with 24 hour/7-day settable timer.
      g) Variable power/Dose pacing interface
   2) Control system must have built in data-logging capabilities to record the following information:
      a) UV intensity required.
      b) UV intensity measured.
      c) Lamp current
      d) Chamber Temperature
      e) Flow Rate
      f) Time and date stamp, every alarm generated.

j. Manufacturers must maintain spare or replacement parts in the USA for the same day or not longer than next day delivery in North America.

D. Electronic Flocculation System

1. The Clear-Flow Electronic Flocculation system must be provided and installed on the recirculation piping for the swimming pool(s) and spa(s). The Clear-Flow system must be a non-chemical water treatment system designed to operate as an electronic flocculant in recreational water systems. When implemented into the system, the Clear-Flow system must work to agglomerate both organic and mineral particulate resulting in filtration enhancement on all types of filtration systems. This filtration enhancement must allow for a reduction in backwashing frequency - saving water, chemicals, and energy.
2. The Clear-Flow system must be UL listed and certified to NSF/ANSI Standard 50 and documentation of such certification must be provided by the manufacturer with each system.
3. When used in a recreational water application, the Clear-Flow system must work as an electronic flocculant. By generating and propagating a low-frequency treatment signal throughout the entire plumbing system, the technology must produce an ongoing flocculation effect which will aid in a reduction in turbidity and improved clarity.
4. The Clear-Flow system's ongoing flocculation effect must enhance filtration efficiency. The flocculation effect must create larger particles allowing for a reduction in both frequency and duration of backwashing.
5. Equipment
    a. The following components are contained in a standard Clear-Flow kit and must be provided for each system:
        1) ABS or SS enclosure with 3 glands (2 for signal leads and 1 for power supply)
        2) Signal cables complete with mounting tags (Temp. rating -40°F to +140°F) (Qty. 2)
        3) Stainless steel hose clamps (Qty. 4)
        4) Gland plug (Qty. 1)
        5) 2A / 250 VAC UL-listed slow blow fuse (Qty. 1)
        6) 4mm Allen wrench (for grub screw) (Qty. 1)
6. Clear-Flow electronic flocculation system models must be the following:
    a. For pipes up to 3": Model # CF-300C
    b. For 4" pipes: Model # CF-400
    c. For 6" pipes: Model # CF-600
    d. For 8" pipes: Model # CF-800
    e. For 10" pipes: Model # CF-1000
    f. For 12 pipes: Model # CF-1200
7. Power Requirements:
    a. Input Voltage: 100–240 VAC
    b. Input Frequency: 50 - 60 Hz
    c. Power Rating: 4W for CF-300C, 5.4W for all other models
    d. Internal Fuse Rating: 2A / 250VAC UL-Listed slow-blow
    e. Temperature Range: -40°F to +140°F
    f. The electrical supply must be properly grounded, or the system will not work. Hard wiring is preferred to avoid accidentally unplugging the unit.
    g. All safety-critical components must conform to relevant CE/IEC/UL 60950. E235235. Terminals, wires, fuse, on/off switch, AC/DC PSU. PSU must be Class II protected.
    h. Armored 2 Core Cable:
        1) Spec. BC 6883; 1999
        2) IEC 600332 –3—22 Category A
        3) Temperature rating - 22°F to +140°F
        4) ISO 9001 – 2008 Approved
8. Installation

a. To ensure proper start-up of equipment the Contractor must consult a Clear-Flow representative.
b. Optimal results are achieved if the Clear-Flow system is connected to a grounded power outlet (100-240 VAC, 50-60 Hz, 4-amp) that shares the same ground as the recirculation system the unit is being installed on.
c. The Clear-Flow system must come with two identical signal cables. One is intended as the “T” (transmit) signal connection, the other is intended as the “A” (antenna) signal connection. The “T” signal tag must be installed downstream from the pump and before the filter. It is preferred that the “T” signal tag is mounted on a metal reducer or stainless-steel spool piece downstream of the pump. The “A” tag must be mounted on a metal structure that is electrically connected to the system loop, which may include but is not limited to a grounded filter, nearby structure, or ground rod.
d. The Contractor must provide a stainless-steel spool piece matching the main recirculation header pipe size installed between flanges downstream of the recirculation pump(s) and upstream of the filters to facilitate installation of the “T” signal tag per manufacturer requirements. Coating must be 3M Scotchkote 134 fusion bonded epoxy, or approved equivalent on the complete interior of fitting.
e. The maximum cable run length from the control cabinet (typically wall mounted) to the “T” signal tag installed on the pool recirculation pipe must be 33 feet. Installation locations must be coordinated to meet this parameter.

9. The Clear-Flow system unit must be rated for -40º F + 140º F ambient operation. The unit must have no ventilation requirements and be able to be used indoors and outdoors.
10. After identifying the proper installation location for the “T” tag, the Contractor must prepare the point for strong electrical contact with the tag. The Contractor must remove any epoxy or enamel coating which may inhibit a strong connection. The Contractor to make output connections per wiring schematic. Connect “T” and “A” connections into the labeled terminals inside the enclosure.
11. The Contractor must confirm Clear-Flow system is functioning properly and operating under the following conditions. After powering on the unit, consult the LCD screen to determine the frequency and amperage output.
    a. The optimal frequency range is between 100-350 kHz.
    b. Optimal amperage is between 1 and 5 amps.
    c. If frequency and amperage are outside of these ranges, the Contractor must adjust capacitor switches on the upper right side inside the enclosure.
    d. If current amperage is not achievable under 5 amps after making capacitor adjustments, the Contractor must disconnect “A” tag from inside the terminal block and repeat adjustment of capacitors.
    e. If these steps do not result in an optimal sine wave within the recommended frequency and amperage, the Contractor must consult a Clear-Flow Representative.
    f. As an additional means of signal verification, an oscilloscope can be used. By touching the oscilloscope probe onto the pipe near where the “T” tag is connected, signal strength and frequency can be measured. A clean, declining sine wave with minimal harmonics should be observed.
12. The Contractor must cut excess signal cable, but not to less than 10 feet (3 meters) in length. The Contractor must not coil power cord or signal cables; doing so will interfere with signal operation.
13. The Clear-Flow system must be powered on/off via a switch on the enclosure.
14. Replacement fuses must be UL-listed.

15. The complete installation must be by the manufacturer's installation instructions and certified on-site for proper operation by the manufacturer's representative for each system installation.
16. The Clear-Flow system requires that the electrical supply be properly grounded. The Contractor must follow Institute of Electrical and Electronics Engineers (IEEE) standards ensuring a ground resistance of 5 ohms or less.

2.7 WATER CHEMISTRY MONITORING AND CONTROL SYSTEMS

A. A programmable pool chemical automation system must be provided for continuous monitoring and control of the pool(s) water chemistry and related disinfection equipment. The installation of the system must be per the manufacturer's specification. A factory trained/authorized representative must provide training to the Owner and the training must be video recorded. Water chemistry controllers must be provided by ProMinent Fluid Controls, BECS Technology, SB Control Systems, or a technically equal system capable of providing equal performance for operating functions.
   1. The water chemistry control systems for the pool(s) and spa must feature and be capable of the following. Water chemistry controllers without these capabilities and features are not considered equal. Water chemistry control system requirements are based upon the following products: ProMinent DCM511/512, BECSys7, Chemtrol 3000.
      a. Continuous, real-time monitoring and control of pH and ORP.
      b. Free chlorine, total chlorine, combined chlorine in PPM, system flow rate, water chemistry balance calculations, water temperature, and other readings and control as deemed necessary for the project per this section.
      c. The controller must have the ability to monitor and control the UV treatment system.
      d. The controller must manage the recirculation pump with a programmable Fireman Cycle feature, which automatically turns off the Heater, UV, and Auxiliary systems prior to shutting off the recirculation pump.
      e. Management of the recirculation pump on/off status.
      f. Management of the heater on/off status based on real-time water temperature reading.
      g. Management of the water level in the pool or surge tank and must provide programming to lock out chemical feed during potable water fill events.
      h. The utilization of simultaneous ORP and PPM (bracketing) control for managing both the quantity and quality of the sanitizer/oxidizer. Controllers that do not have the ability to control simultaneously to ORP and PPM control points or that utilize an alternate chlorine set point or boost function will not be considered equal.
      i. Actuating outputs in the following operator selectable modes: off, manual, automatic, proportional and must have a manual on fail-safe timer to ensure that if the controller is left in manual mode, the controller will revert back to automatic mode to prevent an over-feed event.
      j. Programmable events can be time set to occur daily, weekly, or monthly.
      k. Remote monitoring of the recirculation flow rate of the system when installed with compatible magmeters.
      l. Provide use of flow signal as a supplemental chemical feed interlock to prevent the dosing of chemicals during a system low flow/no flow condition.
      m. The controller must continuously monitor data-log while being monitored and control via two-way remote communication.

n. The controller must continuously calculate and display the Langelier Saturation Index and Ryznar Index using either sensor data and/or manual input for pH, temperature, total alkalinity, and calcium hardness.
o. Programmable high and low alarm levels for control functions with operator-selectable feed lockout and alarm buzzer options.
p. Performance and Certifications
    1) The controller system must be NSF/ANSI 50 listed for automatic controller equipment for swimming pools, spas, and other recreational water facilities.
    2) The controller system must be certified to UL61010/IEC61010 standards.
    3) The controller must automatically activate the appropriate chemical feeders in order to maintain the sanitizer/oxidizer level:
        a) Within +/- 0.1 parts per million (PPM) or +/- 10 mV (millivolts) of oxidation reduction potential (ORP)
        b) The pH within +/- 0.1 pH unit of the set points selected by the operator.
        c) Set point and calibration levels must be adjustable with a keypad mounted on the front panel of the unit as well as the remote interface.
        d) The controller must use pH sensor with +/- 0.04 accuracy in the operational range of 6.8 – 8.2 as certified by NSF.
        e) An ORP sensor with an accuracy of +/- 3% mV as certified by NSF.
        f) A free chlorine and total chlorine sensor that operates in a range of 0.1 parts per million (PPM) up to 10.0 parts per million (PPM) within a 9% accuracy as tested by NSF or another third-party certifying agency.
q. System Supply
    1) The controller must be factory supplied with:
        a) ORP, pH, temperature, and free chlorine and total chlorine sensors.
        b) A relay capable of being named and programmed for controlling a UV system dosing based on a real-time combined chlorine as calculated by the readings from an amperometric free chlorine and total chlorine sensor.
        c) A flowrate sensor to measure system flowrate.
r. Hardware
    1) The controller must have:
        a) A minimum of seven (7) fully configurable digital inputs.
        b) A minimum of four (4) fully assignable digital outputs.
        c) A minimum of nine (9) configurable analog inputs.
        d) A minimum of five (5), 115 VAC fully assignable relays.
        e) The controller must be capable of expanded capabilities with an optional input/output expansion card kit.
        f) High voltage field wiring must be through a separate NEMA 4X factory engineered and supplied enclosure that precludes direct access to controller electronics. High voltage connections must be clearly identified, and a field wiring diagram must be provided with the controller for the Contractor’s reference. Controller high-voltage relay assignment parameters must be programmed at the factory prior to delivery to installation location.
        g) The controller must include a sensing flow cell that is hydraulically designed to allow verified correct flow and consistent pressure

across sensors. Flow cell will be clear PVC that is modular in concept and have the flexibility to add supplementary water chemistry sensors as desired. The sensing flow cell must include a safety flow switch sensor, water spigot, and isolation valves.

s. Communications
   1) The controller must have as a standard feature:
      a) The controller must include the capability of ethernet connection and secondary wireless communication.
      b) The controller must allow full two-way remote communication and full control of parameters.
      c) Accessibility with a standard internet browser using a fully interactive Ethernet TCP/IP graphical interface that includes security access codes.
      d) Real-time monitor/control with real-time auto polling, data logging, email and text alarms and providing both graphical and report formats via a personal computer, smartphone, or tablet device.
      e) The controller must have the ability to facilitate email or text alarm notifications, historical graphing, and real-time control via a personal computer, smartphone, or tablet device.
      f) The controller must have the ability to export a .csv file once per day with reading type, time, and reading. The export must be done via email and must include the controller serial number. Export data must include ORP, Free Available Chlorine, Total Chlorine, Combined Chlorine, pH, and Temperature.
      g) The controller must have the ability to allow software upgrades and programming as needed in the field.

t. Commissioning and Manuals
   1) The control system must be provided with on-site start-up operator training performed by a representative trained and authorized by the controller manufacturer.
   2) The manufacturer must supply an operation and maintenance manual describing features, operating instructions, maintenance procedures and replacement parts.
   3) Installation of the system must be per the manufacturer's specification and no exceptions must be allowed. A factory trained/authorized representative must provide training to the owner and the training must be video recorded.

2.8 FLOW METERS

A. Recirculation flow meter must be provided according to the manufacturer in the filtered water return lines for the pool(s) as indicated on the drawings. The flow sensor must be the GF Signet 2551 insertion magmeter. Provide the coaxial cable from the sensor to the display/transmitter. Flow meter accuracy must be +/- 2% of reading.

B. Impact flow meter must be provided as indicated on the drawings. Impact flow meter must be a pilot, impact ball, variable area type with one piece, impact resistant machined acrylic plastic body. GPM scale must be permanently etched or imprinted on the meter. Flow rate indicator must be of stainless-steel material. The scale range must be appropriate for a specific flow rate. Pipe size to accommodate backwash rate. The backwash piping flow meter must be BLUE-WHITE series F-300 or approved equal.

2.9 WATER LEVEL CONTROLLERS

A. In Surge Tank Water Level Controller – Lap Pool and Wellness Pool

1. Provide a water level sensing and control system for the pool(s) that will monitor the water level in the surge tank and automatically activate the auto water make-up control valve. For sensing water level and activating make-up water control valve for the pool(s), use Series ELC-810 controller housed in a watertight NEMA 4X UL94 5V UL flammability rated polycarbonate enclosure to meet IP66 and NEMA 4, 4X, 12 and 13 ratings. The controller must utilize two sensors to control water level. ELC-810 series must have a menu-driven LCD display screen and utilize a five-switch user interface for navigation through the menu. The menu must allow changing the following settings: delay to shutoff, alternate sensor option, maximum time on, manual override, delay to normal, type of sensor, high level option, flow sensor active, and sounder with alarm. Menu settings must be capable of password protection. The controller must be capable of displaying the following data: last fill time, last drain time, last alarm. The controller must be capable of determining the following: maximum time on exceeded, over current to solenoid valve, no valve/valve wiring problem, and sensor not working properly. The controller must have a low voltage interlock with auto water make-up solenoid valve and the high-level shutoff solenoid valve and must provide adjustable time delay for increasing level and manual override. The controller must require 115 VAC, 1 phase, 60 Hz power. The water level control package must be manufactured by AquatiControl Technology, model ELC-810-DS-ST-XXX (Coordinate the specific length(s) of cable required for each controller prior to ordering). Refer to drawings for additional information.
2. Provide two proximity switch sensor(s) that must be sensitive to within +/- 1/8” (4mm) of nominal water level. Supply voltage to sensor must be 12V to 24V DC from controller. Current consumption must be < or = 15mA. Response frequency must be 100Hz. Maximum control output must be 200mA. The sensor operating temperature must be -25 Deg. C to 70 Deg. C. Operating humidity must range from 0% RH to 95% RH. The sensor(s) must be mounted in a 1” Schedule 80 PVC pipe (length must be determined by depth of surge tank). Sensing pipe must be mounted to surge tank wall with composite/non-metallic hangers and stainless-steel hardware. Sensing pipe(s) must be capable of being submerged under water safely. Refer to drawings for additional information.
3. Wiring from the sensor to the controller must be provided and must be connected to the terminal points mounted within a corrosion resistant, nonmetallic NEMA 4X enclosure. Wiring connections must be made through the bottom of the enclosure. The enclosure size must be no less than 8” wide x 5” high x 4” deep. The access door must be the entire front face panel of the enclosure. Confirm location in field.
4. Major components must be plugged-in using WAGO terminal blocks for ease of installation and replacement. Unit must be designed to activate a 24-volt AC solenoid valve.
5. Discharge of make-up water must be into a fill funnel and piping to the pool(s). Refer to the drawings for additional information.

B. In Mechanical Room – Wet Well Water Level Controller - Spa

1. Provide a water level sensing and control system for the spa that will monitor the water level in a well located in the mechanical room and which will automatically activate the auto water make-up control valve. For sensing water level and activating make-up water control valve for the spa, use Series ELC-810 controller housed in a watertight NEMA 4X UL94 5V UL flammability rated polycarbonate enclosure to meet IP66 and NEMA 4, 4X, 12 and 13 ratings. The controller must utilize two sensor(s) to control water level. ELC-810 series must have a menu-driven LCD display screen and utilize a five-switch user interface for navigation through the menu. The menu must allow changing the following settings: delay to shutoff, alternate sensor option, maximum time on, manual override,

delay to normal, type of sensor, high level option, flow sensor active, and sounder with alarm. All menu settings must be capable of password protection. The controller must be capable of displaying the following data: last fill time, last drain time, last alarm. The controller must be capable of determining the following: maximum time on exceeded, over current to solenoid valve, no valve/valve wiring problem, and sensor not working properly. The controller must interlock with auto water make-up solenoid valve and must provide adjustable time delay for increasing level and manual override. The controller must require 115 VAC, 1 phase, 60 Hz. The water level control package must be manufactured by AquatiControl Technology, model ELC-810- DS-WW-XXX (Coordinate the specific length(s), "XXX," of cable required for each controller prior to ordering). Refer to drawings for additional information.

2. Provide a proximity switch sensor that must be sensitive to within +/- 1/8" (4mm) of nominal water level. Supply voltage to sensor must be 12V to 24V DC from controller. Current consumption must be < or = 15mA. Response frequency must be 100Hz. Maximum control output must be 200mA. The sensor operating temperature must be -25 Deg. C to 70 Deg. C. Operating humidity must range from 0% RH to 95% RH. The sensor must be mounted in a 1" Schedule 80 PVC pipe 3 feet in length – the sensing pipe to then be mounted into a static line from the pool. The sensing pipe must be mounted into the static line via an adjustable collar that allows for quick level adjustments. Refer to drawings for additional information.
3. Wiring from the sensor to the controller must be provided and must be connected to the terminal points mounted within a corrosion resistant, nonmetallic NEMA 4X enclosure. Wiring connections must be made through the bottom of the enclosure. The enclosure size must be no less than 8" wide x 5" high x 4" deep. The access door must be the entire front face panel of the enclosure. Confirm location of controller in field.
4. Major components must be plugged in using WAGO terminal blocks for ease of installation and replacement. Unit must be designed to activate a 24-volt AC solenoid valve.
5. Discharge of make-up water must be into a fill funnel and piping to the spa. Refer to the drawings for additional information.

C. Solenoid Valves

1. Provide a make-up water solenoid valve, normally closed, stainless-steel fitted, bronze body, 24 VAC slow-closing type. Interlock with automatic water level control system. Refer to the drawings for additional information including size of pipe. Solenoid must be by ASCO 8221 or approved equal.
2. Provide a solenoid valve for the high-level sensor, normally opened, stainless-steel fitted, bronze body, 24 VAC slow closing type. Refer to Plumbing drawings for pipe size. Interlock with automatic water level control system. Refer to the drawings for additional information. Solenoid must be the 8221 Series by ASCO or approved equal. Maximum size of 2 1/2".
3. Provide a solenoid valve for the high-level sensor, normally opened, stainless-steel fitted, stainless steel body, 24 VAC slow closing type. Refer to Plumbing drawings for pipe size. Interlock with automatic water level control system. Refer to the drawings for additional information. Solenoid must be the 2DSO400-2000 Series by STC VALVE or approved equal. Sizes range from 3" to 6".

2.10 DECK EQUIPMENT, INSERTS & ANCHOR SOCKETS

A. The following items must be supplied unless otherwise noted. Proprietary names are to designate performance only. Equal products will be accepted.

1. Grab rails must be provided as required in the quantities and to the dimensions as shown on the drawings. Grab rails must be fabricated of one continuous length of polished and buffed tubing. The tubing must be ASTM-A-554 grade 316L stainless-steel, 1.50-inch OD x 0.120-inch minimum wall thickness, polished and buffed to 320 grit finish and must be passivated, in compliance with ASTM A967-99, incorporating organic acid passivation techniques for maximum corrosion resistance. Bends must be smooth and free of wrinkles. Grab rails must be pretzel bend style with dimensions as indicated in the plans and as manufactured by Spectrum Products, SR Smith, Paragon or approved equal. Anchor sockets for grab rails must be of the wedge type, cast bronze or stainless-steel, 4 inches in depth and made to receive 1.50-inch OD tubing as manufactured by Paragon #28105, SR Smith #AS-200B, Spectrum #54052 or approved equal. The wedge must be cast bronze, incorporate a stainless-steel tightening bolt, and flat washer, and be designed as the sacrificial element to the anchor system. Metallic components must be passivated, in compliance with ASTM A967-99, incorporating organic acid passivation techniques for maximum corrosion resistance. Anchors must be provided with flush closure caps and escutcheons with set screws where indicated. Escutcheons must be of the keyhole or oblong shape, similar to the casted, electro-polished stainless-steel escutcheon with set screw by Paragon #28303SS, SR Smith #IEP-200, Spectrum #35222 or approved equal.
2. Entry rails must be provided as shown on the drawings, fabricated from one continuous piece of polished and buffed ASTM-A-554 grade 316L stainless-steel, 1.50-inch OD x 0.120-inch wall thickness, polished and buffed to 320 grit finish and must be passivated for maximum corrosion resistance. Bends must be smooth and wrinkle free. Custom rails as manufactured by Spectrum Products, Paragon, SR Smith or approved equal. Custom rail submittal drawings must be complete with details of custom fabrication and installation information. Anchor sockets for railings must be of the wedge type, cast bronze or stainless-steel, 4 inches in depth and made to receive 1.50-inch OD tubing as manufactured by Paragon #28105, SR Smith #AS-200B, Spectrum #54052 or approved equal. The wedge must be cast bronze, incorporate a stainless-steel tightening bolt, and flat washer, and be designed as the sacrificial element to the anchor system. Metallic components must be passivated, in compliance with ASTM A967-99, incorporating organic acid passivation techniques for maximum corrosion resistance. Anchors must be provided with flush closure caps and escutcheons with set screws where indicated. Escutcheons must be of the keyhole or oblong shape, similar to the casted, electro-polished stainless-steel escutcheon with set screw by Paragon #28303SS, SR Smith #IEP-200, Spectrum #35222 or approved equal.
3. Spa transfer railing must be provided as shown on the drawings, fabricated from one continuous piece of polished and buffed ASTM-A-554 grade 316L stainless-steel, 1.50-inch OD x 0.120-inch wall thickness, polished and buffed to 320 grit finish and must be passivated for maximum corrosion resistance. Bends must be smooth and wrinkle free. Custom rails as manufactured by Spectrum Products, Paragon, SR Smith or approved equal. Custom rail submittal drawings must be complete with details of custom fabrication and installation information. Anchor sockets for railings must be fabricated from advanced glass reinforced copolymer, 6 inches in depth and made to receive 1.50-inch OD tubing. The anchor body must incorporate four (4) copolymer anti-rotation fins. The fins must be located on the anchor body and will prevent the anchor from spinning in the concrete. The fin must be an integral part of the anchor body. Compression anchors must be manufactured by Spectrum #42696 or approved equal from Paragon or SR Smith. Anchors must be provided with flush closure caps and escutcheons with set screws where indicated. Escutcheons must be of circular, similar to the casted, electro-polished stainless-steel escutcheon with set screw by Paragon #28303, SR Smith #EP-150, Spectrum #24095 or approved equal.

4. Stanchion posts (backstroke) must be provided as required and in the quantities shown on the drawings. The posts must be a straight length of type 316L stainless-steel tubing, 1.90-inch OD x 0.145-inch wall thickness x 8-foot overall length, polished and buffed to 320 grit finish. Stanchions must be capped at one end with a closure plug containing a U-shaped hook and fitted with a stainless-steel eyebolt attached to an adjustable nickel-plated bronze sliding collar. Stanchion with sliding collar and eyebolt as manufactured by Paragon #38106 with #38301, SR Smith #10168-MG with #35-102, Spectrum Products #23614 with #23625 or approved equal. Anchor sockets for stanchions must be of cast bronze or stainless-steel, sized to receive a full 6 inches penetration of 1.90-inch OD tubing as manufactured by Paragon #38201TC, Spectrum Products #23626, Kiefer #700103, SR Smith #AS-100D or approved equal. Each anchor socket must be provided with a flush threaded, vandal proof closure cap Paragon #38201TC, Spectrum Products #23628, or Kiefer #700103C and a grounding lug with screw. Provide Paragon #38303, Spectrum Products #23630, Kiefer #700103K or approved equal spanner wrenches for removing the closure cap. Anchors or sockets must be provided with flush closure caps and escutcheons with set screws where indicated.
5. Starting Blocks
    a. Single post starting blocks (7 required, 6 plus 1 spare) must be provided as indicated on the drawings. Starting blocks must have number plates on both sides numbered 1 through 6. Spare block must not be numbered. Starting block height must be 29-1/2” inch above water level. The starting block top (24” wide x 32” deep) and intermediate sidestep (8” x 12”) must be constructed of UV inhibited high density polypropylene. Confirm step is on correct side (right or left) according to plans. The surface must have a non-skid dual cross-grooved sand textured finish. The top must be permanently positioned at a 10° tilt towards the pool. Frames must be 2.5 square inch x 0.125-inch wall thickness 304 stainless-steel tubing with a powder coated finish. Refer to the Owner/Architect for color selections. Verify height of starting block above water before ordering. The backstroke bar must be 1” diameter and allow both horizontal and vertical grab positions. Starting block must be custom blocks as detailed on the plans similar to the Track Start Quickset by Paragon, Legacy by SR Smith, Riptide by Kiefer, Record Breaker by Spectrum Products, or approved equal. Each starting block must have two labels affixed stating "Warning – For Use by Trained Competitive Swimmers Only – Execute Shallow Racing Dives Only - Impact with Pool Bottom Can Cause Permanent Injury."
    b. Anchors sockets for single post starting blocks must be designed to prevent rocking and must be provided with depths that allow for installation of starting blocks at all course layouts indicated on the drawings. A stainless-steel cap must be provided to flush mount on the deck when starting block is removed. The anchor socket must be cast T304 stainless-steel with wedge assembly consisting of a bronze wedge and T304 stainless-steel hardware. Anchors for starting block must be by the starting block manufacturer - Paragon Quickset Dual-wedge anchor, SR Smith Rock Solid anchor, Spectrum Products Record Breaker anchor, or Kiefer Riptide anchor.
    c. Starting block safety covers must be provided for all starting blocks and are designed to keep unwanted users off starting blocks. The cover is made of 1/16” thick tough, lightweight plastic with a UV stabilizer and fits 24” x 32” starting block tops. The conical shape and safety orange color act as a deterrent of stating block use. Each cover is provided with a bungee cord for securing the cover starting block top.
    d. Starting blocks must be manufactured to receive individual timing system speakers for mounting to the starting block. The horn bracket kit must include horn

brackets, left and right slide brackets, and mounting hardware for attaching the timing system speaker and connection plate to the underside of the starting block on site with the provided screws. The horn bracket must be fabricated from T304 stainless-steel and powder-coated clear. Slide brackets must be manufactured of marine-grade HDPE. Mounting hardware must be stainless-steel. Individual timing system speaker mounts must be equivalent to the Speaker Assembly Mount K-SP6/45 with mounting slide kit MK-29 as manufactured by Colorado Time Systems (for Paragon or SR Smith starting blocks), Spectrum Products #1730176, or approved equal.

6. Backstroke start devices (6 required) must be non-slip wedges designed to adapt to starting blocks provided. Backstroke start devices must automatically retract up and out of the water and have a 10-degree angle for secure foot placement at the race start. Backstroke start devices must be the Backstroke Start Device by Colorado Timing, Backstroke Start Device by Spectrum Products, or approved equal. SR Smith #13-603, or Pool Wall Mounting Kit with Strap by SR Smith #13-601.)
7. Lifeguard Chairs
   a. Lifeguard chairs must be constructed of UV inhibited recycled HDPE chairs. Maximum seat height must be 48”/ 66” above the pool deck. Joints must be secured using T- 316L stainless-steel screws. Refer to the Owner/Architect for color selections.
      1) Lifeguard chairs (2 required) must be Spectrum Products Mendota #45023, Tailwind Furniture #LG510, Kiefer Forever Guard Chair #500231, SR Smith Sentry #SLGC42 or approved equal.
      2) Lifeguard chairs (1 required) must be Spectrum Products Mendota #45023, Tailwind Furniture #LG510, Kiefer Forever Guard Chair #500231, SR Smith Sentry #SLGC66, or approved equal.
8. Surge tank access hatch must be provided in quantities as shown on the drawings. The access hatch must be a single door 3’-2” x 2’-6” with 1” fillable pan to receive ceramic tile and grout or concrete fill to match the surrounding deck. The frame must be ¼ inch extruded aluminum with built in neoprene cushion and continuous anchor flange. Door must be ¼” aluminum plate reinforced with aluminum stiffeners as required. The door must be equipped with heavy continuous stainless-steel hinges and must have compression spring operators for easy operation. The door must open to 90 degrees and lock automatically in that position. The door must be built to withstand a live load of 150 lbs. per square foot and equipped with a continuous Type 316L stainless-steel hinge, tubular type, and an automatic hold open arm with release handle. Hardware must be type 316L, 18-8, stainless-steel. A flush lift handle and a snap lock with removable key wrench must be provided. Factory finish must be mill finish with bituminous coating applied to the exterior of the frame. The access door must be Type TER single leaf pan type door ordered as a custom size as manufactured by the Bilco Company.
9. Sleeves for surge tank valve extensions must be Spectrum Products Valve Extension Body with Lid and Key #1910386, or Spectrum Products Bronze Anchor Kit 1.90-inch O.D. x 6-inch-deep Anchor (field modification required) with Lid and Key #23638-00.
10. Surge tank ladder must be provided for the depth of the surge tank as indicated on the drawings and include a pull-up handrail. The ladder and handrail must be constructed of polypropylene that conforms to ASTM-D4101. Ladders must meet all ASTM0C-497 load requirements and OSHA 1910.26 and 1910.27 specifications. The ladder must be fastened to the floor and wall with 1/2” x 3-3/4” 316 stainless-steel anchors and installed per manufacturer’s instructions. Adjustable mounting bracket must be 8”. Aluminum reinforced copolymer polypropylene rail must be 1-3/4” x 1-3/4” diameter. Steel reinforced copolymer polypropylene ladder rungs must be 1-5/8” x 1-1/4” diameter with

molded finger grips, 12” O.C. The ladder must be manufactured by Lane International Corporation or approved equal.

11. Pool Lift
    a. The Lap Pool lift must be a battery powered handicap lift with footrest assembly. Lift must comply with the Americans with Disabilities Act Access Guidelines (ADAAG), be capable of lifting 400 lbs and must include a seat belt assembly. The following accessories must also be provided: caddy, arm rest assembly, lift cover, extra battery, wired controls. Stainless-steel components must be 316L. Lift must be a SR Smith Splash Aquatic Lift Extended Reach #370-0000, Spectrum Products Motion Trek BP 400 #163145, Aqua Creek Products LLC Mighty 400 #F-MTY400 or approved equal. Confirm pool lift fits on pool perimeter and operates correctly.
    b. The Wellness Pool lift must be a battery powered handicap lift with footrest assembly. Lift must comply with the Americans with Disabilities Act Access Guidelines (ADAAG), be capable of lifting 500 lbs, and must include a seat belt assembly. The following accessories must also be provided: caddy, arm rest assembly, lift cover, extra battery, wired controls, stability vest, and spineboard attachment. Stainless-steel components must be 316L. Lift must be the Spectrum Products Traveler BP 500 #27610, Aqua Creek Products LLC Mighty 600 #F-MTY600 or approved equal. Confirm pool lift fits on pool perimeter and operates correctly.
    c. The anchor for the pool lift must be furnished with the lift. The anchor must be an embedded sleeve made of glass reinforced copolymer, 300 series stainless-steel, or bronze. The depth of the anchor must be 6 inches, and the anchor must include a lug for proper bonding with the pool structure. The anchor must be installed in accordance with manufacturer's instructions, including required or recommended support footings. Manufacturer must provide an anchor cap and key for times when the lift is not in use. Sockets must be provided as stainless-steel or cast bronze for swimming pool accessories.

2.11 LOOSE EQUIPMENT

A. The following items must be supplied unless otherwise noted. Proprietary names are to designate performance only. Equal products will be accepted.

1. Competition floating lane ropes must be as shown on the drawings and described in these specifications. Floating lane ropes must be a non-turbulent type with wave quelling floats and 3/16” stainless-steel coated cable. Floats must be injection-molded polyethylene. Colors to alternate the length of the pool with a contrasting solid color for the final 15 feet. Owner/Architect to select colors from standard color chart. Floating lane ropes must be provided as completely assembled and installed with take up reel, type 304 stainless-steel spring and cable lock, hooks, and wrench. 5/8” wrench must be made of a forged steel shaft with a polished chrome finish. The take up reel must be constructed of type 304 stainless-steel. The spool must be a bronze nickel-plated casting with a nylon sleeve. Floating lane ropes must be similar to Competitor Swim Products, Competitor 4” Racing Lanes, Kiefer Advantage I (4.5”) Racing Lanes, or Anti-Wave ForeRunner (4.75”) Racing Lanes, Malmsten Classic Pro (4”) Racing Lanes pre-assembled and sized to fit the length of the pool. Provide contrasting disks located 15 meters from each end to meet resurfacing requirement. This requirement must be met for each possible course length.

Quantities:
Competition Pool: Provide 6 at 25 yards (5 required, plus 1 spare)

2. The lane line anchor must be constructed of two (2) non-corrosive UV stabilized molded PVC sections. The two (2) sections must consist of a top opening flip-up grate hatch and base unit section that are connected with a 316 stainless-steel pin. The grate on the top opening flip-up grate hatch section must have a raised herringbone design and must be certified to AS 4586-2013 Class C for Wet-Barefoot inclining platform (ramp) test for swimming pool surroundings. The unit must not require bonding per NEC 680.26 (c) and must be certified ANSI/NSF/CAN 50-2020 (Section 22.3). Grate sections must be 0.47" (12mm) wide and an outside depth of 1.0" (25.4mm) with a middle depth of 1.83" (46.6mm) for load strength requirements. The lane line anchor unit must be tested to a load pull test of 1,200 lb. minimum based on a 2500 psi concrete pour. The space between grate bars must not exceed 0.315" (8mm) to comply with ANSI/APSP/ICC-16 2017 (and BS EN 13451) for finger and limb entrapment. The grate surface bars must run parallel to the pool wall and with the gap providing at least 40% open space per foot for unrestricted water flow. The lane line anchor unit must include a lane line extension constructed of a stainless-steel braided strap covered with silicon that is flexible and can be stowed within the unit. Lane line extension must be capable of extending beyond the unit to connect to a lane line S-hook. The lane line anchor unit must be secured in a perimeter concrete gutter system with 316 stainless-steel drop-in anchors and socket head cap screws as provided by the manufacturer. The lane line anchor unit must be 16" x 2" wide as indicated on the drawings. Lane line anchor unit must be DalFLEX-16 as manufactured and supplied by Daldorado LLC.
3. Backstroke flags:
    a. Backstroke flags must be provided for all course layouts shown on the drawings. Backstroke flags must be made of Vinyl material, triangular in shape (12" wide x 17" long), and alternating in color, butted end to end on vinyl covered stainless-steel cable. Submit standard color samples for review and approval by the Owner/Architect. The cable must be attached to a stainless-steel take up reel at one end and a stainless-steel tension spring end-fitting at the other. Equipment must be similar to the following items by Kiefer: backstroke flag (#600808), racing lane cable (#210210), take-up reel (#210218S), and spring end fitting (#210219) or approved equal from Competitor Swim Products. Provide backstroke flags with team/school name on one side and lane identification on the other.
4. Recall rope must be 1/2-inch yellow polypropylene rope complete with weight rings and two quick snap connectors made of chrome-plated brass. The rope must consist of a neco plate constructed of soft aluminum that is crimped and used to connect the two pieces of rope to form the required loops. Recall rope must be Recreonics, model #92-965 or equal with specific length ordered to match span between recall rope stanchion posts as indicated in plans.
5. Lane Rope Storage Reel
    a. Lane rope storage reel must be fabricated from two powder-coated aluminum captain wheels joined together by a 1-3/4-inch aluminum axle. This unit must ride easily on four (4) 5" stainless-steel casters with individual brakes. The reel must have a tow handle for safe movability. The storage reel should be able to hold 525' of 4" lane ropes or 300' of 6" lane ropes. The storage reel must come assembled. The correct number of storage reels must be provided to store lane lines. Lane line storage reel must be Competitor Swim Products Classic Plus Stor Lane Reel #200-510 with Competitor storage reel cover #200-351, Kiefer Racing Lane Storage Reel #210300 with Storage Reel Cover #210301, SR Smith Powder-Coated StoReel #13-61-5003 with StoReel Cover #30-61-0502 or approved equal.
6. The lifeline must be 3/4-inch blue and white polyethylene rope with floats that are 5-inch diameter by 9-inch-long. Floats must be spaced on five-foot centers. Metallic rope hooks

must be stainless-steel. Provide lifeline at five-foot break between shallow and deep water as shown on the drawings. Lifeline must be equal to Recreonics #14-438.BW or Lincoln Aquatics #44-115 safety line rope, Recreonics #14-381, Lincoln Aquatics #44-190 or Competitor Swim #350EZBW locking 5" x 9" floats, and Recreonics #14-456 or Lincoln Aquatics #44-125 rope end hooks.

7. T-wrench for operation of valve extensions must be fabricated of ¾" diameter SCH 40 stainless-steel pipe. The T-wrench must be 4'-0" in length with a 24" long welded "T" handle. The wrench must be fitted with a ¾" square stainless-steel male end, 1" in length, for operation of valve extensions at the surge tank. Two complete T-wrenches must be provided.

2.12 MAINTENANCE EQUIPMENT

A. The following items must be supplied unless otherwise noted. Proprietary names are to designate performance only. Equal products will be accepted.

1. Wall brush (2 required) - Brush backing must be a flexible polyethylene material with five (5) rows of nylon bristles. The pool brush holder must be permanent mold cast aluminum with hydrofoil flap. The holder must have stainless-steel screws to facilitate brush changes. Handle bracket must be quick detachable mount to fit standard 1 ¼ or 1 ½ inch diameter handles. Brush must be Recreonics #10-135, Lincoln Aquatics #31-020, or approved equal.
2. Skimming net (2 required) - Skimmer head must consist of one-piece molded plastic frame with a reinforced, integral handle bracket suitable for quick attachment to a standard 1¼ or 1 ½ inch diameter handle using bolts and wing nut. The standard nylon net must be attached to the frame using the groove and spline method. Net depth must be 16 inches minimum in the center. Skimming net must be manufactured by Recreonics #10-124, Lincoln Aquatics #31-103 or approved equal.
3. Telescopic Poles (2 required) - Cleaning tool handle must be of the telescopic design and fabricated from corrosion resistant, high-quality anodized aluminum. Poles must be fully adjustable, to desired length, with a simple twist of a cycolac threaded locking device. Poles must consist of a 1-inch tube fitted inside a 1¼ inch tube and be adjustable from a range of 8 ft. to 16 ft. Handle must be adjustable from 8 ft. to approximately 16 ft. having a threaded bushing type clamp to lock handle at desired position. Poles must be Recreonics #10-348, Lincoln Aquatics #30-050 or approved equal.
4. Portable Vacuum Poles
   a. Stainless-steel poles (1 required) –Vacuum head attachment poles are to have a heavy-duty 1¼ inch stainless-steel handle with special brass male and female threaded inserts on the ends. Poles must be 8 ft. each, totaling a 24 ft. length for vacuum head attachment. Poles must be Recreonics #10-330 or approved equal.
5. Test Kits
   a. Provide two (2) test kits:
      1) The first test kit must feature liquid reagents, a color comparator, waterproof instructions and treatment charts, chemistry guide and water gram. Test kit to have the ability to test for free and total chlorine (0.5 – 5.0 ppm), bromine (1-10 ppm), pH (7.0 – 8.0), acid and base demand, total alkalinity, calcium hardness and cyanuric acid. The test kit must be Taylor Complete K-2005C test kit or approved equal.
      2) The second test kit must be photometric and utilize either liquid and powder reagents or tablet reagents for stability that will allow accurate measurement of free and total chlorine (0-10 ppm), bromine, pH, alkalinity, calcium hardness, and cyanuric acid. The test kit must have

solid-state digital electronics and built-in filters. The test kit must be direct reading with automatic blank settings, automatic power cut-off, and store a minimum of the last 10 results in nonvolatile memory. Provide LMP106C Pooltest 6 with Hard Carry Case Kit and LMC001 Check Standard by Lumiso, AquaPRO 6 Test Kit manufactured by Orbeco-Hellige Inc and Reference Standard Kit (LP275680) or M-2005 Commercial Calorimeter Kit, in hard carry case, by Taylor Technologies or approved equal.

6. Vacuum Cleaner
   a. Vacuum cleaner (filtered water return to pool) - (1 required) must be complete with a 36-inch dual manifold head with 50 feet of 1-1/2-inch floating hose. Hose must be Recreonics, #10-414, Lincoln Aquatics #29-255 or approved equal. 24 ft. stainless-steel pole must be available for attachment. The portable cartridge vacuum cleaner system must include a 155 square foot T-316 stainless-steel up-flow single cartridge filter, a 1 HP self-priming thermoplastic self-priming pump 1-1/2-inch suction and discharge connection and 110 cubic inch strainer capacity. Cartridge must be Harmsco #ST/155 or approved equal. The system must be provided with one spare cartridge filter. The pump motor is 115-volt single phase, open-drip proof and must be UL and NSF listed. The pump motor must be provided with a 120-volt Hubbell switch, weatherproof switch cover, in-line pre-wired GFCI and a 100’ power cord. The cord must be wired to a 20-amp, 115-volt switch which must be mounted on the pump motor. Interconnecting pipe and fittings must be schedule 40 PVC. The entire assembly must be bolted to a T-316 stainless-steel cart and must have pneumatic wheels with grease fittings and roller bearing hubs. The unit must be Recreonics #10-806, Lincoln Aquatics #27-010 or approved equal. Accessories must include a minimum 1-1/2-inch x 25 ft. discharge hose with stainless-steel hose clamp. Hose must be Recreonics #10-440, Lincoln #29-146 or approved equal.
7. Robotic Pool Cleaner
   a. Provide one (1) dual pump floor, wall, and waterline only automatic commercial robotic pool cleaner. The cleaner must provide up to 5,820 square feet per hour of cleaning coverage as well as filter up to 9,000 gallons per hour. Unit must have 4-, 6- and 8-hour cleaning cycles. The pool cleaner must be provided with 131 feet of cable, PVC brushes, two (2) bottom loaded filter bags and a remote control for “spot cleaning”. Features must include zero-depth entry sensor and transportation caddy. Unit requires a dedicated 120-volt circuit receptacle with GFCI to transform which provides 27 volts the automatic pool cleaner. The automatic pol cleaner must be #9999359-W120 WAVE 120 as manufactured by Maytronics USA or approved equal.
8. Stainless-steel Cleaner - Provide a stainless-steel cleaner. The cleaner must comprise of one (1) gallon of organic passivation solution. It must be complete with instructions for proper maintenance of stainless-steel surfaces and material safety data sheets for the passivation solution. The cleaner must be the Spectra-Clean System 2 as manufactured by Spectrum Products. Product must be applied with 3M scouring pad, or equivalent.
9. Stainless-steel Protective - Provide protective coating on swimming pool rail goods. The coating must provide envelope protection. Surfaces coated must be clean and dry and free of oil, films, grease, silicones polishes and waxes, anything that leaves a film on the surface. Care must be taken not to clean the surface with a type of cleaner or solvent that may leave behind a thin film. The coating must be applied at approximately ½ mil WFT yielding a dry film thickness of 3-5 microns. Three coats are required. Allow to dry to touch between coats. The coating must be ProtectaClear-AF

as manufactured by Everbrite and distributed by TMI Salt Pure Corporation or Spectra Shield as manufactured by Spectrum Products.

2.13 SAFETY EQUIPMENT

A. The following items must be supplied unless otherwise noted. Proprietary names are to designate performance only. Equal products will be accepted.

1. Ring buoy and extension rope (2 required) – Buoy must be 24-inch diameter vinyl clad PVC foam with a metal ring molded inside. Buoy must have a 3/8-inch polyethylene rope attached to it at four points and be a minimum 60 feet in length. Preserver must be U.S.C.G. approved. Buoy and rope must be mounted at each lifeguard chair on hooks. Ring buoy must be Recreonics #12-252, Lincoln #44-075 or approved equal. The throw rope must be Recreonics #12-261, Lincoln Aquatics #42-050, or approved equal.
2. Life hook and pole (2 required) – Life hook must be an anodized aluminum 3/8-inch OD "shepherd's crook" with a 1-1/8-inch OD handle attachment suitable for a 1¼-inch 16 ft. aluminum extension pole. Hook must be of looped construction. Each pole must be provided with a set of spring type stainless-steel pole clamps for mounting on each lifeguard chair. Life hook must be Recreonics #12-239, Lincoln #42-060 or approved equal. Pole clamps must be Recreonics #10-353, Lincoln #30-135, or approved equal.
3. Spineboards (2 required) - Spineboard must be 72” long x 20” wide, constructed of 100% virgin high density polyethylene. The design must provide stiffness and torsional rigidity while remaining lightweight. The spineboard must accommodate up to 500 lbs and must feature customizable buoyancy that allows users to adjust the buoyancy by inserting polyethylene foam rods (supplied with the spineboard). There must be (10) handholds around the perimeter of the board. The spineboard must be supplied with one (1) 2-piece head immobilizer, one (1) head strap, four (4) body straps, one (1) head immobilizer with head bed, and two (2) flotation rods. The spineboard must be CJ Rescue 6 package as manufactured by CJ spineboard or approved equal. Provide one (1) set of heavy-duty stainless-steel utility hooks per spineboard for storing the spineboard at a convenient and readily accessible location near the pool (Recreonics #10-362 or Lincoln #44-100).
4. First aid kit (1 required) - First aid kit must be a 50-person unit per American Red Cross standards as manufactured by Recreonics #12-050, Lincoln #47-092 or approved equal.
5. Bloodborne pathogen kit (1 required) – Bloodborne pathogen kit must include a protective gown, medical-grade latex gloves, face mask with eye shield, antimicrobial hand wipes, and body fluid clean-up supplies. The kit must include a wall-mountable hard storage case. Bloodborne pathogen kit must be Lincoln Aquatics #48-061 or approved equal.
6. Rescue tube (6 required) - Provide one rescue tube for each lifeguard chair. Rescue tube must be Recreonics #12-293, Lincoln #42-032 or approved equal.
7. Safety eyewash station (1 required) - Safety eyewash station must be a self-contained system in which eyewash bottles are securely positioned in a portable holder. Eyewash bottles must be 32 ounces and easily removable from case, and must contain a sterile, saline solution with the ability to neutralize a varying quantity acids or caustics. Eyewash stations must be equipped with a double back screw and holes for easy mounting in location determined by the Architect. Stations must be Recreonics #12-033, Lincoln Aquatics #49-026, or approved equal.
8. Safety eyeglasses - Provided a safety eyeglass dispenser station containing ten (10) pairs of safety glasses. Eyeglasses must be ANSI/OSHA accepted.
9. Bag Valve Masks – Provide two (2) bag valve mask assistant resuscitation systems, one size Adult (1500ml tidal volume) and one size Infant/Child (450ml tidal volume). Product must be a latex free disposable bag mask unit with support strap, transparent patient

valve, and textured surface to eliminate slipping. Integral swivel valve, available with a closed reservoir system. Standard pack includes resuscitator, oxygen reservoir and a transparent bag for storage. Bag Valve Masks must be Ambu SPUR II or approved equal.

10. Automatic External Defibrillator
    a. Provide one (1) Automated External Defibrillator and one (1) trainer AED corresponding to the chosen AED per facility level for the aquatic facility. Product location must be coordinated with the Owner and Architect. AED must be Recreonics #12-430 or approved equal and must have an available training AED device. The AED Cabinet must be Recreonics #12-434 or approved equal.

2.14 THERMOMETERS

A. The following items must be supplied unless otherwise noted. Proprietary names are to designate performance only. Equal products will be accepted.
   1. Portable thermometer (2 required) must be a molded ABS plastic tube body type with the ability to measure temperature in both degrees Fahrenheit and Celsius. A 3 ft. polyethylene cord must be attached to thermometer. Thermometer must be manufactured by Pac-Fab/Rainbow #R141036, Recreonics #56-112, Lincoln #21-133 or approved equal.
   2. The inline thermometer must be near the heating loop and must have a 9-inch adjustable angle with a minimum 6-inch stem. There must be a minimum of two (2) thermometers per loop and must have ability to read temperature in both degrees Fahrenheit and Celsius. Thermometers must be Recreonics #32-702, Lincoln Aquatics #21-125, or approved equal.

2.15 SWIMMING POOL FINISHES

A. Paint
   1. The interior surfaces of the gutter trough must be painted with a high build epoxy. The color must be white or an approved light color.
   2. The coating must be a low VOC compliant polyamidoamine epoxy suitable for chlorinated water below 3.2 ppm and for installation on concrete surfaces. Coating must be Tnemec L69 Hi Build Epoxoline II, Induron Perma-Clean II Epoxy or approved equal. Color must be white.
   3. Quality Assurance
      a. At least ten (10) commercial public-use pools with individual water surface areas in excess of 4500 square feet of pool surface area or more must have been completed within the past 5 years.
      b. Submit a letter of approval from the pool paint manufacturer prior to application of the pool paint. Provide manufacturer with required estimated square footage to ensure proper material usage.
   4. Surface Preparation
      a. Cast-In-Place Concrete
         1) Allow concrete to cure a minimum of 28 days per ACI 308 and Divion 3 - Concrete. Perform moisture test of the concrete to ensure dryness. Either the plastic sheet method test (ASTM D 4263) or the Anhydrous Calcium Chloride Test (ASTM F 1869) must be performed prior to painting. Document test with pictures and submit results for record. Relative humidity must be measured with a probe and must be less than 75%. The Contractor must document test with pictures and submit results for review/record.

2) Brush-off pool interior surfaces, then blast clean to remove laitance and weak surface concrete, foreign substances and debris that could reduce or impair adhesion, dirt, oil, grease, curing compounds, or other foreign materials, to produce an anchor profile similar to medium grade sandpaper referencing SSPC-SP13/NACE6 and ICRI-CSP 2-4 Surface Preparation of Concrete. Blasting must open up surface voids, holes, and irregularities. No holes or holidays in the paint surface are allowed. Fill holes or irregularities that cannot be satisfactorily painted with an approved grout or Tnemec Series 215 Surfacing Epoxy, Induron EFS707 Epoxy Surfacer and Filler or Induron Mortarchem. Do not entirely remove the surface or completely expose the underlying aggregate.

b. Pneumatically Applied Concrete

1) Allow concrete to cure a minimum of 28 days per ACI 308 and Division 3 - Concrete. Perform moisture test of the concrete to ensure dryness. Either the plastic sheet method test (ASTM D 4263) or the Anhydrous Calcium Chloride Test (ASTM F 1869) must be performed prior to painting. Document test with pictures and submit results for record. Relative humidity must be measured with a probe and must be less than 75%. The Contractor must document test with pictures and submit results for review/record.

2) Prior to applying paint to a pneumatically applied concrete surface, a brown coat plaster leveling surface must be applied. The pneumatically applied concrete surface must be prepared for the application of the brown coat by removing foreign substances and debris that could reduce or impair adhesion, dirt, oil, grease, curing compounds, or other foreign materials. Brown coat must be applied to provide a clean, firm surface similar to a medium grade sandpaper, suitable for the application of paint. No holes or holidays in the paint surface will be allowed. Fill holes or irregularities that cannot be satisfactorily painted with an approved grout or Tnemec Series 215 Surfacing Epoxy, Induron EFS707 Epoxy Surfacer and Filler or Induron Mortarchem.

5. Application Procedures

a. Before applying material, measure and record the temperature and relative humidity. Apply only if surface and air temperature is above 50°F and at no lower temperature than 5°F above the dew point, unless otherwise approved by the manufacturer. Low temperature cure option must be submitted for approval if required. Do not apply when the relative humidity is greater than 85%. If possible, plan the painting schedule so that painting is done in the coolest part of the day. Provide adequate ventilation during application to minimize odor.

b. Protect exposed tile during preparation and application procedures.

6. Application of the First Coat

a. After the pool surface has been thoroughly dried and cleaned the first coat can be applied. Surface spreading rate must be observed as not to exceed the recommended manufacturer’s rate of application. The first coat must be applied at a minimum rate of 200 SF per gallon and must conform to local VOC requirements. First coat must be thinned 10%. The first coat must be allowed to cure for 12 hours at a minimum temperature of 70°F prior to second coat, unless otherwise approved by the manufacturer. Low temperature cure option must be submitted for approval if required.

7. Application of the Second Coat

a. After the first coat dries, the second coat must be applied at a minimum rate of 200 SF per gallon and must conform to local VOC requirements. The second

coat must be allowed to cure for 12 hours at minimum temperature of 70°F prior to final coat, unless otherwise approved by the manufacturer. Low temperature cure option must be submitted for approval if required.

8. Application of the Final Coat
   a. After the second coat dries, the final coat must be applied at a minimum rate of 200 SF per gallon and must conform to local VOC requirements.
   b. The final coat must be allowed to cure for 7 days at 70°F before filling the pool, unless otherwise approved by the manufacturer. Low temperature cure option must be submitted for approval if required.
9. Application of the Finish
   a. Application must be made by brush, roll, lamb's wool applicator or spray.

B. Swimming Pool Cementitious Finish, Diamond Brite, Pebble Sheen - Reference specification section 13 11 04, Swimming Pool Cementitious Finish.

C. Swimming Pool Tile - Reference specification section 13 11 03, Swimming Pool Tile.

2.16 WATERPROOFING

A. Products
   1. Interior surfaces of surge tanks and backwash pit with NO additional finishes: Apply two (2) coats of Vandex BB White, Xypex Modified, Xypex Megamix I, Miracote BC Pro or Basecrete directly to surface of surge tanks and backwash pit.

B. Surface Preparation
   1. Surface must be structurally sound and free of foreign substances and debris that could reduce or impair adhesion. Surfaces must be roughened by sand blasting or water blasting. Shot blasting, scarifying, or grinding can also be accepted methods of surface preparation. Surface defects or holes must be patched per manufacturer's recommendations.
      a. National Plasterers Council Surface Preparation Definitions
         1) Pressure Washing: The washing or cleaning of a surface by a stream of water ejected from a nozzle at high velocity, typically in the range of 1,000 psi – 4,000 psi.
         2) Water Blasting: The cutting, abrading, or removal of a surface or substrate by a stream of water ejected from a nozzle at ultra-high velocity, typically in the range of 10,000 psi – 40,000 psi.

C. Application
   1. Do not apply materials under conditions where the ambient air temperature is less than 40 degrees Fahrenheit, or to a frozen substrate.
   2. The mixing of products, quantities and application procedures must be done in accordance with the manufacturer's recommendations.

2.17 SEALANTS

A. Provide sealed expansion joints as shown on the pool and pool structural drawings or noted on the construction/expansion joint layout, and as required. Expansion joints must be constructed and sealed as indicated and in accordance with the manufacturer's recommendation. Sealant must be manufactured by LATICRETE International, Inc., Mapei, or Deck-O-Seal. If submerged joints are provided within a pool structure that utilizes a cementitious finish, a 2"x2" tile trim must be installed adjacent to the sealant on each side of the joint. Reference specification section 13 11 03, Swimming Pool Tile.

1. For submerged joints:
    a. Latasil, one component, neutral cure, high performance, 100% silicone sealant in the color(s) as selected by the Owner/Architect. Must be used in conjunction with Latasil 9118 Primer per manufacturer's recommendations.
    b. Mapesil T, 100% silicone sealant in the color(s) as selected by the Owner/Architect.
2. For joints behind the coping, or other horizontal deck joints:
    a. Deck-O-Seal, two component (gun-grade or pourable, self-leveling), high resilience, non-sag, non-flowing, polysulfide-based sealing compound in the color(s) as selected by the Owner/Architect. Must be used in conjunction with Rezi-Weld LV per manufacture's recommendations.

B. Material Storage
1. Materials must be stored in the original unopened factory containers in a cool dry location at 60 to 80 degrees F. Protect from the elements and the hazards of construction.

C. Joint Preparation
1. Clean the joints of deleterious material, to sound, clean and dry substrate.
2. Joint must be formed or filled with an approved, resilient, non-asphaltic, closed cell, polyethylene joint filler material down to firm substrate. Allow space at the top of the joint for the installation of approved closed cell polyethylene backer rod and install same to the required depth below the surface of the slab to control the depth of the sealant bead to within manufacturer requirements.

D. Surface Preparation
1. Concrete surfaces to receive sealant must be fully cured, clean, dry, and free of dirt, dust, curing compounds and other foreign material that might compromise the adhesion and performance of the sealant. Curing aids, form release agents and joint former residue must be completely removed, if necessary, by sand blasting and/or grinding. Loose dust must be brushed off.
2. Prime surfaces to receive Latasil sealant with Latasil 9118 Primer prior to sealant application, and surfaces to receive Deck-O-Seal sealant with P/G Primer prior to application.

E. Application
1. Apply sealant in accordance with the manufacturer's recommendations.
2. Tool the joint immediately after application to ensure a firm, intimate contact with the joint interface.
3. Remove excess sealant and smear from adjacent surfaces with Xylol or Toluol before sealant cures.
4. After the sealant has fully cured (generally a minimum period of five days at 72 degrees and 50% humidity), paint the surface of the sealant with a chlorine resistant chlorinated rubber or equivalent pool paint, in a compatible color as selected by the Owner/Architect. NOTE: Latasil cannot be painted.

2.18 UNDERWATER LIGHTS

A. Underwater lights must be equivalent to 100/500 watts of incandescent light. Underwater lights must be UL listed and, in the quantities, shown and as detailed in the construction drawings and as described in these specifications. Coordinate for proper installation. Refer to the drawings for quantities and locations.

B. The pool underwater lights must be 120VAC or 12VAC, 31 watts LED-type, and equivalent to 500 watts of incandescent light. Fixture housing must be stainless-steel construction with minimum wall thickness of 0.020 inch per UL 676 underwater pool lighting standard. The niche must be stainless-steel with cast brass mounting ring or PVC plastic with stainless-steel mounting ring. Brass construction pressure grounding lug on interior and exterior services. Lens must be 8-3/8 diameter clear tempered heat resistant glass. The gasket must be single piece "U" shaped santoprene or silicone. Fasteners must be silicon-bronze or stainless-steel. The light fixture must be supplied with a #16-3 STW (120V) or 12-3 SJTW (12V) submersible cord with ground wire positively grounded inside the fixture. Cord entrance must be a watertight seal and epoxy encapsulated. Light fixture must be IntelliBrite Architectural Series White LED pool light series by Pentair Commercial Pool and Aquatics or approved equal. Underwater lights must be provided with cord length as required to allow for deck relamping of fixtures.

C. The spa underwater lights must be 120VAC or 12VAC, 18 watts LED-type, and equivalent to 100 watts of incandescent light. Fixture housing must be stainless-steel construction with minimum wall thickness of 0.020 inch per UL 676 underwater pool lighting standard. The niche must be stainless-steel with cast brass mounting ring or PVC plastic with stainless-steel mounting ring. Brass construction pressure grounding lug on interior and exterior services. Lens must be clear tempered heat resistant glass. The gasket must be single piece "U" shaped santoprene or silicone. Fasteners must be silicon-bronze or stainless-steel. The light fixture must be supplied with a #16-3 STW (120V) or 12-3 SJTW (12V) submersible cord with ground wire positively grounded inside the fixture. Cord entrance must be a watertight seal and epoxy encapsulated. Light fixture must be IntelliBrite Architectural Series White LED spa light series by Pentair Commercial Pool and Aquatics or approved equal. Underwater lights must be provided with cord length as required to allow for deck relamping of fixtures.

D. Junction boxes must be provided in the quantities required and must be located at least 8” above the pool coping and 5' from the pool edge. Refer to the Electrical drawings. Cord length must be sufficient to run from fixture to the junction box with sufficient cable in the niche to re-lamp the fixture on the deck. Provide junction boxes that must be installed by Electrical.

E. Transformers for 12V underwater lights must be Intermatic PX Series low voltage landscape and swimming pool/spa light transformer or approved equal as specified by Electrical designer. These safety transformers are specifically designed to supply 12 volts to pool/spa lights, submersible fixtures, and outdoor garden lights. The built-in circuit protection will disconnect power to the transformer in case of defect or overload. These transformers are suitable for direct connection to underwater pool and spa lights. Refer to manufacturer information for cabling distance and gauge requirements. Coordinate transformer locations with Electrical.
   1. Model PX100 and PX100S: 100 W Transformers - input 120 VAC, output 12 VAC or 13 VAC
   2. Model PX300 and PX300S: 300 W Transformers - input 120 VAC, output 12 VAC, 13 VAC, or 14 VAC

2.19 WATER FEATURES AND SUPPORT EQUIPMENT

A. Provide water features in the quantities shown in the drawings by Waterplay, Vortex, or approved equal manufacturer. Waterplay features are basis of design.

B. 0010-3651 Restorative Spray 1
   1. Characteristics: The Restorative Spray 1 consists of a straight lower column and an upper column with a 15° bend and shall be constructed of schedule 10 stainless steel

structural tubing. A two (2) piece fan assembly constructed of stainless steel show be welded to the upper column mount. The fan plates narrows at the opening to restrict and direct the flow of water. Tamper resistant fasteners shall be used to hold all components together to prevent leakage. Water shall flow through the fan head in a flat, dispersed spray

2. Dimensions: The overall height of the structure shall be no less than 126 inches (32000mm) The overall height of the structure shall be no less than 71 inches (1803mm) above final grade. The overall width of the structure shall be no less than 43 x 11 inches (1092 x 279mm)
3. Recommended Flow Rate: The hydraulic requirements shall be 30 gpm @ 4 psi (114 lpm @ 28 kpa).
4. Anchoring/Levelling System: See Playphase Base Medium written spec for more detail.

C. 0010-7496 GS Spray Tunnel 4

1. Characteristics: The four (4) spray canisters shall be connected to a 58 inch (1473mm) diameter base pipe that works as a distribution manifold. Each canister shall be no less than 6 inches (152mm) tall with a diameter of Ø2.88 inches (73mm). The Acetal spray nozzles and winter caps shall be seated into the canister with an o-ring and secured using tamper resistant security bolts. Tamper resistant winter caps are included. All nozzles sit flush with final grade. There shall be one 1.5 inch (38mm) National Pipe Thread water inlet located at the end of the base pipe.
2. Dimensions: Flush to grade mount with an overall height of 8 inches (203) and length of 58 inches (1473mm)
3. Recommended Flow Rate: The hydraulic requirements shall be 24 gpm @ 5 psi (91 lpm @ 34 kpa).
4. Nozzle Count: Four (4)
5. Water Display: Water will flow through four (4) 2.5" acetal nozzles. If restriction is placed on any nozzle, the flow and height on the remaining nozzles will increase.

2.20 POOL HEATERS

A. Provide the pool water heating system. Heating system to include piping, heaters, booster pumps, controls, gauges, thermostats, control valves and wiring required to draw water from the recirculation piping, heat the water and return it back to the recirculation piping. Interlock pool heating system with pool recirculation pumps.

1. Pool heater manufacturer representative must be on site to start and adjust pool heater(s). Copies of the startup report must be sent to the Architect/Engineer.
2. The heater(s) system must consist of a direct gas fired boiler boiler with an internal pumped bypass as shown on the drawings. Proposed substitutions must include a mechanical drawing incorporating required changes in layout, piping valves, gas, venting and electrical connections. The cost of such changes must be included in the price of the substitute. Confirm by 1/4-inch scale shop drawing that the alternate heater(s) must be provided will fit within the available space.
3. The pool heater(s) must have an input rating as shown on the drawings and must be orificed for operation on Natural Gas.

B. Direct Gas Fired Boiler (without Pumped Bypass)

1. Basis of Design: Lochinvar ERN, RayPak Professional Series or approved equal.
   a. The heater water containing section must be of a "Fin Tube" design, with straight cupro nickel tubes having extruded integral fins spaced seven (7) fins per inch. The tubes must terminate into a one-piece rear header and a two-piece front header with an integral bypass assembly. The front header

configuration must allow access to the heat exchanger for the purposes of inspection, cleaning, or repair. The heat exchanger must have a drain for proper draining and winterization. The front header must provide a 3/4" NPT connection for a field installed relief valve. Connection may be made directly to the front header with CPVC pipe. The heat exchanger must be mounted in a stress-free jacket assembly in order to provide a "free floating design" able to withstand the effects of thermal shock.

b. The heater must be constructed to the requirements of the American Society of Mechanical Engineers and bear the “HLW” stamp with a 125 PSI working pressure and must be National Board Listed. The bronze front header assembly must mount with bolts and seal with an EPDM gasket.
c. The combustion chamber must be sealed and completely enclosed with ceramic fiberboard insulation. The material must provide a high efficiency insulation barrier while providing low weight. The burners must be constructed of high temperature stainless steel and fire on a horizontal plane. The heater must have an integral combustion air blower to precisely control the fuel/air mixture for maximum efficiency. Operation of the combustion air blower and venting system must be monitored by an air proving switch.
d. The heater(s) must be constructed with a heavy gauge pre-painted galvanized steel exterior jacket assembly. Steel jacket components must be galvanized on both sides.
e. The heater(s) must be certified and listed by CSA International under the latest edition of the appropriate ANSI test standard. The heater(s) must comply with the energy efficiency requirements of the latest edition of the ASHRAE 90.1 Standard. The heater(s) must operate at thermal efficiency up to 87%.
f. The heater(s) must be furnished with an integral bypass assembly to ensure proper operation without condensation. The bypass assembly must be constructed with corrosion resistant materials for long life. The bypass must automatically control water flow rates through the heat exchanger. No auxiliary bypass is required unless water flow rates exceed 100 GPM.
g. Standard operating controls must include a digital electronic thermostat with independent settings for pool temperature control. The electronic temperature control must ensure accurate temperature control to ±1°F. A pool water safety high limit control must be provided. The heater(s) must have a master on/off switch.
h. The heater(s) must be field convertible to operate on either 120 VAC or 240 VAC. The control system must include a direct-spark ignition system. The ignition system must provide flame supervision for 100% safety shutdown. The heater(s) must be equipped with a digital display to provide the status of operation and troubleshooting assistance on a control sensed malfunction. The heater(s) must be provided with a built-in low water pressure switch to monitor water flow.
i. The heater(s) must have an independent laboratory rating for Oxides of Nitrogen (NOx) of less than 30 ppm corrected to 3% O2.
j. The heater(s) must be approved for indoor installation. The heater(s) must be supplied with venting and air intake in accordance with the National Fuel Gas Code, ANSI Z223.1/NFPA 54 latest edition. Refer to Mechanical drawings for required air intake and venting configuration to include with the heater(s).

C. Direct Gas Fired Boiler (with Internal Pumped Bypass)
1. Basis of Design: Lochinvar Copper-Fin 2, Raypak HiDelta, or approved equal.

a. The water containing section must be of a "fin tube" design, with cupro-nickel tubes having extruded integral fins. The tubes must terminate into a one piece, lined, bronze header. There must be access to the front header of the heat exchanger for the purposes of inspection, cleaning, or repair. The heat exchanger must be mounted in a stress-free jacket assembly in order to provide a "free floating design" able to withstand the effects of thermal shock. The heater(s) must bear the ASME "H" stamp for 160 psi working pressure and must be National Board listed.

b. The combustion chamber must be sealed and completely enclosed with a ceramic fiberboard insulation. A burner/flame observation port must be provided on each end of the unit. The burners must be constructed of a high temperature stainless steel and fire on a horizontal plane. The heater(s) must have a multi-speed combustion air blower to precisely control the fuel/air mixture for maximum efficiency.

c. The heater(s) must be constructed with a heavy gauge galvanized steel jacket assembly, primed and pre-painted on both sides with a minimum dry film thickness of 0.70 mils. The jacket design must allow single unit venting connection without the use of external draft hood devices.

d. The heater(s) must be certified and listed by CSA International under the latest edition of the appropriate ANSI test standard. The heater(s) must comply with the energy efficiency requirements of the latest edition of the ASHRAE 90.1 Standard. The heater(s) must operate at thermal efficiency up to 85% (HiDelta 83%). The heater(s) must be ASME inspected, and HLW-stamped and National Board registered for 160 PSIG working pressure, complete with a Manufacturer's Data Report.

e. Heat Exchanger
   1) The heat exchanger must be of a single-bank, horizontal-grid design with integral cupro-nickel finned tubes, each end of which is rolled into an ASME boiler-quality steel tube sheet. The heater(s) must be capable of operating at inlet water temperatures as low as 105°F without condensation.

f. The heater(s) must be furnished with a factory supplied pumped bypass assembly to ensure proper operation without condensation. The bypass assembly must include a sealed bronze pump. The bypass assembly must be constructed of schedule 80 CPVC piping with brass inserts and an automatic three-way valve to protect the unit against inlet water temperatures that would cause the heat exchanger to condense.

g. The heater(s) must have an independent laboratory rating for Oxides of Nitrogen (NOx) of less than 30 ppm corrected to 3% O2.

h. The heater(s) must be equipped with a controller incorporating software customized for operation of the heater(s). Internal safety, operating and ignition controls must be included in the controller. The controller must provide on/off control of the gas supply to the burner, operation of the combustion air blower, ignition of the gas-air mixture, flame proving, control of water temperature set points, and monitoring of safety functions.

i. The heater(s) must feature an LED/LCD display that provides external heater(s) status/faults. Local communication, programming, and a display of operating and alarm status conditions must be accessible through the control panel. The control panel must contain an on/off main power switch, a digital display of temperature functions, the operational status of the heater(s), or an active alarm fault.

j. The heater(s) must allow 0-10 VDC input connection for BMS control. Supply voltage must be 120 volt / 60 hertz / single phase.
k. The control system must include redundant proven pilot hot surface ignition with full flame monitoring capability. Multiple main gas valves with redundant valve seats and built-in low gas pressure regulators must be supplied as standard. Gas valves will be referenced to the combustion chamber to ensure proper air/gas mixture for efficient combustion.
l. The heater(s) must be approved for indoor installation. The heater(s) must be supplied with venting and air intake in accordance with the National Fuel Gas Code, ANSI Z223.1/NFPA 54 latest edition (Category I). Refer to Mechanical drawings for required air intake and venting configuration to include with the heater(s).
m. Heater Stacking Kit
    1) The heater(s) must be stacked directly one on top of the other as shown on the drawings. Stacking kit must be provided by heater(s) manufacturer to minimize footprint.

PART 3 EXECUTION

3.1 EXISTING CONDITIONS, INSPECTION AND PREPARATION

A. Carefully examine the contract documents for requirements that affect the work of this section. Prior to starting work, notify the Architect of defects requiring correction. Do not start work until conditions are satisfactory.

B. Verify that work by others, related to this section, has been completed. This includes earthwork, concrete work, and mechanical, electrical, and plumbing connections.

C. Protect materials and work completed by others from damage while completing the work in this section.

3.2 FIELD MEASUREMENTS

A. Verify benchmark and pool location prior to layout.

B. If field measurements differ from the construction drawing dimensions, notification must be given to the Architect prior to proceeding with work.

3.3 EXCAVATION, REINFORCING STEEL AND SWIMMING POOL SHOTCRETE OR CAST-IN-PLACE CONCRETE

A. Reference Division 31 - Earthwork

B. Reference Division 3 - Concrete

3.4 TOLERANCES FOR CONSTRUCTION OF THE POOL SHELL

A. The completed structures must be constructed level and to the dimensions, elevation, depths, and thickness as shown on the plans.

B. The elevation tolerance of the pool shell and gutter lip must be plus or minus 1/8 inch.

C. The vertical wall surface tolerance of the pool shell, for the first 36 inches from the water surface must be plus or minus 1/4 inch from plumb measured with a 6-foot straight edge.

D. For competitive racecourses, the following pool shell tolerances must apply:

Course	Tolerance	Minimum	Maximum
25 Yard	+ 1 3/16” /- 0”	75’ – 3/4”	75’ – 1 15/16”

1. The above dimensions include allowances for a touchpad at each end of the course. The maximum dimension includes the construction tolerance. These above tolerances also apply to courses utilizing moveable bulkhead(s).
2. The above dimensions apply to a vertical plane extending 1’-0” above and 3’-0” below the surface of the water at points of both end walls.

E. Provide the services of a registered engineer or land surveyor who must measure and certify the elevations of the gutter lip at 10-foot centers. Courses designed with touchpads for competition must be measured and certified with touchpads in place. Course length survey must be made with the pool filled with water between 78- and 82-degrees Fahrenheit. The Contractor to submit compliant survey measurements to the Architect for review and record.

F. Ground wires or grade pins, if used, must be installed in such a manner that they accurately outline the section of the pool shell as indicated on the plans. They must be located at intervals sufficient to ensure proper thickness throughout and must be maintained tight. Grade pins or grounding wires must not be permanently embedded in the pool shell.

3.5 PIPING INSTALLATION

A. General
1. Provide and erect, according to the best practices of the trade, piping shown on the drawings and required for the complete installation of these systems. The piping shown on the drawings must be considered as diagrammatic in indicating the general run and connections and may or may not in parts be shown in its true position. The piping may have to be offset, lowered, or raised as required or as directed at the site. This does not relieve responsibility for the proper erection of the systems or piping in every respect suitable for the work intended as described in the specifications and approved by the Architect. In the erection of piping, it must be properly supported, and proper provisions must be made for expansion, contraction and anchoring of piping. Piping must be cut accurately for fabrication to measurements established at the construction site. Pipe must be worked into place without springing and/or forcing, properly clearing windows, doors, and other openings and equipment. Cutting or other weakening of the building structure to facilitate installation will not be permitted. Pipes must have burrs and/or cutting slag removed by reaming or other cleaning methods in strict accordance with the manufacturer's instructions. Changes in direction must be made with fittings. Open ends of pipes and equipment must be properly capped or plugged to keep dirt and other foreign materials out of the systems. Plugs of rags, wool, cotton waste or similar materials will not be used in plugging. Piping must be arranged so as not to interfere with removal and maintenance of equipment, filters, or devices, and so as not to block access to manholes, access openings, etc. Flanges or unions applicable for the type of piping specified must be provided in the piping at connections to items of equipment. Piping must be installed to ensure noiseless circulation. Valves and specialties must be so placed to permit easy operation and access.

B. Pipe Hangers and Supports
1. Pipes must be adequately supported by pipe hangers and supports as specified.

2. Horizontal PVC Schedule 80 piping must be supported in accordance with the manufacturer's recommendations for fluid temperature not exceeding 120-degree F and as listed below:

Nominal Pipe Size	Hanger Support Spacing	Minimum Rod Size for Single Rod Hanger
1-1/4" and less	5'-0"	3/8"
1-1/2" to 3"	6'-0"	1/2"
4" to 6"	8'-0"	5/8"
8" to 12"	10'-0"	7/8"
Greater than 12"	12'-0"	1"

3. Horizontal CPVC Schedule 80 piping must be supported in accordance with the manufacturer's recommendations for fluid temperature not exceeding 140-degree F and as listed below:

Nominal Pipe Size	Hanger Support Spacing	Minimum Rod Size for Single Rod Hanger
½" and less *	4'-0"	3/8"
¾" to 2"	6'-0"	3/8"
2-1/2" to 3"	7'-0"	1/2"
4" to 8"	8'-0"	7/8"
Greater than 12"	10'-0"	1"

4. Round rods supporting the pipe hangers must be of the following dimensions:

Nominal Pipe Size	Rod Diameter
1/2" to 2" pipe	-3/8" rod
2-1/2" to 3" pipe	-1/2" rod
4" to 5" pipe	-5/8" rod
6" pipe	-3/4" rod

5. Hanger rods must be galvanized steel. Provide for controlling level and slope by turn buckles or other approved means of adjustment and incorporate lock nuts.
6. Provide means of preventing dissimilar metal contact such as plastic-coated hangers, copper colored epoxy paint, or non-adhesive isolation tape.
7. Provide hangers to provide a minimum of 1-inch space between finished covering and adjacent work.
8. Place a hanger within 12 inches of each horizontal elbow.
9. Support vertical piping independently of connected horizontal piping. Support vertical pipes at every floor. Wherever possible, locate riser clamps directly below pipe couplings or shear lugs.
10. Where several pipes can be installed in parallel and at the same elevation, provide trapeze hangers as specified. Trapeze hangers must be spaced according to the smallest pipe size or provide intermediate supports according to the support spacing schedules. Provide heavier members as required for the load supported for the entire span distance. Hanger rods must be as specified above and properly sized for the load supported, but not less than 5/8 inches diameter.
11. Piping must be rigidly supported from the building structure by means of hanger assemblies properly selected and sized for the application in accordance with the manufacturer's recommendations and specifications. Do not support piping from other pipes, ductwork or other equipment that is not building structure. Do not modify the building structure for hanger installation.
12. Attachment of piping hangers to the building structure must be provided in a manner approved by the Architect. Provide concrete inserts installed by others in the building construction at the time the concrete is poured, and hangers must be attached to these inserts.

13. The use of pipe hooks, chains, or perforated iron for pipe hanger supports will not be permitted.
14. A design for piping in a service tunnel, if required, supported by a structure must be submitted for approval. The structure must be non-corrodible and must be of a size and configuration to rigidly support the piping as shown in the plans at a minimum spacing as shown below.

C. Concrete Inserts
1. Provide inserts for placement in form work before concrete is poured.
2. Provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
3. Where concrete slabs form finished ceilings, inserts must be flush with the slab surface.
4. Provide hook rods to concrete reinforcement section for inserts carrying pipe over 4 inches.

D. Piping Installation – Below Grade
1. Trench bottoms must be smooth and free of rocks and debris. If the trench is dug in ledge rock, hardpan or where large boulders are not removed, place 3 inches of sand or compacted fine-grained soil below the pipe. Pipe must be supported over its entire length with firm, stable material. Blocking will not be used to change pipe grade or provide intermittent support over low sections in the trench. Surround the pipe with backfill meeting the requirements of Section 31 20 00 with a particle size of 1-1/2 inch or less and in accordance with the project geotechnical report. Compact in layers not to exceed 6 inches with vibratory method. Follow installation methods of ASTM D2774 "Underground Installation of Thermoplastic Pressure Piping".

E. Flushing, Draining and Cleaning Pipe Systems
1. Flush out water systems with water before placing them in operation. Other systems must be cleaned by using compressed air or nitrogen. After systems are in operation and during the test period, strainer screens must be removed and thoroughly cleaned.

F. Expansion and Contraction
1. Make necessary provisions for expansion and contraction of piping with offsets, loops, flexible connections, and anchors as required to prevent undue strain. Provide shop drawings for method and arrangement for control of expansion and contraction of piping.

G. Testing
1. Piping installation and pressure testing must be performed by the Contractor and reviewed by the Owner or a designated representative of the Owner before commencement of backfilling. A minimum one (1) week notice must be provided prior to review. Results must be submitted to the Architect. Pictures with time stamps for each section of piping must be included with testing report(s) and be submitted within one (1) week of the pressure test(s).
2. Suction and supply pool piping must be capped and hydraulically pressure tested with water to a pressure of not less than 50 PSI for a period of no less than two (2) hours. Pressure testing must be conducted in accordance with ASTM D2774. The temperature of the water used for the test must be between 40ºF and 90 ºF.
3. Gravity pool piping must be capped and hydraulically pressure tested with water to a pressure of not less than 20 PSI for a period of no less than two (2) hours. Pressure testing must be conducted in accordance with ASTM D2774. The temperature of the water used for the test must be between 40ºF and 90 ºF.
4. Pneumatic testing (air) of any pool piping will not be accepted.

5. The Contractor must verify recirculation fitting pressure limitations can meet testing requirements prior to installation and testing. Piping may be tested prior to a recirculation fitting connection (skimmer, main drain, etc.) within 5’-0” of connection point.
6. Maintain a sustained 20 PSI pressure on pool related piping throughout the course of construction.
7. Adhere to the applicable provisions of Division 22 - Plumbing, "General Provisions" and "Basic Materials and Methods" for installation of piping system.

3.6 EQUIPMENT AND SYSTEMS INSTALLATION

A. Provide and assemble equipment, special parts and accessories as shown on pool drawings, specifications, and shop drawings of the equipment suppliers.

B. Provide anchors and inserts imbedded in the deck including fittings, inserts and structure sleeves and required anchorage as shown on the plans and as indicated in this section of the specifications. Equipment must be set true and plumb, using factory jigs where available. Removable equipment items must be easily removable from anchors and must fit without noticeable wobble.

C. Provide templates for equipment anchors. Provide anchor bolts of the size and spacing as required by the equipment manufacturer. Anchor bolts must be stainless-steel Type 316L and of a length capable of adequate anchorage into rough slab-on-grade allowing for finish deck tile and setting bed. Anchors must be set and cast into place during building concrete work. Inspect anchor settings for horizontal and vertical alignment prior to placing concrete.

D. Provide equipment and systems in accordance with manufacturer's directions. Equipment must be assembled and in place for final observation.

E. Items necessary to complete this section are shown on the plans or described in the specifications including items that may be purchased by the Owner. Items are detailed and specified as a guide for dimensional purposes. Make provisions accordingly and submit shop drawings and submittals based on that data.

3.7 START-UP AND INSTRUCTION

A. Supply the services of an experienced swimming pool operator/instructor for a period of not less than two days (total 16 hours) after the pool(s) have been filled and initially placed in operation. During this period, the Owner's representatives who will be operating the pool(s) must be thoroughly instructed in phases of the pool's operation. Deliver six (6) complete sets of operating and maintenance instructions for the swimming pool, structures, finishes and component equipment. Prior to leaving the job, obtain written certification from the designated Owner's representative acknowledging that the instruction period has been completed and necessary operating information provided. Include the cost of two (2) additional days (total 16 hours) of instruction and operational check out by the qualified representative during the first season of operation.

B. Written reports of each of these visits outlining the pool's operation, competence and performance of the pool's operation personnel, and other pertinent comments must be submitted to the Owner and Architect/Engineer within one (1) week after each visit.

C. Provide specific written procedures that must be followed for emptying and refilling the pool as mentioned previously in this section. The procedures must be included in the bound volume of

operating instructions and references in the front index with a note headed by the words: "CAUTION -- VERY IMPORTANT".

END OF SECTION 13 11 00

SECTION 13 11 03 - SWIMMING POOL TILE

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. The drawings and General Provisions of the contract, including General and Supplementary Conditions apply to the work of this section.

1.2 SUMMARY

A. The cementitious pool finish must have ceramic tile markings and trim at locations including the pool perimeter tile band, vertical tile band, stairs, nosings, recessed wall steps, toe ledge, depth markings, wall targets, floor lane markings, construction joint installations bands and other tile installations as shown and detailed on the contract drawings and in strict accordance with these specifications.

B. Provide a ceramic tile finish on the entire interior surface of the spa.

C. The Contractor must furnish and install the work of this section.

1.3 RELATED SECTIONS

A. Division 1 – Mock Ups

B. Division 7 - Joint Sealers

C. Division 9 - Ceramic Tile

D. Section 13 11 00 - Swimming Pool

E. Section 13 11 04 - Swimming Pool Cementitious Finish

1.4 QUALITY ASSURANCE

A. Reference Standards: Conform to the following standards unless otherwise required herein.
   1. American National Standards Institute (ANSI)
      a. A108.01 – General Requirements: Subsurfaces and Preparations by Other Trades.
      b. A108.02 – General Requirements: Materials, Environmental, and Workmanship.
      c. A108.1, Glazed Wall Tile, Ceramic Mosaic Tile, Quarry Tile and Paver Tile installed with Portland Cement Mortar.
      d. A108.1C – Contractor’s Option: Installation of Ceramic Tile in the Wet-Set Method with Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Mortar or Installation of Ceramic Tile on a Cured Portland Cement Mortar Setting Bed with Dry Set or Latex-Portland Cement Mortar.
      e. A108.5 – Installation of Ceramic Tile with Dry-Set Portland Cement Mortar or Latex-Portland Cement Mortar.
      f. A108.6 – Installation of Ceramic Tile with Chemical Resistant, Water Cleanable Tile Setting and Grouting Epoxy for the Epoxy Grouting Installation Process.

g. A108.10 – Installation of Grout in Tile Work.
h. A137.1 Standard Specifications for Ceramic Tile.

2. American Society for Testing and Materials (ASTM)
   a. C144-99, Aggregate for Masonry Mortar
   b. C150-00, Portland Cement
   c. C171-97a, Sheet Materials for Curing Concrete
   d. C206-97, Finishing Hydrated Lime
   e. C207-91 (R1997), Hydrated Lime for Masonry Purposes
   f. F-1869, Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride
   g. F-2170, Standard Test Method for Determining Relative Humidity in Concrete Floor Slabs Using in Situ Probes
3. Tile Council of North America (TCNA); 2021 Edition, Handbook for Ceramic Tile Installation.
4. American Concrete Institute
   a. ACI 302 – Guide for Concrete and Floor Slab Construction
5. International Concrete Repair Institute (ICRI)
   a. Concrete Surface Profile (CSP)

B. The Contractor must have two years' experience in similar pool projects for which the Owner may require written proof thereof and proper tools to install tile.

1.5 MANUFACTURERS

A. Subject to compliance with requirements provide ceramic tile, mortar, and grout of the following manufacturers: American Olean Tile Co. (tile), Dal-Tile Co. (tile), Buchtal (tile), KlinkerSire (tile), MAPEI, Inc. (thin-set, waterproofing, grout, and admixtures), and LATICRETE International Inc. (thin-set, waterproofing, grout, and admixtures) or approved equal.

1.6 SUBMITTALS

A. Submit shop drawings indicating tile layout, patterns, joint layout, color arrangement, perimeter conditions, junctions with dissimilar materials, thresholds and setting details.

B. Submit product data indicating material specifications, characteristics, and instructions for using adhesives and grouts.

C. Samples:
   1. Submit physical samples for all tile color selections by Owner/Architect.
   2. Submit physical samples for grout color selections by Owner/Architect.

D. Mockups:
   1. Mount tile and apply grout on 24"x24" backerboard to indicate pattern, color variation and grout joint size variations of each pattern. Furnish mounted tile samples as requested by the Architect/Owner for approval.

E. Submit manufacturer's installation instruction.

F. Submit maintenance data.
   1. Include recommended cleaning and stain removal methods, cleaning materials.

1.7 PRODUCT DELIVERY AND STORAGE

A. Deliver tile materials to site in unopened factory containers sealed with grade seals bearing printed name or manufacturer and the words "Standard Grade". Keep the grade seals intact and containers dry until tiles are used. Keep cementitious materials dry until used.

1.8 JOB CONDITIONS

A. Inspect and verify job conditions. Report defects in base surfaces for correction before proceeding.

B. Maintain environmental conditions, including temperature humidity and ventilation, within limits recommended by the manufacturer. Do not install products under environmental conditions outside the manufacturer’s absolute limits.

C. Do not install mortar, set, or grout tile exterior when inclement weather conditions are expected within 48 hours after work is scheduled to be completed unless proper protection is provided.

D. Maintain a temperature range of 50 degrees Fahrenheit to 90 degrees Fahrenheit during installation of tile and grout materials. Tile installation should cure for a minimum 14 days with average a temperature of 70 degrees, while maintaining the minimum 40 degrees and maximum 90 degrees Fahrenheit, prior to filling pool with water.

E. Vent temporary heaters to outside to avoid carbon dioxide damage to the new tile work.

1.9 COLORS

A. Colors must be selected by the Owner/Architect or Interior Designer. Note that swimming pool regulations may dictate color selections within the pool tank. See tile materials for price group breakdowns.

1.10 WARRANTIES

A. The Contractor warrants to the Owner that materials and equipment provided under the contract will be of good quality and new unless otherwise required or permitted by the contract documents, that the work will be free from defects not inherent in the quality required or permitted and that the work will conform with the requirements of the contract documents. Work not conforming to these requirements, including substitutions not properly approved and authorized, may be considered defective. The Contractor’s warranty excludes remedy for damage or defect caused by abuse, improper or insufficient maintenance, improper operation, modifications not executed by the Contractor or improper wear and tear under normal usage. If required by the Owner, provide satisfactory evidence as to the kind and quality of materials and equipment. Warranties must be for a period of five years, unless otherwise specified.

B. Setting materials must be provided by the same manufacturer. Mixing materials and application procedures must be done in accordance with manufacturer’s recommendations and requirements. Documentation must be provided to this effect by the Contractor with verification from the manufacturer. This documentation must be included in the operations and maintenance manual under warranties as documentation qualifying the project for a 15 Year Systems Warranty by LATICRETE International, Inc., MAPEI, Inc. or approved equal.

C. The Contractor must contact the tile setting material manufacturer’s technical representative to review installation details, job site conditions, selected materials, and their conformance to the manufacturer’s warranty requirements prior to the commencement of work. Failure to

follow these requirements will not relieve the Contractor of the requirement to provide specified warranties.

D. The Contractor must agree to repair or replace work at no cost to the Owner upon written notification from the Owner within the warranty period. Pro-rated warranties are not acceptable.

PART 2 PRODUCTS

2.1 TILE MATERIALS

A. Standard grade conforming to ANSI A137.1. Provide trim units as indicated and specified, including special shapes as detailed or required. Tile patterns and colors must be as indicated and specified, colors of approved shades. Mesh mounted or perforated paper backed tile is not allowed where the mesh of paper remains as a permanent part of the installation. If dot mounting is used, a minimum of 67% of the depth of the tile must be free from dots to ensure proper grout curing.

B. Porcelain Mosaic Tile
   1. Slip-resistant porcelain mosaic tile, cushion, or all-purpose edges, 2” square for floor, walls, and stair treads unless otherwise noted below. The minimum dynamic coefficient of friction must be 0.42 for wet surfaces and 0.65 for ramped surfaces. Where special shapes are required, they must be selected from price group 1-4. Equivalents provided by Knoxtile, Dal-Tile or American Olean. For wet surfaces: Dal-Tile Keystones matte 2”x2” (price group 1-3), Buchtal Chroma Mosaics with front mount film 2”x2” (seven color options) 7161HVF or American Olean Unglazed color-body 2”x2” (price group 1-3). For ramps: Buchtal Chroma non-slip mosaics with glass fiber net (four color options) 2”x2” 7161H, Dal-Tile Keystones matte 2”x2” (price group 1-3) with abrasive grain or American Olean Unglazed color-body mosaics 2”x2” with abrasive grain (7 color options). Colors, blends and patterns must be selected by the Owner/Architect.
   2. Tile band at the waterline, toe ledge and recessed steps with color, blends and patterns selected by Owner/Architect must be Dal-Tile Keystones Matte, 2”x2” (price group 1-4), American Olean Unglazed color-body 2”x2” (price group 1-4), or powder glazed 2”x2” Buchtal Chroma Mosaics provided by Knoxtile.
   3. Tile deck band that contains the depth marker letters and numerals, warning signs and the 15-meter resurfacing markers with color, blends and patterns selected by the Owner/Architect must be Dal-Tile Keystones Matte or Criss Cross, 2”x2” (price group 1-4) or American Olean Unglazed color-body 2”x2” (price group 1-4).
   4. Contrasting nosing at pool stairs, recessed steps, toe ledge, underwater bench, spa steps, and spa bench must be Universal Trim 2”x2” with color selected by the Owner/Architect from Dal-Tile Keystone Matte (price group 1-2), American Olean Unglazed color-body 2”x2” (price group 1-2).
   5. Recessed steps and toe ledge must be Universal Trim 2”x2” with color selected by the Owner/Architect from Dal-Tile Keystone Matte (price group 1-4), American Olean Unglazed color-body 2”x2” or 1”x1” (price group 1-4).
   6. Contrasting tile strip, wall targets and lane markings on the pool floor with color selected by Owner/Architect from Dal-Tile Keystone Matte 2”x2” (price group 3-4), American Olean Unglazed color-body 2”x2” (price group 3-4), or from Knoxtile 2”x2” Mosaic 7160HVF 5535 Grey Black. The main racecourse wall targets and lane markings must be black.
   7. Tile band adjacent to all submerged construction joint installation bands with color selected by Owner/Architect from Dal-Tile Keystone Matte, 2”x2” (price group 1-2),

American Olean Unglazed color-body 2”x2” (price group 1-2), or powder glazed 2”x2” Buchtal Chroma Mosaics provided by Knoxtile.

8. Tile at top horizontal plane of the spa and vertical face of the spa exterior and spa waterline tile with color, blends and patterns selected by Owner/Architect from American Olean Unglazed color-body 2”x2” (price group 1-4), DalTile Keystone Matte 2”x2” (price group 1-4) or from Knoxtile: Buchtal Chroma Mosaics 2”x2” 7161HVF (seven color options) or non-slip 7161H 2”x2”.

C. Handhold tiles at pool perimeter must be C701 available from Dal-Tile or American Olean. Color selection by Owner/Architect (price group 1-4). Trim pieces for C701 are as follows: SCR701 (Right Termination Piece), SCL701 (Left Termination Piece), CK701 (Inside Corner), and CC701 (Outside Corner).

D. Provide tile trim units where indicated or necessary for a complete and finished installation. Provide rounded units for external and internal corners and angles. Provide trim units of material and finish identical to the adjoining tile.

E. Provide SCR/L701 units where the C701 hand hold is interrupted to permit draining and at all edges/corners. Color selection by Owner/Architect (price group 1-4). The Contractor should request via non-standard production. The SCR/L701 units are available through DalTile at 314-997-6970 or 1-800-672-2086.

F. Message Tile and Depth Markings

1. Horizontal and vertical depth markings and warning signs must be 6”x6” with 4” high numbers and letters. Horizontal depth markers must be slip resistant. Single tile abbreviations must be used for ‘FT’ and ‘IN.’

2.2 Swimming Pool / SPA Tile Setting Materials and Installation

A. Surface Preparation

1. Surface preparation must be in accordance with ACI 302. The surface must be structurally sound and free of foreign substances and debris that could reduce or impair adhesion, free of dirt, oil, grease, curing compounds, or other foreign materials. Sound and remove loose concrete to firm substrate. Surfaces must be roughened to a CSP of 3 to 5 (reference ICRI CSP Standards for acceptable profile height). Thoroughly wash/rinse with clean potable water. Surface defects or holes in the substrate must be patched per manufacturer’s recommendations.

B. Slurry Bond Coat

1. Horizontal surfaces to receive a thick bed mortar application must be installed over a slurry bond coat of either LATICRETE 254 Platinum one-step, polymer-fortified, thin-set mortar or MAPEI Planislope RS polymer-modified pre-blended, rapid-setting mortar mixed with water only in compliance with ANSI A108.1A (2.2 & 5.2). As manufactured by LATICRETE International, MAPEI, Inc., or approved equal. Note that slurry bond coats are not required under vertical applications of the render and scratch coat.

C. Mortar & Leveling Beds

1. Bonded Thick Bed Method (Floor / Horizontal Surfaces): Provide a dry pack, thick mortar bed on horizontal surfaces consisting of LATICRETE 3701 Fortified Mortar Bed or MAPEI Planislope RS polymer-modified pre-blended, rapid-setting mortar mixed with water only. Apply over a properly prepared slurry bond coat.

2. Render- Scratch and Float Coats (Wall / Vertical Surfaces): Provide wall render (scratch and float coats) on vertical competition turning surfaces to a depth of 4'-0" below the water surface, consisting of either LATICRETE 3701 Fortified Mortar Bed or LATICRETE 3701 Lite Mortar or MAPEI Planislope RS polymer-modified pre-blended, rapid-setting mortar mixed with water only for lift thicknesses up to ½". Wall render is made to a plastic consistency when used vertically. Fill holes and bring surface up to line and plane as required. As manufactured by LATICRETE International, MAPEI, Inc. or approved equal. Note that slurry bond coats are not required under vertical applications of the render and scratch coat. (Refer to Course Length Tolerances for competitive pools.)

D. Tile Thin-Set
1. Use either LATICRETE 254 Platinum one-step, polymer fortified, thin-set mortar or MAPEI Keraflex Super one-step, polymer modified, thin-set mortar, used in accordance with the manufacturer's requirements. As manufactured by LATICRETE International, MAPEI, Inc., or approved equal.

E. Tile Grout
1. Use either LATICRETE SPECTRALOCK PRO Premium Grout or MAPEI Kerapoxy CQ Grout in accordance with the manufacturer's requirements as manufactured by LATICRETE International, MAPEI, Inc. or approved equal. Color selection by Owner/Architect.

F. Elastomeric Sealant
1. Use LATICRETE LATASIL over LATASIL 9118 primer or MAPEI Mapesil "T" 100% silicone sealant for inside/outside corners, expansion/movement joints, and to seal lighting/plumbing fixture penetrations. The primer and sealant installation must be in accordance with the manufacturer's requirements. As manufactured by LATICRETE International, Inc., MAPEI, Inc. or approved equal. Color selection by Owner/Architect.

G. Mixing and application procedures must be in accordance with the manufacturer's recommendations and requirements. The manufacturer's representative must visit the site to verify field conditions, confirm materials and application requirements and ascertain that materials and systems are so installed. Documentation must be provided to this effect.

PART 3 EXECUTION

3.1 PREPARATION

A. Complete water tightness test prior to tile installation. The concrete tank must be watertight per ASTM D5957, the Tile Council of North America, and specification 13 11 00.

B. Clean substrates of dust, dirt, oil, grease, curing compounds and other foreign substances and mechanically roughen concrete and shotcrete for bond. Conform to applicable reference standards and to recommendations of manufacturers of materials used and meeting ICRI, CSP of 3-5.

C. Substrates to Receive Mortar Setting Beds
1. Dampen concrete substrate to receive tile work according to above referenced standards or tile manufacturer's instructions, as required.

D. Substrates to receive thin set tile applications must meet normal construction tolerances of 1/4" in 10' where competition tolerances do not apply and must meet competition tolerances

where required elsewhere in these specifications, and must be free of bumps, dips and surface irregularities that may affect the satisfactory installation of the tile.

E. Tile Wetting
   1. Dampen tile according to above reference standards or tile manufacturer's instructions, as required.

F. Screeds
   1. Accurately set temporary screeds to control the finish plane of mortar-bed set tile and remove as soon as setting bed is sufficiently hardened. Fill void spaces from screeds with same mortar.

3.2 TILE INSTALLATION

A. Arrange tile according to patterns detailed. Set tile with flush well-fitted joints, finished in true planes, plumb, square, joints of uniform size. Provide approved trimmers as shown or required. Cut tile without marring. Carefully grind and joint tile edges and cuts.

B. Follow Tile Council of North America installation methods P601 and B417 to achieve total tile system thickness for thin or thick set.
   1. Thick Set
      a. Apply specified setting bed mortar, up to 2” in thickness, on cured and dried concrete pool shell. Tamp and screed to required planes. Spread no more mortar than can be covered with tile before initial set. Do not use re-tempered mortar. Trowel 3/32” to 1/8” thick bond coat over plastic setting bed mortar just before setting tile or apply bond coat to back of each tile placed. Set tile in position and beat firmly into the setting bed mortar. Bring tile faces to a true and correct plane. Complete beating and leveling before mortar sets and in no case later than one hour after first placing. When ready, wet and remove paper and glue avoiding excess water. At this time adjust out-of-line or out-of-level tile.
   2. Thin Set
      a. Apply specified bond coat on cured and dried concrete pool shell. Trowel 3/32” to 1/8” thick bond coat over concrete pool shell just before setting tile or apply bond coat to back of each tile placed. Set tile in position and beat firmly into the setting bed mortar. Bring tile faces to a true and correct plane. Complete beating and leveling before mortar sets and in no case later than one hour after first placing. When ready, wet and remove paper and glue avoiding excess water. At this time adjust out-of-line or out-of-level tile.

C. Finished tile surface must be level and in plane, with no sharp or protruding edges. Tiles out or plane more than 1/16" must be removed and replaced. Sharp edges must be stoned smooth.

D. Grout Joint Sizes
   1. Unless otherwise approved, install tile with uniform 3/32” joint width. A maximum 1/8" joint width may be utilized to meet specific installation requirements, if required.

E. Ceramic Tile Joint Grouting
   1. Mix grout to a thick creamy consistency and force into joints for entire thick depth, flush with surface. Clean off excess and fill skips and gaps before grout sets. Color selection by Owner/Architect or Interior Designer. Provide dampness for minimum 3-day curing and polish with clean dry cloths (not required when epoxy grouts are used).

F. Expansion Joints

1. Place expansion joint per applicable TCNA Method P601MB, P601TB, or P602 and conforming to Method EJ171. Provide shop drawings showing backer rod and joint dimensions. Expansion, control, construction, cold, and seismic joints in the pool structure should continue through the tile work, including such joints at vertical surfaces. Movement joints must be placed at changes in direction and elevation. Refer to the structural engineer for additional required movement joints. Joint size must be a minimum of 1/8". Joints through tile work directly over structural joints must not be narrower than the structural joint. The Contractor must use cement compatible coatings when using chalk lines for joint layout purposes.

G. Fill and Empty Rates
1. Use a fill and drain rate of 2'-0" per 24 hours to minimize thermal shock and structural movement. Maintain a temperature differential of 10 degrees Fahrenheit or less between the pool water and the substrate during fill and drain cycles.

3.3 TESTING AND INSPECTION

A. Before filling of the pool, and its subsequent provisional acceptance at substantial completion, the tile installation must be visually inspected and sounded in the presence of the Architects and/or the Owner's representative to verify mortar coverage below the tile to its substrate as well as its overall compliance with the requirements of this Section.

B. Tile work found loose, lacking proper mortar coverage, out of plane, misaligned or otherwise non-conforming must be removed and replaced at no additional cost to the Owner.

3.4 CLEANING

A. Upon completion of placement and grouting, clean tile installation as recommended by TCNA and manufacturers of proprietary materials. Tile must be cleaned with pH neutral solutions, free of both sodium and potassium, in accordance with the tile and grout manufacturer's printed instruction.

B. Leave finished installation clean and free of cracked, chipped, broken, un-bonded or otherwise defective tile work.

C. Protect installed tile work with non-staining Kraft paper, polyethylene sheeting, or other approved heavy covering during the construction period to prevent damage.

3.5 REPLACEMENT TILE

A. Provide the Owner with approximately 10% or 25 square feet (whichever is least) of each color and type tile used on the project for Owner's repair and replacement requirements.

END OF SECTION 13 11 03

SECTION 13 11 04 - SWIMMING POOL CEMENTITIOUS FINISH

PART 1 GENERAL

1.1 SUMMARY

A. Provide a proprietary aggregate plaster finish, Diamond Brite, Pebble Sheen to the pool structure(s). Provide installation of bond coat prior to application of pool finishes in strict accordance with manufacturer's instructions. Provide ceramic tile trim on the pool perimeter tile band, vertical tile band, floor, walls, stairs, nosings, recessed wall steps, toe ledge, depth markings, wall targets, floor lane markings and other tile installations as shown and detailed on the contract drawings and in strict accordance with these specifications.

B. The spa has a tile finish. Refer to the Swimming Pool Tile, 13 11 03 specification.

C. Provide water analysis and pre-fill requirements.

1.2 SUBMITTALS

A. Color Samples
   1. Provide physical color samples for review and approval by the Owner/Architect.

B. Mockup
   1. Prepare 12-inch square panel at the site showing color and texture for pool plaster for approval by the Owner/Architect. Finished cementitious finish work must match the approved sample panel.

C. Test Report
   1. Submit results of domestic water analysis and calculation of amounts of chemicals required to balance pool water on initial fill of pool.

1.3 PRODUCT DELIVERY AND STORAGE

A. Deliver manufactured materials to site in manufacturers' original unbroken packages or containers bearing manufacturers' name and brand labels. Keep cementitious materials dry until ready to be used and stored off the ground, under cover and away from damp surfaces.

1.4 JOB CONDITIONS

A. Apply plaster in swimming pool only when ambient temperature is above 40 degrees F and below 90 degrees F and protect applied plaster from rapid drying by sun or wind until curing is completed or pool is filled with water. Confirm and comply with applicable manufacturer's installation requirements.

1.5 QUALITY ASSURANCE

A. The Contractor must have two years' experience in similar pool projects, for which the Owner may require written proof thereof and proper tools to install plaster.

PART 2 PRODUCTS

2.1 DIAMOND BRITE

A. The Contractor must provide a slip-resistant proprietary plaster finish in the areas indicated on the drawings. Description: Diamond Brite finish must be a blend of selected quartz aggregates and fortified white Portland cement. Color and texture selected by the Owner/Architect. Confirm installation requirements with the manufacturer.

B. Surface Preparation
   1. Surface must be structurally sound and free of foreign substances and debris that could reduce or impair adhesion, free of dirt, oil, grease, curing compounds or other foreign materials. Sound and remove loose concrete to firm substrate. Surfaces must be roughened by sand blasting or water blasting. Shot blasting, scarifying, or grinding can also be accepted methods of surface preparation. Pressure-wash the entire surface. Wash with trisodium phosphate (TSP) using a stiff broom. Thoroughly wash/rinse with clean potable water. Surface defects or holes in the substrate must be patched per manufacturer's recommendations. Lightly moisten walls and floors prior to application of Diamond Brite.

C. Bond Coat
   1. Bond Kote by SGM, Inc., or approved equal, in strict accordance with manufacturer's instructions. Apply and cure bond coat per manufacturer's recommendations. After proper curing of bond coat, lightly moisten with clean potable water prior to application of cementitious finish. Ensure bond coat is free of foreign matter prior to plastering.
   2. A bond coat must be installed over all interior pool surfaces prior to plaster application unless the surface profile is adequate to omit the bond coat in accordance with the manufacturer's recommendations. A manufacturer's representative must visit the site and provide written confirmation that the bond coat can be omitted, and all warranties will be maintained.

D. Mixing
   1. Thoroughly mix Diamond Brite to a homogeneous lump-free consistency using 1-1/2 to 2 gallons of potable water per 80 lb. bag.

E. Application
   1. Diamond Brite must be applied to a uniform thickness of 3/8" to 1/2" over the entire surface. The walls must be scratch coated followed by a finish coat. Material applied to the floor after the walls have been applied must be accelerated to assure uniform setting time throughout the pool surface.

F. Coverage
   1. Each 80 lb. bag to cover approximately 25 square feet to a thickness of 3/8".

G. The proprietary plaster finish must be applied by a licensed applicator as approved by the manufacturer.

2.2 PEBBLE SHEEN

A. The Contractor must provide a slip-resistant pebble stone surface in the areas as indicated on the drawings. Description: Pebble Sheen finish must be a blend of selected colored aggregates and fortified white Portland cement. Color and texture selected by the Owner/Architect. Finish to consist of Pebble Sheen as supplied by Pebble Technology, Inc. (480) 948-5058, or approved equal. Confirm installation requirements with the manufacturer.

B. Surface Preparation
   1. Surface must be structurally sound and free of foreign substances and debris that could reduce or impair adhesion, free of dirt, oil, grease, curing compounds or other

foreign materials. Sound and remove loose concrete to firm substrate. Surfaces must be roughened by sand blasting or water blasting. Shot blasting, scarifying, or grinding can also be accepted methods of surface preparation. Pressure-wash the entire surface. Wash with trisodium phosphate (TSP) using a stiff broom. Thoroughly wash/rinse with clean potable water. Surface defects or holes in the substrate must be patched per manufacturer's recommendations. Lightly moisten walls and floors prior to application of Pebble Sheen.

C. Bond Coat
   1. Scratch Kote System by Multicoat Corporation, Bond Kote by SGM, Inc., or approved equal, in strict accordance with manufacturer's instructions. Apply and cure bond coat per manufacturer's recommendations. After proper curing of bond coat, lightly moisten with clean potable water prior to application of cementitious finish. Ensure bond coat is free of foreign matter prior to plastering.
   2. A bond coat must be installed over all interior pool surfaces prior to plaster application unless the surface profile is adequate to omit the bond coat in accordance with the manufacturer's recommendations. A manufacturer's representative must visit the site and provide written confirmation that the bond coat can be omitted, and all warranties will be maintained.

D. The cement-pebble stone mixture must be pneumatically applied to the pool surface.

E. After application of Pebble Sheen material the surface must be hand troweled for exposure of pebble material.

F. Spray down the troweled surface with water to remove excess cement and exposure of pebbles.

G. Surface is allowed a minimum of a 24-hour hardening period. Upon hardening the surface is cleansed with an approved solution as provided by the manufacturer for final exposure and luster of pebble surface.

H. Surface must be buffed so as to ensure sharp edges are removed and final surface texture is per the manufacturer's recommendations.

I. Natural pebble stone surface must be applied by a licensed applicator as approved by the manufacturer.

PART 3 EXECUTION

3.1 PREPARATION OF SURFACES AND BOND COAT

A. Surface must be structurally sound and free of foreign substances and debris that could reduce or impair adhesion, free of dirt, oil, grease, curing compounds or other foreign materials. Sound and remove loose concrete to firm substrate. Surfaces must be roughened by sand blasting or water blasting. Shot blasting, scarifying, or grinding can also be accepted methods of surface preparation. Pressure-wash the entire surface. Wash with trisodium phosphate (TSP) using a stiff broom. Thoroughly wash/rinse with clean potable water. Surface defects or holes in the substrate must be patched per manufacturer's recommendations.
   1. National Plasterers Council Surface Preparation Definitions
      a. Pressure Washing: The washing or cleaning of a surface by a stream of water ejected from a nozzle at high velocity, typically in the range of 1,000 psi – 4,000 psi.

b. Water Blasting: The cutting, abrading, or removal of a surface or substrate by a stream of water ejected from a nozzle at ultra-high velocity, typically in the range of 10,000 psi – 40,000 psi.

2. Apply and cure bond coat in strict accordance with manufacturer's instructions. After proper curing of bond coat, lightly moisten with clean potable water prior to application of cementitious finish. Ensure bond coat is free of foreign matter prior to plastering.

B. Do not apply finish materials to base surfaces containing frost. Provide temporary coverings as required to protect adjoining surfaces from staining or damage by plastering operations.

C. Protect or mask adjacent surfaces that are not scheduled to receive cementitious finish. If expansion or construction joints exist in the areas where cementitious finish will be applied cover plastic joints for protection (if plastic joints are used). Additionally, mark joints for saw-cutting if area will be saw-cut.

D. Verify that concrete surfaces that are to receive a cementitious finish have cured for a minimum of 5 days. Consideration should be given for the application of a primer for concrete structures that is over 28 days old to improve bonding.

3.2 APPLICATION OF CEMENTITIOUS FINISH

A. General

1. Confirm application requirements with the manufacturer. Apply finish plaster to the properly prepared substrate at the minimum thickness required by the manufacturer, but no less than 3/8-inch thickness. Apply finish plaster by hand or machine. If plastering machine is used, control fluidity of plaster to have a slump not exceeding 2-1/2 inches when tested using a 2" by 4" by 6" high slump cone. Do not add additional water to the mix subsequent to determining water content to meet this slump. Perform slump test according to following procedure:
   a. Place cone on level, dry non-absorptive base plate.
   b. While holding cone firmly against base plate, fill cone with plaster taken directly from hose or nozzle of plastering machine, tamping with a metal rod during filling to release air bubbles.
   c. Screed off plaster level with top of cone. Remove cone by lifting it straight up with a slow and smooth motion.
   d. Place cone in a vertical position adjacent to freed plaster sample suing care not to jiggle base plate.
   e. Lay straightedge across top of cone being careful not to vibrate cone, measure slump in inches from bottom edge of straightedge to the top of slumped plaster sample.
2. Mixing of materials and application procedures must be done in accordance with the manufacturer's recommendations and requirements. The manufacturer's representative must visit the site to verify field conditions, confirm materials and application requirements and ascertain that materials and systems are so installed. Documentation must be provided to this effect.

B. Workmanship

1. Unless otherwise required by the manufacturer, apply finish plaster in two coats by "double-back" method with second coat applied as soon as first coat is tamped and initially floated. Apply plaster with sufficient pressure to provide a good bond on bases. Work plaster to screeds at intervals of from 5 feet to 8 feet on straight surfaces. Apply smooth trowel finish without waves, cracks, trowel marks, ridges, pits, crazing, discoloration, projections, or other imperfections. Form plaster carefully

around curves and angles, well up to screeds. Take special care to prevent sagging and consequent drooping of applications. Produce surfaces free of visible junction marks in finish coat where one day's work adjoins another. Finish proprietary plaster as required by the manufacturer.

2. Cementitious finishes must be applied by a licensed applicator as approved by the manufacturer.

C. Curing

1. Curing cementitious finishes with fine fog water spray applied to finish coat as frequently as required to prevent dry-out of surface, or as directed by the manufacturer of the cementitious finish. Keep plaster damp until the pool is filled. Prevent damage or staining of plaster by troweling or curing.

D. Patching, Pointing, and Cleaning Up

1. Upon completion, cut out and patch loose, cracked, damaged, or defective plaster; patches matching existing plaster in texture, color, and finish, flush with adjoining plaster. Perform pointing and patching of surfaces and plasterwork abutting or adjoining other finish work in a neat and workmanlike manner. If 10 percent or more of the pools plaster finish is found to be defective, the plaster must be removed and replaced complete from surfaces. Remove plaster droppings or spattering from surfaces. Leave plaster surfaces in clean, unblemished condition ready for pool filling. Remove protective coverings from adjoining surfaces. Remove rubbish and debris from the site.

3.3 PRE-FILL SPECIFICATION

A. Contractor must employ a qualified water testing agency to analyze the domestic water with which the pool will be filled within 2 weeks of the plaster date and must employ a swimming pool experienced water chemistry consultant to determine types and quantities of chemicals required to ensure calcium-balanced water immediately upon the completion of water filling. Refer to Section 13 11 00 for water filling requirements.

1. Have on hand quantities of the chemicals as determine above, plus 25% overage for follow-up treatment. These chemicals, typically including calcium chloride, bicarbonate of soda, and muriatic acid are in addition to standard bromine/chlorine products and alkalizer/pH control products required elsewhere.

B. The pool(s) must not be plastered until directed by the Owner’s representative and the filtration system and chlorination system are complete and ready for start-up. The Contractor must supply chemicals required for treatment of the pool water.

C. The Contractor must submit domestic water analysis to the Owner and/or Architect at least 2 weeks prior to filling the pool(s).

END OF SECTION 13 11 04

SECTION 13 11 06 - SWIMMING POOL TIMING SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. Provide a proprietary aggregate plaster finish, Diamond Brite, Pebble Sheen to the pool structure(s). Provide installation of bond coat prior to application of pool finishes in strict accordance with manufacturer's instructions. Provide ceramic tile trim on the pool perimeter tile band, vertical tile band, floor, walls, stairs, nosings, recessed wall steps, toe ledge, depth markings, wall targets, floor lane markings and other tile installations as shown and detailed on the contract drawings and in strict accordance with these specifications.

PART 2 GENERAL

2.1 RELATED DOCUMENTS

A. The BIDDING REQUIREMENTS, CONTRACT FORMS, AND CONDITIONS OF THE CONTRACT and applicable parts of DIVISION 1 - GENERAL REQUIREMENTS, as listed in the Table of Contents, must be included in, and made a part of, this Section.

2.2 SUMMARY OF WORK

A. Introduction
   1. Provide labor, materials, equipment, and services necessary to provide an electronic timing and scoreboard system with multi-sport capability for race swimming and pace clock.

B. Work included in this section.
   1. It is the intent of this section to place the entire responsibility for the electronic timing and scoreboard system (including appropriate connections) with multi-sport capability under one vested supplier. The supplier is responsible for providing full integration of this system. Multiple suppliers for a system will not be approved.

C. Related work specified in Electrical sections. Reference Division 26 – Electrical.
   1. Ground and bond pool structures, fittings, and equipment in accordance with Article 680 of the N.E.C. Test and verify that the system electrical ground is true and solid. Provide certification for this effort.
   2. Obtain permits, inspections, and approvals of wiring including grounding and bonding of metal components associated with the pool in accordance with Local, State and National Electrical Codes.
   3. Provide power, conduits, electrical boxes, ethernet connections and wiring for the Contractor provided electronic timing and scoreboard system with multi-sport capability for race swimming and pace clock.
   4. Supply junction boxes for equipment outlined in these specifications and depicted on the timing system drawings.

D. Basis of Design:
   1. The complete electronic timing and scoreboard system with multi-sport capability is based upon Colorado Timing Systems, Inc.

2.3 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

A. Colorado Time Systems, Inc. (Basis of Design: Timing System & Scoreboard)

2.4 SUBMITTALS

A. Submittals must include the following:
   1. Product data
   2. Shop drawings detailing system layout.
   3. Operations and maintenance manuals for the systems. Manuals must include a complete parts list.
   4. Warranty for each piece of equipment within this section.

2.5 JOB CONDITIONS

A. Manufacturers proposing to submit a quotation for the electronic timing and scoreboard system must confirm that embedded items are compatible with the installation of their respective systems.

B. Manufacturers must review the construction documents and must notify the architect 10 days prior to the bid date of conflicts or additions to the work of other trades for the proper installation of their system.

2.6 WARRANTIES

A. The Contractor must warranty the completed installation of systems in this section for one year.

B. The manufacturer must provide a warranty for the computer consoles, pace clocks and starting system for two (2) years.

C. The manufacturer must provide a warranty for the touchpads for three (3) years.

D. The manufacturer must provide a warranty for the titanium timing system wall plate and deck plates for five (5) years.

E. The manufacturer must provide a warranty for the scoreboard for five (5) years.

PART 3 PRODUCTS

3.1 SCOREBOARD SYSTEM

A. Multi-Sport LED Numeric Scoreboard System
   1. The multi-sport LED Scoreboard system must display necessary information to time swimming in compliance with the appropriate sanctioning body - USA SWIMMING and NFHS.
      a. Basis of Design: Multi-Sport LED Scoreboard System is based upon Colorado Timing Systems, Inc. or approved equal.
   2. Each line of scoreboard must use seven segments 10” high LED digits choosing red or amber color.
   3. Each line of scoreboard must have an internal data selector switch to permit owner/operator selection of data codes that must be installed at each line of scoreboard. Data select codes may be manually changed at the scoreboard or logically changed from the timer console. Scoreboards with fixed function displays are unacceptable.

4. Each line of scoreboard can have up to eight operable digits, eight operable decimals, and one operable colon to provide maximum display flexibility and reduced cost. Scoreboards with fixed decimals and colons are unacceptable.
5. Each line of scoreboard must have an individual internal power supply and individual control circuit to limit loss of data to one line if a malfunction should occur or to permit its use as an independent line of scoreboard.
6. Each line of scoreboard must have true multi-sport capability through the use of sliding digits to permit reformatting to desired configurations. Digits must move freely without the use of hand tools.
7. Each line of scoreboard must be constructed identically (modular) to permit on-site substitution or replacement of failed unit.
8. The scoreboard must be capable of being used in a time-of-day mode when not being used in display modes.
9. Power must be 115VAC, 2 amp, 250 watts per module maximum.
10. Scoreboard must be constructed for indoor installation. Facility name panel must be provided with artwork provided by the Owner/Architect. Contractor to coordinate artwork for facility name panels with Owner/Architect and submit mockups as required.
11. The scoreboard must display the following minimum requirements:

1-6 Lines	Lane Place and Time 8-Digit Display
1 Line	Sponsor/Facility Name
1 Line	Event and Heat
2 Lines	Lane Place and Time Sign

B. Scoreboard Hanging Requirements
   1. The scoreboard manufacturer must provide drawings with hanging information.
      a. Material: Scoreboard hangers must be galvanized steel for an indoor natatorium.
      b. Coordinate scoreboard hanging requirements with structural engineer prior to the submittal process.
   2. Anchors
      a. Hollow Block Construction
         1) Sleeve type anchors feature a split expansion sleeve over a threaded stud bolt body and integral expander, nut, and washer. Anchors must be made of zinc plated Carbon Steel, or Type 18-8 Stainless Steel. Anchors should be installed with carbide tipped hammer drill bits made in accordance with ANSI B212.15-1994. Anchors must be tested to ASTM E488 criteria and must meet or exceed U.S. Government G.S.A. specification A-A-55614 Type 2 (Formerly GSA: FF-S-325 Group VIII, Type 2), California State Fire Marshal, Factory Mutual and Underwriters Laboratories.
      b. Filled Block or Solid Concrete Construction:
         1) The anchor must be a torque-controlled expansion anchor, which provides consistent performance for a wide range of mechanical anchor applications. This anchor series is available in carbon steel with zinc electroplated coating, carbon steel with hot-dip galvanized coating, 304 stainless steel and 316 stainless steel versions. The threaded stud version of the anchor is available in a variety of diameters ranging from 1/4- to 1-in. depending on the steel and coating type. Applicable base materials include normal-weight concrete, structural lightweight concrete, lightweight concrete over metal deck, and grout-filled concrete masonry.

Basis of design is AISI Type 316 stainless steel KWIK Bolt 3 (KB3) manufactured by Hilti, Inc.

2) Three anchors must have an anchor body, nut and washer that conform to AISI Type 316. The expansion wedges conform to AISI Type 316 stainless steel.

3) Anchor bodies smaller than 3/4-inch, excluding KWIK Bolt 3 Countersunk, are produced from AISI Type 304 or Type 316 stainless steel having the bolt fracture loads shown in table 1. Anchor bodies 3/4-inch and larger, and stainless-steel KWIK Bolt 3 Countersunk anchor bodies are produced from AISI Type 304 or Type 316 stainless steel having the mechanical properties shown in table 1. Nuts meet the dimensional requirements of ASTM F594. Washers meet the dimensional requirements of ANSI B18.22.1, Type A, plain. Stainless steel expansion wedges for AISI Type 304 are made from either AISI Type 304 or Type 316. Stainless steel expansion wedges for AISI Type 316 anchors are made from type 316. Stainless-steel nuts and washers for AISI Type 304 or Type 316 anchors are manufactured from AISI Type 304 or 316, respectively.

3. Supports
   a. Unistrut (LED Numeric Board)
      1) Material
         a) Unistrut channels are accurately and carefully cold formed to size from low-carbon strip steel. Spot-welded combination members, except P1001T, are welded 3" (76 mm) maximum on center.
      2) Finishes
         a) Channels are available in Perma Green III (GR), Pre-galvanized (PG) conforming to ASTM A653 G90, Hot-dipped galvanized (HG) conforming to ASTM A123.
4. Brackets
   a. Per ANSI B1.1- Surface roughness per ANSI B46.1- Surface roughness on holes 250 MAX unless otherwise specified. Variations in form from unmachined features are permitted within established –l filets 0.005-0.020 (APPROX. RADIUS) – Screw threads per ANSI B1.1- Pipe threads commercial standards. Edges and corners 0.005-0.020 (approx. radius or chamfer).
   b. Materials and components used in the assembly of this item must be RoHS complaint material: 12GA (.105) HRS. The finish must be ZINC CLEAR CHROMATE PLATED. Manufacturer must break sharp edges and corners.
   c. Support hardware, brackets, fasteners, hangers, etc. used during installation of the scoreboard must be Zinc Clear Chromated Plated.

3.2 MULTI-SPORT COMPUTER/TIMING SYSTEM

A. Gen 7 Serial Timing System
   1. The Swim Timing System must be supplied with the necessary software to time swimming in compliance with the appropriate sanctioning body - USA SWIMMING and NFHS.
      a. Basis of Design: The Swim Timing System is based upon the GEN7 TIMING as manufactured by Colorado Timing Systems, Inc.
   2. The Swim Timing System must be a standalone unit with physical connections to timing inputs. Timer must be controlled by user interface device (e.g., computer, tablet, etc.) via network. One (1) laptop must be provided.

a. A timer PC or tablet interface device must be supplied with necessary software to time and score swimming in compliance with the appropriate governing organization(s) - USA SWIMMING and NFHS.
b. Configuration of racecourses must be through graphical user interface. It is unacceptable that race configurations need specific cable connections to system connections such as wall plates defining a specific end of a course.
c. The user interface must display complete race status. The interface must be capable of functioning as miniature scoreboard displaying information simultaneously for active lanes including lane number, current length in race or final place, split or finish time, relay judging status indicator, and backup time and backup button status.
d. Timer must automatically flag timing discrepancies (in the user interface, on the results printouts and in stored memory) greater than a user defined interval between touch pad and backup times.

3. Multi-Sport Computer/Timing System input/output ports must include:
   a. Must accept inputs for up to 4 courses of up to 20 lanes each for a serial in-deck wiring installation and must be able to time them simultaneously.
   b. Must accept on-deck cable harness inputs for up to 20 lanes near end and/or far end.
   c. Must communicate with meet management peripheral software on a two-way “handshake” basis, enabling the meet manager’s resident computer to query the timer’s memory via the USB port or via the network at any time for any race results.
   d. Must provide backup time via push button provided on a per lane basis should swimmer fail to trigger touch pad or touch pad fail to register. The timer must be capable of accepting up to three backup button times per lane.
   e. Must automatically compare the touch pad hit of an incoming swimmer with the starting swimmer’s time of departure from the optional relay-judging platform. Results display both “plus” and “minus” takeoff times and can be printed and stored in race memory.
4. Accuracy of the Multi-Sport Computer/Timing System:
   a. Must time to a user-selectable resolution from 1 second to .001 second. It must take starts and finishes from the near end and/or far end of the pool. It must accept inputs from the start system; touch pads, up to three manual button backup times per lane, and relay judging platforms.
   b. Must be able to evaluate and report multiple states of timing component input condition, ranging from excellent to failure. It is unacceptable that only two states such as on or off are reported.
   c. Must have touch pad delay feature with ability to program delays from 1 to 99 seconds.
   d. Must permit the operator to correct for an erroneous touch by adding/subtracting a touch pad hit to correct the lengths completed. The interface must not permit the operator to finish a race in any lane; timers including such a function are unacceptable because they permit the possibility of cheating.
   e. Later recall of stored race data must allow for a re-run of a given race including changes in user decisions.
5. Multi-Sport Computer/Timing System Detection:
   a. Must be capable of detecting timing components such as pushbuttons, touchpads, RJPs, speakers, Speedlight and start systems connected to an in-

deck system and capable of detecting touchpads and RJPs connected to an on-deck system.

b. Must be capable of reporting corrosion in the in-deck wiring installation.

6. Multi-Sport Computer/Timing System must run off a 12-volt power supply connected to a standard 110/240 VAC outlet and will automatically switch to (and display on screen of connected interface device) internal battery power source, in case of line power failure without affecting the continuity and accuracy of the timing system.
7. Multi-Sport Computer/Timing System must interface to single-line and multi-line scoreboard and must post immediate results to scoreboard in “Lane” or “Place” order (user selectable). The timer must also have the capability to pull race results from memory and post those results to the scoreboard in “Lane” or “Place” order (user selectable).
8. Multi-Sport Computer/Timing System must include an internal clock calendar with self-sustaining battery to time/date stamp results.
9. Multi-Sport Computer/Timing System must meet acceptable safety standards. Must be UL approved, or equivalent.
10. Multi-Sport Computer/Timing System Storage and Internal Memory:
    a. System must store each and every timing input state change. It is not acceptable that state changes get discarded and are not available for later re-evaluation of a race.
    b. Race data, including near and far end splits, must be stored to internal memory for later recall to facilitate meet management connectivity and printing. Printed reports must include cumulative and subtractive splits as well as relay judging times (when required).
    c. Meet memory must be capable of being transferred to external storage (via USB) or cloud data backup services (e.g., Dropbox, Google Drive).
11. Multi-Sport Computer/Timing System must have an Automatic Event Sequencer that is capable of holding both standard and user defined event sequences. The event order will be able to be downloaded from meet management software. The desired order is user selectable. EVENT SEQUENCES with appropriate race distance and race description for high school, college meets, and two “User Defined” meets to permit construction of custom meets, USA SWIMMING and NFHS. When recalled from memory, race distance and descriptions are automatically selected for the operator.
12. Multi-Sport Computer/Timing System must have user interface software that permits operation of essential functions including Lane Off/On, Finish Arm, Split Arm, & Print Results directly from the main screen to ensure speed and simplicity of operation during critical race times. The interface must permit the operator to edit a time when required or to disqualify a lane (DQ), automatically posting it to the scoreboard, and provide automatic re-ranking of results. Corrections generated by the operator (edit or disqualification) must be clearly identified on the results printouts.
13. Multi-Sport Computer/Timing System must include electronic beeper and LED signaling to indicate touchpad, backup button and RJP inputs. Timers which do not allow the user to configure (enable/disable) this feature are unacceptable.
14. Multi-Sport Computer/Timing System connectivity must include:
    a. USB (Type A) port for external storage
    b. USB (Type B) port for meet management connectivity.
    c. USB (Type B) port for user interface computer connectivity
    d. Ethernet port for network connectivity
    e. 3 independent scoreboard output ports
    f. Wireless 2.4GHz scoreboard connectivity

g. Connection for in-deck wiring and two connections for on-deck (near and far end) wiring.
h. Start system connection directly to timer.
i. External DC power port

15. Multi-Sport Computer/Timing System must be capable of updating internal software/firmware via Internet connection.
16. Multi-Sport Computer/Timing System software must have the ability to adjust the intensity of LED scoreboard brightness.
17. Cabling, conduit, and wiring must be provided by the manufacturer of the Multi-Sport Computer/Timing System to connect the Multi-Sport Computer/Timing System to the scoreboard should the scoreboard be provided by an alternative manufacturer to the Multi-Sport Computer/Timing System.

3.3 SWIMMING TIMING SYSTEM CONNECTORS

A. General Description
1. The Multi-Sport Computer/Timing System must employ the topology of a single communication bus to which timing and connectivity nodes are connected and communicate with each other.
2. Connection points must be production items and not a one off or prototypes.
3. Exposed connectors must feature titanium contacts. They must be wet pluggable and electrically passive if not connected. No maintenance to prevent corrosion of deck plate connector contacts is needed.
4. Self-test capabilities to detect compromised timing bus wire terminations and scoreboard bus wire terminations.

B. Wall Plates
1. Wall plates must be provided as required in the quantities as shown on the drawings. Wall plates must be the termination point for connections between deck cables, timers, start system, and other wall plates.
a. Basis of Design: Wall plates are based upon TITANIUM SERIAL WALL PLATE as manufactured by Colorado Timing Systems, Inc.
2. Wall plates must allow for the following connections depending on location and usage:
a. Connection to the timer.
1) Connectivity to timing courses and one scoreboard bus with one cable connection.
2) Detection of presence or absence of connected timer.
3) Diagnostic capabilities to detect anomalies with connectors (corrosion, shorts).
b. Connection to a start system and must provide the following:
1) Inputs for start system and speaker.
2) Diagnostic capabilities to detect anomalies with connectors (corrosion, shorts) and anomalies with the speaker input or start system.
3) Detection of presence or absence of speaker input or start system.
c. Connection to a scoreboard and must provide the following:
1) Detection of presence or absence of connected scoreboard.
2) Self-test capabilities to detect compromised timing bus wire terminations.
3. Junction Boxes (Provided by Electrical):
a. Wall plate components must fit into a 12” x 12” x 6” PVC junction box.
b. Acceptable Manufacturer: Cantex (P/N 5133713) or similar box that will fit wall plate assembly of the following dimensions: 12” x 12” x 6” +-0.05”, cover plate width must be 15” +-0.02” square.

c. Conduit interconnects between boxes (deck plates and wall plates) must be PVC. Refer to drawings for sizing.
d. Verify routing of conduit with Multi-Sport Computer/Timing System manufacturer prior to installation.

C. Deck Plates
1. Deck plates must be provided as required in the quantities as shown on the drawings. Deck plates to permit plug-in connection for touch pads, A, B, C, backup buttons, electronic relay judging, start light signal, start speakers and a signal to start the timing device at each lane.
a. Basis of Design: Deck plates are based upon TITANIUM SERIAL DECK PLATE as manufactured by Colorado Timing Systems, Inc.
2. Domed deck plate node with contacts mounted on integrated slopes that cause corrosive pool water which creates water bridges to flow off through gravity, overcoming water surface tension and therefore reducing electrolytic currents and corrosion. No maintenance for corrosion is needed.
3. Titanium contacts as exposed connectors.
4. Inputs for button A, B, C, touchpad, start system, speaker, RJP and Speedlight (RJP as separate input, not piggy backed on another input).
5. Speedlight must be controlled in synchronicity and individually per lane (requires RJPs).
6. Diagnostic capabilities to detect anomalies with connectors (corrosion, shorts) and anomalies with the timing components push buttons, touchpad, RJP, Speedlight, speaker or start system.
7. Ability to detect presence or absence of push buttons, touchpad, RJP, Speedlight, speaker or start system.
8. Plate must have self-test capabilities to detect compromised timing bus wire terminations.
9. Junction Boxes (Provided by Electrical):
a. In deck system components must fit into a 4” x 4” x 6” PVC junction box (Carlon Model #E989NNR-CAR).
b. Conduit interconnects between boxes (deck plates and wall plates) must be PVC. Refer to drawings for sizing.
c. Verify routing of conduit with Multi-Sport Computer/Timing System manufacturer prior to installation.

D. Start System Deck Plate
1. Start system deck plates must be provided as required in the quantities as shown on the drawings.
a. Basis of Design: Start system deck plates are based upon TITANIUM SERIAL START SYSTEM DECK PLATE as manufactured by Colorado Timing Systems, Inc.
2. Connection to start system that must provide the following:
a. Inputs/outputs for start system and speaker.
b. Detection of presence or absence of speaker input or start system.
c. Diagnostic capabilities to detect anomalies with connectors (corrosion, shorts) and anomalies with the speaker or start system.
3. Junction Boxes (Provided by Electrical):
a. In deck system components must fit into a 4” x 4” x 6” PVC junction box.
b. Conduit interconnects between boxes (deck plates and wall plates) must be PVC. Refer to drawings for sizing.

c. Verify routing of conduit with Multi-Sport Computer/Timing System manufacturer prior to installation.

E. Timer Deck Plate
1. Timer deck plates must be provided as required in the quantities as shown on the drawings.
   a. Basis of Design: Timer deck plates are based upon TITANIUM SERIAL TIMER DECK PLATE as manufactured by Colorado Timing Systems, Inc.
2. Connection to timer which must allow for a pool setup without a wall plate, and must provide the following:
   a. Connectivity to timing courses and one scoreboard bus with one cable connection
   b. Detection of presence or absence of connected timer
   c. Diagnostic capabilities to detect anomalies with connectors (corrosion, shorts)
   d. In deck system components must fit into a 4” x 4” x 6” PVC junction box
3. Junction Boxes (Provided by Electrical):
   a. In deck system components must fit into a 4” x 4” x 6” PVC junction box.
   b. Conduit interconnects between boxes (deck plates and wall plates) must be PVC. Refer to drawings for sizing.
   c. Verify routing of conduit with Multi-Sport Computer/Timing System manufacturer prior to installation.

3.4 SWIMMING TIMING START SYSTEM

A. Starting System
1. Swim Timing Start System (1 required) must be provided to start the automatic Multi-Sport Computer/Timing System. The start system must be capable of driving up to twenty (20) (45 ohm) individual starting block speakers mounted under the starting blocks or two (2) underwater/aux speakers (up to 8 ohm each), the relay judging platform strobe lights and deck side start indicators with microphone.
   a. Basis of Design: Swimming Timing Start System is based upon the CHAMPIONSHIP ELITE START SYSTEM (SSE) as manufactured by Colorado Time Systems, Inc.
2. The start system must use a wired microphone and must have volume control, including base and treble.
3. The start system must have a sturdy, all metal, non-corrosive enclosure with feet. The start system should include a tripod mount (TR-3) for each start system.
4. The start system must have external connections for additional external visual indicator strobe light(s) (EVI’s), speaker output, start output and speedlights.
5. The system must run off two (2) internal lead acid batteries. The internal batteries must automatically be recharged while the starter is plugged in to the external power supply. Under typical operation the batteries must last more than 15 hours and must typically recharge in approximately 2.5 hours.
6. System must have an LED showing the battery status (green, yellow, red) when the internal batteries are starting to get low on power. Battery status percentage must be displayed on the LCD screen.
7. The start system must be compatible with an underwater speaker system (SP-UND).
8. The start system must have a standard CTS start tone and alternate start tone.
9. Loudness of start tones and under block speakers must be configurable by the end user for optimal use both indoors and outdoors.
10. The intensity of the onboard strobe and EVIs must be configurable by the end user for optimal use both indoors and outdoors.

11. The start system must include a backlit and transflective LCD screen that provides easy navigation and onboard help menus.
12. The start system must include a visual start signaling system (VSS) option to provide a clear visual start sequence for all athletes. Visual functionality includes the following: call to block (EVI blinks red), step up (EVI steady red), take your marks (EVI steady yellow), start (EVI flashes green or white). VSS must be controllable via user operated pushbutton device separate from starter microphone.
13. The start system must include a training mode that provides both a pre-recorded and customizable “take your marks” message and start signaling with a variable interval between starts. Time interval between “take your marks” and start signal must include random delay The training mode must be configurable by the user to include VSS signaling.
14. The start system must be FCC compliant, and safety listed. UL or equivalent.
15. The start system must be able to be updated by customer.
16. Provide cabling quantities required to connect the start system to the Multi-Sport Computer/Timing System including (R-015-715-8) 8M Start Cable(s) for connection to the Multi-Sport Computer/Timing System and Elite Start to wall plate cable(s).

B. Starting Block Speaker:
1. Provided one speaker per championship starting block, plus one spare speaker (7 required). The speaker must be mounted on the starting platform. Speaker must be corrosion resistant and designed for use in an aquatic environment and rated for such use.
   a. Basis of Design: The starting block speaker is based upon the CTS MODEL SP-6/45 as supplied by Colorado Timing Systems, Inc.
2. The loudspeaker must be a flex driver type horn projector of integrated construction. It must be rated 6 watts for voice or music material with an on-axis frequency response of 320-6000 Hz (“6dB). The sound pressure level must average 97dB (1W/1M) for 500 to 5000 Hz.
3. The horn and mounting base must be tan in color and constructed of impact & UV resistant ABS, which will retain mechanical properties from -20q to +160qF. The driver cone diaphragm must be moisture resistant. Materials must resist damage from extreme weather exposure. Electrical connector must be of 2-conductor banana type, 0.750 center to center.
4. Provision for mounting must include clearance slots in the adjustable base and hole location points in the horn flange for adapting unit must be recess mounted.

3.5 SWIMMING TIMING COMPONENTS

A. Gutter Hung Touchpads
1. Provide 7 touchpads (6 plus 1 spare) to time swimming, in compliance with the appropriate sanctioning body.
   a. Basis of Design: The gutter hung touchpad is based upon the AQUAGRIP GUTTER HUNG TOUCHPAD as manufactured by Colorado Timing Systems, Inc.
2. Touchpad must be constructed of an all-plastic exterior with only electrical connector metal exposed. Touchpad must be the following dimensions:
   a. Touch pad must be the TP-78G AQUAGRIP, 78” wide x 22” tall x 0.3” thick.
3. Touchpad must have a uniform fine grit and non-abrasive surface that prevents swimmer slippage in any direction.
4. Touchpad markings must have contrasting colors with a 2” black border and black end-wall cross pattern for portion covered by touchpads.

5. Touchpad brackets must be custom made to fit the pool. The Contractor to provide sufficient number of brackets for support of each touchpad. The Contractor is to provide gutter/bulkhead dimensional drawings for confirmation of custom brackets.
   a. The Contractor to provide an additional two (2) spare touchpad brackets.

B. Push Buttons
1. Provide two (2) back-up buttons for each touchpad provided plus (2 spares)
2. Back-up buttons must be plunger style buttons with a 5’ cable.

C. Swimming Timing Systems Caddies
1. Provide touchpad caddy for storing touch pads. The correct number of touchpad caddies must be supplied to store touchpads. The caddy must be sized to match timing system touch pad widths. Touchpad caddy must consist of an aluminum frame with four freewheeling casters. The Contractor is responsible for assembly. Touchpad caddy must be CAD-TP as manufactured by Colorado Timing Systems, Inc.

3.6 PACE CLOCKS

A. Pace Clock Program
1. Accessory software program must turn multi-sport computer and multi-sport scoreboard into an effective training system and coaching tool.
   a. Basis of Design: GEN7 PACE CLOCK PROGRAM as manufactured by Colorado Timing Systems, Inc.
2. Accessory software program must turn scoreboard into an effective training system and coaching tool.
3. Interface to HYTEK's "Workout Manager" software with direct download to computer timer.
4. Programmable workouts are saved into memory for up to 80 workouts.
5. Workouts display on multi-line scoreboard by lane.
6. START/STOP lanes with one keystroke, or individually.

B. Slim Pace Clocks
1. Pace clocks must be provided as required in the quantities as shown on the drawings.
   a. Basis of Design: SLIM PACE CLOCKS as manufactured by Colorado Timing Systems, Inc.
2. The pace clock must include thirteen (13”) high visibility LED digits, with variable intensity settings. The pace clock must include a rugged powder-coated aluminum enclosure, conformal coated to protect against corrosion, a real time of day clock, and must be suitable for indoor or outdoor use.
3. The pace clock must include twelve (12) operating channels to eliminate interference.
4. Pace clocks have an integrated real time of day chip (RTC). If multiple pace clocks are used in a facility, they will synchronize the time automatically.
5. The pace clock must include a wireless frequency of 2.4 GHz and have autosensing power capabilities for 120/240 VAC.
6. Pace clock must be FCC compliant, and UL listed or equivalent.
7. The pace clock must have four (13”) digits.
   a. Overall Size (H x W x D): 19.25” x 42.25” x 2.8”
   b. Weight: 15 lbs
8. The pace clock must be provided with a cable hiding end cap to hide electrical connections. The end cap must be Colorado Timing Systems model PN K-TRIM-8 or approved equal.

PART 4 EXECUTION

4.1 EXISTING CONDITIONS

A. Verify that work by others, related to this section, is installed.

B. Carefully examine the construction documents that affect the work of this section.

C. Prior to starting work, notify the Architect of defects requiring correction.

D. Protect other materials and installed work against damage while completing work in this section.

4.2 INSTALLATION

A. Provide custom cables, connectors, scoreboard mounting brackets, and fasteners.

B. Provide scaffolding and labor for mounting scoreboard and pulling cables.

C. Provide equipment in accordance with the manufacturer’s drawings and instructions.

D. Provide scoreboard mounting, Multi-Sport Computer/Timing System cable terminations, system checkout, and local operator training at time of installation. Training must consist of one 4-hour session.

E. Provide as-built drawings precisely locating items.

F. Wiring and grounding must be installed in strict accordance with the latest edition of the National Electric Code – Article 680.

END OF SECTION 13 11 06

SECTION 13 24 16 SAUNAS AND STEAM ROOMS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Pre-Cut Custom Saunas

B. Salt Saunas

C. Modular Saunas

D. Sauna Accessories.

E. Sauna Heaters.

F. Hybrid Steam Rooms.

G. Steam generator and controls.

H. Steam Room Accessories.

1.2 RELATED SECTIONS

A. Section 05 40 00 - Cold-Formed Metal Framing.

B. Section 06 10 00 - Rough Carpentry.

C. Section 07 90 00 - Joint Protection.

D. Section 09 30 00 - Tiling.

E. Section 09 30 33 - Stone Tiling.

F. Section 22 11 13 - Facility Water Distribution Piping.

G. Section 22 14 26.13 - Roof Drains.

H. Section 26 05 00 - Common Work Results for Electrical.

1.3 REFERENCES

A. ASTM E 774 - Standard Specification for the Classification of the Durability of Sealed Insulating Glass Units

1.4 SUBMITTALS

A. Submit under provisions of Section 01 30 00 - Administrative Requirements.

B. Product Data: Manufacturer's data sheets on each product to be used, including:
1. Preparation instructions and recommendations.
2. Storage and handling requirements and recommendations.
3. Installation methods.

C. Shop Drawings: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns

D. Selection Samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.

E. Verification Samples: For each finish product specified, two samples, minimum size 6 inches (150 mm) square, representing actual product, color, and patterns.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications: All primary products specified shall be supplied by a single manufacturer with a minimum of 10 years documented experience.

B. Installer Qualifications: A single installer with a minimum of 5 years demonstrated experience installing products of the same type and scope as specified.

C. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
1. Finish areas designated by Architect.
2. Do not proceed with remaining work until workmanship, color, and sheen are approved by Architect.
3. Refinish mock-up area as required to produce acceptable work.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging until ready for installation.

B. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.7 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

1.8 WARRANTY

A. Provide an executed copy of the manufacturer's standard limited warranty against manufacturing defect, outlining its terms, conditions, and exclusions from coverage.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer: AM-FINN Sauna & Steam, which is located at: 372 S. Eagle Rd. Suite 341; Eagle, ID 83616; Toll Free Tel: 800-237-2862; Tel: 208-724-8040; Fax: 208-286-0290; Email:request info (admin@am-finn.com); Web:https://www.am-finn.com

B. Requests for substitutions will be considered in accordance with provisions of Section 01 25 00,Substituion Procedures and Substitution Request Form.

2.2 SAUNA MATERIALS

A. Lumber: Wood species and grades as follows, unless otherwise indicated:
   1. Western Red Cedar: WCLIB or WWPA; Clear Hear

B. Insulating/Tempered Glass: Preassembled units consisting of insulating/tempered-glass units made from two lites of 5/32 inch (4mm) thick with 7/16 inch (11mm) air space, clear glass double sealed. Provide jamb and casing of western red cedar and complying with ASTM E 774 for Class CBA units

C. Fasteners: Exposed: Stainless steel, or Exposed: hot-dip galvanized.

2.3 SAUNAS

A. Pre-Cut Saunas: Provide manufacturer's standard interior finishes, pre-hung door, and trim; designed to be constructed as a permanent part of the structure.
   1. Rooms must be prepared ahead of sauna installation, including studding, insulation, and plywood for attaching paneling
   2. Vapor Barrier - FSK Shield Vapor Barrier on all walls and ceilings
   3. Wood Species: Western Red Cedar, Clear Grade, S4S
   4. Interior Wall and Ceiling Paneling: 1/2 inch by 6 inches nominal V-joint, tongue-and-groove wood boards; kiln-dried to no more than 12 percent moisture content. Attached to wall vertically. Standard vertical pattern is 35 inch lower piece with 60 inch upper piece. Gap is covered by Split Wall Trim.
   5. Interior Trim: Clear Western Red Cedar
      a. Split Wall Trim (Euro-Trim): 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between 35 inch and 60 inch Wall boards.
      b. Ceiling Trim: 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between ceiling and wall boards.
      c. Corner Trim: 1 inch by 1 inch with 1/2 inch radius. Covers gap on corners.
      d. Ceiling Corner Medallion: 1-1/2 inch by 1-1/2 inch by 3-1/2 inch Medallion for top of corner trim.
      e. Base Trim: 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between wall boards and floor.
   6. Door: Manufacturer's standard, solid core, prehung door with glass vision panel as follows:
      a. Door Wood Species: Western Red Cedar.
      b. Jamb and Casing Wood Species: Western red cedar.
      c. Glass Vision Panel: Preassembled units consisting of insulating/tempered-glass units made from two lites of 5/32 inch (4 mm) thick with 7/16 inch (11 mm) air space, clear glass double sealed. Provide jamb and casing of western red cedar and complying with ASTM E 774 for Class CBA units.
      d. Size: 36 inches by 80 inches outside dimensions. Provide rough opening of 38 inches by 82 inches.
      e. All doors are undercut 1 inch to 1-1/2 inches to provide proper and sufficient air flow into sauna. Do not cut vents or other openings in sauna walls unless required for sauna heater.
      f. Door Hardware: Provide three self-closing brass hinges, and two wood door pulls (interior and exterior of door) of Western Red Cedar.
   7. Benches: ADA Compliant, Western Red Cedar, Clear Grade, S4S. All sharp edges have been broken, bench top boards have .125 inch fillet on corners, fasteners are hidden, standard 20 inch Depth and 19 inch Height. Exposed bench ends are covered

with End Caps.
   a. Standard 1 inch by 4 inch nominal wood boards, spaced not more than 1/2 inch apart and supported by 2 inch by 4 inch nominal wood framing.
8. Flooring:
   a. 2 foot by 2 foot Duckboards, 1 inch by 4 inch boards, 3/8 inch spacing, removable for cleaning
9. Lighting:
   a. Standard UL Listed Shatter-proof, water-proof light, hardwired.

B. Himalayan Salt Saunas: Provide manufacturer's standard interior finishes, pre-hung door, and trim; designed to be constructed as a permanent part of the structure.
1. Rooms must be prepared ahead of sauna installation, including studding, insulation, and plywood for attaching paneling
2. Vapor Barrier - FSK Shield Vapor Barrier on all walls and ceilings
3. Wood Species: Western Red Cedar, Clear Grade, S4S
4. Interior Wall and Ceiling Paneling: 1/2 inch by 6 inches nominal V-joint, tongue-and-groove wood boards; kiln-dried to no more than 12 percent moisture content. Attached to wall vertically. Standard vertical pattern is 35 inch lower piece with 60 inch upper piece. Gap is covered by Split Wall Trim.
5. Interior Trim: Clear Western Red Cedar
   a. Split Wall Trim (Euro-Trim): 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between 35 inch and 60 inch Wall boards.
   b. Ceiling Trim: 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between ceiling and wall boards.
   c. Corner Trim: 1 inch by 1 inch with 1/2 inch radius. Covers gap on corners.
   d. Ceiling Corner Medallion: 1-1/2 inch by 1-1/2 inch by 3-1/2 inch Medallion for top of corner trim.
   e. Base Trim: 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between wall boards and floor.
6. Door: Manufacturer's standard, solid core, prehung door with glass vision panel as follows:
   a. Door Wood Species: Western Red Cedar.
   b. Jamb and Casing Wood Species: Western red cedar.
   c. Glass Vision Panel: Preassembled units consisting of insulating/tempered-glass units made from two lites of 5/32 inch (4 mm) thick with 7/16 inch (11 mm) air space, clear glass double sealed. Provide jamb and casing of western red cedar and complying with ASTM E 774 for Class CBA units.
   d. Size: 36 inches by 80 inches outside dimensions. Provide rough opening of 38 inches by 82 inches.
   e. All doors are undercut 1 inch to 1-1/2 inches to provide proper and sufficient air flow into sauna. Do not cut vents or other openings in sauna walls unless required for sauna heater.
   f. Door Hardware: Provide three self-closing brass hinges, and two wood door pulls (interior and exterior of door) of Western Red Cedar.
7. Benches: ADA Compliant, Western Red Cedar, Clear Grade, S4S. All sharp edges have been broken, bench top boards have .125 inch fillet on corners, fasteners are hidden, standard 20 inch Depth and 19 inch Height. Exposed bench ends are covered with End Caps.
   a. Standard 1 inch by 4 inch nominal wood boards, spaced not more than 1/2 inch apart and supported by 2 inch by 4 inch nominal wood framing.
8. Flooring:
   a. 2 foot by 2 foot Duckboards, 1 inch by 4 inch boards, 3/8 inch spacing, removable for cleaning
9. Lighting:
   a. Standard UL Listed Shatter-proof, water-proof light, hardwired.
10. Himalayan Salt Panels: Himalayan pink salt bricks assembled into panels with 6 salt

bricks per panel. Panels are provided with stainless steel mounting hardware.
a. Overall Panel Size: 15.5 inches wide by 17.24 inches high by 1.75 inches thick.
b. Backlighting: Color changing LED backlighting, hardwired.

C. Modular Saunas: Prefabricated, demountable, panelized system complete with framing, 2 inch tongue and groove paneling, prehung door, conduit to bring power to the electrical control panel and from the control panel to the heater, and trim; designed to be freestanding.
1. Interior Wall and Ceiling Paneling: 2 inch by 6 inch (51 mm by 152 mm) nominal W-joint, tongue-and-groove wood boards of species and grade indicated; sanded smooth; kiln-dried to no more than 12 percent moisture content.
a. Wood Species: Western red cedar.
2. Exterior Wall Finish:
a. Solid Wall construction, 2 inch thick tongue-and-groove groove paneling serves as interior and exterior surfaces.
3. Interior Trim: Clear Western Red Cedar:
a. Split Wall Trim (Euro-Trim): 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between 35 inch and 60 inch Wall boards.
b. Ceiling Trim: 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between ceiling and wall boards.
c. Corner Trim: 1 inch by 1 inch with 1/2 inch radius. Covers gap on corners.
d. Ceiling Corner Medallion: 1-1/2 inch by 1-1/2 inch by 3-1/2 inch Medallion for top of corner trim.
e. Base Trim: 7/16 inch by 3-1/2 inch boards, mitered corners for blending. Covers gap between wall boards and floor.
4. Door: Manufacturer's standard, solid core, pre-hung door with glass vision panel.
a. Door Wood Species: Western Red Cedar.
b. Jamb and Casing Wood Species: western red cedar.
c. Glass Vision Panel: Preassembled units consisting of insulating/tempered-glass units made from two lites of 5/32 inch (4 mm) thick with 7/16 inch (11 mm) air space, clear glass double sealed. Provide jamb and casing of western red cedar and complying with ASTM E 774 for Class CBA units.
d. Door size is 36 inch by 80 inch outside dimensions with rough opening of 38 inches by 82 inches.
e. All doors are undercut 1 inch to 1 1/2 inches to provide proper and sufficient air flow into sauna. Do not cut vents or other openings in sauna walls unless required for sauna heater.
f. Door Hardware: Provide three self-closing brass hinges, and two wood door pulls on interior and exterior of door of Western Red Cedar.
5. Benches: ADA Compliant, Clear Grade Western Red Cedar, S4S. All sharp edges have been broken, bench top boards have .125 inch fillet on corners, fasteners are hidden, standard 20 inch Depth and 19 inch Height for single tier, exposed bench ends are covered with end cap.
a. Standard 1 inch by 4 inch nominal wood boards, spaced not more than 1/2 inch apart and supported by 2 inch by 4 inch nominal wood framing
6. Flooring:
a. 2 foot by 2 foot Duckboards, 1 inch by 4 inch boards, 3/8 inch spacing, removable for cleaning
7. Lighting:
a. Standard UL Listed Shatter-proof, water-proof light, hardwired.

2.4 SAUNA ACCESSORIES

A. Guardrail: Wood guardrail for heater. Dimensions as required by heater UL listing.

B. Thermometer.

C. Aluminum Hygrometer with Temperature and humidity readings.

D. Wood bucket: 1-gallon (3.8L) capacity with plastic liner and wood ladle.

2.5 SAUNA HEATERS

A. Scandia Ultra Sauna Heaters - Manufacturer's standard electric convection unit with stainless-steel interior, stainless-steel exterior. Provide heat-tested, shatter-resistant igneous rocks that are not in direct contact with heating-unit coils and are completely separated from the heating-unit coils. U.L. listed. Obtain rough-in instructions from supplier for electrical work which must be performed during build out phase prior to sauna installation. Especially critical if block or CMU wall construction is used. Conduits and location for heater control assembly on front wall are essential. Capacity as determined by manufacturer based upon square footage of sauna.
   1. Power Supply: 208 or 240-Volt and either single or three phase.
   2. Mounting: Wall mounted with bracket.
   3. Built-in Thermostat in Heater Controls: Manufacturer's T-Model system mounted integral with heater unit, with thermostat.
   4. Controls: Remote mechanical controls with thermostat and the following features:
      a. Dial timer that automatically shuts off heater after 60 minutes.
      b. Dial time-delay that allows heater to be preset up to 24-hours, seven days in advance, with manual override.

B. Scandia Ultra Gas-Fired Sauna Heaters - Double-wall heater construction. Heater chamber constructed of heavy gauge (#16 gauge) #321 spec stainless steel and exterior shell finished in louvered #304 stainless steel..
   1. Rock Capacity: Minimum 80 lbs - 40 KBTU or 160 lbs - 80K BTU).
   2. Capacity: Determined by manufacturer based upon square footage of sauna.
   3. Burner system: Cast-steel; designed specifically for sauna heater application.
   4. Gas valve and pilot system: CSA or AGA listed.
   5. Fuel source: Natural gas or liquid propane (LP).
   6. Mounting: Floor-mount with through-wall back panel assembly
   7. Rock tray: Self-contained in a cone shaped pan construction to facilitate fast heat-up time and support large amounts of water for steam production.
   8. Controls: Remote mechanical controls with thermostat and the following features:
      a. Dial timer that automatically shuts off heater after 60 minutes.
      b. Dial time-delay that allows heater to be preset up to 24-hours, seven days in advance, with manual override.

2.6 FABRICATION

A. Fabricate saunas to dimensions, profiles, and details indicated. Sand boards smooth and ease edges to a radius of not less than 1/16 inch (1.6mm).

B. Complete fabrication of Modular sauna panels, including assembly and hardware application, to maximum extent possible, before shipment to Project site. Disassemble components only as necessary for shipment and installation.

C. Shop cut openings, to maximum extent possible, to receive hardware, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.

D. Nail or screw bench components together from bottom side. Countersink fasteners.

E. Secure glass in wood frames with removable stops.

F. Flush mount junction boxes for heater, control panel, and light fixtures, with concealed connecting electrical conduit.

2.7 ADVANCED HYBRID STEAM ROOMS

A. Prefabricated, packaged unit, complete with fittings, door, benches, ceiling, flooring, lighting, and accessories.
   1. Frame made of 1 inch by 2 inch by 0.125 inch Aluminum Tubing Uprights, Ceiling Trusses, and Cross-Members, manufactured and pre-assembled in manufacturers production facility.
   2. Composite cell-cast acrylic wall and ceiling panels, walls are 1/2 inch thick, ceiling panels are 3/8 inch, overall panel dimensions 48 inch by 120 inch
   3. Risers for ceiling sloping made of 1.5 inch Aluminum L-Angle
   4. White PVC Corner Trim 1-1/2 inch by 1-1/2 inch.
   5. Finish: High glazed, white color. Can have floor to ceiling acrylic, or have Window Risers to set the ceiling slope and add another lighting feature as well. Different Colors and Custom print options available
   6. Highly customizable, can be designed to fit into odd or custom room sizes.

B. Capacity and Dimensions: Consult supplier for appropriate model.

C. Door: All glass door mounted on powder-coated aluminum frame with custom colors available.
   1. Glass: 3/8 inch (9 mm), tempered.
   2. Opening: 36 inches by 72-1/4 inches (914 mm by 1835 mm). Glass size 36 inch by 82.75 inch, Frame size 38-1/2 inch by 85 inch with required rough openings of 40 inches by 86 inches.
   3. Opening: 36 inches by 84 inches (914 mm by 2134 mm).
   4. Hinge: 304 Stainless steel gravity hinges with mirror finish.
   5. Door Pulls: 10 inch (254 mm) chrome door pulls.
   6. Door Swings out of steam room for user safety.

D. Lighting:
   1. LED back-lighting to be mounted on custom acrylic ceiling risers.
      a. LED strip placed outside the room around the perimeter of the Risers, providing a semi-opaque window that filters in the LED light to the room. Receiver and transformer are encased in a waterproof electrical box that sits underneath the bench, and goes through the acrylic walls. Provide 120V power to GFCI that sits inside waterproof box.
      b. LEDs are controlled by remote control, and should be placed on their own circuit to ensure that the circuit is not being turned on and off.
   2. Center LED Lighting Strip
      a. LED Strip encased in waterproof channel with clear plastic cover, controls and transformer are encased in a waterproof electrical box that sits underneath the bench, and goes through the acrylic walls. Provide 120V power to GFCI that sits inside waterproof box.
      b. LEDs are controlled by remote control, and should be placed on their own circuit to ensure that the circuit is not being turned on and off.
   3. Above Ceiling LED lights, "Moonglow Ceiling"
      a. Two shop LED lights, these are hardwired together using Armorlite 12/2 Metal Clad Cable, as well a 10ft chord of the same Armorlite 12/2 will be provided to finalize a connection to Jbox.
      b. These cannot be on the same circuit as the LED control box

E. Seating:
   1. Bench Tops and Frame: Fabricated from Marine Grade HDPE, 20 inch Depth, 12 inch by 0.5 inch slots spaced equally across bench, 6061 Aluminum L-angle underframe used to attach to wall brackets and connect benches together for stability
   2. 1 Tier benching comes with 3 inch skirting strip, covering aluminum frame
   3. 2 Tier benching comes with 18 inch full skirting, slots matching bench tops

4. Legs: 14 Gauge 304 Stainless Steel tubing with a stainless faceplate welded to the top for fastening to bench tops. Heavy Duty Adjustable feet inserts, corrosion resistant and allows for height and angle adjustments.
5. Wall Brackets: 1 inch by 2 inch 6061 Aluminum square tubing, 0.125 inch wall thickness. 0.75 inch L-angle welded on top, creating a wall bracket that both supports the benches, holds them closely to the wall, and allows for benches to be removed

F. Ceiling:
1. "Moonglow Ceiling" Semi-opaque white acrylic panels backlit by LED Shoplight
2. Paneled Brushed Stainless-Steel Ceiling
3. Combination of Moonglow and Stainless Steel, "Racing Stripes"

G. Storefronts:
1. Storefronts or vision panels made from either clear acrylic or glass depending on the size, 6061 Aluminum frame, Aluminum L-angle used to hold the acrylic or glass in position, gasket placed in between the L-angle and other material to create watertight seal. Aluminum powder-coated to match storefront.

2.8 STEAM GENERATORS AND CONTROLS

A. Generator:
1. Size generator as recommended by manufacturer for volume of steam room and type of construction materials employed.
2. Provide manual or automatic controls with on/off, temperature setting, and time setting.
3. Provide steam heads designed not to exceed 125 degrees F (52 degrees C).
4. Eucalyptus pump/Aroma Dispenser.

B. Generator Model No. _____- Size according to room dimensions and voltage.

2.9 STEAM ROOM ACCESSORIES

A. Dual Filter Scale-X Cartridge.

B. Aroma Guard II.

C. Power Zone 400 Ozone o3 generator cleaning system.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that rough-ins for all utilities are properly sized and in correct locations.

B. Do not begin installation until substrates have been properly prepared.

C. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 SAUNA INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install sauna components level, plumb, true, and straight with no distortions. Shim, as required, with concealed shims. Install level and plumb to a tolerance of 1/8 inch in 96 inches (3 mm in 2400 mm). Install with no more than 1/16 inch in 96 inches (1.6 mm in 2400 mm) vertical cup or bow and 1/8 inch in 96 inches (3 mm in 2400 mm) horizontal variation from a true plane.

C. Where local code requires installation of sprinkler heads inside sauna, insure heads are rated at a high enough temperature to withstand the heat which will collect at the ceiling of the sauna. Recommended sprinkler rated for temperatures between 250-300 degrees.

3.4 STEAM ROOM INSTALLATION

A. Hybrid Steam Room Enclosures: Install prefabricated panels to final room dimensions in accordance with manufacturer's assembly instructions; lock panels into place

B. Steam Generators and Accessories: Install and connect steam generators, steam outlets, controls, and temperature sensors. Coordinate with work of mechanical and electrical sections, and connect to utilities.

3.5 PROTECTION

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 13 49 13 - INTEGRATED X-RAY SHIELDING ASSEMBLIES PART 1 GENERAL

1.01 SECTION INCLUDES

A. Construction of lead enclosure around x-ray treatment rooms and control rooms.

B. Lead sheet applied to gypsum board.

C. Radiation treatment room view window frames.

D. Leaded glass.

E. Lead-lined radiation-shielded solid core wood doors.

F. Lead-lined hollow metal door frames.

G. Related accessories.

1.02 RELATED REQUIREMENTS

A. Section 08 1113 - Hollow Metal Doors and Frames:

B. Section 08 1416 - Flush Wood Doors:

C. Section 08 7100 - Door Hardware: Lead-lined door hardware.

D. Section 09 2116 - Gypsum Board Assemblies: Joint taping over lead lined gypsum board.

E. Section 09 9000 - Painting and Coating: Field painting.

1.03 REFERENCE STANDARDS

A. ASTM B749 - Standard Specification for Lead and Lead Alloy Strip, Sheet, and Plate Products; 2014.

B. ASTM C 954: Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness.

C. ASTM C1396/C1396M - Standard Specification for Gypsum Board; 2017.

D. NCRP Report 147 - Structural Shielding Design and Evaluation for Medical Uses of X Rays and Gamma Rays of Energies up to 10 MeV; 2004.

E. Federal Specification QQL-201 F Grade C.

F. Hollow Metal Manufacturers Association (HMMA) 840 - Installation and Storage of Hollow Metal Doors.

G. National Council on Radiation Protection and Measurements (NCRP):
   1. NCRP Report No. 145 - Radiation Protection in Dentistry.
   2. NCRP Report No. 147 - Structural Shielding for Medical X-Ray Imaging Facilities.
   3. NCRP Report No. 151 - Structural Shielding Design and Evaluation for Megavoltage X- and Gamma Ray Radiotherapy Facilities.

H. Steel Door Institute (SDI)-100 - Recommended Specifications for Standard Steel Doors and Frames.

1.04 ADMINISTRATIVE REQUIREMENTS

A. Coordinate this work with the construction of the building elements that x-ray protection is applied to or installed in.

B. Preinstallation Meeting: Convene one week prior to commencing work of this section.

1.05 SUBMITTALS

A. See Section 01 3000 - Submittal Procedures.

B. Shop Drawings: Indicate layout, details, dimensions, interface with adjoining work of radiation protected areas .
   1. Indicate details, dimensions, finishes, and interface with adjoining work.
   2. Indicate lead thickness or lead equivalencies of components.

C. Product Data: Provide data on leaded glass and all products to be used.

D. Manufacturer's Certificate: Certify that walls, leaded glazing capabilities frame, door capabilities and frame meet or exceed the provisions of the National Council of Radiation Protection, (NCRP)..

E. Initial Selection Samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.

F. Verification Samples: For each finish product specified, two samples, minimum size 6 inches (152 mm) square, representing actual product, color, and patterns.

G. Manufacturer's Instructions:
   1. Preparation and installation instructions and recommendations.
   2. Storage and handling requirements and recommendations.

H. Qualification Statements:
   1. Manufacturer.
   2. Installer.
   3. X-ray physicist.

1.06 CLOSEOUT SUBMITTALS

A. Maintenance Data: Cleaning instructions for leaded and acrylic glass.

B. Record Documentation: Record Drawings, with dimensions, showing locations of radiation protection.

C. Radiation Protection Survey: Record copy of physicist’s Radiation Protection Survey indicating measurements and evaluation of measurements of installed radiation shielding materials.

D. Manufacturer’s Certification: Upon completion of radiation protection work, Manufacturer and Installer shall furnish a certificate of compliance that all materials are in accordance with the specifications and physicist’s radiation protection survey.

1.07 QUALITY ASSURANCE

A. Perform Work in accordance with NCRP Report 147 and Report No. 049 - Structural Shielding Design and evaluation for Medical Use of X-Rays and Gamma Rays of energies uo to 10 MeV regulations.1. Comply with requirements of local regulatory agencies where local standards and criteria exceed requirements of NCRP Report Nos. #145, #147 and #151.

B. Maintain one copy of each document on site.

C. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with at least three years documented experience.

D. Installer Qualifications: Company specializing in performing work of the type specified and with at least three years of.

E. Single Source Responsibility: Obtain radiation protection materials and accessories produced or distributed as standard products from single manufacturer regularly engaged in production of X-ray and gamma ray shielding materials. Ensure all materials are compatible and coordinated to meet performance requirements as specified.

1.08 REGULATORY REQUIREMENTS

A. Conform to applicable health and occupation code for integrity of radiation protection and continuity of protected construction.

1.09 DELIVERY, STORAGE, AND HANDLING

A. Comply with manufacturer's instruction for receiving, handling, storing, and protecting materials.

B. Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.

C. Store materials in original packaging, protected from exposure to harmful environmental conditions, including static electricity, and at temperature and humidity conditions recommended by manufacturer.

D. Exercise care to prevent edge damaged materials.

1.10 FIELD CONDITIONS

A. Ambient Conditions: Maintain temperature, humidity, and ventilation condition within limits recommended by manufacturer for optimum results. Do not install products under ambient conditions outside manufacturer's absolute limits.

B. Lead-Laminated Gypsum Board:
   1. Environmental Limitations: Comply with ASTM C 840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.
   2. Do not install paper-faced gypsum panels until installation areas are enclosed and conditioned.
   3. Do not install panels that are wet, those that are moisture damaged, and those that are mold damaged.
      a. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
      b. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

1.11 COORDINATION

A. Coordinate the work of this Section with the respective trades responsible for installing interfacing work.

PART 2 PRODUCTS

2.01 DESIGN REQUIREMENTS:

A. Provide materials and workmanship, including joints and fasteners, that maintain continuity of radiation protection at all points and all directions equivalent to materials specified in thicknesses and locations indicated.
   1. Employ a physicist knowledgeable in radiation protection for medical facilities to determine thicknesses and configurations of lead-lined materials.

B. Lead-Lined Assemblies: Provide lead thickness in gypsum board, plywood, doors, door frames, window frames, and other items located in lead-lined assemblies, not less than that indicated for assemblies in which they are installed unless indicated otherwise.

C. Lead Glazing: Provide lead equivalence not less than that indicated for assembly in which glazing is installed unless indicated otherwise and approvals by radiation physicist.

2.02 MANUFACTURERS:

A. Wood Doors: Masonite Architectural Lead Lined or approved equal.

B. Door and Window Steel Frames: A&L Shielding, Lead Lined - welded hollow metal door frames or approved equal.

C. Glazing: TGP LX-57B x-ray Shielding Glass (LX7) or approved equal.

2.03 LEAD SHEET AND ASSOCIATED MATERIALS

Lead sheets and all associated materials are to be approved by the radiation physicist.

A. Lead Sheet: 99.9 percent or better pure unpierced virgin lead, free from dross, oxide inclusions, scale, laminations, blisters, and cracks.
   1. Sheet Lead shall meet or exceed the Federal Specification QQL-201 F Grade C and ASTM B749-03 Standard Specification for Lead and Lead Alloy Strip, Sheet, and Plate

Products, see NCRP reports #145, #147 and #151.
2. Thickness: As determined by Radiation Protection Survey, but not less than 1/16 inch (1.5 mm) if not indicated.
3. Variation in Sheet Thickness: Not to exceed five (5) percent.

2.04 LEAD-LAMINATED GYPSUM BOARD, GENERAL

A. Size: Provide maximum lengths and widths available that will minimize joints in each area and that correspond with support system indicated

2.05 LEAD-LAMINATED GYPSUM BOARD

A. Lead-Laminated Gypsum Board: Single unpierced layer of sheet lead laminated to back of gypsum board.

2.06 RADIATION SHIELDING LEADED GLASS

A. Radiation Shielding Leaded Glass: Clear leaded glass containing 48 percent lead oxide (by weight) and 15 percent barium. Thickness as required to provide radiation protection equivalent to that provided by sheet lead in partition in which lead glass is installed.
1. Thickness: 8.0 mm (5/16") yielding an equivalency of 2.0 mm (1/16").

2.07 LEAD-LINED TWO-PIECE SLIP FRAMES

A. Lead-Lined Telescopic View Window Frames: Two-piece slip lead lined frames manufactured to a specific throat dimension to suit wall thickness. Frames shall be capable of accepting any thickness of radiation shielding leaded glass, radiation shielding X-Ray safety glass, or radiation shielding leaded acrylic. Frame corners shall be fully welded and ground smooth.
1. Throat Dimension: As required to suit wall thickness.
2. Metal Thickness: 16 gauge.
3. Provide radiation protection equivalent to that provided by sheet lead in partition in which view window is installed.
4. Provide ½" (13 mm) removable, reversible stops. Predrill and countersink to allow for:
   a. One pane of 5/16" leaded shielding glass.

2.08 LEAD-LINED SOLID CORE WOOD DOORS

A. Flush veneered construction using single layer of sheet lead in center of door. Laminate wood cores under hydraulic pressure on each side of lead.
1. Extend sheet lead lining to door edges providing X-Ray absorption equal to partition in which door occurs.
2. Shield cutouts for lock sets with sheet lead lapping, lead lining of lock sets or door lining, of equal thickness lead as used in door of same opening.
3. Further bond cores with 6 poured lead dowels at the following locations:
   a. 2 at 8 inches (203 mm) from top and 4 inches (102 mm) sides, 2 at center 4 inches from sides, and 2 at 8 inches (203 mm) from bottom and 4 inches (102 mm) sides.
4. Edge Strips: Minimum thickness of 2 inches (51 mm) each edges of door.
   a. Species: Same as wood face veneer. Section 08 1416 Flush Wood Doors
   b. Glue strips to cores before face veneer is applied.
   c. Extend vertical edge strips full height of door and bevel 1/8 inch (3 mm) for each 2 inches (51 mm) of door thickness.
5. Face Veneer for Transparent Finish: Match species and finish of Section 08 1416 Flush Wood Doors of existing doors.
6. Mineral Core with Lead: Radiation Shielded
7. Lead thickness per drawings and Radiation Physicist's approvals.
8. Fire Rating: per drawings
9. Astragal at Pairs: Lead-lined meal Edge & Astragal

10. Warranty: Full; Life of original installation

2.09 LINED HOLLOW METAL DOOR FRAMES

A. Lead-Lined Hollow Metal Door Frames:
   1. Construction: Line inside of frames with single unpierced strip of sheet lead of not less than same thickness as lead in doors and walls in which installed.
      a. Form lead sheet to match contour of frame on radiation exposure side of frame, continuous in each jamb and across head and over lap into formed stop.
      b. Form lead shields around areas prepared to receive hardware.
      c. Fabricate lead lining wide enough to maintain an effective 1/2" (13 mm) minimum overlap lap with lead of adjoining shielding.
      d. Design lead-lined door frames to accommodate lead lining up to 1/2 inch (13 mm) thick.
   2. Door Frame Supports: 2-1/4 inches (57 mm) steel angle iron.
   3. Jamb Depth: 4 7/8”, or as required.
   4. Jamb Profile: 2”
   5. Head Profile: 2”
   6. Joints mitered with integral tabs for interlocking and reinforcing
   7. Interlapping lead joints to ensure continuity of shielding per drawings
   8. Frames plumbed and square, installed and approved by architect prior to installation of lead lined drywall

2.10 ACCESSORIES

A. Lead Discs: 5/16 inch (8 mm) diameter lead discs for use with screw heads.

B. Lead Strips: 2 inches (51 mm) wide, unless indicated otherwise, by same thickness as sheet lead laminated on gypsum board.

C. Lead Angles: Leak-proof, lead angle system providing complete coverage of gamma rays used in lieu of lead strips and lead discs where sheet lead thickness is greater than 1/8 inch (3 mm) thick.

D. Gypsum Board Fasteners:
   1. Screw Fasteners for Metal Framing - Self Tapping: Type S, bugle head self-piercing tapping screws complying with ASTM C 1002, length as required, for applying lead-laminated gypsum board to light gage metal framing having thickness of 0.033 to 0.112 inch [0.84 to 2.84 mm] thick.

E. Adhesive: Acceptable to radiation protection product manufacturer and capable of adhering lead sheets where required.

F. Tie Wire: Leaded steel, annealed.

2.10 FINISHES

A. Field Painted Surfaces: Color as selected by Architect.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verify that existing surfaces are ready to receive work and opening dimensions are as indicated on shop drawings.

3.02 INSTALLATION OF LEAD-LAMINATED GYPSUM BOARD

A. Comply with manufacturer's recommendations.

B. Specifier Note: Lead strips are not required on 49” or greater lead sheet widths. Delete this paragraph only if 49” or greater lead sheet widths are specified.

C. Lead Strips: Adhere lead strips on face of studs at joints in lead-laminated gypsum board, including inside and outside corners. Use 2 inches (51 mm) wide strips by same thickness as sheet lead laminated on gypsum board.

D. Shim studs and other framing members as necessary to provide flat, flush finished surfaces.

E. Install lead angles per manufacturer's recommendations.

F. Install lead-laminated gypsum board on framing with screws spaced not more than 8 inches (203 mm) on center along edges of board and 12 inches (305 mm) on center in field of board.

G. Adhere lead discs to fastener heads. In each case, use method that provides continuous radiation shielding.

H. Where lead-laminated gypsum board is final substrate, apply joint treatment on fasteners and joints per “Section 09 2916 - Gypsum Board Assemblies.”

I. Where second layer of gypsum board occurs over lead-laminated gypsum board, comply with “Section 09 29160 - Gypsum Board Assemblies” for application of second layer.

3.03 INSTALLATION OF DOORS AND FRAMES

A. Lead-Lined Frames: Install lead-lined steel door frames in accordance with “Section 08 1113 - Hollow-Metal Doors and Frames.” Comply with NAAMM HMMA 840 unless otherwise indicated. Set frames accurately in position, plumb, and braced securely until permanent anchors are set.
   1. Secure door frames with steel stud anchors if lead lining is below 1/8 inch (3 mm) thick.
      a. Door Frame Supports (utilize if lead thickness is 1/8 inch (3 mm) or greater):Run steel angle supports full height on each door frame jamb and fasten to structure above.
      b. Spot-weld supports at 6 inches (152 mm) along jambs and at corners of jambs and head frame.
      c. Anchor frame to substrate with fasteners appropriate for substrate.
      d. Apply coat of asphalt mastic or paint to lead lining in door frames where lead will come in contact with masonry or grout.
   2. Provide 3 anchors per jamb, located adjacent to hinge on hinge jamb, and at corresponding heights on strike jamb.
   3. In metal stud construction, use wall anchors attached to studs with screws.
   4. Lap lead lining of frames over lining in walls at least 1 inch (25 mm).
   5. Lead Lining of Frames: Line inside of frames with lead of thickness not less than that required in doors and walls in which frames are used. Form lead to match frame contour, continuous in each jamb and across head, lapping stops. Form lead shields around areas prepared to receive hardware. Lap lining over lining in walls at least 1 inch (25 mm).

B. Lead-Lined Wood Doors:
   1. Install lead-lined wood doors in accordance with “Section 08 1416 - Flush Wood Doors” unless otherwise indicated
   2. Install doors in frames level and plumb, aligned with frames and with uniform clearance at edges.

C. Hardware: Line covers, escutcheons, and plates to provide effective shielding at cutouts and penetrations of frames and doors. Refer to “Section 08 7100 - Door Hardware” for other installations requirements.

D. Touch up damaged finishes with compatible coating after sanding smooth.

3.04 INSTALLATION OF WINDOW FRAMES

A. Set unleaded side of frame plumb and square in wall opening on control room side of wall with

shims.

B. Set leaded side of frame plumb and square in wall opening on X-Rayside of wall.

C. Compress sides together against faces of wall.

D. Install setting blocks, shims, and glazing tape in glazing channel to prevent galls from touching steel frame.

E. Install radiation resistant glazing in telescopic frame.

F. Place steel stops in position and mark location of stop and frame retaining holes on steel frame.

G. Remove glazing and drill holes in steel frame.

H. Place glazing and stops and hand drive setting screws.

3.05 INSTALLATION OF PENETRATING ITEMS

A. At penetrations of lead linings; provide lead shields to maintain continuity of protection.

B. Provide lead linings, sleeves, shields, and other protection in thickness not less than that required in assembly being penetrated.

C. Cut wall penetration covers from lead sheet of equal or greater thickness than backing on adjacent wall panels. Cut wall penetration covers to size required to cover wall penetrations with laps 1 inch (25 mm) minimum wide as indicated on penetration detail drawings.

D. Adhesive-apply lead sheet penetration covers on penetrating boxes and raceways and return penetration covers to backside of lead-backed wall panels with 1 inch (25 mm) minimum laps.
   1. Do not use penetrating fasteners unless indicated otherwise.

E. Outlet Boxes and Conduit: Install between studs using steel telescoping mounting brackets. Cover or line with lead sheet lapped over adjacent lead lining at least 1 inch (25 mm). Wrap conduit with lead sheet for 10 inches (250 mm) in from box.

3.06 INSTALLATION OF WALL PENETRATION COVERS

A. Duct Penetrations With 8 PSF or Less Lead Sheet:
   1. Wrap ducts with wall penetration covers, lapping lead joints 1 inch (25 mm) minimum.
   2. Secure lead sheet in place with 1 inch (25 mm) minimum width steel bands spaced not more than 12 inches (305 mm) on center.
   3. Do not cut into lead sheet with tightening steel bands.

B. Duct Penetrations with Greater than 8 psf Lead Sheet and Where Duct Shielding Exceeds 24 Inches (610 mm) in Width:
   1. Laminate wall penetration covers to plywood or other similar structural panels conforming to shape of duct, lapping lead joints 1 inch (25 mm) minimum.
   2. Secure lead laminated panels to ducts with mechanical fasteners located at duct seams and corners.
   3. Where necessary to prevent lead laminated panels from overloading duct supports, independently suspend panels from hangers secured to overhead building structure.
   4. Cover fastener heads with lead sheet matching thickness of adjacent lead.

C. Piping: Unless indicated otherwise, wrap piping with lead sheet for 10 inches (250 mm) from point of penetration.

3.07 ACCESSORY INSTALLATION

A. Comply with manufacturer's recommendations.

B. Wherever lead protection is penetrated, cut, or punctured, assure continuity of shielding by use of sheet lead, lead plugs or other approved method.

C. Install sheet lead lining within steel door frames to provide radiation protection to levels indicated or levels required to match adjacent wall protection.

D. Wrap electrical outlet boxes, view window frames, and other penetrations through lead barrier

material with sheet lead to provide radiation protection to levels indicated or levels required to match adjacent wall protection.

3.08 INSTALLATION - COMPONENTS AND ACCESSORIES

A. Install components and accessories in accordance with manufacturer's instructions.

3.09 FIELD QUALITY CONTROL

A. Radiation Protection Survey: Employ a registered X-Ray physicist, certified by American Board of Radiology, for testing specified radiation protective Work and to conduct radiation protection survey of facility after radiation shielding materials are installed.
   1. Take radiation measurements and indicate evaluation of measurements in report. Submit report to Architect and Owner upon completion of report.
   2. Take radiation measurements in locations indicated by Architect.

B. Correct deficiencies in, or remove and replace, radiation protection Work that testing indicates does not comply with specified requirements.

3.10 ADJUSTING

A. Check and readjust operating hardware items, leaving doors and frames undamaged and in proper operating condition.

3.11 CLEANING

A. Remove excess materials from site and leave Work areas broom clean.

B. Leave exposed surfaces ready for site finishing.

3.12 PROTECTION

A. Lock radiation-protected rooms once door hardware is installed. Limit access to only those persons performing Work in radiation-protected rooms or as directed by Owner.

B. Tape temporary paper signs on radiation-resistant walls with the following text:
   1. “Do not mount equipment on this wall without covering penetrating fasteners with lead sheet of thickness required by Contract Documents."

3.13 SCHEDULES

A. Viewing window between Control Room and X-Ray Room.

END OF SECTION

DIVISION

14

CONVEYING EQUIPMENT

SECTION 14 21 23.16
MACHINE ROOM-LESS ELECTRIC TRACTION PASSENGER ELEVATORS

PART 1 GENERAL

1.01 SUMMARY

A. Section includes: Machine room-less electric traction passenger elevators as shown and specified. Elevator work includes:
   1. Gearless electric traction passenger elevators.
   2. Elevator car enclosures, hoistway entrances and signal equipment.
   3. Operation and control systems.
   4. Accessibility provisions for physically disabled persons.
   5. Equipment, machines, controls, systems and devices as required for safely operating the specified elevators at their rated speed and capacity.
   6. Materials and accessories as required to complete the elevator installation.

B. Related Sections:
   1. Division 1 General Requirements: Meet or exceed all referenced sustainability requirements.
   2. Division 3 Concrete: Installing inserts, sleeves and anchors in concrete.
   3. Division 4 Masonry: Installing inserts, sleeves and anchors in masonry.
   4. Division 5 Metals:
      a. Providing hoist beams, pit ladders, steel framing, auxiliary support steel and divider beams for supporting guide-rail brackets.
      b. Providing steel angle sill supports and grouting hoistway entrance sills and frames.
   5. Division 9 Finishes: Providing elevator car finish flooring and field painting unfinished and shop primed ferrous materials.
   6. Division 16 Sections:
      a. Providing electrical service to elevators, including fused disconnect switches where permitted. (note: fused disconnect switch to be provided as part of elevator manufacture product)
      b. Emergency power supply, transfer switch and auxiliary contacts.
      c. Heat and smoke sensing devices.
      d. Convenience outlets and illumination in control room (if applicable), hoistway and pit.
   7. Division 22 Plumbing
      a. Sump pit
   8. Division 23 Heating, Ventilation and Air Conditioning
      a. Heating and ventilating hoistways and/or control room.

C. Work Not Included: General contractor shall provide the following in accordance with the requirements of the Model Building Code and ANSI A17.1 Code. For specific rules, refer to ANSI A17.1, Part 2 for traction elevators. State or local requirements must be used if more stringent. The cost of this work is not included in the TK Elevator's proposal, since it is a part of the building construction.
   1. A plumb and legal hoistway, properly framed and enclosed an including a pit of proper depth, and a pit ladder for each elevator. Hoistway walls require a minimum two hours of fire rating. Hoistway should be clear and plumb with variations not to exceed 1/2" at any point. Drains, lights, access doors, waterproofing and hoistway ventilation, as required.

2. Elevator controller space
    a. Door jamb controller option - controller landing wall thickness must be a minimum of 8 1/2 inches thick. This is due to the controller being mounted on the top floor landing in the door frame on the return side of the door. For center opening doors, the controller is located on the right hand frame (from inside the elevator cab looking out). Provide telephone line, light fixture (200 lx / 19 fc), and convenience outlet in the hoistway at the landing where the elevator controller is located. Final location must be coordinated with elevator contractor. These requirements must be coordinated between the general contractor and the elevator contractor.
    b. Control room option - provide a suitable control closet with access and ventilation in accordance with all applicable codes and regulations. The control closet shall be maintained at a temperature between 32 F (0 C) and 104 F (40 C). To be measured at 6 feet (1830 mm) above the floor and 1 foot (305 mm) out from the front center of the car controller(s). Relative humidity is not to exceed 95% non-condensing. Local codes may require tighter temperature ranges, and higher ventilation levels, please check with your local code authority for the exact requirements in your area. If your control closet temperatures exceed these requirements, contact your local TK Elevator sales representative for assistance. All telephone wiring to controller room control panel, and installation of telephone instrument or other communication equipment in elevator cab with all connections to elevator in controller room.
3. Hoistway must be maintained between 32ºF (0ºC) and 122ºF (50ºC) measured at the machine.
4. Adequate supports to carry the loads of all equipment, including overhead machine and machine beams located in hoistway including supports for guide rail brackets.
5. Complete 3 phase connections from the electric power mains to each controller, including necessary circuit breakers and fused mainline disconnect switches unless otherwise specified herein by elevator manufacture.
6. Electric power of the same characteristics as the permanent supply without charge for the construction, testing and adjusting.
7. Provide proper piping and conduit.
8. Divider beams for rail bracket support as required.
9. Cutting of walls floor, etc. and removal of such obstructions as may be necessary for proper installation of the elevator.
10. Grouting of door sills, hoistway frames, and signal fixtures after installation of the elevator equipment.
11. All painting, except as otherwise specified.
12. Provide hoistway walls designed and constructed in accordance with the required fire rating (including those places where elevator fixture boxes, rail bracket fastenings, and any other penetration into the hoistway walls).
13. Temporary enclosures, barricades and other protection from open hoistways and elevator work area during the time the elevator is being installed to meet all permanent installation safety codes. A temporary work platform to be provided at the top landing across the hoistway; if required, it should conform to all code and safety requirements.
14. Smoke detector\ sensing devices and contacts wired to elevator control as required by local code. A means to automatically disconnect the main line power supply to the elevator prior to the application of water in the elevator controller room shall be furnished by the electrical contractor. This means shall not be self-resetting.

15. Before erection of rough walls and doors; erect hoistway sills, headers, and frames. After rough walls are finished; erect fascias and toe guards. Set sill level and slightly above finished floor at landings.
16. A standby power source, including necessary transfer switches and auxiliary contact, where elevator operation from an alternate power supply is required.
17. Adequate storage facilities for elevator equipment prior to and during installation at ground level within 150 feet of hoistway.
18. Setting of anchors and sleeves.
19. Install bevel guards at 75° on all recesses, projections or setbacks over 2" (4" for A17.1 2000 areas) except for loading or unloading.
20. For car light and fan: provide a feeder and branch wiring circuits to elevator control cabinet.
21. Locate a light fixture (200 lx / 19 fc) and convenience outlet in pit with switch located adjacent to the access door.
22. Where pit access is by means of the lowest hoistway entrance, a vertical ladder of non-combustible material extending 42" minimum, (48" minimum for A17.1-2000 areas) shall be provided at the same height, above sill of access door or handgrips.

1.02 SUBMITTALS

A. Product data: When requested, the elevator contractor shall provide standard cab, entrance and signal fixture data to describe product for approval.

B. Shop drawings:
   1. Show equipment arrangement in the corridor, pit, and hoistway and control room. Provide plans, elevations, sections and details of assembly, erection, anchorage, and equipment location.
   2. Indicate elevator system capacities, sizes, performances, safety features, finishes and other pertinent information.
   3. Show floors served, travel distances, maximum loads imposed on the building structure at points of support and all similar considerations of the elevator work.
   4. Indicate electrical power requirements and branch circuit protection device recommendations.

C. Powder Coat paint selection: Submit manufacturer’s standard selection charts for exposed finishes and materials.

D. Plastic laminate selection: Submit manufacturer’s standard selection charts for exposed finishes and materials.

E. Metal Finishes: Provide standard metal samples for finishes indicated in Drawings.

F. Operation and maintenance data. Include the following:
   1. Owner’s manuals and wiring diagrams.
   2. Parts list, with recommended parts inventory.

1.03 QUALITY ASSURANCE

A. Manufacturer Qualifications: An approved manufacturer with minimum 15 years of experience in manufacturing, installing, and servicing elevators of the type required for the project.
    1. The manufacturer of machines, controllers, signal fixtures, door operators cabs, entrances, and all other major parts of elevator operating equipment.
        a. The major parts of the elevator equipment shall be manufactured by the installing company, and not be an assembled system.
    2. The manufacturer shall have a documented, on-going quality assurance program.
    3. ISO-9001:2000 Manufacturer Certified
    4. ISO-14001:2004 Environmental Management System Certified

B. Installer Qualifications: The manufacturer or an authorized agent of the manufacturer with not less than 15 years of satisfactory experience installing elevators equal in character and performance to the project elevators.

C. Regulatory Requirements:
    1. ASME A17.1 Safety Code for Elevators and Escalators, latest edition or as required by the local building code.
    2. NFPA 70 National Electrical Code.
    3. NFPA 80 Fire Doors and Windows.
    4. Americans with Disabilities Act - Accessibility Guidelines (ADAAG)
    5. Section 407 in ICC A117.1, when required by local authorities

D. Fire-rated entrance assemblies: Opening protective assemblies including frames, hardware, and operation shall comply with ASTM E2074, CAN4-S104 (ULC-S104), UL10(b), and NFPA Standard 80. Provide entrance assembly units bearing Class B or 1 1/2 hour label by a Nationally Recognized Testing Laboratory (2 hour label in Canada).

E. Inspection and testing:

    1. Elevator Installer shall obtain and pay for all required inspections, tests, permits and fees for elevator installation.
    2. Arrange for inspections and make required tests.
    3. Deliver to the Owner upon completion and acceptance of elevator work.

1.04 DELIVERY, STORAGE AND HANDLING

A. Manufacturing shall deliver elevator materials, components and equipment and the contractor is responsible to provide secure and safe storage on job site.

1.05 PROJECT CONDITIONS

A. Temporary Use: Elevators shall not be used for temporary service or for any other purpose during the construction period before Substantial Completion and acceptance by the purchaser unless agreed upon by Elevator Contractor and General Contractor with signed temporary agreement.

1.06 WARRANTY

A. Warranty: Submit elevator manufacturer's standard written warranty agreeing to repair, restore or replace defects in elevator work materials and workmanship not due to ordinary wear and tear or improper use or care for 12 months after final acceptance.

1.07 MAINTENANCE

A. Furnish maintenance and call back service for a period of 12 months for each elevator after completion of installation or acceptance thereof by beneficial use, whichever is earlier, during normal working hours excluding callbacks.
   1. Service shall consist of periodic examination of the equipment, adjustment, lubrication, cleaning, supplies and parts to keep the elevators in proper operation. Maintenance work, including emergency call back repair service, shall be performed by trained employees of the elevator contractor during regular working hours.
   2. Submit parts catalog and show evidence of local parts inventory with complete list of recommended spare parts. Parts shall be produced by manufacturer of original equipment.
   3. Manufacturer shall have a service office and full time service personnel within a 100 mile radius of the project site.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Basis of Design: Subject to compliance with requirements, provide TK Elevator’s evolution 200 Self-Supported Machine Room-Less elevator or comparable product by one of the following:
   1. Kone Elevator.
   2. Otis Elevator.
   3. Schindler Elevator.

2.02 MATERIALS, GENERAL

B. All Elevator Cab materials including frame, buttons, lighting, wall and ceiling assembly, laminates and flooring are as indicated in the Drawings and intended to be taken from manufacturer’s full range of available finishes or as otherwise indicated for finishes such as flooring selected that may not be by the elevator manufacturer.

C. Colors, patterns, and finishes: As indicated in the Drawings.

D. Steel:
   1. Shapes and bars: Carbon.
   2. Sheet: Cold-rolled steel sheet, commercial quality, Class 1, matte finish.
   3. Finish: Factory-applied baked enamel for structural parts, powder coat for architectural parts. Color selection must be based on elevator manufacture’s standard selections.

E. Plastic laminate: Decorative high-pressure type, complying with NEMA LD3, Type GP-50 General Purpose Grade, nominal 0.050" thickness. Laminate selection must be based on elevator manufacture’s standard selections.

F. Flooring by others. Flooring as indicated in Drawings – provide appropriate cab bottoms for indicated flooring materials.
    1. Cars 1 and 2 – Terrazzo floor finish.
    2. Car 3 (Service Car) – LVT
    3. Cars 4 and 4 - Carpet

2.03 HOISTWAY EQUIPMENT

A. Platform: Fabricated frame of formed or structural steel shapes, gusseted and rigidly welded with a wood sub-floor. Underside of the platform shall be fireproofed. The car platform shall be designed and fabricated to support one-piece loads weighing up to 25% of the rated capacity.

B. Sling: Steel stiles bolted or welded to a steel crosshead and bolstered with bracing members to remove strain from the car enclosure.

C. Deflector Sheaves: None

D. Guide Rails: Dry, non-lubricated steel, fastened to the building with steel brackets.

E. Guides: Guide shoes or roller guides with a minimum of three tires shall be mounted on top and bottom of the car and counterweight frame and be held in contact with the guide rail by adjustable devices.

F. Buffers: Provide substantial buffers in the elevator pit. Mount buffers on continuous channels fastened to the elevator guide rail or securely anchored to the pit floor. Provide extensions if required by project conditions.

G. Machine: The hoisting machine shall be a compact energy efficient permanent magnet Gearless traction type, consisting of PMAC motor, brake and driving sheave mounted on a rigid bedplate in the top of the hoistway. A large solid, forged shaft shall serve as a support for the motor rotor assembly and for the drive sheave and brake system. It shall be supported by roller bearings mounted in the machine housing.

H. Drive System:
    1. The drive system shall be of the Variable Voltage Variable Frequency (VVVF) regenerative.
    2. The system shall be a vector controlled pulse-width modulated AC drive. The variable voltage variable frequency drive shall convert the AC power supply using a two-step process to a variable voltage variable frequency power supply for use by the hoist motor.
    3. The speed control shall be by means of vector control providing direct torque and field excitation automatically provided by permanent magnet. A digital absolute velocity encoder shall be provided giving feedback to the controller on armature position and motor speed.
    4. Dual solid state electronics (IGBT Insulated Gate Bipolar Transistor) in series shall be used in place of mechanical contactors.

I. Motor/Machine: The motor shall be PMAC, totally enclosed, non-ventilated with class "B" insulation. Ventilation fans are used if the situation requires a larger motor such as systems requiring six belts or speeds greater than 350 fpm. The motor armature shall be dynamically balanced and supported by roller bearings of ample capacity. The armature and driving sheave shall be properly balanced for smooth, high-speed elevator performance. The PM machine shall be mounted horizontally in the top of the hoistway in a unitized formed steel structure on bearing plates furnished by the elevator installer. The unitized formed steel structure shall be mounted on the guide rails provided by TK Elevator.

J. Brake: The brake shall be a spring applied electric brake; held open by an electro-magnet actuated by a digital brake controller and designed to make smooth, positive stops. The Brake shall be designed to automatically apply in the event of interruption of power supply from any cause. Operation and control of the brake shall be all digital. The setting and lifting of the brake shall be software based and all electronic. All adjustments and setup of the brake shall be made using a PC interface. No contactors or resistors shall be used in the actuation of the brake.

K. Suspension Belts and Governor Rope: Suspension belts shall be flat belts of polyurethane with an inner core of 12 steel cords with an FT1 fire rating such that hoistway sprinklers are not required by NFPA-13. Each belt shall have a suspension strength of 60 KN (13,488 pounds).
    1. Four to six belts shall be used depending on the car capacity.
    2. Suspension tension monitor shall detect differences in belt tension and for loss of tension. If fault is detected, the car shall stop at the nearest floor and an Out of Service call be registered.
    3. Trip criteria shall be monitored and data shall be stored in redundant non-volatile locations. Belts shall be replaced prior to the end of service life. Messages shall be issued at 180, 90, and 30 days prior to the last day of service life.
    4. Governor ropes shall be of iron construction.
    5. Any special tools, devices, software or equipment required for monitoring the wear of suspension shall be included with the installation of the equipment and become the property of the owner at time of elevator completion. This includes special ongoing monitoring systems, special tools and instruction needed to monitor the suspension system.

L. Counterweight: Counterbalance each elevator for smooth and economical operation by using iron or steel plate weights securely fastened in a steel counterweight frame. Counterweight shall equal the weight of the complete elevator car and approximately 50 percent of the specified capacity load.

M. Safety and Governor: Car safety shall be mounted on the bottom members of the car frame and be operated by a centrifugal speed governor. The governor shall be designed to cut off power to the motor and apply the brake whenever the governor indicates the car has excessive speed. The governor shall function when the car over speeds.

N. Emergency Terminal Limits: Place electric limit devices in the hoistway near the terminal landings. Limit switch(es) shall be designed to cut off the electric current and stop the car if it runs beyond either terminal landing.

O. Automatic Self-Leveling: Provide each elevator car with a self-leveling feature to automatically bring the car to the floor landings and correct for over travel or under travel. Self-leveling shall, within its zone, be automatic and independent of the operating device. The car shall be maintained approximately level with the landing irrespective of its load.

2.04 HOISTWAY ENTRANCES

A. Doors and Frames: Provide complete hollow metal type hoistway entrances at each hoistway opening bolted\knock down construction.
   1. Manufacturer's standard entrance design consisting of hangers, doors, hanger supports, hanger covers, fascia plates (where required), sight guards, and necessary hardware.
   2. Main landing door & frame finish: Stainless steel panels, no. 4 brushed finish with no. 4 brushed finish entrance frame.
   3. Typical door & frame finish: Stainless steel panels, no. 4 brushed finish with no. 4 brushed finish entrance frame.

B. Interlocks: Equip each hoistway entrance with an approved type interlock tested as required by code. Provide door restriction devices as required by code.

C. Door Hanger and Tracks: Provide sheave type two point suspension hangers and tracks for each hoistway horizontal sliding door.
   1. Sheaves: Polyurethane tires with ball bearings properly sealed to retain grease.
   2. Hangers: Provide an adjustable device beneath the track to limit the up-thrust of the doors during operation.
   3. Tracks: Drawn steel shapes, smooth surface and shaped to conform to the hanger sheaves.

D. Hoistway Sills: Extruded metal, with groove(s) in top surface. Provide mill finish on aluminum.

2.05 PASSENGER ELEVATOR CAR ENCLOSURE

A. Car Enclosure:
   1. Walls: Cab type TKS, reinforced cold-rolled steel. Walls shall be constructed of stainless steel, no. 4 brushed finish.
   2. Reveals and frieze: Not Applicable
   3. Canopy: Cold-rolled steel with hinged exit.
   4. Ceiling: Downlight type, metal pans with suspended LED downlights and dimmer switch. Number of downlights shall be dependent on platform size with a minimum of six. The metal pans shall be finished with a stainless steel, no. 4 brushed finish.
   5. Cab Fronts, Return, Transom, Soffit and Strike: Provide panels faced with brushed stainless steel
   6. Doors: Horizontal sliding car doors reinforced with steel for panel rigidity. Hang doors on sheave type hangers with polyurethane tires that roll on a polished steel track and are guided at the bottom by non-metallic sliding guides.
      a. Door Finish: Stainless steel panels: No. 4 brushed finish.
      b. Cab Sills: Extruded aluminum, mill finish.

7. Handrail: Provide 2' flat metal bar on side and rear walls on front opening cars and side walls only on front and rear opening cars. Handrails shall have a stainless steel, no. 4 brushed finish.
8. Ventilation: Manufacturer's standard exhaust fan, mounted on the car top.
9. Protection pads and buttons: Not required

B. Car Top Inspection: Provide a car top inspection station with an "Auto-Inspection" switch, an "emergency stop" switch, and constant pressure "up and down" direction and safety buttons to make the normal operating devices inoperative. The station shall give the inspector complete control of the elevator. The car top inspection station shall be mounted in the door operator assembly.

2.06 DOOR OPERATION

A. Door Operation: Provide a direct or alternating current motor driven heavy duty operator designed to operate the car and hoistway doors simultaneously. The door control system shall be digital closed loop and the closed loop circuit shall give constant feedback on the position and velocity of the elevator door. The motor torque shall be constantly adjusted to maintain the correct door speed based on its position and load. All adjustments and setup shall be through the computer based service tool. Door movements shall follow a field programmable speed pattern with smooth acceleration and deceleration at the ends of travel. The mechanical door operating mechanism shall be arranged for manual operation in event of power failure. Doors shall automatically open when the car arrives at the landing and automatically close after an adjustable time interval or when the car is dispatched to another landing. AC controlled units with oil checks, or other deviations are not acceptable.
   1. No Un-Necessary Door Operation: The car door shall open only if the car is stopping for a car or hall call, answering a car or hall call at the present position or selected as a dispatch car.
   2. Door Open Time Saver: If a car is stopping in response to a car call assignment only (no coincident hall call), the current door hold open time is changed to a shorter field programmable time when the electronic door protection device is activated.
   3. Double Door Operation: When a car stops at a landing with concurrent up and down hall calls, no car calls, and no other hall call assignments, the car door opens to answer the hall call in the direction of the car's current travel. If an onward car call is not registered before the door closes to within 6 inches of fully closed, the travel shall reverse and the door shall reopen to answer the other call.
   4. Nudging Operation: The doors shall remain open as long as the electronic detector senses the presence of a passenger or object in the door opening. If door closing is prevented for a field programmable time, a buzzer shall sound. When the obstruction is removed, the door shall begin to close at reduced speed. If the infra-red door protection system detects a person or object while closing on nudging, the doors shall stop and resume closing only after the obstruction has been removed.
   5. Door Reversal: If the doors are closing and the infra-red beam(s) is interrupted, the doors shall reverse and reopen. After the obstruction is cleared, the doors shall begin to close.
   6. Door Open Watchdog: If the doors are opening, but do not fully open after a field adjustable time, the doors shall recycle closed then attempt to open six times to try and correct the fault.

7. Door Close Watchdog: If the doors are closing, but do not fully close after a field adjustable time, the doors shall recycle open then attempt to close six times to try and correct the fault.
8. Door Close Assist: When the doors have failed to fully close and are in the recycle mode, the door drive motor shall have increased torque applied to possibly overcome mechanical resistance or differential air pressure and allow the door to close.

B. Door Protection Device: Provide a door protection system using microprocessor controlled infra-red light beams. The beams shall project across the car opening detecting the presence of a passenger or object. If door movement is obstructed, the doors shall immediately reopen.

2.07 CAR OPERATING STATION

A. Car Operating Station, General: The main car control in each car shall contain the devices required for specific operation mounted in an integral swing return panel requiring no applied faceplate. Wrap return shall have a brushed stainless steel finish. The main car operating panel shall be mounted in the return and comply with handicap requirements. Pushbuttons that illuminate using long lasting LED's shall be included for each floor served, and emergency buttons and switches shall be provided per code. Switches for car light and accessories shall be provided.

B. Emergency Communications System: Integral phone system provided.

C. Auxiliary Operating Panel: No

D. Column Mounted Car Riding Lantern: A car riding lantern shall be installed in the elevator cab and located in the entrance. The lantern, when illuminated, will indicate the intended direction of travel. The lantern will illuminate and a signal will sound when the car arrives at a floor where it will stop. The lantern shall remain illuminated until the door(s) begin to close.

Special Equipment:
Limited Access Operation: Keyswitch and card reader space.(card reader by others)

2.08 CONTROL SYSTEMS

A. Controller: The elevator control system shall be microprocessor based and software oriented. The system shall operate in real time, continuously analyzing the car(s) changing position, condition, and work load. All controller and operational circuits including the brake control and drive system shall be digital. Control of the elevator shall be automatic in operation by means of push buttons in the car numbered to correspond to floors served, for registering car stops, and by "up-down" push buttons at each intermediate landing and "call" push buttons at terminal landings.
1. Momentary pressing of one or more buttons shall dispatch the car to the designated landings in the order in which the landings are reached by the car, irrespective of the sequence in which the buttons are pressed. Each landing call shall be canceled when answered.
2. When the car is traveling in the up direction, it shall stop at all floors for which car buttons or "up" hall buttons have been pressed. The car shall not stop at floors where "down"

buttons have been pressed, unless the stop for that floor has been registered by a car button or unless the down call is at the highest floor for which any buttons have been pressed. Pressing the "up" button when the car is traveling in the down direction shall not intercept the travel unless the stop for that floor has been registered by a car button or unless the up call is the lowest for which any button has been pressed.

3. When the car has responded to its highest or lowest stop, and stops are registered for the opposite direction, its direction of travel shall reverse automatically and it shall then answer the calls registered for that direction. If both up and down calls are registered at an intermediate floor, only the call corresponding to the direction of car travel shall be canceled upon the stopping of the car at the landing.
4. A car that is stopping for the last hall call in the preference direction, and that hall call is for the opposite direction with no onward car calls, shall reverse preference when the selector position advances to the landing at which the car is committed to stop. A car that is stopping for the last hall call in the preference direction, and that hall call is for the same direction, shall hold its preference until the door is almost closed allowing time for a passenger to register an onward car call which shall maintain the preference. If no car call is registered before the door is almost closed, the car shall lose its preference and shall be available to accept calls in either direction.

B. Operation: Selective Collective – ETA based. The system is optimized to get a car to the floor where a hall call has been registered, in the shortest time. The system receives input information from standard call pushbuttons located in the hall, car position and car load information from individual car load weighers.

1. When group operation is required, the group supervisory operation shall be embedded within selected car controllers. No separate group controller shall be supplied. The microprocessor shall constantly scan the system for hall calls. When hall calls are registered, the control system shall immediately calculate the estimated time for arrival using such information as, number of floors to travel from the current position, the time it takes to travel one floor at top speed, calls assigned to a car, and car reversal time to respond to a call in the opposite direction of travel. When a car’s status changes or additional hall calls are registered, the estimated time of arrival shall be recalculated and calls reassigned if necessary.
2. Traffic Pattern: The microprocessor shall provide flexibility to meet well defined patterns of traffic, including up peak, down peak, and heavy interfloor demands, and adjust for indeterminate variations in these patterns which occur in buildings.
3. Artificial Intelligence: Artificial Intelligence shall be an integral part of the group control system software. The enhanced artificial intelligence shall optimize the interfloor traffic performance. Inputs for the artificial intelligence shall include accurate passenger load from an electronic loadweigher, probable car calls generated from each hall call, type of building and observed traffic patterns.

C. Load Weighing Device: Provide a load weighing device on each car which, when the particular car is filled to an adjustable percentage of the capacity load, shall cause the car to bypass landing calls but not car calls. The passed landing calls shall remain registered for the next following car.
    1. The device shall be unaffected by the action of compensating chain or rope. The device shall detect a 50 pound (23 Kg.) load change under all conditions.

2. The load sensor shall use a load cell to accurately measure the weight in the car. The information shall be transferred via a serial link to the elevator controller.

D. Anti-Nuisance Call Control: The microprocessor control system shall evaluate the number of people on the car and compare that value to the number of car calls registered. If the number of car calls exceeds the number of people by a field programmable value, the car calls shall be canceled after the first call has been answered.

E. Position Selector: The position selector shall be part of the microprocessor system. The car position in the hoistway shall be digitized through a primary position encoder. The microprocessor control system shall store the floor position and slow down points in memory.

F. Motion Control: The drive control system shall be dual-loop feedback system based primarily on car position. The velocity profile shall be calculated by the microprocessor control system producing extremely smooth and accurate stops. The velocity encoder shall permit continuous comparison of machine speed to velocity profile and to actual car speed. This accurate position/velocity feedback shall permit a fast and accurate control of acceleration and retardation.

G. Motor Pre-Torque: Current shall be applied to the elevator drive before the brake is released and the speed pattern is dictated to eliminate roll back and sling shot effects of unbalanced loads in the car. The electronic loadweigher shall determine the load on the car determining a pre-torque reference to send to the drive.

H. Emergency Power Operation: (Group 10-D4A) Upon loss of normal power, building-supplied standby power is available to the elevator on the same wires as the normal power. Once the loss of normal power has been detected and standby power is available, one elevator at a time from each group will be lowered to a pre-designated landing and will open the doors. After passengers have exited the elevator, the doors are closed and the car shuts down. The next available car in the group will then be selected to lower, allow passengers to exit, close the doors and shutdown. This process is repeated until all cars in the group have been lowered and parked. At this time, an elevator is automatically allowed to continue service using the building-supplied standby power. A manual selection switch is available to override the automatic selection and allow and car in the group to provide service to the building. When normal power is restored, the elevators automatically resume operation.

I. Destination Dispatch: Not Applicable

J. Automatic Light and Fan shut down: The control system shall evaluate the system activity and automatically turn off the cab lighting and ventilation fan during periods of inactivity. The settings shall be field programmable.

2.09 HALL STATIONS

A. Hall Stations, General: Buttons shall illuminate to indicate call has been registered at that floor for the indicated direction.
   1. Provide one pushbutton riser with faceplates having a brushed stainless steel finish.
      a. Phase 1 firefighter's service key switch, with instructions, shall be incorporated into the hall station at the designated level.

B. Floor Identification Pads: Provide door jamb pads at each floor. Jamb pads shall comply with Americans with Disabilities Act (ADA) requirements.

C. Hall Position Indicator: An electronic dot matrix position indicator shall be provided and mounted for optimum viewing. As the car travels, its position in the hoistway shall be indicated by the illumination of the alphanumeric character corresponding to the landing which the elevator is stopped or passing. When hall lanterns are provided, the position indicator shall be combined with the hall lanterns in the same faceplate. Faceplates shall match hall stations. Provide at all typical landings.

D. Hall lanterns: Not Applicable

2.10 CONTROLLER LOCATION

A. A control closet shall be provided remote to the hoistway. The control closet for simplex cars shall be 5'-6" x 6'-4" x 7'-6" high minimum size. For two-car group operation, the control closet shall be 8'-0' x 5'-6" x 7'6" high minimum. The control closet must be located within a distance that limits the wire length to 150'-0" or less from the elevator machine to elevator controller. The control closet shall have a 3?-0? wide door minimum. The control closet disconnect is provided by others. A disconnect shall be provided by others for each elevator in the optional control closet.

PART 3 EXECUTION

3.01 EXAMINATION

A. Before starting elevator installation, inspect hoistway, hoistway openings, pits and/or control room, as constructed, verify all critical dimensions, and examine supporting structures and all other conditions under which elevator work is to be installed. Do not proceed with elevator installation until unsatisfactory conditions have been corrected in a manner acceptable to the installer.
B. Installation constitutes acceptance of existing conditions and responsibility for satisfactory performance.

3.02 INSTALLATION

A. Install elevator systems components and coordinate installation of hoistway wall construction.
    1. Work shall be performed by competent elevator installation personnel in accordance with ASME A17.1, manufacturer's installation instructions and approved shop drawings.
    2. Comply with the National Electrical Code for electrical work required during installation.

B. Perform work with competent, skilled workmen under the direct control and supervision of the elevator manufacturer's experienced foreman.

C. Supply in ample time for installation by other trades, inserts, anchors, bearing plates, brackets, supports, and bracing including all setting templates and diagrams for placement.

D. Welded construction: Provide welded connections for installation of elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustment,

inspection, maintenance, and replacement of worn parts. Comply with AWS standards for workmanship and for qualification of welding operators.

E. Coordination: Coordinate elevator work with the work of other trades, for proper time and sequence to avoid construction delays. Use benchmarks, lines, and levels designated by the Contractor, to ensure dimensional coordination of the work.

F. Install machinery, guides, controls, car and all equipment and accessories to provide a quiet, smoothly operating installation, free from side sway, oscillation or vibration.

G. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with cars. Where possible, delay final adjustment of sills and doors until car is operable in shaft. Reduce clearances to minimum safe, workable dimensions at each landing.

H. Erect hoistway sills, headers, and frames before erection of rough walls and doors; erect fascia and toe guards after rough walls finished. Set sill units accurately aligned and slightly above finish floor at landings.

I. Lubricate operating parts of system, including ropes, as recommended by the manufacturer.

3.03 FIELD QUALITY CONTROL

A. Acceptance testing: Upon completion of the elevator installation and before permitting use of elevator, perform acceptance tests as required and recommended by Code and governing regulations or agencies. Perform other tests, if any, as required by governing regulations or agencies.

B. Advise Owner, Contractor, Architect, and governing authorities in advance of dates and times tests are to be performed on the elevator.

3.04 ADJUSTING

A. Make necessary adjustments of operating devices and equipment to ensure elevator operates smoothly and accurately.

3.05 CLEANING

A. Before final acceptance, remove protection from finished surfaces and clean and polish surfaces in accordance with manufacturer's recommendations for type of material and finish provided. Stainless steel shall be cleaned with soap and water and dried with a non-abrasive surface; it shall not be cleaned with bleach-based cleansers.

B. At completion of elevator work, remove tools, equipment, and surplus materials from site. Clean equipment rooms and hoistway. Remove trash and debris.
    1. Use environmentally preferable and low VOC emitting cleaners for each application type. Cleaners that contain solvents, pine and/or citrus oils are not permitted.

3.06 PROTECTION

A. At time of Substantial Completion of elevator work, or portion thereof, provide suitable protective coverings, barriers, devices, signs, or other such methods or procedures to protect elevator work from damage or deterioration. Maintain protective measures throughout remainder of construction period.

3.07 DEMONSTRATION

A. Instruct Owner's personnel in proper use, operations, and daily maintenance of elevators. Review emergency provisions, including emergency access and procedures to be followed at time of failure in operation and other building emergencies. Train Owner's personnel in normal procedures to be followed in checking for sources of operational failures or malfunctions.

B. Make a final check of each elevator operation, with Owner's personnel present, immediately before date of substantial completion. Determine that control systems and operating devices are functioning properly.

3.08 ELEVATOR SCHEDULE

A. Cars 1 and 2 - Elevator Qty. 2
   1. Elevator Model: evolution 200
   2. Elevator Type: Gearless Traction Machine Room-Less, Passenger
   3. Rated Capacity: 5000 lbs.
   4. Rated Speed: 200 ft./min.
   5. Operation System: TAC32T
   6. Travel: 34'-0"
   7. Landings: 3 total
   8. Openings:
      a. Front: 3
      b. Rear: 0
   9. Clear Car Inside: 5'-8" wide x 8'-5" deep
   10. Inside clear height: 7'-4" standard
   11. Door clear height: 7'-0" standard
   12. Hoistway Entrance Size: 4'-6" wide x 7'-0" high
   13. Door Type: Two-speed | RH-LH Side opening
   14. Power Characteristics: 460 volts, 3 Phase, 60 Hz.
      a. Note: Isolation Transformer required for jobs with less than 480vac, 3 Phase building power.
   15. Seismic Requirements: Zone
   16. Hoistway Dimensions: 8'-3" wide x 10'-2" deep
      a. Note: Hoistway dimensions listed above are for Seismic Zone 1 only. If you have chosen a seismic zone other than zone 1 please consult your local TK Elevator Sales Representative for the proper hoistway dimensions.
   17. Pit Depth: 5'-0"
   18. Button & Fixture Style: Traditional Signal Fixtures
   19. Special Operations:
      Limited Access with card readers by others

A. Car 3 - Elevator Qty. 1
    1. Elevator Model: evolution 200
    2. Elevator Type: Gearless Traction Machine Room-Less, Passenger
    3. Rated Capacity: 5000 lbs.
    4. Rated Speed: 200 ft./min.
    5. Operation System: TAC32T
    6. Travel: 34'-0"
    7. Landings: 3 total
    8. Openings:
        a. Front: 3
        b. Rear: 0
    9. Clear Car Inside: 5'-8" wide x 8'-5" deep
    10. Inside clear height: 7'-4" standard
    11. Door clear height: 7'-0" standard
    12. Hoistway Entrance Size: 4'-6" wide x 7'-0" high
    13. Door Type: Two-speed | RH Side opening
    14. Power Characteristics: 460 volts, 3 Phase, 60 Hz.
        a. Note: Isolation Transformer required for jobs with less than 480vac, 3 Phase building power.
    15. Seismic Requirements: Zone
    16. Hoistway Dimensions: 8'-3" wide x 10'-2" deep
        a. Note: Hoistway dimensions listed above are for Seismic Zone 1 only. If you have chosen a seismic zone other than zone 1 please consult your local TK Elevator Sales Representative for the proper hoistway dimensions.
    17. Pit Depth: 5'-0"
    18. Button & Fixture Style: Traditional Signal Fixtures
    19. Special Operations:
        Limited Access with card readers by others

B. Car 4 - Elevator Qty. 1
    1. Elevator Model: evolution 200
    2. Elevator Type: Gearless Traction Machine Room-Less, Passenger
    3. Rated Capacity: 2500 lbs.
    4. Rated Speed: 200 ft./min.
    5. Operation System: TAC32T
    6. Travel: 17'-0"
    7. Landings: 2 total
    8. Openings:
        a. Front: 2
        b. Rear: 0

9. Clear Car Inside: 6'-8" wide x 4'-3 3/8" deep
10. Inside clear height: 7'-4" standard
11. Door clear height: 7'-0" standard
12. Hoistway Entrance Size: 3'-6" wide x 7'-0" high
13. Door Type: One-speed Center opening
14. Power Characteristics: 460 volts, 3 Phase, 60 Hz.
    a. Note: Isolation Transformer required for jobs with less than 480vac, 3 Phase building power.
15. Seismic Requirements: Zone
16. Hoistway Dimensions: 8'-6" wide x 5'-9" deep
    a. Note: Hoistway dimensions listed above are for Seismic Zone 1 only. If you have chosen a seismic zone other than zone 1 please consult your local TK Elevator Sales Representative for the proper hoistway dimensions.
17. Pit Depth: 5'-0"
18. Button & Fixture Style: Traditional Signal Fixtures
19. Special Operations: None

C. Car 5 - Elevator Qty. 1
1. Elevator Model: evolution 200
2. Elevator Type: Gearless Traction Machine Room-Less, Passenger
3. Rated Capacity: 2500 lbs.
4. Rated Speed: 200 ft./min.
5. Operation System: TAC32T
6. Travel: 34'-0"
7. Landings: 3 total
8. Openings:
    a. Front: 2
    b. Rear: 1
9. Clear Car Inside: 6'-8" wide x 4'-3 7/8" deep
10. Inside clear height: 7'-4" standard
11. Door clear height: 7'-0" standard
12. Hoistway Entrance Size: 3'-6" wide x 7'-0" high
13. Door Type: One-speed Center opening
14. Power Characteristics: 460 volts, 3 Phase, 60 Hz.
    a. Note: Isolation Transformer required for jobs with less than 480vac, 3 Phase building power.
15. Seismic Requirements: Zone
16. Hoistway Dimensions: 8'-6" wide x 6'-8 3/8" deep
    a. Note: Hoistway dimensions listed above are for Seismic Zone 1 only. If you have chosen a seismic zone other than zone 1 please consult your local TK Elevator Sales Representative for the proper hoistway dimensions.
17. Pit Depth: 5'-0"
18. Button & Fixture Style: Traditional Signal Fixtures
19. Special Operations: None

3.09 SPECIAL CONDITIONS (Note: Add Special Conditions as Needed)

END OF SECTION

DIVISION

21

FIRE SUPPRESSION

SECTION 21 00 00 - FIRE PROTECTION SYSTEM

PART 1 GENERAL

1.1 WORK INCLUDED:

A. The General Conditions of the Contract and Supplementary Conditions of the Contract shall govern the work under this Section of the Specifications. The Contractor is specifically directed to refer to said conditions.

B. It is understood that these specifications, and the accompanying drawings, complement complete apparatus, fully erected and in successful operating condition. All work must be preformed in the best and most substantial manner.

C. These specifications are intended to provide complete, and in proper operation, all sprinkler system piping, equipment, heads, valves, controls, air compressor, and accessories, all as specified herein or shown on the accompanying drawings, or reasonably implied in either. The building shall be provided with complete coverage sprinkler system for the spaces designated on the drawings classification as required. System shall consist of a calculated dry system unless indicated otherwise. Verify all pertinent criteria. The systems shall conform to layout shown and meet all requirements of agencies listed under "REGULATIONS AND STANDARDS" below. Refer to plans and specifications for additional information.

D. Pipe, fittings, valves, and connections for fire protection and sprinkler systems shall be furnished by fire protection contractor.

1.2 RELATED WORK:

A. Section 21 13 13 - Wet-pipe Sprinkler Systems.

1.3 SYSTEM LAYOUT:

A. Where plans indicate layout of system components, the layout shall be verified to comply with "REGULATIONS AND STANDARDS" and shall be revised if required to comply. The location of the sprinkler system piping and components shall be coordinated with all other trades. Revisions to sprinkler system layout shall be at Sprinkler Contractor's expense. Any such revisions shall be verified with the Architect.

1.4 ELECTRICAL WORK

A. See 28 31 00 – Fire Alarm

1.5 SPRINKLER SYSTEM CONTRACTOR:

A. It is intended that the work under this section is to be preformed by a qualified Fire Protection Piping Systems Contractor regularly engaged in this type of work. The Contractor is to hold a current license to perform this work and be certified by the State Fire Marshall. All documents shall bear this certification.

1.6 REGULATIONS, STANDARDS AND REFERENCES:

A. It is the intention of these specifications and the accompanying drawings, that all elements and features of the fire protection system shall be in accordance with the standards of the National Fire Association (NFPA), the State Fire Marshall, all applicable building codes and Property Insurance Association of Louisiana whether so indicated or not. NFPA standards are on file in office of Engineer and may be examined at the Contractor's request.

B. ASME B16.1 - Cast Iron Pipe Flanges and Flanged Fittings, Class 150.

C. ANSI/ASME B16.3 - Malleable Iron Threaded Fittings, Class 150. Interior of building.

D. Specifications for Qualification of Welding Procedures and Welders for Piping and Tubing.

E. NFPA 13 - Installation of Sprinkler Systems.

F. NFPA 14 - Standpipe and Hose Systems.

1.7 QUALITY ASSURANCE:

A. Conform to NFPA 13 for sprinkler systems.

B. Conform to NFPA 14 for standpipe hose systems.

C. Welding Materials and Procedures: Conform to ASME Code.

D. Employ certified welders in accordance with ANSI/ASME Section 9. AWS D10.9.

E. Valves: Bear UL FM label or marking. Provide manufacturer's name and pressure rating marked on valve body.

1.8 SUBMITTALS:

A. Submit product data under provisions of section 01 33 00 – Submittal Procedures

B. Indicate pipe materials used, jointing methods, supports, floor and wall penetration seals.

C. Indicate valve data and ratings.

1.9 DELIVERY, STORAGE, AND HANDLING:

A. Deliver and store valves in shipping containers, with labeling in place, under provisions of Section 01 60 00– Materials and Equipment.

B. Provide temporary protective coating on cast iron and steel valves.

C. Provide temporary end caps and closures. Maintain in place until installation.

D. Sprinkler piping shall be stored off the ground or floor with ends sealed to protect from debris.

1.10 AREAS SUBJECT TO FREEZING:

A. For areas requiring protection and not receiving direct heating during times of potential freezing, such as building overhangs, porches, canopies, attics, etc. provide a compressed air dry pipe system for these areas only, see drawings for locations. Coordinate electrical requirements with contractor.

1.11 MANUFACTURER'S OR TRADE NAMES:

A. Where the plans or specifications mention the names of manufacturers or the products of specific manufacturers, it is intended that the Contractor shall furnish the item or items as specifies. Products of manufacturers that are not mentioned shall be subject to prior review by the Engineer and shall in any case mentioned shall be subject to prior review by the Engineer and shall in any case be in accordance with regulations and standards as state above.

1.12 SHOP DRAWINGS AND SUBMITTAL DATA:

A. Within fifteen (15) days of award of the contract, the contractor shall submit one (1) copy of system piping shop drawings and one (1) copy of manufacturer's data and descriptive literature and drawings for all equipment and materials. Additionally, provide a reproducible (sepia) copy of the system piping shop drawings. All drawings, literature and data on all equipment shall be submitted at the same time; this material shall contain complete layout, capacity data, dimensions and other pertinent information necessary for the Architect to properly review and evaluate the item that necessary to meet the requirements for submittal to the State Fire Marshall.

B. The contractor shall obtain approval of agencies listed under "REGULATIONS AND STANDARDS" before submitting to the Engineer, except that the date for State Fire Marshall's review shall be submitted to the Engineer prior submitting to the Fire Marshall. All required review fees and applicable requirements shall be by the contractor. No item of equipment or material shall be place on order until Final Review comments have been received from the Architect. See "DRAWINGS" below.

1.13 ORDINANCES, RULES AND REGULATIONS:

A. All material and construction shall conform to the requirements of all building, plumbing and sanitary codes and laws in force in the locality in which the work is to be done. All materials and construction shall also conform to the rules and regulations listed above under "REGULATIONS AND STANDARDS".

1.14 DRAWINGS:

A. The contractor shall submit detailed drawings for all sprinkler system showing exact locations and sizes of all elements in the system before fabrication is begun. Engineer shall have the prerogative of changing the position or configuration of these systems without changing the total scope of work involved to comply with "Regulations And Standards".

1.15 GUARANTEE:

A. The contractor shall guarantee all materials and workmanship under this contract for a period of one (1) year from date of final acceptance of his work and shall repair or replace any such defective materials and workmanship without cost to the Owner.

B. The guarantee shall include complete service, including adjustment service and inspection, during the guarantee period as required by local codes and regulations.

1.16 APPROVAL OF PRODUCT PRIOR TO BIDDING

A. Refer to Instructions to Bidders

PART 2 PRODUCTS

2.1 PIPE AND TUBE:

A. See Section – 21 13 13 Wet-pipe Sprinkler System

B. Underground pipe shall be C900 to within 5' of building.

2.2 PIPE FITTINGS:

A. Steel Fittings: ANSI/ASME B16.9, wrought steel, butt welded. ANSI/ASME B16.25, buttweld ends. ASTM A234, wrought carbon steel and alloy steel. ANSI/ASME B16.5,steel flanges and fittings. ANSI/ASME B16.11, forges steel socket welded and threaded.

B. Cast Iron Fittings: ANSI/ASME B16.1,flanges and fittings. B16.4, screwed fittings.

C. Malleable Iron Fittings: ANSI/ASME B16.3, screwed type. ANSI/ASTM A47.

D. All piping and fittings in PDDC areas must be schedule 40 galvanized steel piping.

2.3 JOINT MATERIALS:

A. Solder: ANSI/ASTM B32, 95/5 alloy.

B. Brazing: ANSI/AWS A5.8.

C. Threaded Joint Compound.

2.4 UNIONS, FLANGES, AND COUPLINGS:

A. Unions: 150 psi malleable iron for threaded ferrous piping.

B. Flanges: 150 psi forges steel slip-on flanges for ferrous piping.

2.5 ACCEPTABLE MANUFACTURER - GATE VALVES:

A. Nibco 637-31

B. Central 722 U Series

C. Substitutions: Under provisions of Instructions To Bidders.

2.6 GATE VALVES:

A. Bronze, rising stem, inside screw, solid wedge.

2.7 ACCEPTABLE MANUFACTURERS - GLOBE OR ANGLE VALVES:

A. Nibco GS-132-U

B. Crane 143

C. Substitutions: Under provisions of Instructions To Bidders.

2.8 GLOBE OR ANGLE VALVES:

A. Bronze, rising stem, inside screw, renewable composition disc.

2.9 ACCEPTABLE MANUFACTURERS - CHECK VALVES:

A. NIBCO CS-172

B. Crane 147

C. Substitutions: Under provisions of Instructions To Bidders.

2.10 CHECK VALVES:

A. Iron body, bronze trim, swing disc, renewable disc and seat.

2.11 ACCEPTABLE MANUFACTURERS - BUTTERFLY VALVES:

A. Nibco LD 3510-2 Series

B. Central Fig. 570 or 580

C. Substitutions: Under provisions of Instructions To Bidders.

2.12 BUTTERFLY VALVES:

A. Iron body, bronze stainless steel disc and stem extended for insulated work, resilient replaceable liner seat.

2.13 ACCEPTABLE MANUFACTURERS - DRAIN VALVES:

A. Nibco F-667-0 Series

B. Central 722 U Series

C. Substitutions: Under provisions of Instructions To Bidders.

2.14 DRAIN VALVES:

A. Brass ball valve with cap and chain, 3/4 inch (19 mm) hose thread.

2.15 VALVE OPERATORS:

A. Provide handwheels for gate, globe or angle, and drain valves.

B. For butterfly valves provide gear operators for sizes 8 inches and larger. For smaller sizes provide level lock handle with toothed plate.

2.16 VALVE CONNECTIONS:

A. Provide valve connections to match pipe joints. Use valves of pipe size.

B. For copper tube, provide threaded solder adapters for connection to valve.

C. Provide butterfly valve with tapped lug body when used for isolating service.

2.17 SIAMESE FIRE DEPARTMENT CONNECTIONS:

A. Provide two-way standard siamese fire department connection with chrome plated finish, local fire department threads, dust caps and chains, 3/4" automatic drip, marked "SPRINKLER - FIRE DEPARTMENT CONNECTION:.

2.18 ACCEPTABLE MANUFACTURERS - SPRINKLER HEADS:

A. Reliable Automatic Sprinkler

B. Viking Corp.

C. Tyco-Fire

D. Substitutions: Under provisions of Instruction To Bidders.

E. Sprinkler heads in any pool areas shall be corrosion resistant.

PART 3 INSTALLATION

3.1 GENERAL:

A. Furnish and install in a neat workmanlike manner, all piping shown on drawings or that is

specified or required to provide a complete, properly operating installation. All piping and accessories shall conform to standards as applicable.

B. Run piping parallel with the lines of the building, unless specifically shown or noted otherwise. All pipe, fittings, valves, etc., shall have sufficient clearance from other work to finish at least 1/2 inch from other work or finished covering of other piping.

C. Provide all necessary hangers, anchors, thrust blocks, etc., to properly support and protect piping system, as required by agencies listed under "REGULATIONS AND STANDARDS".

D. Under no circumstances is the contractor to attach to or support from any bar joist bridging. Any supports to the bar joists or any structural systems are to be approved by the Architect/Engineer. All supplement angle or channel iron required to support equipment of this Specification is to be furnished by the contractor and is to be independent of any other supports.

3.2 DESIGN:

A. The sprinkler systems shall be designed as required for occupancies specified by experienced personnel have competency in the execution of such work. Sprinkler system design shall be performed only by licensed sprinkler contractors.

B. Sprinkler piping shall be protected from freezing during the lay-a-way period.

C. NFPA rules and regulations governing the design shall be scrupulously adhered to.

D. Piping shall be installed in accordance with NFPA 13.

3.3 EXECUTION:

A. Run piping concealed above furred ceiling and in joists to minimize obstructions. Expose only heads.

B. Coordinate sprinkler piping routing and heads with all trades.

C. Protect sprinkler heads against mechanical injury.

D. Include all costs of shop drawings review and approval from authorities in price.

E. Locate outside alarm on wall of building adjacent to Siamese department connections.

F. Provide cabinet containing required number of spare heads as per NFPA 13, of each type, along with wrench suitable for each type of head.

G. Provide flow switch on leaving side of main valve and monitoring switch on main valve. Flow switch shall sense flow and sound appropriate zone of fire alarm system monitoring switch on each main valve; when valve is started to its "closed" position shall indicate trouble on appropriate zone of fire alarm system and sound local audible alarm. Wiring between flow switches and monitoring switches and fire alarm system shall be provided under the Electrical Division.

H. Furnish and install sprinkler zone valves and flow switches where indicated on the drawings for the zoning of the system. Each of these devices shall be connected into the fire alarm system as indicated for the main valve, including local alarming.

I. Provide all test and drain valves as required per NFPA 13.

J. Support sprinkler piping in accordance with NFPA 13.

K. Provide new water service as shown on the drawings.

L. Install air compressor on vibration isolators, as required.

M. Screw joint steel piping up to and including 1-1/2 inch diameter. Screw or Roll Goove 2 inch diameter and larger. PER NFPA 13.

N. Die cut screw joints with full cut standard taper pipe threads with red lead and linseed oil or other non-toxic joint compound applied to male threads only.

O. Coat threaded ends with pipe lubricant compound.

P. Steel piping, main sized saddle branch connections or direct connection of branch lines to mains is permitted if main is one pipe size larger than the branch for up to 6 inch mains and if main is two pipe sizes larger than branch for 8 inch and larger mains.

Q. Solder Braze copper tubes.

R. Install piping in accordance with NFPA 13 for sprinkler systems and NFPA 14 for standpipe and hose systems.

S. Do not penetrate building structural members unless indicated.

T. Provide sleeves when penetrating footings floors and walls.

U. Seal pipe and sleeve penetration to achieve fire resistance equivalent to fire separation required.

3.4 INSTALLATION - VALVES:

A. Install valves with stems upright or horizontal, not inverted.

B. Provide gate valves for shut-off or isolating service.

C. Where approved, butterfly valves may be used instead of gate valves.

D. Provide drain valves at main shut-off valves, low points of piping and apparatus.

3.5 SLEEVES AND PLATES:

A. Wherever pipes pass through concrete slabs, furnish and install sleeves, properly located for the work.

B. Use sleeves of sufficient size to allow the specified pipe covering to pass through the sleeves and finish sleeves flush with walls and ceiling.

C. Sleeves shall be galvanized steel not lighter than 24 gauge.

D. Seal spaces between sleeve and pipe. Use packing device or material for UL rating to match rating of wall or floor/ceiling as rated under UL File R9658.

3.6 ESCUTCHEONS:

A. Where pipes passing through floors, walls or ceiling exposed to view in finished areas, provide pressed steel split plates which cover the opening and fit snugly to pipe.

3.7 COORDINATION:

A. All interlock and signal wiring runs to the annunciator panel will be furnished and installed

and as part of the Electrical Work.

B. This contractor shall provide for all switches and interlocking devices on all valves as required.

3.8 UNDERGROUND PIPING:

A. Underground fire protection system piping shall be installed in accordance with the requirements of NFPA 24, Private Fire Service Mains and Their Appurtenances. Provide concrete thrust blocking at each change of direction of the piping and at all tees, plugs, and caps in accordance with NFPA 24. Where thrust blocking is impractical, fittings with a mechanical joint retainer gland, approved for the piping material utilized, may be used in lieu of thrust blocking.

END OF SECTION 21 00 00

SECTION 21 13 13 - WET-PIPE SPRINKLER SYSTEMS

PART 1 GENERAL

1.1 WORK INCLUDED

A. Installation of new sprinkler and related piping systems in new construction.

1.2 WORK INSTALLED BUT SPECIFIED UNDER OTHER SECTIONS

A. Section Fire Protection Piping: Piping and valves.

1.3 WORK FURNISHED BUT INSTALLED UNDER OTHER SECTIONS

A. Furnish sleeves to General Contractor.

1.4 RELATED WORK

A. Section 23 05 29 - Supports and Anchors.

1.5 REFERENCES:

A. NEMA 250 - Enclosures for Electrical Equipment (1000 Volt maximum).

B. NFPA 13 - Installation of Sprinkler Systems.

1.6 SYSTEM DESCRIPTION:

A. System to provide coverage for entire new building area.

B. Interface system with building control system. Building fire and smoke alarm system.

C. Provide system per NFPA 13 hazard requirement.

1.7 QUALITY ASSURANCE:

A. Design and installation to conform to NFPA 13.

B. Equipment and components: Bear UL FM label or marking.

C. Specialist Firm: Company specializing and licensed in sprinkler systems.

1.8 REGULATORY REQUIREMENTS:

A. Hydraulic Calculations, Product Data, Shop Drawings: Bear stamp of approval of Fire Marshal.

B. Indicate hydraulic calculations, detailed pipe layout, hangers and supports, components and accessories.

C. Submit shop drawings product data hydraulic calculations to Fire Marshal. Submit proof of approval to Architect. Include check for review fee with submittal to Fire Marshal's office.

1.9 PROJECT RECORD DOCUMENTS:

A. Submit documents under provisions of Section 01 78 39.

1.10 OPERATION AND MAINTENANCE DATA:

A. Submit manufacturer's operation and maintenance data under provisions of Section 01 78 23.

B. Include written maintenance data on components of system, servicing requirements, and record drawings.

C. Include maintenance, inspection data, replacement part numbers and availability, and location and numbers of service depot.

1.11 DELIVERY, STORAGE, AND HANDLING:

A. Deliver and store materials in shipping containers with labeling place under provisions of Section 01 60 00 – Materials and Equipment .

B. Provide suitable wrenches for each head type.

C. Maintain caps in place until installation.

D. Sprinkler piping shall be stored off the ground or floor with ends sealed to protect from debris.

1.12 EXTRA STOCK:

A. Provide extra sprinkler heads under provisions of NFPA 13.

B. Provide suitable wrenches for each head type.

C. Provide storage cabinet, size and type as per NFPA-13 – See 21 00 00 Fire Protection

PART 2 PRODUCTS

2.1 PIPING MATERIALS:

A. Above Ground Inside Building Piping: Pipe diameter smaller than and up to 2" shall be Steel Schedule 40 pipe, Pipe diameters 2-1/2" and larger shall be Steel Schedule 10 or Steel Schedule 40 pipe, As permitted by NFPA 13.

B. All piping in pool areas shall be scheduled 40 galvanized steel PBing and fittings

2.2 ACCEPTABLE MANUFACTURERS - SPRINKLER HEADS:

A. Reliable Automatic Sprinkler

B. Viking Corp.

C. Tyco-Fire

D. Substitutions: Under provisions of Instruction To Bidders.

E. All sprinkler heads in pool areas shall be corrosion resistive.

2.3 SPRINKLER HEADS:

A. Exposed Area Type: Standard upright type with brass finish.

B. Sidewall Type: Brass Chrome plated finish with matching escutcheon.

C. Fusible Link: Temperature rated for specific area hazard.

D. Guards: finish to match sprinkler head.

E. Finished ceilings: Pendent sprinklers - concealed type with white cover plates. Unless otherwise noted on plans.

PART 3 EXECUTION

3.1 PREPARATION:

A. Place pipe runs to minimize obstruction to other work.

3.2 INSTALLATION:

A. Run piping concealed above furred ceiling and in joists to minimize obstructions. Expose only heads.

B. Coordinate sprinkler piping routing and heads with all trades.

C. Protect sprinkler heads against mechanical injury.

D. Include all costs of shop drawings review and approval from authorities in price.

E. Locate outside alarm on wall of building adjacent to siamese fire department connections.

F. Provide cabinet containing required number of spare heads as per NFPA 13, of each type, along with wrench suitable for each type of head.

G. Provide flow switch on leaving side of main valve and monitoring switch on main valve. Flow switch shall sense flow and sound appropriate zone of fire alarm system monitoring switch on each main valve; when valve is started to its "closed" position shall indicate trouble on appropriate zone of fire alarm system and sound local audible alarm. Wiring between flow switches and monitoring switches and fire alarm system shall be provided under electrical division.

H. Furnish and install sprinkler zone valves and flow switches where indicated on the drawings for the zoning of the system. Each of these devices shall be connected into the fire alarm system as indicated for the main valve, including local alarming.

I. Provide all test and drain valves as required for system per NFPA 13.

J. Support sprinkler piping in accordance with NFPA 13.

K. Provide new water service as shown on the drawings.

3.3 CLEANING:

A. Flush entire piping system of foreign matter.

3.4 SYSTEM TESTS:

A. Hydrostatically test entire system.

B. Test shall be witnessed by Fire Marshal and Architect.

C. Test shall be witnessed by commissioning agent.

END OF SECTION 21 13 13

SECTION 21 30 00 - FIRE PUMP

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Fire pump and controller.

B. Jockey pump.

1.2 RELATED WORK

A. Section 21 00 00 - Fire Protection System

B. Section 21 13 13 - Wet-Pipe Sprinkler System

1.3 REFERENCES

A. NFPA Pamphlet 20.

1.4 QUALITY ASSURANCE

A. Fire pump, jockey pumps and controller shall be by one manufacturer and shall be listed by Underwriters Laboratories, and approved by Factory Mutual Fire Insurance Companies.

B. Acceptable Manufacturers

1.5 SUBMITTAL

A. Aurora

B. Peerless

C. Submit product data under provisions of Section 01 33 00 – Submittal Procedures.

1.6 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data.

1.7 APPROVAL OF PRODUCT PRIOR TO BIDDING

A. Refer to Section 01 60 00 –Material and Equipment, Material and Equipment for product prior approval requirements.

PART 2 PRODUCTS

2.1 FIRE PUMP

A. Furnish and install a complete fire pump system with pump, driver, controller, jockey pump and all accessories. The fire pump shall meet all requirements of NFPA and be fully approved by Factory Mutual Fire Insurance Company. ***400 GPM***

B. The fire pump shall be a horizontal, base mounted, split case, single stage, double suction centrifugal type.

C. The driver shall be a horizontal, foot mounted, open drip-proof, ball bearing type, AC, induction, squirrel cage motor ***25*** HP, 460/3ph/60, ***60*** psi. The motor shall be of such capacity that 115% of the full load ampere rating shall not be exceeded at any pump load for U.L. listed fire pump systems. Locked rotor current shall not exceed the values listed in

NFPA 20.

D. Pump and motor shall be mounted on a common base plate.

E. Impellers shall be enclosed type, cast bronze. Impellers shall be dynamically balanced, keyed to shaft and held in place with thread shaft sleeves. Pump shaft shall be made of SAE 1045 steel or equal. All pumps where the suction is expected 40 psi or below shall be provided with lantern ring connected to pressure side of the pump.

F. The fire pump unit shall be provided with the following accessories:
1. Eccentric tapered suction reducer.
2. Concentric tapered discharge increaser.
3. Hose valves.
4. Caps and chains.
5. Hose valve header.
6. Pressure gauges.
7. Circulation relief valve.
8. Automatic air release valve.
9. Coupling guard.

2.2 FIRE PUMP CONTROLLER

A. The fire pump controller shall be U.L. listed and FM approved. It shall be completely assembled and wired and tested at factory. The controller shall be locked as not to be water damaged and shall be of the combination manual/automatic type. The controller shall be primary resistor type complete with the following accessories:
1. Disconnect switch and auto transfer switch.
2. Circuit breaker - time delay type with trips in all phases set for 300% of motor full load current interrupting capacity - 100,000.
3. Motor starter.
4. Pressure switch.
5. Running period timer.
6. Pilot light.
7. Ammeter.
8. Alarm relay with audible alarm.
9. Manual selection station marked "automatic" - "non-automatic".
10. Means shall be provided on the controller to operate an alarm signal continuously while pump is running.
11. All control equipment shall meet requirements of NFPA 20.
12. Tests: The pump and electric motor shall be shop tested and meet NFPA 20, the pump shall be given a complete performance test with positive suction pressure. A certified performance curve shall be prepared and submitted. Pumps shall also be hydrostatically tested to twice shut-off head. The pump manufacturer shall assume unit responsibility and shall provide the services of a factory trained representative to supervise and/or be available to conduct final field test.

2.3 JOCKEY PUMP

A. Furnish and install where indicated on drawings an in-line close coupled jockey pump.

B. Pump shall have the following capacities: 10 GPM, at ***50*** psi, 3 HP, 3500 RPM, 480/3ph/60.

C. Acceptable Manufacturers
1. Aurora
2. Grundfos

1.4 QUALITY ASSURANCE:

A. Valves: Manufacturer's name and pressure rating market on valve body.

B. Welding Materials and Procedures: Conform to ASME Code and applicable state labor regulations.

C. Welders Certification: In accordance with ANSI/ASME Sec. 9. ANSI/AWS D 1.1.

D. Cast iron pipe and fittings shall be marked with CISPI's collective trademark.

1.5 SUBMITTALS:

A. Submit shop drawings and product data under provisions of Section 01 30 00.

B. Include data on pipe material, pipe fittings, valves and accessories.

1.6 WATER PIPE AND FITTING MATERIALS STANDARD

A. Plastic Water Pipe and Fittings
1. ABS and PVC Plastic Tubular Fittings: ASTM F 409, ANSI/NSF 24, ANSI/NSF 14
2. Joints for IPS PVC pipe using solvent cement: ASTM D 2672
3. Chlorinated poly (vinyl chloride) (CPVC) plastic pipe, Schedule 80, 2" and under: ASTM F 441, listed
4. Chlorinated poly (vinyl chloride) (CPVC) plastic pipe (SDR-PR): ASTM F 442
5. CPVC Pipe and fittings: ASTM D 2846, Listed
6. Cross-linked Polyethylene/Aluminum/Cross-linked Polyethylene (PEX-AL-PEX) pressure pipe and fittings: ASTM F 1281
7. Cross-linked Polyethylene (PEX) plastic hot and cold water distribution system: ASTM F 877, Listed
8. Cross-linked Polyethylene (PEX) tubing: ASTM F 876
9. Cross-linked Polyethylene (PEX) tubing systems for pressure: CAN/CSA-B137.5M89, listed
10. Flexible Elastomeric pressure joints: ASTM D 3139, See 308.8
11. Metal insert fittings for PB tubing: ASTM F 1380
12. Polyethylene/Aluminum/Polyethylene (PE-AL-PE) pressure pipe and fittings: ASTM F 1282
13. Polyethylene pipe and tubing (PE) Number 2305, 2306, 3306, 3406, 3408: ASTM D 2104, ASTM D 2239, ASTM D 2737, Listed, See 303.8.2
14. Poly (vinyl chloride) (PVC) plastic pipe fittings, Schedule 40: ASTM D 2466
15. Pressure rated ABS-fittings: ASTM D 2468, Listed
16. Pressure rated ABS-pipe Number 1210, 2112, 1316: ASTM D 1527, ASTM D 2282, Listed, See 303.8.2
17. PVC injection molded gasketed fittings for pressure applications: CAN/CSA-B137.2-M89, Listed
18. PVC Pipe, Number 1120, 1220: ASTM D 1785, ASTM D 2241, listed, See 303.8.2

19. PVC socket-type fittings, Schedule 80: ASTM D 2467, listed
20. Socket-type chlorinated poly (vinyl chloride) (CPVC) plastic pipe fittings, Schedule 80, 2” and under: ASTM F 439, listed
21. Threaded chlorinated poly (vinyl chloride) (CPVC) plastic pipe fittings, Schedule 80, 2” and under: ASTM F 437, listed

B. Ferrous Water Pipe and Fittings
1. Cast Iron fittings (threaded): ASTM A 126
2. Cast iron pipe (threaded): ANSI A40.5
3. Cast iron water pipe: ASTM A377
4. Ductile-iron water pipe: ANSI/AWWA C 151/A 21.51
5. Ductile-iron water fittings: ANSI/AWWA C 110/A 21.10
6. Malleable iron fittings (threaded): ASTM A 197
7. Nipples pipe (threaded): FS WW-N-351a
8. Stainless steel water pipe Grade H: ASTM A 268, See 303.8.4
9. Steel couplings, threaded, black and galvanized: ASTM A 865
10. Steel pipe black and galvanized: ASTM A 53
11. Welded and seamless steel pipe: ASTM A 53

C. NonFerrous Pipe and Fittings
1. Cast bronze fittings for flared copper tube: ANSI B16.26
2. Cast bronze threaded fittings: ASME B16.15
3. Cast bronze solder-joint pressure fittings: ANSI B16.18
4. Cast copper alloy fittings for flared copper tubes: ASME B 16.26
5. Pipe flanges and flanged fittings: ANSI B16.5
6. Seamless brass tube: ASTM B 135
7. Seamless copper pipe: ASTM B 42
8. Seamless copper tube: ASTM B 75
9. Seamless copper water tube types K, L, & M: ASTM B 88
10. Seamless red brass pipe: ASTM B 43
11. Seamless and welded copper distribution tube (type D): ASTM B 641
12. Threadless copper pipe (TP): ASTM B 302
13. Welded brass tube: ASTM B 587
14. Welded copper tube: ASTM B 447
15. Welded copper alloy UNS # C21000 water tube: ASTM B 642
16. Wrought copper and copper-alloy solder-joint pressure fittings: ASME B 16.22 for copper water tube
17. Wrought seamless copper and rectangular copper-alloy pipe and tube: ASTM B 251, square and tubing not applicable
18. Valves-flanged threaded, and welding end: ANSI B 16.34

D. Backflow Prevention Devices Materials Standard
1. Air gap standards: ASME A112.1.2
2. Backflow preventers, double check valve assembly: ASSE 1015, ANSI/AWWA C510
3. Backflow preventers with intermediate atmospheric vent: ANSI/ASSE 1012
4. Backflow preventers, double check detector assembly: ANSI/ASSE 1048
5. Backflow preventers, hose connection: ANSI/ASSE 1052
6. Backflow preventers, reduced pressure detector assembly: ANSI/ASSE 1047
7. Backflow preventers, reduced pressure principle assembly: ANSI/AWWA C511, ASSE 1013
8. Dual check valve type backflow preventer: ASSE 1032, for carbonated beverage dispensers-post mix type
9. Field test procedures for backflow preventer assemblies: ASSE 5010
10. Manual for the selection, installation, maintenance, and field testing of backflow prevention devices: CAN/CSA B64.10
11. Vacuum breakers, Anti-Siphon, pressure type assembly (outdoor use): ASSE 1020

12. Vacuum breakers-atmospheric pipe applied: ANSI/ASSE 1001
13. Vacuum breakers, back siphonage, pressure type assembly (spill resistant): ANSI/ASSE 1056
14. Vacuum breakers, hose connections: ANSI/ASSE 1011
15. Vacuum breakers, laboratory faucet: ANSI/ASSE 1035
16. Vacuum breaker wall hydrants, fronts resistant automatic draining: ASSE 1019
17. Water closet flush tank fill valves (ballcocks): ASSE 1002

E. Valves Material Standards
1. Valves, ball: MSS SP-72, MSS SP-110

F. Temperature Control Device Standards
1. Individual shower control valves, anti-scald: ASSE 1016
2. Temperature actuated mixing valves for primary domestic use: ASSE 1017
3. Water supply valves, mixing valves and single control mixing valves: ASSE 1029

G. Potable Water Piping
1. All potable water pipes, pipe related products, and materials that join of seal pipes conform to ANSI/NSF 61.

1.7 DRAINAGE SYSTEM MATERIALS STANDARDS

A. NonMetallic Piping
1. Concrete drain tile: ASTM C 412
2. Concrete perforated: ASTM C 444
3. Concrete reinforced culverts: ASTM C 76, for storm drains only
4. Concrete reinforced sewer pipe: ASTM C 361, for storm drains only
5. Concrete sewer pipe: ASTM C 14, for storm drains only
6. Sewer manholes: ASTM C 478
7. Concrete (steel cylinder type): FS SS-P-381

B. Plastic Pipe and Fittings
1. Coextruded composite pipe: ASTM F 1488, See 303.8.3, 303.8.5, 704.1, 1101.5, 1103.2, 1103.4
2. Coextruded composite drain, waste, and vent pipe (DWV): ASTM F 1499, See 303.8.3, 303.8.5, 704.1, 1101.5, 1103.2, 1103.4
3. Coextruded PVC plastic pipe: ASTM F 891, See 303.8.3, 303.8.5, 704.1, 1101.5, 1103.2, 1103.4
4. Flexible elastomeric non-pressure joints: ASTM D 3212, See 303.8
5. Large diameter ribbed PVC sewer pipe and fittings: CAN/CSA-B182.4
6. Polyolefin laboratory drainage systems: CAN/CSA-B181.3
7. PVC-DWV pipe and fittings: ASTM D 2665, listed, See 303.8.3
8. Type PS 46 and type PS 115 sewer pipe (for outside building sewers, storm drains): ASTM F 789, See 704.1, 1101.4, 1103.2, 1103.4, ASTM D 2321, installation
9. Type PSM PVC sewer pipe and fittings (for outside building sewers, storm drains, and storm sewers): ASTM 3034, See 704.1, 1101.5, 1103.2, 1103.4, ASTM D 2321, installation
10. Type PSP PVC sewer pipe and fittings (for outside building sewers, storm drains, and storm sewers): ASTM D 2321, Installation
11. All plastic piping pipes, plastic plumbing piping components and related materials shall be listed as conforming with ANSI/NSF Standard 14.

C. Ferrous Pipe and Fittings
1. Cast iron soil pipe and fittings: ASTM A 74, CISPI HS
2. CI NO-HUB pipe and fittings: ASTM A 888, CISPI Std. 301
3. Ductile-iron gravity sewer pipe: ASTM A 746
4. Hubless cast iron sanitary system: CISPI Std. 310

5. Manhole top frames and covers: ASTM A 48

D. NonFerrous Pipe and Fittings
1. Cast copper alloy solder-joint drainage fittings: ASME B 16.23, for plumbing drainage waste and vents
2. Cast copper alloy solder-joint fittings for solvent drainage systems: ANSI B 16.32
3. Copper drainage tube DWV: ASTM B 306
4. Welded copper and copper alloy heat exchanger tube: ASTM B 543
5. Wrought copper and wrought copper alloy solder-joint drainage fittings for plumbing drainage waste and vents: ASME B 16.29
6. Wrought copper and wrought copper alloy solder-joint fittings for solvent drainage systems: ANSI B 16.43

PART 2 PRODUCTS

2.1 SANITARY SEWER PIPING AND STORM SEWER - BURIED BEYOND 5 FEET OF BUILDING:

A. Schedule 40 PVC/DWV
Fittings: Same as piping
Joints: Solvent welded

2.2 SANITARY SEWER AND STORM SEWER PIPING - BURIED WITHIN 5 FEET OF BUILDING:

A. Cast Iron Pipe: ASTM A74, service weight.
Fittings: Cast Iron.
Joints: Hub-and-spigot, CISPI HSN compression type with ASTM C564 neoprene gaskets

B. Cast Iron Pipe: CISPI 301, hubless, service weight.
Fittings: Cast Iron.
Joints: CISPI 310 neoprene gaskets and stainless steel clamp-and-shield assemblies.

C. All sanitary sewer piping in pool shall be schedule 40 PVC.

D. All underground piping shall be supported every 5’ and 1’ from each elbow by a stainless steel clevis hanger that is tied to the structural slab via a stainless steel threaded rod.

2.3 SANITARY SEWER AND STORM SEWER PIPING, ABOVE GRADE:

A. Cast Iron Pipe: ASTM A74, service weight.
Fittings: Cast Iron.
Joints: Hub-and-spigot, CISPI HSN compression type with ASTM C564 neoprene gaskets or lead and oakum.

B. Cast Iron Pipe: CISPI 301, hubless, service weight.
Fittings: Cast Iron.
Joints: CISPI 310 neoprene gaskets and stainless steel clamp-and-shield assemblies.

C. All sanitary sewer piping in pool shall be schedule 40 PVC.

2.4 WATER PIPING, ABOVE GRADE: Exterior water piping buried beyond 5' of building to be schedule 40 PVC.

A. Copper Tubing: ASTM B88, Type L, hard drawn.
Fittings: ANSI/ASME B16.18, cast bronze solder-joint pressure fittings, or ANSI/ASME B16.22, wrought copper.

B. All potable water pipes, pipe related products and materials that join or seal pipes and pipe related products shall be evaluated and listed as conforming with a national consensus

product or material standard and ANSI/NSF Standard 61.

2.5 WATER PIPING, TRAP PRIMERS: Piping for trap primer piping below slab only.

A. Soft Copper Tube: ASTM B 88, Types K and L, water tube, annealed temper.

2.6 NATURAL GAS PIPING, BURIED BEYOND 5 FEET OF BUILDING:

A. Polyethylene Pipe: ASTM D2513, SDR 11.5.
Fittings: ASTM D2683 to ASTM D2513, socket type.
Joints: Fusion welded.

2.7 NATURAL GAS PIPING, ABOVE GRADE:

A. Steel Pipe: ASTM A53 or A120, Schedule 40, black.
Fittings: ANSI/ASME B16.3, malleable iron, or ASTM A234, forged steel welding type.
Joints: Screwed for pipe two (2) inches and under; ANSI/AWS D1.1 welded, for pipe over two (2) inches. All gas piping run in a concealed space shall be welded.
B. All exterior gas pipe shall be painted safety yellow and tagged.

2.8 FLANGES, UNION, AND COUPLINGS:

A. Pipe Size two (2) Inches and Under: 150 psig malleable iron unions for threaded ferrous piping; bronze unions for copper pipe, solder joints.

B. Pipe Size Over two (2) Inches: 150 psig forged steel slip-on flanges for ferrous piping; bronze flanges for copper piping; neoprene gaskets for gas service.

C. Dielectric Connections: Unions with galvanized or plated steel threaded end, copper solder end, water impervious isolation barrier.

2.9 BALL VALVES:

A. Up to 2 Inches: Bronze or stainless steel body, stainless steel ball, teflon seats and stuffing box ring, lever handle and balancing stops, solder threaded ends with union. Nibco Model 580 Series, Crane Model 2330 Series, Red White 5092/5095 or approved equal.

B. Over 2 inches: Cast steel body, chrome plated steel ball teflon seat and stuffing box seals, lever handle or gear drive handwheel for sizes 10 inches and over, flanged.

C. All potable water isolation valves shall be S.S. Ball valves.

D. Water hamper arestors shall be installed on all domestic cold and hot water batteries and where required by the IBC.

2.10 BUTTERFLY VALVES:

A. Iron body, bronze disc, resilient replaceable seat for service to 180-degrees F, or lug end butterfly, 10 position over handle or infinite position lever handle with memory stop.

2.11 SWING CHECK VALVES:

A. Up to 2 inches: Bronze 45 degree swing disc, solder or screwed ends. Nibco Model 413 Series, Crane Model 37 Series, Red White 236/237 or approved equal.

B. Over 2 inches: Iron body, bronze trim, 45 degrees swing disc, renewable disc and seat, flanged ends. Red White 435, Nibco F918, Crane 373 or approved equal.

2.12 SPRING LOADED CHECK VALVES:

A. Iron body, bronze trim, spring loaded, bronze disc, wafer.

B. Red White 442, Nibco W920W, Stockham W6-970 or approved equal.

PART 3 EXECUTION

3.1 PREPARATION:

A. Ream pipe and tube ends. Remove burrs. Bevel end Ferrous pipe.

B. Remove scale and dirt, on inside and outside, before assembly.

C. Prepare piping connections to equipment with flanges or unions.

3.2 INSTALLATIONS:

A. Provide non-conducting dielectric connections wherever jointing dissimilar metals.

B. Route piping in orderly manner and maintain gradient.

C. Install piping to conserve building space and not interfere with use of space.

D. Group piping whenever practical at common elevations.

E. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.

F. Provide clearance for installation of insulation and access to valves and fittings.

G. Provide access where valves and fittings are not exposed.

H. Slope water piping and arrange to drain at low points.

I. Establish elevations of buried piping outside the building to insure not less than 3 feet of cover.

J. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welding.

K. Prepare pipe, fittings, supports, and accessories not prefinished, ready for finish painting.

L. Establish invert elevations, slope all drainage piping 4 inches and larger to 1/8 inch per foot minimum. All drainage piping 3 inches and smaller shall be sloped to 1/4 inch per foot minimum.

M. Install bell and spigot pipe with bell end upstream.

N. Install valves with stems upright or horizontal, not inverted.

O. Provide one plug cock wrench for every ten plug cocks sized 2 inches and smaller, minimum of one. Provide one plug cock wrench for each plug cock sized 2-1/2 inches and larger.

P. In pipe 3 – inch nominal diameter of less, cleanouts shall be located at not more than 50ft.intervals

Q. In pipe 4 – inches nominal diameter through 6 inches nominal diameter, cleanouts shall be located at not more than 80ft. intervals

R. Each building drain shall be provided with a cleanout within 6ft. of the junction of the building

drain and building sewer.

S. All plumbing piping shall be installed in a manner to freeze protect.

3.3 APPLICATION:

A. Grooved mechanical couplings and fasteners not allowed.

B. Install unions downstream of valves and at equipment or apparatus connections.

C. Install brass male adapters each side of valves in copper piped system. Sweat solder adapters to pipe. All joints in potable lines to be lead free.

D. Install ball, butterfly valves for shut-off and to isolate equipment, part of systems, or vertical risers.

E. Install ball, butterfly valves for throttling, bypass, or manual flow control services.

F. Provide spring loaded check valves on discharge of water pumps.

3.4 TEST

A. Upon completion of the domestic water piping system, The system shall be tested and proved tight under a water pressure not less than 200 psi. The water used for testing shall be obtained from a potable source of supply. This pressure test shall be performed before the disinfection of the domestic water piping system is started. This test shall conform to the Louisiana State Plumbing Code

B. Upon completion of the sanitary sewer piping system the contractor shall perform a water test to prove that the system is tight and with out leaks. No section of the piping system shall be tested with less than 10 ft head of water. The pressure shall be kept on the system for a time no less that 1 hour. This test shall conform to the Louisiana State Plumbing Code.

C. Upon completion of the sanitary vent piping system the contractor shall perform a pressure test to prove that the system is tight and is with out leaks. This test shall conform to the Louisiana State Plumbing Code.

D. All Gas piping shall be tested in accordance to NFPA 54.

E. Prior to any test, the Contractor shall notify the Architect in writing a minimum of 5 business days, the date and time the test will take place. No exceptions. After the completion of the test but before the building is substantially complete the contractor shall submit a written report with the following information for each test performed.
   1. Project Name
   2. Project Location
   3. Plumbing Contractor Name, Address and Contact Information
   4. Identification of test performed.
   5. Time and Date test was started
   6. Time and Date test was completed.

3.5 DISINFECTION OF DOMESTIC WATER PIPING SYSTEM:

A. Prior to starting work, verify system is complete, flushed and clean.

B. New or repaired potable water systems shall be purged of deleterious matter and disinfected prior to utilization. The method to be followed shall be that prescribed by the health authority or water purveyor having jurisdiction or, in the absence of a prescribed method, the procedure described in either AWWA C651 or AWWA C652, or as described in this section.

This requirement shall apply to “onsite or in-plant” fabrication of a system or to a modular portion of a system.

1. The pipe system shall be flushed with clean, potable water until dirty water does not appear at the points of outlet.
2. The system or part thereof shall be filled with a water/chlorine solution containing not less than 50 parts per million (50 mg/L) of chlorine, and the system or part thereof shall be valved off and allowed to stand for 24 hours; or the system or part thereof shall be filled with a water/chlorine solution containing not less than 200 parts per million (200 mg/L) of chlorine and allowed to stand for 3 hours.
3. Following the required standing time, the system shall be flushed with clean potable water until the chlorine is purged from the system.
4. The procedure shall be repeated where shown by a bacteriological examination that contamination remains present in the system.

C. Prior to the disinfection of the domestic water piping system the contractor shall inform the architect in writing the date and time the disinfection will take place. After the completion of the disinfection of the domestic water piping system but before the building is substantially completed the contractor shall submit a written report with the following information.

1. Project Name
2. Project Location
3. Plumbing Contractors Name, Address, and contact information
4. Chemicals used in the disinfection process.
5. Time and Date disinfection process was started
6. Time and Date disinfection process was completed

3.6 SERVICE CONNECTIONS:

A. Provide new sanitary and storm sewer services and tie as shown on plans. Re: Civil Before commencing work check invert elevations required for sewer connections, confirm inverts and insure that these can be properly connected with slope for drainage and cover to avoid freezing. Contractor to tie in existing services as shown on drawings.

B. Tie domestic water services as shown on drawings. Re: Civil Provide sleeve in wall for service main and support at wall with reinforced concrete bridge. Caulk enlarged sleeve and make watertight with pliable material. Provide 18-gauge galvanized sheet metal sleeve around service main to 6 inches above floor and 6 feet minimum below grade. Size for minimum of 2 inches of loose batt insulation stuffing. Contractor shall utilize and tie in existing water lines as indicated on the drawings.

C. Tie new gas service Re: Civil. Coordinate connection with gas service provider.

END OF SECTION 21 10 00

SECTION 22 10 10 - PLUMBING SPECIALTIES

PART 1 GENERAL

1.1 WORK INCLUDED

A. Floor drains

B. Trap Primers

C. Cleanouts

D. Backflow preventors

E. Water hammer arrestors

F. Hose bibbs hydrants

1.2 RELATED WORK

A. Section 23 05 29 - Supports and Anchors

B. Section 22 10 00 - Plumbing Piping

C. Section 22 40 00 - Plumbing Fixtures

1.3 REFERENCES

A. ANSI/ASSE 1012 - Backflow Preventers with immediate Atmospheric Cent.

B. ANSI/ASSE 1011 - Hose Connection Vacuum Breakers.

C. ANSI/ASSE 1013 - Backflow Preventers, Reduced Pressure Principle.

D. ANSI/ASSE 1019 - Wall Hydrants, Frost Proof Automatic Draining Anti-Backflow Types.

E. ANSI A112.21.1 - Roof Drains

F. ANSI A112.26.1 - Water Hammer Arrestors

G. PDI WH-201 Water Hammer Arrestors

1.4 QUALITY ASSURANCE

A. Manufacturer: For each product specified, provide components by same manufacturer throughout.

1.5 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Include component sizes, rough-in requirements, service sizes, and finishes.

PART 2 PRODUCTS

2.1 FLOOR DRAINS

A. Floor Drain (FD): ANSI A112.21.1; lacquered cast iron two piece body with double drainage

flange, weep holes, reversible clamping collar, square adjustable nickel- bonze strainer, and trap primer connection; Wade model 1100G, Zurn model Z415s or Smith model 2005.

B. All floor drains installed shall have trap primers.

C. All floor drains and trench drains in pool areas shall be hope heavy duty bodies and covers. Must be suitable for forklift traffic.

2.2 TRAP PRIMERS

A. Trap primers shall be PPP, Inc. Prime-Rite 500 with AG-500 air gap fitting. Distribution unit may be used for multiple floor drains. Trap primers shall be installed as per manufacturer recommendations and in strict accordance with the Louisiana Plumbing Code. Elastomeric flexible type trap guards will not be allowed on this project.

2.3 ROOF DRAINS

A. Roof Drains (RD): Duco Cast Iron body with adjustable extension sleeve, reversible collar, combined flashing clamp, under deck clamp, and gravel stop, with cast iron dome. Coordinate outlet with storm sewer piping. Wade model 3000-ADF, Zurn model Z100, or Smith model 1015.

2.4 EMERGENCY ROOF DRAIN

A. Emergency roof drain (ERD): Duco cast iron body with adjustable extension sleeve, 2” high combination membrane flashing clamp/gravel guard with cast iron dome drain. Coordinate outlet size with storm sewer piping. Zurn Z-100, Wade, or Smith.

2.5 FLOOR SINK

A. Floor sink (FS): 12”x12” floor sink with square nickel bronze top, 8” deep, aluminum dome strainer. Zurn Z1901, Wade 9144, or Smith 300.

2.6 CLEANOUTS

A. Exterior Surfaced Areas: As detailed on Plans.

B. Interior Finished Floor Areas: Lacquered cast iron, two piece body with double drainage flange, weep holes, reversible clamping collar, and adjustable nickel- bronze strainer, square with scoriated cover in service areas and square with depressed cover to accept floor finish in finished floor areas; Model W-6000 manufactured by Wade or Model ZN-1400 manufactured by Zurn or 4000 Series manufactured by Smith.

C. Interior Finished Wall Areas: Line type with lacquered cast iron body and round epoxy coated gasketted cover, and round stainless steel access cover secured with stainless steel machine screw; Model W-8460-R manufactured by Wade or Model ZN-1445-1 manufactured by Zurn or Model 4532 manufactured by Smith.

D. Interior Unfinished Accessible Areas: Caulked or threaded type, provide bolted stack cleanouts on vertical rainwater leaders.

E. Acceptable Manufacturers
1. Wade 6000
2. Zurn 1400
3. Substitutions: Under provisions of Instructions To Bidders.

2.7 BACKFLOW PREVENTERS

A. Pressure Backflow Preventers: ANSI/ASSE 1013;bronze body with bronze and plastic internal parts and Stainless steel springs; two independently operating,spring loaded check valves; diaphragm type differential pressure relief valve located between check valves; third check valve which opens under back pressure in case of diaphragm failure; non-threaded vent outlet; assembled with two gate valves, strainer, and four test cocks.

B. Acceptable Manufacturers
   1. Watts Model 909
   2. Wilkins Model 375
   3. Substitutions: Under provisions of Instructions To Bidders.

2.8 REDUCED-PRESSURE-DETECTOR, FIRE-PROTECTION, BACKFLOW-PREVENTER ASSEMBLIES

A. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   1. Ames Fire & Waterworks; a Watts Water Technologies Company
   2. FEBCO; a Watts Water Technologies Company
   3. Watts Regulator; a Watts Water Technologies Company
   4. Substitutions: Under provisions of Instructions To Bidders

B. Standard: ASSE 1047 and is FM Global approved or UL listed.

C. Operation: Continuous-pressure applications.

D. Pressure Loss: 12 psig maximum, through middle third of flow range.

E. Body: Cast iron with interior lining that complies with AWWA C550 or that is FDA approved.

F. End Connections: Flanged.

G. Configuration: Designed for vertical-inlet, horizontal-center-section, and vertical-outlet flow.

H. Accessories:
   1. Valves: Outside-screw and yoke-gate type with flanged ends on inlet and outlet.
   2. Air-Gap Fitting: ASME A112.1.2, matching backflow-preventer connection.
   3. Bypass: With displacement-type water meter, shutoff valves, and reduced-pressure backflow preventer.

2.9 WATER HAMMER ARRESTORS

A. ANSI A112.26.1; sized in accordance with PDI WH-201, precharged suitable for operation in temperature range - 100 to 300 degrees F (-73 to 49 Degrees C) and maximum 250 psig (1700 kpa) working pressure.

B. Acceptable Manufactures
   1. Wade Model W-5, W-10, W-20
   2. Zurn Model Z-1700-100, 200, 300
   3. Smith Model 5000
   4. Substitutions: Under provisions of Instructions To Bidders.

PART 3 EXECUTION

3.1 PREPARATION

A. Coordinate cutting forming of roof/floor construction to receive drains to required invert elevations.

3.2 INSTALLATION AND APPLICATION

A. Install specialties in accordance with manufacturer's instructions to permit intended performance.

B. Extend cleanouts to finished floor or wall surface. Lubricate threaded cleanout plugs with mixture of graphite and linseed oil. Insure clearance at cleanout for rodding of drainage system.

C. Encase exterior cleanouts in concrete flush with grade.

D. Install water hammer arrestors complete with accessible isolation valve.

E. In pipe 3 – inch nominal diameter of less, cleanouts shall be located at not more than 50ft.intervals

F. In pipe 4 – inches nominal diameter through 6 inches nominal diameter, cleanouts shall be located at not more than 80ft. intervals

G. Each building drain shall be provided with a cleanout within 6ft. of the junction of the building drain and building sewer.

END OF SECTION 22 10 10

SECTION 22 40 00 - PLUMBING FIXTURES AND TRIM

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Plumbing Fixtures and Trim

1.2 RELATED WORK

A. Section 23 00 00 - General Mechanical

B. Section 22 10 00 - Plumbing Piping

C. Section 22 10 10 - Plumbing Specialties

1.3 SUBMITTALS

A. Furnish and install plumbing fixtures as shown on the accompanying drawing and in accordance with the approved rough-in drawings. This will include service sinks, lavatories, water closets, urinals, etc., with all brass in connection with supply tubing, traps, escutcheons, stop and basin cocks, etc. All fixtures shall be new and must be delivered to the building properly crated and in perfect condition.

B. All brass must be best quality. All brass pipe to be seamless brass tubing and all fixture traps shall be heavy with C.O. plugs. Nipples shall be extra heavy. Lightweight goods will not be accepted. All exposed metal on fixtures shall be C.P. or Chromard. All "P" traps shall be complete with cleanout plug.

C. Contractor shall submit in his fixture brochure for approval, a rough-in sheet of each fixture and indicate any variation required for the fixtures. Fixtures are to be roughed-in in accordance with these approved rough-in sheets and anchored so that piping cannot be moved.

1.4 JOB CONDITIONS

A. Check millwork shop drawings. Conform location and size of fixtures and openings before rough-in and installation.

PART 2 PRODUCTS – see plans

PART 3 EXECUTION

3.1 INSTALLATION

A. Install furnish and install all plumbing fixtures and accessories according to manufacturer's instruction and according to national, state and local codes governing the various systems. Carefully review the Architectural floor plans and millwork details to determine exact number of all fixtures, outlets, and accessories required. Coordinate all fixtures, outlets, drains, accessories, etc., prior to submitting shop drawings.

B. Install each fixture in accordance with rough-in drawings as per manufacturers recommendations. At completion thoroughly clean plumbing fixtures and equipment. Anchor fixtures rigidly; anchor piping in walls so that piping cannot be moved.

C. Provide chrome plated rigid or flexible supplies to fixtures with stops, reducers and escutcheons.

E. Install each fixture with trap, easily removable for servicing and cleaning.

F. All fixtures supplied with domestic water, hot or cold, shall be installed with integral stops on all supply lines.

G. Mount fixtures to the following heights above finished floor:
   1. Water Closets:
      a. Standard — 15" to top of bowl rim
      b. Handicapped — 18" to top of seat
   2. Urinal:
      a. Standard — 22" to top of bowl rim
   3. Lavatories:
      a. Handicapped — 34" to top of basin rim
   4. Water Closet Flush Valves:
      a. Standard — 11" min. above bowl rim'

H. Contractor shall caulk all joints at walls and floors with plumbing fixtures.

I. Contractor shall provide approved ADA drain and water line insulation covers on all exposed services for lavatories and sinks. Truebro Lav Guard or approved equal.

3.2 FIXTURE ROUGH-IN SCHEDULE:

A. Rough-in fixture piping and size connections shall be in accordance with the following table of minimum sizes for particular fixtures unless noted different on the drawing:

PLUMBING FIXTURE ROUGH-IN SCHEDULE

DESCRIPTION	C.W.	H.W.	WASTE	VENT
WATER CLOSET (FLUSH VALVE)	1"	--	4"	3"
URINAL (FLUSH VALVE)	3/4"	--	2"	1-1/2"
LAVATORY	½"	--	2"	1-1/2"
SERVICE SINK	½"	½"	3"	2"
ELECTRIC WATER COOLER	½"	--	2"	1-1/2"
SINK	½"	½"	2"	1-1/2"
HOSE BIBB	3/4"	--	--	--
2" FLOOR DRAIN	--	--	2"	1-1/2"
3" FLOOR DRAIN	--	--	3"	2"
3" HUB DRAIN	--	--	3"	2"

WATER PIPE SIZING TABLE

UNLESS SHOWN OTHERWISE, DOMESTIC WATER LINES SHALL RUN CONCEALED OVERHEAD AS DESIGNATED IN PLUMBING FIXTURE SCHEDULE AND BE SIZED ACCORDING TO TABLE BELOW.

PLANS AND RISER DIAGRAMS DO NOT NECESSARILY SHOW ALL PIPING RUNS. INSTALL A FACTORY SHOCK ABSORBER AT TOP OF EACH FIXTURE GROUP AND ALSO AT WATER HEATERS.

NUMBER OF FIXTURES*	PIPE SIZE (IPS)
2 OR LESS	1/2"
3 TO 5	3/4"
6 TO 10	1"
11 TO 15	1-1/4"
16 TO 28	1-1/2"

*FLUSH VALVE WATER CLOSET IS EQUIVALENT TO SIX (6) FIXTURES SIZES INDICATED ABOVE ARE

MINIMUM SIZES TO BE USED UNLESS OTHERWISE STATED

END OF SECTION 22 40 00

DIVISION

23

HEATING, VENTILATION, AND AIR CONDITIONING

SECTION 23 00 00 - GENERAL MECHANICAL

PART 1 GENERAL CONDITIONS

1.1 WORK INCLUDED

A. The general conditions of the general specifications are made a part of these specifications and apply the same as if attached hereto. The contractor should, before bidding, read and thoroughly understand all general conditions, priority and scheduling.

1.2 SCOPE OF WORK

A. This section calls for the furnishing of labor, materials, equipment, and all the services, and of performing all operations required for the complete mechanical systems as hereinafter specified and/or shown on the accompanying drawings.

1.3 GENERAL REQUIREMENTS

A. Contractor shall install his work to meet and to accommodate work of other trades. This contractor shall be responsible for timely placing of sleeves in forms before concrete is poured. Cooperate with the general contractor and place pipes and ducts in floors, walls, furred spaces, etc., so there will be no delay. Sheet metal or iron pipe sleeves shall be provided for pipes passing through floors, wall or partitions.

B. Contractor shall furnish and properly install materials, devices, equipment, insulation, controls, appurtenances, etc., mentioned in these specifications and/or shown on plans or required to make a complete and satisfactory installation in working order whether fully shown or not.

C. Contractor should visit the site and acquaint himself thoroughly with conditions governing installation of his work.

D. All other plans shall be checked in relation to these plans so that all conditions will be furnished and installed in this contract to provide complete and satisfactory systems.

1.4 LAWS, RULES, REGULATIONS, FEES, ETC.

A. The entire mechanical work shall comply with rules and regulations of the local and state authorities having jurisdiction including the State Fire Marshal and the State Board of Health. All modifications required by the said authorities at any time shall be made by the mechanical contractor without additional charge. In cases where alterations to or deviations from this specification and accompanying plans are required by the authorities, contractor shall report same to the Architect and obtain his approval before work is started.

1.5 DRAWINGS

A. Plans and detail sketches are submitted to limit, explain, and define structural conditions, specified requirements, pipe sizes, and manner of erecting work. Structural or other conditions may require certain deviations from manner of installation shown, and such deviations shall be made as required, but specified sizes and requirements necessary for satisfactory operation shall remain unchanged.

B. It may be necessary to shift or to change routing of ducts and or piping and this shall be done, but such changes must be referred to Architect for approval before proceeding. Extra charges will not be allowed for these changes.

C. Typical details are shown on plans, and in any cases where Contractor is not certain about

the method of installation of this work, he shall ask for details, lack of details will not be an excuse for improper installation.

D. Contractor bidding on this portion of the work must be fully experienced in installations of equal size, complexity and quality. In bidding, he acknowledges that he fully understands the scope of the work and design and has the ability, for the contract price to assemble and install the equipment, piping, and ductwork shown or specified, so as to mold same into a satisfactory workable system and arrangement, without responsibility for capacities and sizes set by these documents.

E. Contractor shall recognize that the amount of information and detail that could be provided in Contract Documents is limitless and could extend into every minute detail, step, sequence, and operation to a point where only workmen would be required, without drawing on ability experience, and ingenuity of the Contractor.

1.6 MATERIALS

A. Where directed by the Architect, Contractor shall submit sample for approval before proceeding.

1.7 STANDARDS

A. In general, standards for products and workmanship shall be as described in each individual section.

B. The standards referred to, except as modified in these specifications shall have full force and effect as though printed in these specifications. These standards are not furnished to bidders for the reason that the manufacturers and trades involved are assumed to be familiar with their requirements. The Architect will furnish, upon request, information as to how copies of the standards referred to may be obtained.

C. Notwithstanding any reference in this section of the specifications to any article, device, product, material, fixture, form or type of construction by name, make or catalogue number, such references shall be interpreted as establishing a standard of quality and shall not be construed limiting competition and the Contractor in such cases, may at his option, use any article, device, product, material, fixture, form or type of construction which in the judgment of the Architect, expressed in writing, is equal to that specified.

1.8 MATERIALS SPECIFIED OR SUBSTITUTED (Prior Approvals)

A. Refer to Instructions to Bidders.

1.9 SHOP DRAWINGS

A. Before proceeding with the work, contractor shall make complete shop and working drawings of such apparatus or connections as directed by the Architect and/or hereinafter specified. These drawings shall show construction details and dimensions of each piece of equipment so drawn.

B. Architects approval of shop drawings shall not relieve the Contractor from responsibility of incorrectly figured dimensions or any other errors in these drawings or specified even though approved by the Architect, shall not relieve this Contractor from furnishing and erecting same.

C. Ten (10) sets of prints of shop drawings shall be submitted to Architect for approval. These prints shall be supplied as part of this contract. Submit all shop drawings at the same time or as soon as practical after award of the contract. No separate items will be accepted.

D. Where laws or local regulations provide that certain accessories such as gauges, thermometers, relief valves and parts be installed on equipment, it shall be understood that such accessories shall be furnished if no specific reference to them is made in the specifications.

1.10 CUTTING AND PATCHING

A. All cutting necessary for this work will be done by this Contractor at his own expense, but all patching shall be done by the General Contractor. No beams or joists shall be cut without prior approval of Architect. After initial resurfacing has been done any further cutting, patching or painting shall be done at the expense of this Contractor.

1.11 INTERFERENCES

A. The drawings are generally diagrammatic and this Contractor shall harmonize his work with that of the different trades so that interferences of the different equipment, piping, etc., shall be installed so as to function properly. In the case where interference develops, the Architect is to state which equipment, piping, etc., is to be relocated regardless of which item was first installed.

1.12 EXCAVATION AND BACKFILL

A. This Contractor shall do all excavating required to lay the specified services and after same have been laid, he shall do all backfilling to the satisfaction of all parties concerned and shall cart away from the premises all unnecessary dirt, rubbish, etc., as directed. Backfill shall be well tamped. All piping must be a minimum of 36” below grade. Piping must be set in 12” of sand.

1.13 SPACE REQUIREMENTS

A. Contractor shall check all plans pertaining to this job so as to be fully aware of the space limitations for all various items of equipment. Equipment is not to be bid on, submitted for preliminary approval nor placed on the job if it is so bulky and large that adequate access for proper maintenance and servicing cannot be achieved in the space provided.

1.14 FOUNDATIONS AND SUPPORTS

A. This contractor shall furnish and install foundations and supports of concrete or steel shapes for equipment requiring same, unless specifically indicated otherwise or specified.

B. All floor mounted mechanical equipment shall be mounted on 4" high concrete housekeeping pad unless specifically shown otherwise on plans. Refer to plans for special requirements for foundations and supports.

1.15 HANGERS, ESCUTCHEONS, ETC.

A. See Section 23 05 29 – Supports and Anchors.

B. Mechanical Contractor shall furnish and install all thimbles, inserts and other requirements necessary for the support of his equipment and piping. Assist and cooperate with other trades in locating and placing these items.

C. All sanitary and storm sewer piping shall be supported by stainless steel clevis hangers every 5’ and within 12” of each elbow. All hangers must be tied to the structural steel in the slab.

1.16 CEILING AND WALL ACCESS PANEL

A. Factory made access doors and frames, prime coat finish, screw driver latch(s) of suitable size as required.

B. Access panels in rated ceiling to have same rating as ceiling.

C. Where valves, dampers, controls, fire dampers, smoke dampers, and detectors, reheat coils, etc. are concealed in walls or non-accessible ceilings, install factory made access doors and frames.

1.17 DUCTWORK ACCESS PANELS

A. Access panels in ductwork to be double wall type with insulation sandwiched in between, same insulation value as adjacent ductwork.

1.18 SIPHON PREVENTERS

A. Furnish and install approved type siphon preventors on all equipment and fixtures in such a manner as to prevent water being siphoned back into the water supply in the event the water supply is shut off.

1.19 FLAME SPREAD PROPERTIES OF MATERIALS

A. All materials and adhesives used for acoustical linings, jackets and insulation shall comply with requirements of NFPA 90A and 90B and UL guide # 40V.8.15. Products exceeding a flame spread rating of 25, or a smoke developed rating of 50, as determined by ASTM Test Method E-84 are prohibited. Adhesives and sealers shall be fire retardant and fire resistant when dry. Flame proofing treatments which are subject to decomposition, deterioration, or the effects of moisture are prohibited.

1.20 DOMESTIC AND FIRE WATER TIE-IN

A. Contractor shall provide any necessary meters and tap fees for domestic or fire water tie-ins to utility companies. All domestic and fire water taps shall have aboveground reduced pressure back flow preventors near the tie-in point. Coordinate with Engineer exact location.

B. All backflow preventors shall be installed in an insulated Hot Box with aluminum cover. The enclosure shall have a minimum of 500w freeze protection. Provide all necessary electrical requirements.

1.21 PROTECTION OF EQUIPMENT

A. See individual sections for protection of equipment.

B. This Contractor shall at all times take such precautions as may be necessary to properly protect his equipment from damage. Failure on the part of the Contractor to comply with the above to the entire satisfaction of the Architect will be sufficient cause for the rejection of the particular piece of equipment in question.

1.22 TESTING

A. All pressure lines, unless elsewhere specified, shall be tested under 150# hydrostatic pressure unless rated pressure is less for a minimum of 5 hours. Contractor shall provide valve at farthest point in line to bleed off air and for inspection.

B. Notice shall be given the Architect before tests are made, the test is not to be drawn off pipes and pipes are not to be covered or insulated until filled pipes have been examined and testing approved by the Architect.

C. In case of defects, they shall be made good to the satisfaction of the Architect and work retested. All such work shall be done by the Contractor with no additional expense to the Owner.

D. Contractor shall make any other such tests as may be called for by the Architect, and all other tests so called for elsewhere in these specifications.

1.23 CLEANING AND ADJUSTING

A. Before receiving final approval from the Architect, the Contractor shall clean out all lines; adjust all valves, control equipment and other equipment. Clean all pipe and equipment and leave the entire installation in good working order. All heaters, fans, grilles, controls, etc., shall be adjusted to perform in correct and satisfactory manner, with sequences, etc., as called for in the specifications hereinafter specified and on plans.

1.24 PAINTING

A. Refer to Section 09 91 23 – Interior Painting and 23 05 53 – Mechanical Identification for painting requirements.

1.25 MOTORS, MOTOR STARTERS AND ELECTRICAL WORK

A. Refer to Section 23 05 13 - Motors.

B. Motors shall be suitable for voltage indicated on the plans, plus or minus 10% and be designed for constant operation at 40 degrees C ambient, 65 degrees C rise for class A, 90 degrees C rise for Class B, etc. Electrical equipment furnished under this contract shall meet standards as set forth by NEMA and NEC requirements. All electrical equipment shall be UL labeled.

1.26 PARTS LIST AND INSTRUCTION MANUAL

A. See individual sections for specific instructions.

B. This Contractor shall deliver to the Architect three (3) copies of printed instructions relating to operating, proper maintenance and repair parts list indicating the various parts by name, number and diagram for each piece of equipment installed. Test and balance report shall also be included in parts list and instruction manual.

C. The shop drawings, parts list, and maintenance and repair instructions shall be neatly bound in a canvas-covered notebook and turned over to the Architect before acceptance of the work.

1.27 BOILER TEST CERTIFICATES

A. Each boiler, water heater (with a capacity equal to or greater than 50 gallons), and pressure vessels are to be inspected by a State of Louisiana certified inspector upon installation.

B. Submit a copy of each report to the Architect and include one copy in each of the Close-out Manuals.

1.28 GUARANTEE/ Warranty

A. Contractor shall guarantee materials, equipment and workmanship installed and performed under this contract for a period of one (1) year from date of the final completion and official acceptance of the contract.

B. He shall furnish free of charge to the Owner all materials and labor necessary to comply with

the above guarantee, which shall be based on defective materials and/or workmanship, and on such basis shall be responsible if a deficiency is found, for any adjustment, replacement, or correction which may be necessary to replace the project to first class condition. This guarantee shall include refrigerant charges, but shall not include the changing of filters.

1.29 RECORD DRAWINGS

A. The Contractor shall maintain a set of record drawings on-site throughout the construction. The record drawings shall reflect accurate dimensional record of all underground, buried, above ceiling, or otherwise concealed work.

B. The Contractor shall maintain these record documents and keep them up-to-date daily.

END OF SECTION 23 00 00

SECTION 23 00 01 - MECHANICAL GENERAL PROVISIONS – COMMISSIONING

PART 1 - GENERAL

1.1 DESCRIPTION

A. Division 23 will be responsible to carry out the commissioning requirements specified in Section 23 08 10, 01 91 13 and other sections referenced in 01 91 13.

END OF SECTION

SECTION 23 01 00 - MECHANICAL COORDINATION DRAWINGS

PART 1 GENERAL CONDITIONS

1.1 SECTION INCLUDES

A. Coordination Drawings

B. Coordination with Requirements of related sections of the specifications.

1.2 RELATED SECTIONS

A. Refer to Mechanical, Plumbing, and Sprinkler sections.

1.3 COORDINATION DRAWINGS

A. The Contractor shall coordinate work of all various sections having interdependent responsibilities for installing, connecting to, and placing such equipment. All (including, but not limited to, mechanical, plumbing, sprinkler system) necessary offsets, beds, duct size/configurations, crossings/crossovers shall be provided and installed as necessary to integrate within the structural system and the architectural features (ceilings and walls, etc.)

B. Coordination Drawings: The purpose of the coordination drawings is to assure proper forethought and coordination of the subcontractors and their installation and integrating of all systems of the building within the structural framework, architectural ceilings, floors, and walls of the building. The Contractor shall provide coordination drawings prior to the submittal of all system shop drawings. The coordination drawings shall include ductwork and all mechanical HVAC piping and associated items, plumbing verticals and sprinkler piping, chases, and shall indicate sizes of these items and the structural members.

C. The Contractor shall submit the Coordination Drawings to the Architect for the Architect's review no later than one month after the Work has commenced on the project site. The Architect's review is only for assistance to the Contractor and to assure general design intent.

D. The Coordination Drawings shall include, but is not limited to, the following:
   1. Plan drawings for each floor indicating structural member sizes, HVAC components sizes/routes/locations, major electrical conduit grouping/routes, vertical chases/openings, and all other items as necessary to comply with the requirements of 1.03.A and 1.03.B of this section.
   2. Section Drawings through major pathways for systems (such as corridors, if appropriate), and exemplary rooms.
   3. Any and all other drawings, schedules, and information necessary to illustrate the Contractor's understanding of the architectural design intent of the critical ceiling heights, wall locations, and all other design parameters and how they are accommodated upon the Contractor's proposed integration of the Systems noted in the Contract Documents.

E. During construction, the Contractor shall update the Coordination Drawings in a clean, clear, and legible manner for continuous reference by the Design Team. Upon Substantial Completion, the Contractor shall submit the updated Coordination Drawings and Specifications to the Architect to assist the Architect in the preparation of the Record Documents.

F. If the Contractor proceeds prior to the submittal and review of the Coordination Drawings, he does so at his own risk; the Owner will not compensate the Contractor for any revisions necessary for work already in place (that the Architect interprets) to be as a result of conflict of systems layout, planning, and/or coordination.

END OF SECTION 23 01 00

SECTION 23 05 00 - BASIC MECHANICAL MATERIALS AND METHODS

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following:
1. Piping materials and installation instructions common to most piping systems.
2. Dielectric fittings.
3. Mechanical sleeve seals.
4. Sleeves.
5. Escutcheons.
6. Grout.
7. Equipment installation requirements common to equipment sections.
8. Concrete bases.
9. Supports and anchorages.

1.2 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

1.3 SUBMITTALS

A. Welding certificates.

1.4 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Mechanical Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

PART 2 PRODUCTS

2.1 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 23 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.2 JOINING MATERIALS

A. Refer to individual Division 23 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch (3.2-mm) maximum thickness unless thickness or specific material is indicated.

C. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

E. Brazing Filler Metals: AWS A5.8, BCuP Series or BAg1, unless otherwise indicated.

F. Welding Filler Metals: Comply with AWS D10.12.

G. Solvent Cements for Joining Plastic Piping:
1. ABS Piping: ASTM D 2235.
2. CPVC Piping: ASTM F 493.
3. PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.
4. PVC to ABS Piping Transition: ASTM D 3138.

2.3 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig (1725-kPa) minimum working pressure at 180 deg F (82 deg C).

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig (1035- or 2070-kPa) minimum working pressure as required to suit system pressures.

E. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig (2070-kPa) minimum working pressure at 225 deg F (107 deg C).

F. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig (2070-kPa) minimum working pressure at 225 deg F (107 deg C).

2.4 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

B. Sealing Elements: NBR interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

C. Pressure Plates: Carbon steel. Include two for each sealing element.

D. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.5 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
1. Underdeck Clamp: Clamping ring with set screws.

E. Molded PVC: Permanent, with nailing flange for attaching to wooden forms.

F. PVC Pipe: ASTM D 1785, Schedule 40.

G. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.6 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw.
1. Finish: Polished chrome-plated and rough brass.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw.
1. Finish: Polished chrome-plated and rough brass.

2.7 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
2. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

PART 3 EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 23 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve and equipment servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors.

M. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.

N. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Install steel pipe for sleeves smaller than 6 inches (150 mm) in diameter.
   2. Install cast-iron "wall pipes" for sleeves 6 inches (150 mm) and larger in diameter.
   3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

O. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.
   1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

P. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 7 Section 07 84 13 "Penetration Firestopping" for materials.

Q. Verify final equipment locations for roughing-in.

R. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

S. All piping shall be installed so it is protected during freezing conditions.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 22 and 23 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

I. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402, for safe-handling practice of cleaners, primers, and solvent cements.
   2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
   3. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
   4. PVC Pressure Piping: Join schedule number ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
   5. PVC Nonpressure Piping: Join according to ASTM D 2855.
   6. PVC to ABS Nonpressure Transition Fittings: Join according to ASTM D 3138 Appendix.

J. Plastic Pressure Piping Gasketed Joints: Join according to ASTM D 3139.

K. Plastic Nonpressure Piping Gasketed Joints: Join according to ASTM D 3212.

L. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
   1. Plain-End Pipe and Fittings: Use butt fusion.
   2. Plain-End Pipe and Socket Fittings: Use socket fusion.

M. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.

3.3 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:
   1. Install unions, in piping NPS 2 (DN 50) and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 (DN 65) and larger, adjacent to flanged valves and at final connection to each piece of equipment.
   3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
   4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated. All work in accordance with NFPA 101

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

3.5 CONCRETE BASES

A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions at Project.
   1. Construct concrete bases of dimensions indicated, but not less than 4 inches (100 mm) larger in both directions than supported unit.
   2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of the base.
   3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
   4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   5. Install anchor bolts to elevations required for proper attachment to supported equipment.
   6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
   7. Use 3000-psi (20.7-MPa), 28-day compressive-strength concrete and reinforcement.

3.6 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Division 5 Section 05 50 00 "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

C. Field Welding: Comply with AWS D1.1.

3.7 GROUTING

A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

END OF SECTION 23 05 00

SECTION 23 05 13 - MOTORS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Single phase electric motors.

B. Three phase electric motors.

1.2 RELATED WORK

A. Section 23 21 23 – Pumps

B. Section 23 36 00– Air terminal Units

C. Section 23 34 10 – Exhaust Fans

D. Section 23 65 00 – Cooling Towers

E. Section 23 70 00 - Central Station Air Handler

1.3 REFERENCES

A. AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings.

B. AFBMA 11 - Load Ratings and Fatigue Life for Roller Bearings.

C. ANSI/IEEE 112 - Test Procedure for Polyphase Induction Motors and Generators.

D. ANSI/NEMA MG 1 - Motors and Generators

E. ANSI/NEMA 70 - National Electrical Code

1.4 SUBMITTALS

A. Submit product data under provisions of Sections 01 33 00 – Submittal Procedures & 23 00 00 – General Mechanical.

B. Submit test results verifying nominal efficiency and power factor for three phase motors larger than 5 horsepower.

1.5 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data under provisions of Section 01 78 23 Operation and Maintenance Datat.

B. Include assembly drawings, bearing data including replacement sizes, and lubrication instructions.

1.6 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacture of electric motors for commercial use, and their accessories, with documented product development, testing, and manufacturing experience.

1.7 REGULATORY REQUIREMENTS

A. Conform to ANSI/NFPA 70.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to site under provisions of Section 01 33 00 – Submittal Procedures.

B. Store and protect products under provisions of Section 01 33 00 – Submittal Procedures.

C. Protect motors stored on site from weather and moisture by maintaining factory covers and suitable weather-proof covering. (For extended outdoor storage, remove motors from equipment and store separately).

1.9 WARRANTY - See General Section 23 00 00– General Mechanical.

PART 2 PRODUCTS

2.1 MOTORS

A. Motors controlled by VFD's shall comply with NEMA MG1, Part 31, Definite Purpose Inverter Fed Motors (withstand repeated voltage peaks of 1600V with rise times of 0.1 microseconds and greater).

B. Starters for single phase motors which are not automatically started shall be manual type with melting alloy thermal overload protection and pilot light. Starters for automatically controlled single phase motors shall be magnetic type with NEMA rated AC magnetic contactor, melting alloy thermal overloads and pilot light.

C. Starters for three phase motors 25 horsepower and below shall be combination type starter/disconnect, full voltage non reversing (FVNR), with magnetic NEMA rated contactors rated for horsepower of motor served, adjustable trip magnetic circuit breaker disconnect (circuit breaker, not a fused switch) capable of being padlocked in the open position, 10K a/c minimum fault rating with higher rating when necessary due to available faut levels. Starters shall have a fused 100VA minimum control transformer (120V unless required otherwise), HOA switch, push to test operating pilot light, solid state overload relays set for actual motor nameplate full load amps, phase failure and phase reversal protection relay, minimum two NO. and two N.C auxiliary contracts and terminal blocks factory prewired for field wiring. Starters shall be housed in a NEMA 1 enclosure for indoor locations and NEMA 3R enclosure for outdoor or wet locations. Only to be used if VFD are not called for on plans.

D. Starter for motors 30 horsepower and above shall be soft start type or variable frequency drives

E. Coordinate with electrical and specify fault rating on all motor controllers.

F. Winding heaters shall be installed on all chilled water pumps. These shall be energized when pumps are deenergized.

2.2 MANUFACTURERS

A. Electrical Service - Refer to Division 26 for required electrical characteristics.

B. Motors: Design for continuous operation in 40 degrees C environment, and for temperature rise in accordance with ANSI/NEMA MG 1 limits for insulation class, Service Factor, and motor enclosure type.

C. Visible Nameplate: Indicating motor information as required by NEC 430-7(a).

D. Electrical Connection: Conduit connection boxes, threaded for conduit. For fractional

horsepower motors where connection is made directly, provide screwed conduit connection in end frame.

E. Starters: General electric, Cerus Industrial

2.3 SINGLE PHASE POWER - PERMANENT-SPLIT CAPACITOR MOTORS

A. Starting Torque: Exceeding one fourth of full load torque.

B. Starting Current: Up to six times full load current.

C. Multiple Speed: Through tapped windings.

D. Open Drip-proof or Enclosed Air Over Enclosure: Class A 65 degree C temperature rise insulation, Minimum 1.15 service factor, pre-lubricated sleeve or ball bearings, automatic reset overload protector.

2.4 SINGLE PHASE POWER - CAPACITOR START MOTORS

A. Starting Torque: Three times full load torque.

B. Starting Current: Less than five times full load current.

C. Pull-up Torque: Up to 350 percent of full load torque.

D. Breakdown Torque: Approximately 250 percent of full load torque.

E. Motors: Capacitor in series with starting winding; capacitor-start/capacitor-run motors shall have two capacitors in parallel with run capacitor remaining in circuit at operating speeds.

F. Drip-proof Enclosure: Class A 65 degree C temperature rise insulation, NEMA service factor, prelubricated sleeve ball bearings.

G. Enclosed Motors: Class A 65 degree C temperature rise insulation, NEMA service factor, prelubricated sleeve ball bearings.

2.5 THREE PHASE POWER - SQUIRREL CAGE MOTORS

A. Starting Torque: Between one and one-half times full load torque.

B. Starting Current: Six times full load current.

C. Power Output, Locked Rotor Torque, Breakdown or Pullout Torque: NEMA Design B characteristics.

D. Design, Construction, Testing, and Performance: Conform to ANSI/NEMA MG for design B motors.

E. Insulation System: NEMA Class B or better.

F. Testing Procedure: In accordance with ANSI/IEEE 12, Test Method B. Load test motors to determine freedom from electrical or mechanical defects and compliance with performance data.

G. Motor Frames: NEMA standard T-frames of steel, aluminum, or cast iron with end brackets of cast iron or aluminum with steel inserts.

H. Thermister System (Motor Frame Sizes 254T and larger): Three PTC thermister imbedded in motor windings and epoxy encapsulated solid state control relay for wiring into motor

starter.

I. Bearings: Grease lubricated anti-friction ball bearings with housings equipped with plugged provision for re-lubrication, rated for minimum AFBMA 9, L-10 life of 20,000 hours. Calculate bearing load with NEMA minimum V-belt pulley with belt center line at end of NEMA standard shaft extension. Stamp bearing sizes on nameplate.

J. Sound Power Levels: To ANSI/NEMA MG1.

K. Nominal Efficiency: Meet or exceed values in schedules at full load and rated voltage when tested in accordance with ANSI/IEEE 112, and ASHRAE 90.1.

L. Motors, Motor Starters and Electrical Work: Mechanical Contractor shall furnish all motors, motor starters, start-stop push buttons, pilot lights, firestats, interlocking diagrams, etc. for each piece of motor driven equipment under this Contract. Mechanical Contractor shall install all motors. All motor starters, start-stop push buttons, pilot lights, etc. shall be turned over to the Electrical Contractor for installation. Electrical contractor shall be responsible for power wiring. This contractor will be responsible for control wiring.

M. Motor Starters and Push Buttons: All automatic starters shall be nominal 600 volt rating. All starters shall have two (2) auxiliary contacts.
1. Starters for single speed motors, 3/4 through 25 HP inclusive, shall be magnetically operated, "Across-the-line" 3 phase, with three overload relays, "HAND-OFF-AUTO" selector switch and pilot in cover. Starters shall be combination type with fused or circuit breaker type disconnect mechanism.
2. Starters for 30 HP and larger are to be reduced voltage, auto-transformer, combination type with fused or circuit breaker type disconnect mechanism. Starters shall be complete with three overload relays, "HAND-OFF-AUTO" selector switch and pilot lights.
3. Enclosures for starters mounted indoors shall be NEMA 1. Enclosures for starters mounted outdoors or in wet areas shall be NEMA 3 R.
4. Remote push button stations shall be as follows: Start-stop stations shall be recess mounted with neon pilot lamp of proper voltage.
5. Push buttons for controls which are interlocked with automatic controls shall be maintained contact type. All others may be of momentary contact type.
6. Control voltage for all motor starters shall 120 volts provided by integral control voltage transformers.
7. If the Mechanical Contractor purchases equipment of larger horsepower than specified or shown on the plans, he shall pay all costs to increase the wiring and conduit.

PART 3 EXECUTION

3.1 APPLICATION

A. Motors drawing less than 250 watts and intended for intermittent service may be germaine to equipment manufacturer and need not conform to these specifications.

B. Motors shall be open drip-proof type, except where specifically noted otherwise.

C. Single phase motors for shaft mounted fans or blowers shall be permanent split capacitor type.

3.2 NEMA OPEN MOTOR SERVICE FACTORS

HORSEPOWER	3600 RPM	1800 RPM	1200 RPM	900 RPM
1/6-1/3	1.35	1.35	1.35	1.35
1/2	1.25	1.25	1.25	1.15

3/4	1.25	1.25	1.15	1.15
1	1.25	1.15	1.15	1.15

3.3 MOTOR EFFICIENCY

A. Each motor furnished on the job must meet ASHRAE 90.1 and shall have a minimum guaranteed efficiency as listed in table below. Minimum guaranteed efficiencies for all motors shall be clearly stamped on motor nameplate. The lack of such stamp shall be cause for rejection of motor.

HORSEPOWER	EFFICIENCY
1, 1-1/2, 2	84.00
3	88.50
5, 7-1/2, 10	90.20
15, 20	91.70
25, 30, 40	93.00
50, 60, 75	94.10
100, 125, 150, 200	95.00

D. Danfoss

2.2 VARIABLE FREQUENCY DRIVE (VFD)

A. DESCRIPTION: VFD converts fixed frequency utility power into adjustable frequency power necessary to operate three phase AC motors at variable speed. VFD incorporates microprocessor logic to ease user set up for application functions. VFD shall be Bacnet

compatible.

B. OPERATING PRINCIPLE: Input three phase AC line voltage is first rectified to a fixed DC voltage. Using pulse width modulation (PWM) inverter technology, the DC voltage is processed to produce an output voltage waveform in a series of variable width pulses. Because of high frequency of these voltage pulses, output current closely approximates a true sinusoidal waveform.

C. SERVICE CONDITIONS:
1. Operating ambient temperature - 10 to 40 C
2. Storage temperature - 20 to 60 C
3. Relative humidity to 90 % noncondensing
4. Vibration 1 G max under 20 Hz; 0.2 G at 20 to 60 Hz.

D. STANDARD ENCLOSURE:
1. Power electronics and control electronics housed in NEMA 1 wall mount enclosure.

E. ELECTRO-MECHANICAL CONSTRUCTION:
1. Input voltage 460 volt model for nominal (+/-10%), 460 VAC systems.
2. Output current overload rating of 125% of motor FLA for 1 minute.
3. Voltage source design using PWM inverter technology.
4. Microprocessor based control circuit generating sine coded PWM output current waveform.
5. Non-volatile memory (NV RAM); all programming is maintained when disconnected from power.
6. Corrects displacement power factor to 98 % throughout the motor speed range and eliminates power line notching, through the use of diode bridge input section or power factor correction capacitors and isolation transformer.
7. Input phase insensitive, sequencing of the 3 phase input lines is not required.
8. Capable of single phase input operation - requires 50% drive derating and a three phase motor on the output.
9. Fused DC bus with capacitive filtering.
10. Insulated Gate Bipolar Transistors (IGBT) output, allowing motor noise, at 60 Hz, less than 2 dB (@ 1 meter) above that resulting from across the line operation. The VFD manufacturer must provide output reactor to reduce noise.
11. Three current transformers detect the output current to provide: Electronic thermal overload protection, Three phase current limit, Ground fault protection, Short circuit protection and Speed search capability.
12. Surface mount technology with conformal coating provides 100,000 Hrs MTBF at the specified service conditions.
13. Digital operator keypad and display provides local control and readout functions -or- provide individual meters for readout and PLC for terminal status indication:
    a. Run / Stop / Jog commands.
    b. Speed command.
    c. Reset command.
    d. Output frequency meter and speed command meter, which can be programmed for other speed related indications including, RPM, CFM, FPM and, % max. RPM.
    e. Volt meter, Amp meter, Kilowatt meter functions.
    f. Input and output terminal status indication.
    g. Diagnostic indication.
14. Power electronics provides efficiency of 97% minimum.
15. Materials of construction UL 94-V0 rated.
16. Physical size and weight.
    a. Less than 180 cubic inches/horsepower for 5 to 75 HP drives.
    b. Less than 5 pounds/horsepower for 5 to 75 HP drives.

F. PERFORMANCE FEATURES:
1. Output frequency and voltage modulation with selectable volts/hertz ratio for optimum variable torque output.
   a. Output frequency from 0 to 400 Hz.
   b. Output voltage from 0 to motor rated voltage.
2. Fixed carrier frequency programmable up to 15 KHz, allowing motor noise, at 60 Hz, less than 2 dB (@ 1 meter) above that resulting from across the line operation -or- output reactor must be provided to reduce noise.
3. Compatible with standard NEMA B motors. All motors that are run by VFD shall be inverter duty rated.
4. UL listed.
5. Lock out reverse operation.
6. Drive defaults to 80% of last speed through internal logic.
7. Soft start, linear or S-curve function.
8. Ramp to stop or coast to stop selection.
9. Provide braking through DC injection with voltage level, current limit and duration adjustable, and selectable for either stop, deceleration braking or braking before start, anti-windmill braking.
10. Critical frequency rejection capability in 3 ranges with adjustable span of 0 to 10 Hz to avoid possible vibration problems at driven equipment resonant frequencies.
11. 2 second momentary power loss ride thru (drive logic is maintained).
12. Auto restart, up to 10 attempts.
    a. Start into free running (coasting) motor via speed search feature.
13. High starting torque capability for high inertia loads.
14. Full range auto torque boost for high inertia loads.
15. Stall prevention.
16. Standard frequency reference (speed) input signals; 0-10 Vdc, 4-20 mA.
17. Accepts reverse or direct acting frequency reference input signal.
18. Programmable bias and gain for frequency reference input signal.
19. External fault input (i.e. firestat or freezestat) programmable to command ramp to stop, coast to stop, emergency stop or continue operation.
20. Speed search to start a rotating motor and load.
21. Terminals and programming for remote run/stop and speed reference.
22. Remote operation run/stop, 2 wire or 3 wire control.
23. Local/remote operation input via contact closure.
24. Analog output (0 to 10 Vdc) proportional to frequency or current.
25. Run/fault output contacts (1 amp resistive) selectively activated at initial fault occurrence or after final auto restart attempt.
26. Stall prevention by reducing output voltage and frequency during momentary overload. Automatically resume normal operation when overload clears.
27. Digital diagnostic indication and protection for:
    a. DC bus undervoltage and overvoltage.
    b. Load over torque.
    c. Fuse blown.
    d. Motor overload.
    e. Heatsink over temperature.
    f. Instantaneous over current.
    g. Operator error.
    h. Central processor fault.
    i. External fault.
    j. Dynamic braking fault.

G. ADJUSTMENTS AND PROGRAMMABILITY:
1. Incremental / Floating Point control.
   a. One contact closure input causes acceleration for duration of the closure, another causes deceleration. When both switches are open the last speed

command is held.

2. Factory default settings for most common HVAC applications. These settings can be easily re-established thru a reset code.
3. Program security code.
4. 30 operational changes possible in control and display functions without stopping the drive including:
   a. Acceleration and deceleration time.
   b. Frequency command.
   c. Frequency command bias and gain.
   d. Multi-step speed references.
   e. Jog reference.
   f. Monitor display.
5. Two independent, selectable acceleration/deceleration ramp times.
6. Acceleration time from .1 to 6000 seconds.
7. Deceleration time from .1 to 6000 seconds.
8. Maximum and minimum output frequency from 0 to 400 Hz.
9. Programmable upper and lower frequency limits.
10. 15 pre-set selectable Volts/Hertz (V/Hz) patterns plus 1 custom pattern.
11. Auto speed reference (instrument follower) input signal adjustable for bias and gain.
12. Programmable start and stop ramp time.
13. Four programmable multi-function input terminals.
14. Multi-function output contacts programmable for:
    a. Run mode Zero speed detect
    b. Over torque detect Coast to stop detect
    c. Run reference mode Speed reference mode
    d. Output frequency detect Speed synchronization
    e. Low voltage detect Operation ready
    f. Speed reference missing Braking resistor fault
    g. Drive fault Fire stat /freeze stat.
15. Adjustable torque and current limit from 0 to 170%.
16. Ramp to stop or coast to stop selection.
17. Adjustable upper and lower frequency limits independent of pre-set V/Hz pattern.
18. Programmable lock out code, to prevent operator access to parameter settings.
19. 9 selectable pre-set speed programming capability.
20. Programmable jog speed.

2.3 COMPONENTS

A. Input section - VFD power input stage converts three phase AC line power into a fixed DC voltage via a solid state full wave diode rectifier with metal oxide varistor (MOV) protection.

B. Intermediate section - DC bus maintains a fixed DC voltage with filtering and short circuit protection as a DC supply to the VFD output section. It is interfaced with the VFD diagnostic logic circuit to continuously monitor and protect power components.

C. Output section - Insulated gate bipolar transistors (IGBT) convert DC bus voltage to variable frequency and voltage PWM sine coded output to the motor.

2.4 ACCESSORIES / OPTIONS

A. Bypass control allows operation of the motor across the line should the VFD require service:
   1. Bypass and drive are factory assembled and electrically interlocked.
   2. VFD can be removed with bypass control left in place. (3 Contactor)
   3. NEMA 1 enclosure.
   4. Door interlocked disconnect.
   5. VFD input contactor.
   6. VFD output contactor.

7. Bypass contactor.
8. Overload relay.
9. 115 VAC control transformer.
10. Safety circuit terminal strip.
11. Drive-Off-Line selector.
12. Power on light.
13. VFD select light.
14. Line select light.

B. Manufacturers startup service.

C. Input circuit breaker disconnect.

D. Input fusing.

E. Input interface for digital (parallel) speed reference input signal.

F. NEMA 1 enclosure.

G. Operator controls, custom, remote.

H. Serial interface.

I. Set point controller (PID).

J. Transformer, isolation.

2.5 SOURCE QUALITY CONTROL

A. Mean time between failure (MTBF) 100,000 hours minimum.

B. In-circuit testing of all printed circuit boards.

C. Printed circuit boards burned in for 96 hours at 85 C.

D. Functional testing of printed circuit boards after burn in.

E. Fully assembled VFD tested with induction motors.

F. All integrated circuits tested to .5% AQL acceptance criteria.

PART 3 EXECUTION

3.1 INSTALLATION AND STARTUP OF EQUIPMENT

A. Per manufacturer's installation and technical manual.

B. Manufacturer's application engineering department to be accessible for consultation during startup.

C. Commissioning agent shall be present for the start up for all major equipment.

END OF SECTION 23 05 15

SECTION 23 05 16-EXPANSION COMPENSATION

PART 1 GENERAL

1.1 WORK INCLUDED

A. Flexible pipe connections.

1.2 RELATED WORK

A. Section 23 21 13 - Hydronic Piping

B. Section 23 05 23 - Supports and Anchors

C. Section 22 10 00 – Plumbing Piping

1.3 DESIGN CRITERIA

A. Base expansion calculations on 50 degrees F installation temperature to 210 degrees F for hot water heating and 140 degrees F for domestic hot water, plus 30 percent safety factor.

1.4 SUBMITTALS

A. Submit shop drawings under provisions of Section 01 30 00 – Administrative Requirements.

B. Flexible pipe connector shop drawing data to include maximum allowable temperature and pressure rating, overall face-to-face length, live length, hose wall thickness, hose convolutions per foot and per assembly, fundamental frequency of assembly, braid structure and total number of wires in braid.

C. Expansion joint shop drawings to include maximum allowable temperature and pressure rating, and maximum expansion compensation.

PART 2 PRODUCTS

2.1 ACCEPTABLE MANUFACTURER'S

A. Flexicraft Model N.

B. Metraflex Model HP

2.2 FLEXIBLE PIPE CONNECTIONS

A. For steel piping construct with stainless steel inner hose and braided exterior sleeve.

B. For copper piping construct with bronze inner hose and braided exterior sleeve.

C. Use connectors suitable for minimum 125 psi WSP and 450 degrees F and 200 psi WOG and 250 degrees F.

D. Construct spool pieces to exact size for insertion of flexible connection.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install flexible pipe connectors on pipes connected to equipment supported by vibration isolation.

B. Accomplish structural work and provide equipment required to control expansion and contraction of piping, loops, pipe offsets, and swing joints, and provide corrugated bellows type expansion joints where required.

C. Install flexible connectors at right angles to displacement. Install one end immediately adjacent to isolated equipment and anchor other end.

D. Rigidly anchor pipe to building structure where necessary. Provide pipe guides so that movement takes place along axis of pipe only.

END OF SECTION 23 05 16

SECTION 23 05 23 - VALVES

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Butterfly Valves

B. Check Valves

C. Plug Valves

D. Drain Valves

E. Pet Cocksp

F. Ball Valves

1.2 RELATED WORK

A. Section 23 21 13 - Hydronic Piping

B. Section 23 21 23 - Pumps

C. Section 23 21 16 - Hydronic Specialties

1.3 SUBMITTALS

A. Submit copies of valve ordering schedule for approval prior to ordering valves.

B. Submit detailed shop drawings under provisions of individual sections. Clearly indicate make, model, type, size, and pressure ratings, and materials of construction.

1.4 APPROVAL OF PRODUCT PRIOR TO BIDDING

A. Refer to Instruction to Bidders.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Certain items in this Specification are listed by manufacturer and/or manufacturer’s model number to establish general style, type, character, and quality or product desired. Similar items manufactured by other than those listed will be considered, providing submittals are made according to Pre-Bid approval requirements of Instruction to Bidders.

B. Where no manufacturer or model number are given, any product meeting performance or design criteria, or referenced trade association standard may be used and Pre-Bid Approval is not required.

C. Provide valves of same manufacturer throughout wherever possible.

D. Provide valves with manufacturer's name and pressure rating clearly marked on outside of body.

2.2 VALVE CONNECTIONS

A. Provide valves suitable to connect to adjoining piping as specified for pipe joints. Use pipe

size valves.

B. Thread pipe sizes 2 inches and smaller.

C. Flange pipe sizes 2-1/2 inches and larger.

D. Solder or screw to solder adapters for copper tubing.

E. Provide butterfly valve with tapped lug body when used for isolating service.

2.3 BALL VALVES (All isolation valves are to be ball valves)

A. Ball valves 2" and smaller (heating coils) valves to be bronze body with stainless steel cartridge, threaded, combination valve and flow control. Control range 2-32 psid.

B. Manufacturer's: NIBCO T-590-Y-66 or Red & White 5092 or approved equal.

C. Ball valves 3" and larger (chilled water) to be cast steel 150 lbs. psig flange type, ASTM A216, GR. WCB carbon steel, 416 stainless steel stem and ball, Teflon gasket, malleable iron handles.

D. Manufacturer's: NIBCO F515 or Red & White 4151 or approved equal.

2.4 CHECK VALVES

A. Chilled Water, Hot Water:
Body: Cast iron ASTM A-48 Class 35
Seat: Bronze ASTM 145 Alloy
Disc: Bronze ASTM 145 Alloy
Spring: Stainless Steel Type 302
Bushing: 6" and smaller ASTM B-16 8" and larger ASTM 145
Set screws: Stainless Steel Type 304
Manufacturer's: NIBCO F-918-B, Red & White 435, B&G, or Armstrong

2.5 BALANCING VALVES (Eccentric Plug Type)

A. Valves shall be of the non-lubricated eccentric type with resilient faced plugs and shall be furnished with end connections as shown on the plans. Flanged valves shall befaced and drilled to the ANSI 125/150 lb. standard.

B. Port areas for valves through 20" shall be minimum 80% of ull pipe area and port areas of 24" and larger valves shall be minimum 70% of full pipe area.

C. Valve bodies shall be of ASTM A126 Class B cast iron in compliance with AWWA C504 Section 2.2. Bodies in 3" and larger valves shall be furnished with a welded overlay seat of not less than 90% pure nickel in accordance with AWWA C507 Section 7.2. Valves utilizing resilient seat attached to the body shall not be acceptable. As per AWWA C504-80 Section 35.2 and AWWA C507-73 Section 7.2, sprayed or plated seats are not acceptable, nor shall screwed in seats be acceptable.

D. Valve shaft seals shall be of the multiple V-ring type and shall be externally adjustable, re-packable without removing the bonnet or actuator from the valve, and re-packable under pressure. Shaft seals shall conform to AWWA C504-80, Section 3.7 and AWWA C507-73, Section 10.2. Valves utilizing O-ring seals or non-adjustable packing shall not be acceptable. All exposed nuts, bolts, springs, washers zinc plated.

E. Valve pressure ratings shall be 175 psi through 12" and 150 psi for 14" through 48". Each valve shall be given a hydrostatic and seat test.

F. Where required, valves shall be capable of providing drip-tight shutoff up to the full rating with pressure in either direction.

G. Acceptable Manufacturers
1. Dezurik Series 100
2. Alloyco 257A
3. Nexus

2.6 DRAIN VALVES

A. Bronze gate, class 125, ASTM B-62 with bronze wedge, hose cap and safety chain.

B. Acceptable Manufacturer's
1. NIBCO T-113-HC
2. Crane 1701

2.7 PRESSURE RATINGS

A. Unless otherwise indicated, use valves suitable for 150 minimum psig WSP and 450 degrees F and maximum 200 psig and 250 degrees F.

2.8 VALVE OPERATORS

A. Provide one plug cock wrench for every ten plug cocks sized 2 inches and smaller, minimum of one. Provide each plug cock sized 2-1/2 inches and larger with a wrench, with set screw.

B. For butterfly valves (provide gear operators for sizes 8 inches and larger. For smaller sizes, provide lever lock handle with toothed plate for shut-off service and infinitely adjustable handle with lock nut and memory stop for throttling service.

C. Provide valves located more than 8 feet from floor in equipment room areas with chain operated sheaves. Extend chains to 4 feet above floor and hook to clips arranged to clear walking aisles.

D. All valves shall be furnished with valve stem extensions to facilitate insulation installation.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install valves with stems upright or horizontal, not inverted.

B. Install S.S Ball valves for shut-off and isolating service, to isolate equipment, part of systems, or vertical risers.

C. Provide spring-loaded check valves on discharge of condenser water chilled water, and hot water pumps.

END OF SECTION 23 05 23

SECTION 23 05 29 - SUPPORTS AND ANCHORS

PART 1 GENERAL

1.1 WORK INCLUDED

A. Pipe and equipment hangers, supports, and associated anchors.

B. Equipment bases and supports.

C. Sleeves and seals.

D. Flashing and sealing equipment and pipe stacks.

1.2 RELATED WORK

A. Section 23 07 00 - Piping and Equipment Insulation.

B. Section 23 21 13 - Hydronic Piping.

C. Section 23 31 00 – Ductwork

1.3 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Indicate hanger and support framing and attachment methods.

PART 2 PRODUCTS

2.1 ACCEPTABLE MANUFACTURER'S

A. Fee and Mason

B. Grinnel

2.2 PIPE HANGERS AND SUPPORTS

A. Hangers for pipe sizes 1/2 to 1-1/2 inch: Galvanized Malleable iron, adjustable swivel, split ring.

B. Hangers for pipe sizes 2 to 4 inches and cold pipe sizes 6 inches and over: Carbon steel, adjustable, clevis.

C. Multiple or trapeze hangers: Galvanized Steel channels with welded spacers and hanger rods; cast iron roll and stand for hot pipe sizes 6 inches and over.

D. Vertical Support: Galvanized Steel riser clamp.

E. Floor support for pipe sizes 4 inches and over: Welded steel bracket and wrought steel clamp; adjustable steel yoke and cast iron roller for hot pipe 6 inches and over.

F. Shields for insulated piping 2 inches and smaller: 18 gauge galvanized steel shield over insulation in 180 degree segments, minimum 12 inches long at pipe support.

G. All hangers to be sized to include insulation.

2.3 HANGER RODS

A. Stainless Steel Hanger Rods: Threaded both ends, threaded one end, or continuous threaded.

2.4 INSERTS

A. Inserts: Malleable iron case or galvanized steel shell and expander plug for threaded connection with lateral adjustment, top slot for reinforcing rods, lugs for attaching to forms, size inserts to suit threaded hanger rods.

2.5 FLASHING

A. Metal Flashing: 26 gauge galvanized steel.

B. Caps: Steel, 22 gauge minimum, 16 gauge at fire resistant elements.

2.6 SLEEVES

A. Sleeves for pipes through non-fire rated floors: Form with 18 gauge galvanized steel.

B. Sleeves for pipes through non-fire rated beams, walls, footings, and potentially wet floors: Form with steel pipe or 18 gauge galvanized steel.

2.7 FABRICATION

A. Size sleeves large enough to allow for movement due to expansion and contraction. Provide for continuous insulation wrapping.

B. Design hangers without disengagement of supported pipe.

2.8 FINISH – hot dipped galvanized

A. Prime coat exposed steel hangers and supports.

B. Protect against galvanic action with dielectric unions for dissimilar metals.

PART 3 EXECUTION

3.1 INSERTS

A. Provide inserts to General Contractor for placement in concrete formwork.

B. Provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.

C. Provide hooked rod to concrete reinforcement section for inserts carrying pipe over 4 inches.

D. Where concrete slabs form finished ceiling, provide inserts to be flush with slab surface.

E. Where inserts are omitted, drill through concrete slab from below and provide thru-bolt with recessed square steel plate and nut recessed into and grouted flush with slab.

3.2 PIPE HANGERS AND SUPPORTS

A. Support horizontal piping as follows:

PIPE SIZE	MAX HANGER SPACING	MIN. HANGER DIAMETER
1-1/2 TO 2 INCH	10' - 0"	3/8"
2-1/2 TO 3 INCH	10' - 0"	1/2"
4 to 6 inch	10' - 0"	5/8"
8 to 12 inch	10' - 0"	7/8"
14 to 20 inch	15' - 0"	1"

B. Install hangers to provide minimum 1/2 inch space between finished covering and adjacent work.

C. Place a hanger within 12 inches of each horizontal elbow.

D. Use hangers with 1-1/2 inch minimum vertical adjustment.

E. Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.

F. Support riser piping independently of connected horizontal piping.

3.3 EQUIPMENT BASES AND SUPPORTS

A. Provide equipment bases of reinforced concrete as detailed on plans.

B. Provide templates, anchor bolts, and accessories for mounting and anchoring equipment.

C. Provide rigid anchors for pipes after vibration isolation components are installed.

3.4 FLASHING

A. Provide flexible flashing and metal counterflashing where piping and ductwork penetrate weather or waterproofed walls, floors, and roofs.

END OF SECTION 23 05 29

SECTION 23 05 48 - VIBRATION ISOLATION

PART 1 GENERAL

1.1 WORK INCLUDED

A. Inertia Bases

B. Vibration Isolation

1.2 RELATED WORK

A. Fire Protection System

B. Plumbing System

C. HVAC System

1.3 REFERENCES

A. ASHRAE - Guide to Average Noise Criteria Curves.

1.4 QUALITY ASSURANCE

A. Maintain ASHRAE criteria for average noise criteria curves for all equipment at full load condition.

1.5 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Indicate vibration isolator locations, with static and dynamic load on each, on shop drawings and described on product data.

C. Submit manufacturer's installation instructions.

1.6 CERTIFICATES

A. Submit manufacturer's certificate that isolators are properly installed and properly adjusted to meet or exceed specified requirements.

PART 2 PRODUCTS

2.1 INERTIA BASES

A. Pumps: Reinforced 3,000 psi concrete base with chamfered edges, without channel frame.

2.2 VIBRATION ISOLATORS

A. A.H. Units: Open spring mount with stiff springs. Horizontal stiffness equal to vertical stiffness. Minimum 1" deflection. No. and size of springs as per A.H. unit manufacturer's recommendations.

B. Color code spring mounts.

C. Select springs to operate at 2/3 maximum compression strain, with 1/4 inch (6 mm) ribbed neoprene pads.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install vibration isolators for motor driven equipment.

B. Set steel bases for one inch clearance between housekeeping pad and base. Set concrete inertia bases for 2 inch (50 mm) clearance. Adjust equipment level.

C. Provide spring isolators on piping connected to isolated equipment as follows: Up to 4 inch diameter, first three points of support; 5 to 8 inch diameter, first four points of support; 10 inch diameter and over, first six points of support. Static deflection of first point shall be twice deflection of isolated equipment.

END OF SECTION 23 05 48

SECTION 23 05 53 - MECHANICAL IDENTIFICATION

PART 1 GENERAL

1.1 WORK INCLUDED

A. Identification of all mechanical products installed under this Division.

1.2 RELATED WORK

A. Section 09 91 23 – Interior Painting

1.3 REFERENCES

A. ANSI/ASME A13.1 - Scheme for the Identification of Piping Systems.

1.4 SUBMITTALS

A. Submit product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Mechanical and plumbing contractors shall coordinate color codes and marking procedures.

1.5 APPROVAL OF PRODUCT PRIOR TO BIDDING

A. Refer to Instructions to Bidders, Page IB-3, Paragraph 4.3 Substitution.

PART 2 PRODUCTS

2.1 MATERIALS

A. Color: Unless specified otherwise, conform with ANSI/ASME A13.1.

B. Plastic Nameplates: Laminated three-layer plastic with engraved black letters on light contrasting background color.

C. Metal Tags: Brass with stamped letters, tag size minimum 1-1/2 inch (38 mm) diameter with smooth edges.

D. Stencils: With clean cut symbols and letters of following size:

OUTSIDE DIAMETER OF INSULATION OF PIPE	LENGTH OF COLOR FIELD	SIZE OF LETTERS
3/4" - 1-1/4"	8"	1/2"
1-1/2" - 2"	8"	3/4"
2-1/2" - 6"	12"	1-1/4"
8" - 10"	24"	2 - 1/2"
Over 10"	32"	3 - 1/2"
Ductwork & Equipment	-------	2 - 1/2"

E. Plastic Tape Pipe Markers: Flexible, vinyl film tape with pressure sensitive adhesive backing printed markings.

F. Underground Plastic Pipe Markers: Bright colored continuously printed plastic ribbon tape of not less than 6" wide by 4 mil thick manufactured for direct burial service.

PART 3 EXECUTION

3.1 PREPARATION AND INSTALLATION:

A. Degrease and clean surfaces to receive adhesive for identification material.

3.2 INSTALLATION

A. Plastic Nameplates: Install with corrosive-resistant mechanical fasteners, or adhesive.

B. Plastic Pipe Markers: Install in accordance with manufacturer's instructions.

C. Plastic type Pipe Markers: Install complete around pipe in accordance with manufacturer's instructions.

D. Underground Plastic Pipe Markers: Install 6 to 8 inches (150 to 200 mm) below finished grade, directly above buried pipe.

E. Equipment: Identify air handling units, pumps, heat transfer equipment, tanks and water treatment devices, and motor starters with plastic nameplates. Small devices, such as in-line pumps, may identified with plastic tags.

F. Controls: Identify control panels and major control components outside panels with plastic nameplates.

G. Valves: Identify valves in main and branch piping with tags.

H. Piping: Identify piping, concealed or exposed, with plastic pipe markers. Tags may be used on small diameter piping. Identify service and flow direction. Install in clear view and align with axis of piping. Locate identification not to exceed 20 feet on straight runs including risers and drops, adjacent to each valve and "T", at each side penetration of structure or enclosure, and at each obstruction.

3.3 PAINTING

A. All surfaces requiring painting shall be left clean by the Mechanical Subcontractor. All painting shall be done by the General Contractor's painting Subcontractor. All exposed piping or insulation, convectors, grilles, or fans, in building or on roof will be painted. Paint pipe, equipment, hangers and accessories in Equipment Rooms including covering and foundations with two (2) coats of approved paint after thoroughly cleaning. Equipment having factory finish shall be touched up and given one (1) additional coat of machinery enamel color as selected. The above shall be done by the General Contractor. See Section 09 91 23 – Interior Painting.

B. All piping in all equipment rooms shall be identified with pipe markers with directional arrows. The following color code shall be followed.

LEGEND	PIPING	DIRECTIONAL MARKER	BAND COLOR BACKGROUND
Domestic Water	Green	Black	White
Chilled Water	Blue	Black	White

Heating Hot Water Supply	Aluminum	Black	White
Heating Hot Water Return	Aluminum	Black	White
Condenser Water	Light Blue	Black	White

NOTE: On any asphalt finished surfaces, prime with one (1) coat of aluminum paint before final color. All piping and equipment tags must be verified with TGHS prior to ordering.

END OF SECTION 23 05 53

SECTION 23 05 93 - TESTING, ADJUSTING, AND BALANCING

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. All division 23 specification sections, drawings, and general provisions of the contract apply to work of this section, as do other documents referred to in this section.

1.2 SCOPE OF WORK

A. The Owner shall obtain the services of an independent Test and Balance (TAB) Company which specializes in the testing and balancing of heating, ventilating and air conditioning (HVAC) systems to test, adjust and balance all HVAC systems in the building(s).

B. The work included in this section consists of furnishing labor, instruments, and tools required in testing, adjusting and balancing the HVAC systems as described in these specifications or shown on accompanying drawings. Services shall include checking equipment performance, taking the specified measurements, and recording and reporting the results. The testing, adjusting and balancing agency shall act as a reporting agency; that is, list and report each piece of equipment as to identification number, manufacturer, model number, serial number, proper location, specified performance, and report actual performance of all equipment as found during testing. The report is intended to be used during the life of the building as a ready reference indicating original conditions, equipment components, etc.

C. Representatives of the Test and Balance Company shall visit the job site during installation of the HVAC equipment, piping and ductwork as required.

D. Upon completion of the HVAC system installation, the Test and Balance Company shall perform all required testing and balancing with the full cooperation of the Contractor and his Sub-contractors. The Contractor shall make changes and/or adjustments to the HVAC system components that are required by the Test and Balance Company to accomplish proper balancing. The TAB agency shall not supply or install any materials or balancing devices such as pulleys, drives, belts, etc. All of this work is by the Contractor and shall be performed at no additional cost to the Owner.

E. The test and balance report complete with a summary page listing all deficiencies shall be submitted to the Architect for review by his Mechanical Engineer. If the Mechanical Engineer agrees with the report, he shall sign it and return it to the Architect. The test and balance report must be complete and must be accepted by the Mechanical Engineer prior to acceptance of the project. Any outstanding test and balance items shall be placed on the punch list and a monetary value shall be assigned to them.

F. After all deficiencies have been corrected the Mechanical Engineer shall sign the testing and balancing report, and the Test and Balance Company shall supply four (4) copies of the final and complete report to the Architect for inclusion in the Operation and Maintenance Manuals.

G. The items requiring testing, adjusting, and balancing include (but are not restricted to) the following:

HYDRONIC SYSTEMS:	AIR SYSTEMS
Pumps	Supply Exhaust Fans
System Mains and Branches	Zone, Branch, & Main Ducts
Heat Exchangers	VAV System
Coils	Diffusers, registers, & grilles

Control Valves Coils

1.3 DEFINITIONS, REFERENCES, STANDARDS

A. All work shall be in accordance with the latest edition of the Associated Air Balance Council (AABC) National Standards or the latest standards of the National Environmental Balancing Bureau (NEBB). If these contract documents set forth more stringent requirements than the AABC National Standards or the NEBB Standards, these contract documents shall prevail.

1.4 QUALIFICATIONS

A. Agency Qualifications: The TAB Agency shall be a current member of the AABC or the NEBB and must be in good standing.

1.5 SUBMITTALS

A. Procedures and Agenda: The TAB agency shall submit the TAB procedures and agenda proposed to be used.

B. Sample Forms: The TAB agency shall submit sample forms, which shall include the minimum data required by the AABC National Standards or the NEBB Standards.

1.6 TAB PREPARATION AND COORDINATION

A. Shop drawings, submittal data, up-to-date revisions, change orders, fan curves, pump curves and other data required for planning, preparation, and execution of the TAB work shall be provided when available and no later than 30 days after the Designer has returned the final approved submittal data to the Contractor.

B. System installation and equipment startup shall be complete prior to the TAB agency's being notified to begin.

C. The building control system (BCS) contractor shall provide and install the control system, including all temperature, pressure and humidity sensors. These shall be calibrated for accurate control. If applicable, the BCS contractor shall install all necessary computers and computer programs, and make these operational. Assistance shall be provided as required for reprogramming, coordination, and problem resolution.

D. All test points, balancing devices, identification tags, etc., shall be accessible and clear of insulation and other obstructions that would impede TAB procedures.

E. Qualified installation or startup personnel shall be readily available for the operation and adjustment of the systems. Assistance shall be provided as required for coordination and problem resolution.

1.7 REPORTS

A. Final TAB Report - The TAB agency shall submit the final TAB report for review by the Architect. On plans provided, all outlets, devices, HVAC equipment, etc., shall be identified (including manufacturer, model number, serial number, motor manufacturer, HP, drive type, fan and motor sheaves and belt number), along with a numbering system corresponding to report unit identification. The TAB agency shall submit an AABC "National Project Performance Guaranty" (or similar NEBB Guaranty) assuring that the project systems were tested, adjusted and balanced in accordance with the project specifications and AABC National Standards (or similar NEBB Standards). The Designer shall certify his approval on the Performance Guaranty.

B. Submit 4 copies of the Final TAB Report to the Architect for inclusion in the Operation and

Maintenance Manuals.

PART 2 INSTRUMENTATION

A. All instruments used for measurements shall be accurate and calibrated. Calibration and maintenance of all instruments shall be in accordance with the requirements of AABC National Standards (or similar NEBB Standards).

PART 3 EXECUTION

3.1 GENERAL

A. The specified systems shall be reviewed and inspected for conformance to design documents. Testing, adjusting and balancing on each identified system shall be performed. The accuracy of measurements shall be in accordance with AABC National Standards (or similar NEBB Standards). Adjustment tolerances shall be + or - 10% unless otherwise stated.

B. Equipment settings, including manual damper quadrant positions, valve indicators, fan speed control levers, and similar controls and devices shall be marked to show final settings.

C. All information necessary to complete a proper TAB project and report shall be per AABC or NEBB standards unless otherwise noted. The descriptions of work required, as listed in this section, are a guide to the minimum information needed.

D. TAB contractor shall cut insulation, ductwork and piping for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. Upon completion, patch insulation, ductwork and housings using materials identical to those removed. Seal insulation to reestablish integrity of the vapor barrier.

E. TAB work shall include additional inspection and adjustment of components during the season following the initial balance to include re-balance of any items influenced by seasonal changes or as directed by the architect.

3.2 AIR SYSTEMS

A. The TAB agency shall verify that all ductwork, splitters, extractors, dampers, grilles, registers, and diffusers have been installed per design, are functional and set full open. Any leakage in the ductwork shall be repaired prior to the test. The TAB agency shall perform the following TAB procedures in accordance with the AABC National Standards or NEBB Standards:

For supply exhaust fans:

1. Fan speeds - Test and adjust fan RPM to achieve design CFM requirements.
2. Current and Voltage - Test and record motor voltage and amperage, and compare data with the nameplate limits to ensure fan motor is not in or above the service factor.
3. Pitot-Tube Traverse - Perform a Pitot-tube traverse of main supply and return ducts, as applicable to obtain total CFM. If a Pitot-tube traverse is not practical, an explanation of why a traverse was not made must appear on the appropriate data sheet.
4. Outside Air - Test and adjust the outside air on applicable equipment using a Pitot-tube traverse. If a traverse is not practical, an explanation of why a traverse was not made must appear on the appropriate data sheet. If a traverse is not practical use the mixed-air temperature method if the inside and outside temperature difference is at least 20 degrees Fahrenheit or use the difference between Pitot-tube traverses of the supply and return air ducts.

5. Static Pressure - Test and record system static pressure, including the static pressure profile of each supply fan.

For exhaust fans:
1. Fan speeds - test and adjust fan RPM to achieve design CFM requirements.
2. Current and Voltage - Test and record motor voltage and amperage, and compare data with the nameplate limits to ensure motor is not in or above the service factor.
3. Pitot-Tube Traverse - Perform a Pitot-tube traverse of main exhaust ducts to obtain total CFM. If a Pitot-tube traverse is not practical, an explanation of why a traverse was not made must appear on the appropriate data sheet.
4. Static Pressure - Test and record system static pressure, including the static pressure profile of each exhaust fan.

For zone, branch and main ducts:
1. Adjust ducts to within design CFM requirements. As applicable, at least one zone balancing damper shall be completely open. Multi-diffuser branch ducts shall have at least one outlet or inlet volume damper completely open.

For VAV systems:
1. Identify the type, location, and size of each terminal box. This information shall be recorded on terminal box data sheets.
2. Test, adjust and record the maximum and minimum box air quantities for each VAV box.
3. Set volume regulators on all terminal boxes to meet design maximum and minimum CFM requirements.
4. Test and record entering and leaving air temperature of hot water coils with full heating air flow and water flow.
5. Insure the entering static pressure is sufficient for normal, proper box operation.

For diffusers, registers and grilles:
1. Tolerances - Test, adjust, and balance each diffuser, grille, and register to within 10% of design requirements. Minimize drafts. Include required CFM, initial test CFM and final CFM.
2. Identification - Identify the type, location, and size of each grille, diffuser, and register. This information shall be recorded on air outlet data sheets.

For coils:
1. Air Temperature - Once air flows are set to acceptable limits, take wet bulb and dry bulb air temperatures on the entering and leaving side of each cooling coil. Dry-bulb temperature shall be taken on the entering and leaving side of each heating coil.

3.3 HYDRONIC SYSTEMS

A. The TAB agency shall, as applicable, verify that all hydronic equipment, piping, and coils have been filled and purged; that strainers have been cleaned; and that all balancing valves (except bypass valves) are set full open. Examine water in system and determine if it has been treated and cleaned. As applicable, it shall check air vents and expansion or compression tank for proper operation. The TAB agency shall perform the following testing and balancing functions in accordance with the AABC National Standards (or similar NEBB Standards):

For pumps:
1. Test and adjust, hot water, pump to meet design GPM requirements. Check pump rotation and verify impeller size. Check pumps for proper operation. Pumps shall be free of vibration and cavitation. Record appropriate gauge readings for final TDH and Block-Off/Dead head calculations. List pump N.P.S.H. (as applies).
2. Current and Voltage - Test and record motor voltage and amperage, and compare

data with the nameplate limits to ensure pump motor is not in or above the service factor.

For system mains and branches:
1. Adjust water flow in pipes to within design GPM requirements. As applicable, at least one branch balancing valve shall be completely open.

For heat exchangers:
1. Verify that heat exchangers have been filled and started by others, and are in operation.
2. Current and Voltage - As applicable, test and record motor voltage and amperage, and compare data with the nameplate limits to ensure motor is not in or above the service factor.
3. Test and adjust water flow through heat exchangers.
4. Test and record entering and leaving temperature and pressure profiles of water or steam heat exchangers.

For coils:
1. Tolerances - Test, adjust, and balance all chilled-water and hot-water coils within 10% of design requirements.
2. Verification - Verify the type, location, final pressure drop and GPM of each coil. This information shall be recorded on coil data sheets.

For control valves:
1. Check operation of automatic valves.
2. Test and record pressure drop and flow across control valves at full flow.

3.4 PROCEDURES FOR CHILLERS

A. Balance water flow through each evaporator to within specified tolerances of indicated flow with all pumps operating. With only one chiller operating in a multiple chiller installation, do not exceed the flow for the maximum tube velocity recommended by the chiller manufacturer. Measure and record the following data with each chiller operating at design conditions:
   1. Evaporator-water entering and leaving temperatures, pressure drop, and water flow.
   2. If water-cooled chillers, condenser-water entering and leaving temperatures, pressure drop, and water flow.
   3. Evaporator and condenser refrigerant temperatures and pressures, using instruments furnished by chiller manufacturer.
   4. Power factor if factory-installed instrumentation is furnished for measuring kilowatt.
   5. Kilowatt input if factory-installed instrumentation is furnished for measuring kilowatt.
   6. Capacity: Calculate in tons of cooling.

3.5 PROCEDURES FOR COOLING TOWERS

A. Shut off makeup water for the duration of the test, and verify that makeup and blow down systems are fully operational after tests and before leaving the equipment. Perform the following tests and record the results:
   1. Measure condenser-water flow to each cell of the cooling tower.
   2. Measure entering- and leaving-water temperatures.
   3. Measure wet- and dry-bulb temperatures of entering air.
   4. Measure wet- and dry-bulb temperatures of leaving air.
   5. Measure condenser-water flow rate recirculating through the cooling tower.
   6. Measure cooling tower pump discharge pressure.
   7. Adjust water level and feed rate of makeup-water system.

3.6 ADDITIONAL TAB SERVICES

A. Job Site Inspections: During construction, the TAB agency shall inspect the installation of pipe systems, sheet metal work, temperature controls, and other component parts of the HVAC systems as required.

B. Verification of HVAC Controls: The TAB agency shall be assisted by the building control systems Contractor in verifying the operation and calibration of all HVAC and temperature control systems. The following tests shall be conducted:
   1. Verify that all control components are installed in accordance with project requirements and are functional, including all electrical interlocks, damper sequences, air and water resets, fire and freeze stats, and other safety devices.
   2. Verify that all controlling instruments are calibrated and set for design operating conditions.

C. Temperature Testing: To verify system control and operation, a series of three temperature tests shall be taken at approximately two hour intervals in each separately controlled zone. The resulting temperatures shall not vary more than two degrees Fahrenheit from the thermostat or control set point during the tests. Outside temperature and humidity shall also be recorded during the testing periods.

D. TAB Report Verification: At the time of final inspection, the TAB agency may be required to recheck, in the presence of the owner's representative, specific and random selections of data, air quantities, and air motion recorded in the certified report. Points and areas for recheck shall be selected by the owner's representative. Measurements and test procedures shall be the same as approved for the initial work for the certified report. Selections for recheck, specific plus random, will not exceed 10% of the total number tabulated in the report.

END OF SECTION 23 05 93

SECTION 23 07 00 - PIPING AND EQUIPMENT INSULATION

PART 1 GENERAL

1.1 WORK INCLUDED

A. Piping Insulation

B. Jackets and Accessories

C. Equipment Insulation

D. Duct Insulation

1.2 RELATED WORK

A. Section 23 31 00 – Ductwork

B. Section 22 10 00 – Plumbing Piping

1.3 REFERENCES

A. ANSI/ASTM C547 - Mineral Fiber Preformed Pipe Insulation

B. ANSI/ASTM C552 - Cellular Glass Block and Pipe Thermal Insulation.

C. ASTM B209 - Aluminum and Aluminum Alloy Sheet and Plate

D. ASTM E845 - Surface Burning Characteristics of Building Materials.

E. NFPA 255 - Surface Burning Characteristics of Building Materials.

F. UL 723 - Surface Burning Characteristics of Building Materials.

1.4 QUALITY ASSURANCE

A. Applicator: Company specializing in application of piping insulation.

B. Materials: Flame spread/fuel contributed/smoke developed rating of 25/50/50 in accordance with ASTM E84, NFPA 255.0, UL 723.

1.5 SUBMITTALS

A. Submit product data for each application as per Section 01 30 00– Administrative Requirements.

B. Submit manufacturer's installation instructions.

PART 2 PRODUCTS

2.1 INSULATION

A. After all work has been tested and found to be leak free and tight, and accepted by the Architect, insulate as follows:

1. All chilled water, supply and return, piping above ground shall be covered with 2" thick molded cellular foam, foamglas or cell-u-glass type sectional pipe covering to be complete with F.R.J. jacket, with the exception of hot water run-outs - see item No. 2. Sections of covering shall be joined together, the mastic to be buttered on only one of the two adjoining surfaces at both the longitudinal and circumferential joints so that a complete seal at the joints is obtained. The piping insulation is to be secured in place with copper wire spaced not more than 12" on center.
2. All heating water, supply and return, piping above ground shall be covered with 2” thick rigid fiberglass type sectional pipe covering to be complete with F.R.J. jacket, with the exception of hot water run-outs – be 1” rigid fiberglass. Sections of covering shall be joined together, the mastic to be buttered on only one of the two adjoining surfaces at both the longitudinal and circumferential joints so that a complete seal at the joints is obtained. The piping insulation is to be secured in place with copper wire spaced not more than 12” on center.
3. All domestic hot and cold piping above ground shall be covered with 1" thick fiberglass, molded type sectional pipe covering complete with FRJ jacket. Sections of pipe covering shall be joined together, the mastic to be buttered on only one of the two adjoining surfaces at both the Longitudinal and circumferential joints so that a complete seal at the joints is obtained. The piping insulation will be secured in place with copper wire spaced not more than 12 on center. All domestic water piping insulation shall be continuous. Contractor shall not cut insulation to fit around structural items. No exceptions.
4. Insulate the square to round connections on each air handling unit with 3" thick 3/4 lb. density insulation board using stick pins randomly spaced 18" apart. Insulation board shall have aluminum vapor barrier.
5. Fittings, flanges, valves, etc., shall be covered with molded or fabricate covers of same material as pipe covering and shall be finished with two (2) coats of white vapor barrier mastic reinforced with 20-20 mesh glass fabric.
6. Insulate all VAV boxes, rectangular supply, return, exhaust, and fresh air ducts with 3" thick 3/4 lb. density fiberglass insulation with reinforced aluminum vapor barrier. Seal all joints with duct tape.
7. All round and flat oval supply return and exhaust air ducts shall be wrapped with 3" thick, 3/4 lb. density fiberglass insulation with reinforced aluminum vapor barrier. Seal all joints with 2" duct tape.
8. Insulate cooling coil condensate drain lines from air handling units with 1/2“ thick aerotube type insulation tied on and sealed over with tape.
9. Insulate back of all ceiling diffusers with 3" thick fiberglass with reinforced aluminum vapor barrier.
10. All chilled heating and water valves, and hot water pumps shall be insulated with a factory fabricated removable cover. Cover shall be fabricated of 1" close cell elastomeric insulation complete with Velcro closures.
11. Insulate all horizontal roof drains with 2” thick ¾ lb. density fiberglass insulation with reinforced aluminum vapor barrier. Seal all joints with duct tape.
12. All outdoor mechanical piping shall be covered with aluminum jacket, water tight.
13. All external duct work must be externally insulated and double wall. Seal water tight.
14. All exterior ductwork and ductwork run in attic spaces shall be wrapped with 3” thick, 3/4 lb. density fiberglass insulation with reinforced aluminum vapor barrier.
15. Insulate all PVC piping located in a return air plenum with 2” thick ¾ lb. density fiberglass insulation with reinforced aluminum vapor barrier. Seal all joints with duct tape.
16. All hydronic piping in mechanical room and any interior exposed piping shall have color coded PVC jacket watertight. Color to be coordinated with Engineer.

PART 3 EXECUTION

3.1 PREPARATION

A. Install materials in accordance with manufacturer's instructions.

3.2 INSTALLATION

A. Install materials in accordance with manufacturer's instructions.

B. Continue insulation with vapor barrier through penetrations.

C. On insulated piping with vapor barrier, insulate fittings, valves, unions, flanges, strainers, flexible connections, and expansion joints.

D. Neatly finish insulation at supports, protrusions, and interruptions.

END OF SECTION 23 07 00

SECTION 23 08 10 - MECHANICAL SYSTEMS COMMISSIONING

PART 1 - GENERAL

1.1 DESCRIPTION

A. The purpose of this section is to specify Division 23 responsibilities in the commissioning process.

B. The systems to be commissioned are listed in Section 01 91 13.1.7.

C. Commissioning requires the participation of Division 23 to ensure that all systems are operating in a manner consistent with the Contract Documents. The general commissioning requirements and coordination are detailed in Division 01 91 13. Division 23 shall be familiar with all parts of Division 01 91 13 and the commissioning plan issued by the CxA and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

1.2 RESPONSIBILITIES

A. Mechanical, Controls and TAB Contractors. The commissioning responsibilities applicable to each of the mechanical, controls and TAB contractors of Division 23 are as follows (all references apply to commissioned equipment only):

Construction and Acceptance Phases

1. Include the cost of commissioning in the contract price.

2. In each purchase order or subcontract written, include requirements for submittal data, commissioning documentation, O&M data and training.

3. Attend a commissioning scoping meeting and other meetings necessary to facilitate the Cx process.

4. Contractors shall provide the CxA with normal cut sheets and shop drawing submittals of commissioned equipment.

5. Provide additional requested documentation, prior to normal O&M manual submittals, to the CxA for development of start-up and functional testing procedures.

    a. Typically, this will include detailed manufacturer installation and start-up, operating, troubleshooting and maintenance procedures, full details of any owner-contracted tests, fan and pump curves, full factory testing reports, if any, and full warranty information, including all responsibilities of the Owner to keep the warranty in force clearly identified. In addition, the installation, start-up and checkout materials that are actually shipped inside the equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the Commissioning Agent.

    b. The Commissioning Agent may request further documentation necessary for the commissioning process.

    c. This data request may be made prior to normal submittals.

6. Provide a copy of the O&M manuals and submittals of commissioned equipment, through normal channels, to the CxA for review and approval.

7. Contractors shall assist (along with the design engineers) in clarifying the operation and control of commissioned equipment in areas where the specifications, control drawings or equipment documentation is not sufficient for writing detailed testing procedures.

8. Provide limited assistance to the CxA in preparing the specific functional performance test procedures as specified in Section 23 08 11. Subs shall review test procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests.

9. Develop a full start-up and initial checkout plan using manufacturer's start-up procedures and the pre-functional checklists from the CxA for all commissioned equipment. Submit to CxA for review and approval prior to startup. Refer to Section 01 91 13 for further details on start-up plan preparation.

10. During the startup and initial checkout process, execute the mechanical-related portions of the pre-functional checklists for all commissioned equipment.

11. Perform and clearly document all completed startup and system operational checkout procedures, providing a copy to the CxA.

12. Address current A/E punch list items before functional testing. Air and water TAB shall be completed with discrepancies and problems remedied before functional testing of the respective air related systems.

13. Provide skilled technicians to execute starting of equipment and to execute the functional performance tests. Ensure that they are available and present during the agreed upon schedules and for sufficient duration to complete the necessary tests, adjustments and problem-solving.

14. Provide skilled technicians to perform functional performance testing under the direction of the CxA for specified equipment in Section 23 08 11 and 01 91 13. Assist the CxA in interpreting the monitoring data, as necessary.

15. Correct deficiencies (differences between specified and observed performance) as interpreted by the CxA, CM and A/E and retest the equipment.

16. Prepare O&M manuals according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built conditions.

17. During construction, maintain as-built red-line drawings for all drawings and final CAD as-builts for contractor-generated coordination drawings. Update after completion of commissioning (excluding deferred testing).

18. Provide training of the Owner's operating staff using expert qualified personnel, as specified.

19. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

Warranty Period

1. Execute seasonal or deferred functional performance testing, witnessed by the CxA, according to the specifications.

2. Correct deficiencies and make necessary adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

B. Mechanical Contractor. The responsibilities of the HVAC mechanical contractor, during construction and acceptance phases in addition to those listed in (A) are:

1. Provide startup for all HVAC equipment, except for the building automation control system.

2. Assist and cooperate with the TAB contractor and CxA by:

   a. Putting all HVAC equipment and systems into operation and continuing the operation during each working day of TAB and commissioning, as required.

   b. Including cost of sheaves and belts that may be required by TAB.

   c. Providing test holes in ducts and plenums where directed by TAB to allow air measurements and air balancing. Providing an approved plug.

   d. Providing temperature and pressure taps according to the Construction Documents for TAB and commissioning testing.

3. Prepare a preliminary schedule for Division 23 pipe and duct system testing, flushing and cleaning, equipment start-up and TAB start and completion for use by the CxA. Update the schedule as appropriate.

4. Notify the PM or CxA depending on protocol, when pipe and duct system testing, flushing, cleaning, startup of each piece of equipment and TAB will occur. Be responsible to notify the PM or CxA, ahead of time, when commissioning activities not yet performed or not yet scheduled will delay construction. Be proactive in seeing that commissioning processes are executed and that the CxA has the scheduling information needed to efficiently execute the commissioning process.

C. Controls Contractor. The commissioning responsibilities of the controls contractor, during construction and acceptance phases in addition to those listed in (A) are:

1. Sequences of Operation Submittals. The Controls Contractor's submittals of control drawings shall include complete detailed sequences of operation for each piece of equipment, regardless of the completeness and clarity of the sequences in the specifications. They shall include:

   a. An overview narrative of the system (1 or 2 paragraphs) generally describing its purpose, components and function.

   b. All interactions and interlocks with other systems.

   c. Detailed delineation of control between any packaged controls and the building automation system, listing what points the BAS monitors only and what BAS points are control points and are adjustable.

   d. Written sequences of control for packaged controlled equipment. (Equipment manufacturers' stock sequences may be included but will generally require additional narrative).

   e. Start-up sequences.

   f. Warm-up mode sequences.

   g. Normal operating mode sequences.

   h. Unoccupied mode sequences.

   i. Shutdown sequences.

   j. Capacity control sequences and equipment staging.

k. Temperature and pressure control: setbacks, setups, resets, etc.

l. Detailed sequences for all control strategies, e.g., economizer control, optimum start/stop, staging, optimization, demand limiting, etc.

m. Sequences for all alarms and emergency shut downs.

n. Initial and recommended values for all adjustable settings, setpoints and parameters that are typically set or adjusted by operating staff; and any other control settings or fixed values, delays, etc. that will be useful during testing and operating the equipment.

o. Schedules, if known.

p. To facilitate referencing in testing procedures, all sequences shall be written in small statements, each with a number for reference. For a given system, numbers will not repeat for different sequence sections, unless the sections are numbered.

2. Control Drawings Submittal

a. The control drawings shall have a key to all abbreviations.

b. The control drawings shall contain graphic schematic depictions of the systems and each component.

c. The schematics will include the system and component layout of any equipment that the control system monitors, enables or controls, even if the equipment is primarily controlled by packaged or integral controls.

d. Provide a full points list with at least the following included for each point:

1) Controlled system

2) Point abbreviation

3) Point description

4) Display unit

5) Control point or setpoint (Yes / No)

6) Monitoring point (Yes / No)

7) Intermediate point (Yes / No)

8) Calculated point (Yes / No)

a) Key:

b) Point Description: DB temp, airflow, etc.

c) Control or Setpoint: Point that controls equipment and can have its setpoint changed (OSA, SAT, etc.)

d) Intermediate Point: Point whose value is used to make a calculation which then controls equipment (space temperatures that are averaged to a virtual point to control reset).

e) Monitoring Point: Point that does not control or contribute to the control of equipment, but is used for operation, maintenance, or performance verification.

f) Calculated Point: "Virtual" point generated from calculations of other point values.

9) The Controls Contractor shall keep the CxA informed of all changes to this list during programming and setup.

3. An updated as-built version of the control drawings and sequences of operation shall be included in the final controls O&M manual submittal.

4. Assist and cooperate with the TAB contractor in the following manner:

   a. Meet with the TAB contractor prior to beginning TAB and review the TAB plan to determine the capabilities of the control system toward completing TAB. Provide the TAB any needed unique instruments for setting terminal unit boxes and instruct TAB in their use (handheld control system interface for use around the building during TAB, etc.).

   b. For a given area, have all required pre-functional checklists, calibrations, startup and selected functional tests of the system completed and approved by the CxA prior to TAB.

   c. Provide a qualified technician to operate the controls to assist the TAB contractor in performing TAB or provide sufficient training for TAB to operate the system without assistance.

5. Assist and cooperate with the CxA in the following manner:

   a. Using a skilled technician who is familiar with this building, execute the functional testing of the controls system as specified for the controls contractor in Section 23 08 11 and 26 08 11. Assist in the functional testing of all equipment specified in Section 23 08 11 and 26 08 11. Provide two-way radios during the testing.

   b. Execute all control system trend logs specified in Section 23 08 11 and 26 08 11.

6. The controls contractor shall prepare a written plan indicating in a step-by-step manner, the procedures that will be followed to test, checkout and adjust the control system prior to functional performance testing, according to the process in Section 01 91 13. At minimum, the plan shall include for each type of equipment controlled by the automatic controls:

   a. System name.

   b. List of devices.

   c. Step-by-step procedures for testing each controller after installation, including:

      1) Process of verifying proper hardware and wiring installation.

      2) Process of downloading programs to local controllers and verifying that they are addressed correctly.

      3) Process of performing operational checks of each controlled component.

      4) Plan and process for calibrating valve and damper actuators and all sensors.

      5) A description of the expected field adjustments for transmitters, controllers and control actuators should control responses fall outside of expected values.

   d. A copy of the log and field checkout sheets that will document the process. This log must include a place for initial and final read values during calibration of each point and clearly indicate when a sensor or controller has "passed" and is operating within the contract parameters.

e. A description of the instrumentation required for testing.

f. Indicate what tests on what systems should be completed prior to TAB using the control system for TAB work. Coordinate with the CxA and TAB contractor for this determination.

7. Provide a signed and dated certification to the CxA and PM upon completion of the checkout of each controlled device, equipment and system prior to functional testing for each piece of equipment or system, that all system programming is complete as to all respects of the Contract Documents, except functional testing requirements.

8. Beyond the control points necessary to execute all documented control sequences, provide monitoring, control and virtual points as specified in Section 23 09 00.

9. List and clearly identify on the as-built duct and piping drawings the locations of all static and differential pressure sensors (air, water and building pressure).

D. TAB Contractor. The duties of the TAB contractor, in addition to those listed in (A) are:

1. Six weeks prior to starting TAB, submit to the PM the qualifications of the site technician for the project, including the name of the contractors and facility managers of recent projects the technician on which was lead. The Owner will approve the site technician's qualifications for this project.

2. Submit the outline of the TAB plan and approach for each system and component to the CxA, PM and the controls contractor six weeks prior to starting the TAB. This plan will be developed after the TAB has some familiarity with the control system.

3. The submitted plan will include:

a. Certification that the TAB contractor has reviewed the construction documents and the systems with the design engineers and contractors to sufficiently understand the design intent for each system.

b. An explanation of the intended use of the building control system. The controls contractor will comment on feasibility of the plan.

c. All field checkout sheets and logs to be used that list each piece of equipment to be tested, adjusted and balanced with the data cells to be gathered for each.

d. Discussion of what notations and markings will be made on the duct and piping drawings during the process.

e. Final test report forms to be used.

f. Detailed step-by-step procedures for TAB work for each system and issue: terminal flow calibration (for each terminal type), diffuser proportioning, branch / submain proportioning, total flow calculations, rechecking, diversity issues, expected problems and solutions, etc. Criteria for using air flow straighteners or relocating flow stations and sensors will be discussed. Provide the analogous explanations for the water side.

g. List of all air flow, water flow, sound level, system capacity and efficiency measurements to be performed and a description of specific test procedures, parameters, formulas to be used.

h. Details of how *total* flow will be determined (Air: sum of terminal flows via BAS calibrated readings or via hood readings of all terminals, supply (SA) and return air (RA) pitot traverse, SA or RA flow stations. Water: pump curves, circuit setter, flow station, ultrasonic, etc.).

i. The identification and types of measurement instruments to be used and their most recent calibration date.

j. Specific procedures that will ensure that both air and water side are operating at the lowest possible pressures and provide methods to verify this.

k. Confirmation that TAB understands the outside air ventilation criteria under all conditions.

l. Details of whether and how minimum outside air cfm will be verified and set, and for what level (total building, zone, etc.).

m. Details of how building static and exhaust fan / relief damper capacity will be checked.

n. Proposed selection points for sound measurements and sound measurement methods.

o. Details of methods for making any specified coil or other system plant capacity measurements.

p. Details of any TAB work to be done in phases (by floor, etc.), or of areas to be built out later.

q. Details regarding specified deferred or seasonal TAB work.

r. Details of any specified false loading of systems to complete TAB work.

s. Details of all exhaust fan balancing and capacity verifications, including any required room pressure differentials.

t. Details of any required interstitial cavity differential pressure measurements and calculations.

u. Plan for hand-written field technician logs of discrepancies, deficient or uncompleted work by others, contract interpretation requests and lists of completed tests (scope and frequency).

v. Plan for formal progress reports (scope and frequency).

w. Plan for formal deficiency reports (scope, frequency and distribution).

4. A running log of events and issues shall be kept by the TAB field technicians. Submit hand-written reports of discrepancies, deficient or uncompleted work by others, contract interpretation requests and lists of completed tests to the CxA and PM at least twice a week.

5. Communicate in writing to the controls contractor all setpoint and parameter changes made or problems and discrepancies identified during TAB which affect the control system setup and operation.

6. Provide a draft TAB report within two weeks of completion. A copy will be provided to the CxA. The report will contain a full explanation of the methodology, assumptions and the results in a clear format with designations of all uncommon abbreviations and column headings. The report should follow the latest and most rigorous reporting recommendations by AABC, NEBB or ASHRAE Standard 111.

7. Provide the CxA with any requested data, gathered, but not shown on the draft reports.

8. Provide a final TAB report for the CxA with details, as in the draft.

9. Conduct functional performance tests and checks on the original TAB as specified for TAB in Section 23 08 11.

E. Mechanical Designer. Refer to Section 01 91 13 for the responsibilities of the mechanical designer.

1.3 RELATED WORK

A. Refer to Section 01 91 13, Part 1.5 for a listing of all sections where commissioning requirements are found.

B. Refer to Section 01 91 13 Part 1.7 for systems to be commissioned and section 01 91 13 Part 1.6 and 23 08 11 for functional testing requirements.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. Division 23 shall provide all test equipment necessary to fulfill the testing requirements of this Division.

B. Refer to Section 01 91 13 Part 2.1 for additional Division 23 requirements.

PART 3 - EXECUTION

3.1 SUBMITTALS

A. Division 23 shall provide submittal documentation relative to commissioning as required in this Section Part 1, Section 01 33 01 and Section 01 91 13.

3.2 STARTUP

A. The HVAC mechanical and controls contractors shall follow the start-up and initial checkout procedures listed in the Responsibilities list in this section and in 01 91 13. Division 23 has start-up responsibility and is required to complete systems and sub-systems so they are fully functional, meeting the design objectives of the Contract Documents. The commissioning procedures and functional testing do not relieve or lessen this responsibility or shift that responsibility partially to the commissioning agent or Owner.

B. Functional testing is intended to begin upon completion of a system. Functional testing may proceed prior to the completion of systems or sub-systems at the discretion of the CxA and PM. Beginning system testing before full completion, does not relieve the Contractor from fully completing the system, including all pre-functional checklists as soon as possible.

3.3 TAB

A. Refer to the TAB responsibilities in Part 1.2 above.

3.4 FUNCTIONAL PERFORMANCE TESTS

A. Refer to Section 01 91 13 Part 1.7 for a list of systems to be commissioned and to Part 3.6 for a description of the process and to Section 23 08 11 for specific details on the required functional performance tests.

3.5 TESTING DOCUMENTATION, NON-CONFORMANCE AND APPROVALS

A. Refer to Section 01 91 13 Part 3.4 for specific details on non-conformance issues relating to pre-functional checklists and tests.

B. Refer to Section 01 91 13 Part 3.7 for issues relating to functional performance tests.

3.6 OPERATION AND MAINTENANCE (O&M) MANUALS

A. The following O&M manual requirements do not replace O&M manual documentation requirements elsewhere in these specifications.

B. Division 23 shall compile and prepare documentation for all equipment and systems covered in Division 23 and deliver this documentation to the GC for inclusion in the O&M manuals, according to this section and Section 01 78 23, prior to the training of owner personnel.

C. The CxA shall receive a copy of the O&M manuals for review.

D. Special Control System O&M Manual Requirements. In addition to documentation that may be specified elsewhere, the controls contractor shall compile and organize at minimum the following data on the control system in labeled 3-ring binders with indexed tabs.

1. Three copies of the controls training manuals in a separate manual from the O&M manuals.

2. Operation and Maintenance Manuals containing:

a. Specific instructions on how to perform and apply all functions, features, modes, etc. mentioned in the controls training sections of this specification and other features of this system. These instructions shall be step-by-step. Indexes and clear tables of contents shall be included. The detailed technical manual for programming and customizing control loops and algorithms shall be included.

b. Full as-built set of control drawings (refer to Submittal section above for details).

c. Full as-built sequence of operations for each piece of equipment.

d. Full points list. In addition to the updated points list required in the original submittals (Part 1 of this section), a listing of all rooms shall be provided with the following information for each room:

1) Floor

2) Room number

3) Room name

4) Air handler unit ID

5) Reference drawing number

e. Full print out of all schedules and set points after testing and acceptance of the system.

f. Full as-built print out of software program.

g. Electronic copy on disk of the entire program for this facility.

h. Marking of all system sensors and thermostats on the as-built floor plan and mechanical drawings with their control system designations.

i. Maintenance instructions, including sensor calibration requirements and methods by sensor type, etc.

j. Control equipment component submittals, parts lists, etc.

k. Warranty requirements.

l. Copies of all checkout tests and calibrations performed by the Contractor (not commissioning tests).

3. The manual shall be organized and subdivided with permanently labeled tabs for each of the following data in the given order:

a. Sequences of operation

b. Control drawings

c. Points lists

d. Controller / module data

e. Thermostats and timers

f. Sensors and DP switches

g. Valves and valve actuators

h. Dampers and damper actuators

i. Program setups (software program printouts)

4. Field checkout sheets and trend logs should be provided to the CxA for inclusion in the Commissioning Record Book.

E. Special TAB Documentation Requirements. The TAB will compile and submit the following with other documentation that may be specified elsewhere in the *Specifications.*

1. Final report containing an explanation of the methodology, assumptions, test conditions and the results in a clear format with designations of all uncommon abbreviations and column headings.

2. The TAB shall mark on the drawings where all traverse and other critical measurements were taken and cross reference the location in the TAB report.

F. Review and Approvals. Review of the commissioning related sections of the O&M manuals shall be made by the A/E and by the CxA. Refer to Section 01 91 13, Part 3.8 for details.

3.7 TRAINING OF OWNER PERSONNEL

A. The GC shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed. Refer to Section 01 91 13 for additional details.

B. The CxA shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment. Refer to Section 01 91 13 for additional details.

C. Mechanical Contractor. The mechanical contractor shall have the following training responsibilities:

1. Provide the CxA with a training plan two weeks before the planned training according to the outline described in Section 01 91 13, Part 3.9.

2. Provide designated Owner personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of HVAC equipment including, but not limited to air conditioning units, air handling units, fans, fan coil units, controls and water treatment systems, etc.

3. Training shall normally start with classroom sessions followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.

4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.

6. The controls contractor shall attend sessions other than the controls training, as requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.

7. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

8. Training shall include:

    a. Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.

    b. A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.

    c. Discussion of relevant health and safety issues and concerns.

    d. Discussion of warranties and guarantees.

    e. Common troubleshooting problems and solutions.

    f. Explanatory information included in the O&M manuals and the location of all plans and manuals in the facility.

    g. Discussion of any peculiarities of equipment installation or operation.

    h. Classroom sessions shall include the use of overhead projections, slides, video/audio-taped material as might be appropriate.

9. Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance for all pieces of equipment.

10. The mechanical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not *controlled* by the central control system.

11. Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.

12. Duration of training as necessary to properly train owner's staff.

D. Controls Contractor. The controls contractor shall have the following training responsibilities:

1. Provide the CxA with a training plan four weeks before the planned training according to the outline described in Section 01 91 13, Part 3.9.

2. The controls contractor shall provide designated Owner personnel training on the control system in this facility. The intent is to clearly and completely instruct the Owner on all the capabilities of the control system.

3. Training manuals. The standard operating manual for the system and any special training manuals will be provided for each trainee, with three extra copies left for the O&M manuals. In addition, copies of the system technical manual will be demonstrated during training and three copies submitted with the O&M manuals. Manuals shall include detailed description of the subject matter for each session. The manuals will cover all control sequences and have a definitions section that fully describes all relevant words used in the manuals *and* in all software displays. Manuals will be approved by the CxA. Copies of audiovisuals shall be delivered to the Owner.

4. The trainings will be tailored to the needs and skill-level of the trainees.

5. The trainers will be knowledgeable on the system and its use in buildings. For the on-site sessions, the most qualified trainer(s) will be used. The Owner shall approve the instructor prior to scheduling the training.

6. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

7. The controls contractor shall attend sessions other than the controls training, as requested, to discuss the interaction of the controls system as it relates to the equipment being discussed.

8. There shall be two training sessions:

    a. Training I. Control System. The first training shall consist of 4 hours of actual training. This training may be held on-site. If held off-site, the training may occur prior to final completion of the system installation. Upon completion, each student, using appropriate documentation, should be able to perform elementary operations and describe general hardware architecture and functionality of the system.

    b. Training II. Building Systems. The second session shall be held on-site for a period of 4 hours of actual hands-on training after the completion of system commissioning. The session shall include instruction on:

        1) Specific hardware configuration of installed systems in this building and specific instruction for operating the installed systems.

        2) Security levels, alarms, system start-up, shut-down, power outage and restart routines, changing setpoints and alarms and other typical changed parameters, overrides, freeze protection, manual operation of equipment, optional control strategies that can be considered, energy savings strategies and set points that if changed will adversely affect energy consumption, energy accounting, procedures for obtaining vendor assistance, etc.

        3) All trending and monitoring features (values, change of state, totalization, etc.), including setting up, executing, downloading, viewing both tabular and graphically and printing trends. Trainees will actually set-up trends in the presence of the trainer.

        4) Every screen shall be completely discussed, allowing time for questions.

        5) Use of keypad or plug-in laptop computer at the zone level.

6) Use of remote access to the system via phone lines or networks.

7) Setting up and changing a fan coil unit controller.

E. TAB The TAB contractor shall have the following training responsibilities:

1. TAB shall meet for ___2____ hours with facility staff after completion of TAB and instruct them on the following:

a. Go over the final TAB report, explaining the layout and meanings of each data type.

b. Discuss any outstanding deficient items in control, ducting or design that may affect the proper delivery of air or water.

c. Identify and discuss any duct runs, diffusers, coils and fans that are close to or are not meeting their design capacity.

d. Discuss any temporary settings and steps to finalize them for any areas that are not finished.

e. Other salient information that may be useful for facility operations, relative to TAB.

3.8 DEFERRED TESTING

A. Refer to Section 01 91 13, Part 3.10 for requirements of deferred testing.

3.9 WRITTEN WORK PRODUCTS

A. Written work products of Contractors will consist of the start-up and initial checkout plan described in Section 01 91 13 and the filled out start-up, initial checkout and pre-functional checklists.

END OF SECTION

SECTION 23 08 11 - MECHANICAL TESTING REQUIREMENTS

PART 1 - GENERAL

1.1 INCLUDED SYSTEMS AND EQUIPMENT

A. The following is a list of the equipment and system test requirements included in this section:

1)Air Handling Unit

2)Chilled Water System

3)Building Automation System

4)Domestic Hot Water System

5)Exhaust Fans

6)Heating Hot Water System

1.2 DESCRIPTION

A. This section specifies the functional testing requirements for Division 23 systems and equipment. From these requirements, the Commissioning Authority (CxA) shall develop step-by-step procedures to be executed by the Subs or the Commissioning Authority. The general functional testing process, requirements and test method definitions are described in Section 01 91 13. The test requirements for each piece of equipment or system contain the following:

1. The contractors responsible to execute the tests, under the direction of the CxA.
2. A list of the integral components being tested.
3. Pre-functional checklists associated with the components.
4. Functions and modes to be tested.
5. Required conditions of the test for each mode.
6. Special procedures.
7. Required methods of testing.
8. Required monitoring.
9. Acceptance criteria.
10. Sampling strategies allowed.

1.3 PREREQUISITES

The following applicable generic prerequisite checklist items are required to be listed on each written functional test form and be completed and checked off by CxA prior to functional testing.

__ All related equipment has been started up and start-up reports and pre-functional checklists submitted and approved ready for functional testing:

__ All control system functions for this and all interlocking systems are programmed and operable per contract documents, including final setpoints and schedules with debugging, loop tuning and sensor calibrations completed.

_____ _____
Controls Contractor Signature or Verbal Date

__ All A/E punchlist items for this equipment corrected.

__ These functional test procedures reviewed and approved by installing contractor.

__ Safeties and operating ranges reviewed by the CxA.

__ Test requirements and sequences of operation attached.

__ Schedules and setpoints attached.

__ False loading equipment, system and procedures ready.

__ Sufficient clearance around equipment for servicing.

__ Record of all values for pre-test setpoints changed to accommodate testing has been made and a check box provided to verify return to original values (control parameters, limits, delays, lockouts, schedules, etc.).

__ Other miscellaneous checks of the pre-functional checklist and start-up reports completed successfully.

1.4 MONITORING

A. Monitoring is a method of testing as a stand-alone method or to augment manual testing.

B. All points listed in the required monitoring section of the test requirements which are control system monitored points shall be trended by the controls contractor. Other points shall be monitored by the CxA using dataloggers. At the option of the CxA, some control system monitoring may be replaced with datalogger monitoring. At the CxA's request, the controls contractor shall trend up to 20% more points than listed herein at no extra charge.

C. Hard copies of monitored data must be in columnar format with time down the left column and at least 5 columns of point values on the same page.

D. Graphical output is desirable, and will be required for all output, if the system can produce it.

PART 2 – PRODUCTS

-- NOT APPLICABLE --

PART 3 – EXECUTION

1. AIR HANDLER UNIT

A. Parties Responsible to Execute Functional Test
1. Controls contractor: operate the controls to activate the equipment.
2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
1. Air Flow Measuring Station

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 23 08 11 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent will also spot-check misc. items and calibrations on the pre-functional checklists previously completed by the installer, before the beginning of functional testing.

D. Functions / Modes Required To Be Tested, Test Methods and Seasonal Test Requirements
The following testing requirements are in addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual, Monitoring, Either or Both[3]	Required Seasonal Test[1]
General 1. Test each sequence in the sequence of operations, and other significant modes and sequences not mentioned; including startup, shutdown, unoccupied & manual modes and power failure. Test functionality of this piece of equipment or system in all control strategies or interlocks that it is associated with.	Manual	
In addition to, or as part of (1) above, the following modes or tests are required:		
2. Supply air, space temp and space humidity	Both	
3. Dehumidification functions / humidification functions	Both	
4. Damper interlocks including fire and smoke dampers	Manual	
5. Temperature difference across heating and cooling coils, if spec'd	Manual	
6. Verification of minimum OSA quantity	Either	
7. Night low and high limit, morning warmup cycle,	Either	
8. Verify TAB reported SF cfm with control system reading	Manual	
9. All alarms (low limits, freezestat, etc.)	Manual	
10. Sensor and actuator calibration checks on: SAT, OSAT, etc. economizer (EMS readout against hand-held calibrated instrument must be within 0.5°F for temps. or within a tolerance equal to 10% of static pressure setpoint, with an inclined manometer)	Manual	
11. Verify control strategies, schedules and setpoints to be reasonable and appropriate		

[1]Cooling season, Heating season or Both. "Design" means within 5°of season design (ASHRAE 2 1/2%), or 95% of loading design. A blank cell denotes no special seasonal test is required and that test can be executed during any season, if condition simulation is appropriate.

E. Special Procedures (other equipment to test with, etc.; reference to function ID)

F. Required Monitoring

1. All points listed below which are control system monitored points shall be trended by the controls contractor. Other points shall be monitored by the CA using dataloggers. Refer to the Monitoring section at the beginning of Section 23 08 11 for additional monitoring details.

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)
For each Unit being tested:				
HUM, SAT	5	5 days incl. weekend	Y	Y
Space Temp., Hum	5	5 days incl. weekend	Y	Y
O/A CFM	1	5 days incl. weekend	Y	Y
Outdoor Air Temp., Hum	5	5 days incl. weekend	Y	Y

Remarks:

G. Acceptance Criteria (referenced by function or mode ID)

1-11. For the conditions, sequences and modes tested, the system, integral components and related equipment respond to varying loads and changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

2. AHU shall be able to maintain the SA temperature within 1.0F either side of the deadband of the current setpoint without excessive hunting.

H. Sampling Strategy for Identical Units

1. All identical AHU's over 15 tons shall not have any sampling--test all units. However, 25% of the units may have monitoring be the verification method for modes listed with Monitoring or Both as testing methods, with no less than three units being fully tested per the above requirements.
2. All AHU's shall be sampled:
   Randomly test at least 25% of each group of fan coil units per the above tests. In no case test less than three units in each group. If 25% of the units in the first sample fail the functional performance tests, test the remaining 50%, fully at the contractor's expense. This sampling applies to the testing subsections. That is, if calibration is off on more than 10% of the tested piece of equipment, then another sample shall have calibrations checked, but not all other tests need to be done on the second sample.
3. All units not included in the sampling testing and monitoring shall be fully monitored for the monitoring modes listed above in the monitoring section.

END OF REQUIREMENTS FOR AIR HANDLING UNIT TEST

2. CHILLED WATER SYSTEM

100% of condenser water system shall be verified to maintain proper control. Specific test requirements for this may have been identified elsewhere in this specification. For all areas not specifically specified, otherwise, the following tests shall be conducted.

A. Parties Responsible to Execute Functional Test
1. Controls contractor: operate the controls and provide trend logs
2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
1. Control system

C. Prerequisites All listed systems in Part B, above, shall have had successful functional tests completed prior to this test.

D. Functions / Modes Required To Be Tested, Test Methods and Seasonal Test Requirements

This is a performance test to verify that the chilled water system can provide and maintain the cooling water as specified, during normal and extreme weather and occupancy conditions. The test consists of monitoring, via trend logs, of various points during the cooling season.

E. Special Procedures (other equipment to test with, etc.; reference to function ID)
1. None

F. Required Monitoring
1. All points listed below which are control system monitored points shall be trended by the controls contractor. Refer to the Monitoring section at the beginning of Section 23 08 11 for additional monitoring details.

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)	Function Being Tested
Chilled Water Supply Prim.	5	5 days incl. weekend	Y	Y	1,2
Chilled Water Return Prim.	5	5 days incl. weekend	Y	Y	1,2
Chilled Water Supply Sec.	5	5 days incl. weekend	Y	Y	1,2
Chilled Water Return Sec.	5	5 days incl. weekend	Y	Y	1,2
Chilled Water Sec. VFD	1	5 days incl. weekend	Y	Y	1,2
Chilled Water DP	1	5 days incl. weekend	Y	Y	1,2
DP Setpoint	1	5 days incl. weekend	Y	Y	1,2
Cond. Water Supply	5	5 days incl. weekend	Y	Y	1,2
Cond. Water Return	5	5 days incl. weekend	Y	Y	1,2
Tower Fan VFD	5	5 days incl. weekend	Y	Y	1,2
Chiller Status	COV	5 days incl. weekend	Y	Y	1,2

Remarks:

END OF REQUIREMENTS FOR CHILLED WATER SYSTEM

3. BUILDING AUTOMATION SYSTEM (BAS)

A. Parties Responsible to Execute Functional Test
1. Controls contractor: operate the controls to activate the equipment.
2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
1. Building Automation System
2. All pre-functional checklists of controlled equipment

D. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 23 08 11 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent will also spot-check misc. items and calibrations on the pre-functional checklists previously completed by the installer, before the beginning of functional testing.

E. A significant part of the BAS functional testing requirements is the successful completion of the functional tests of equipment the BAS controls or interlocks with. Uncompleted equipment functional tests or outstanding deficiencies in those tests lend the required BAS functional testing incomplete.

F. Integral or stand-alone controls are functionally tested with the equipment they are attached to, including any interlocks with other equipment or systems and thus are not covered under the BAS testing requirements, except for any integrated functions or interlocks listed below.

G. In addition to the controlled equipment testing, the following tests are required for the BAS, where features have been specified. The following testing requirements are in addition to and do not replace any testing requirements elsewhere in the specifications.

Function / Mode	**Test Method Manual (demonstration), Monitoring, Either or Both**
MISC. FUNCTIONS	
1. All specified functions and features are set up, debugged and fully operable	Verbal discussion of features
2. Power failure and battery backup and power-up restart functions	Demonstration
3. Specified trending and graphing features demonstration	See equipment trends
4. Global commands features	Demonstration
5. Security and access codes	Demonstration
6. Occupant over-rides (manual, telephone, key, keypad, etc.)	Demonstration
7. O&M schedules and alarms	Demonstration
8. Scheduling features fully functional and setup, including holidays	Observation in terminal screens or printouts
9. Date and time setting in central computer and verify field panels read the same time	Demonstration
10. Included features not specified to be setup are installed (list)	Demonstration
11. Override Push Button	Demonstration
12. Demonstrate functionality of field panels using local operator keypads and local ports (plug-ins) using portable computer/keypad	Demonstration of 100% of panels and 10% of ports
13. All graphic screens and value readouts completed	Demonstration

Function / Mode	Test Method Manual (demonstration), Monitoring, Either or Both
14. Setpoint changing features and functions	Done during equipment testing
15. Communications to remote sites	Demonstration
16. Sensor calibrations	Sampled during equipment tests
17. Final as-builts or redlines (per spec) control drawings, final points list, program code, setpoints, schedules, warranties, etc. per specs, submitted for O&Ms.	Observation
18. Verify that points that are monitored only, having no control function, are checked for proper reporting to BAS.	Observation
INTEGRATED TESTS	
20. Fire alarm interlocks and response	Demonstration
21. Sequential staging ON of equipment	Either
22. Optimum start-stop functions	Monitoring
23. All control strategies and sequences not tested during controlled equipment testing	Either
24. Other integrated tests specified in the contract documents	
25. Security system interlocks	Demonstration
26. Fire protection and suppression systems	Demonstration

H. Special Procedures (other equipment to test with, etc.; reference to function ID)
None

I. Additional Required Monitoring
1. Besides the trending and monitoring required with the functional testing of equipment, all points listed below which are control system monitored points shall be trended by the controls contractor. Other points shall be monitored by the CA using dataloggers. Refer to the Monitoring section at the beginning of Section 23 08 11 for additional monitoring details.

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)	Function Being Tested
Optimum start/stop equip.	5	5 days incl. weekend	Y	Y	24

Remarks:

I. Acceptance Criteria (referenced by function or mode ID)
All For the conditions, sequences and modes tested, the BAS, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

J. Sampling Strategy for Identical Units
1. Sample 10% of the field panels for procedure 9, and 10% of the local ports for procedure 12. If 10% fail, test another 10%. If 10% of those fail, test all remaining units at the contractor's expense.

END OF REQUIREMENTS FOR BAS TEST

4. DOMESTIC HOT WATER SYSTEM

100% of solar hot water system shall be verified to maintain proper control. Specific test requirements for this may have been identified elsewhere in this specification. For all areas not specifically specified, otherwise, the following tests shall be conducted.

A. Parties Responsible to Execute Functional Test
   1. Controls contractor: operate the controls and provide trend logs
   2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
   1. Control system

C. Prerequisites All listed systems in Part B, above, shall have had successful functional tests completed prior to this test.

D. Functions / Modes Required To Be Tested, Test Methods and Seasonal Test Requirements

   This is a performance test to verify that the domestic hot water system can provide and maintain the domestic hot water as specified, during normal and extreme weather and occupancy conditions. The test consists of monitoring, via trend logs, of various points during the heating or cooling season.

E. Special Procedures (other equipment to test with, etc.; reference to function ID)
   1. None

F. Required Monitoring
   1. All points listed below which are control system monitored points shall be trended by the controls contractor. Refer to the Monitoring section at the beginning of Section 23 08 11 for additional monitoring details.'

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)
Flow Switch	5	5 days incl. weekend	Y	Y
Isolation Valve	5	5 days incl. weekend	Y	Y
Domestic Hot Water Supply	5	5 days incl. weekend	Y	Y
Domestic Hot Water Return	1	5 days incl. weekend	Y	Y
Outdoor Air Temp.	1	5 days incl. weekend	Y	Y
Domestic Hot Water Setpoint	1	5 days incl. weekend	Y	Y

END OF REQUIREMENTS FOR DOMESTIC HOT WATER SYSTEM

5. EXHAUST FANS

The testing requirements apply to the following fans: Shop Exhaust Fans

A. Parties Responsible to Execute Functional Test
   1. Controls contractor: operate the controls to activate the equipment, if BAS controlled.
   2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
   1. Exhaust fans

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 15997 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent will also spot-check misc. items and calibrations on the pre-functional checklists previously completed by the installer, before the beginning of functional testing.

D. Functions / Modes Required To Be Tested, Test Methods and Seasonal Test Requirements
The following testing requirements are in addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	Test Method Manual, Monitoring, Either or Both[1]	Required Seasonal Test
General 1. Test each sequence in the sequence of operations, and other significant modes and sequences not mentioned; including startup, shutdown, unoccupied & manual modes and power failure. Test functionality of this piece of equipment or system in all control strategies or interlocks that it is associated with.	Manual	
In addition to, or as part of (1) above, the following modes or tests are required:		
2. Verify Alarm		
3. Check TAB report record of air flow and compare to specifications	Review	

[1]Refer to Special Procedures

E. Special Procedures (other equipment to test with, etc.; reference to function ID)
None

F. Required Monitoring
   1. All points listed below which are control system monitored points shall be trended by the controls contractor. Other points shall be monitored by the CA using dataloggers. Refer to the Monitoring section at the beginning of Section 15997 for additional monitoring details.

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)
For each fan:				

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)	ASCII File? (Y/N)
Exhaust Fan Status	5	5 days incl. weekend	Y	Y

Remarks:

G. Acceptance Criteria (referenced by function or mode ID)

1-6. For the conditions, sequences and modes tested, the fans, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

H. Sampling Strategy for Identical Units of the same type and function, but different in size, are considered identical for sampling purposes.

1. Randomly test at least 10% of each group of identical equipment (the 1st sample). In no case test less than three units in each group. If 10% of the units in the first sample fail the functional performance tests, test another 10% of the group (the 2nd sample). If 10% of the units in the 2nd sample fail, test all remaining units in the whole group, fully at the contractor's expense. This sampling applies to the testing subsections. That is, if calibration is off on more than 10% of the tested piece of equipment, then another sample shall have calibrations checked, but not all other tests need to be done on the second sample.

END OF REQUIREMENTS FOR EXHAUST FAN TEST

6. HEATING HOT WATER SYSTEM

100% of hot water system shall be verified to maintain proper control. Specific test requirements for this may have been identified elsewhere in this specification. For all areas not specifically specified, otherwise, the following tests shall be conducted.

A. Parties Responsible to Execute Functional Test
   1. Controls contractor: operate the controls and provide trend logs
   2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
   1. Control system

C. Prerequisites All listed systems in Part B, above, shall have had successful functional tests completed prior to this test.

D. Functions / Modes Required To Be Tested, Test Methods and Seasonal Test Requirements

   This is a performance test to verify that the heating hot water system can provide and maintain the heating hot water as specified, during normal and extreme weather and occupancy conditions. The test consists of monitoring, via trend logs, of various points during the heating or cooling season.

E. Special Procedures (other equipment to test with, etc.; reference to function ID)
   1. None

F. Required Monitoring
   1. All points listed below which are control system monitored points shall be trended by the controls contractor. Refer to the Monitoring section at the beginning of Section 23 08 11 for additional monitoring details.

Point	Time Step (min.)	Minimum Time Period of Trend	Hard Copy? (Y/N)
Flow Switch	5	5 days incl. weekend	Y
Isolation Valve	5	5 days incl. weekend	Y
Hot Water Supply	5	5 days incl. weekend	Y
Hot Water Return	1	5 days incl. weekend	Y
Outdoor Air Temp.	1	5 days incl. weekend	Y
Heating Hot Water Setpoint	1	5 days incl. weekend	Y

END OF REQUIREMENTS FOR HEATING HOT WATER SYSTEM

END OF SECTION

SECTION 23 08 12 - COMMISSIONING PRE-FUNCTIONAL CHECKLISTS

PART 1 – GENERAL

1.1 DESCRIPTION

A. This section contains representative Pre-functional Checklists in a form format (PC).

B. The checklists contain items for Division 23 contractors to perform. On each checklist, a column is provided that should be filled out by the Contractor assigning responsibility for that line item to a trade.

C. Those executing the checklists are only responsible to perform items that apply to the specific application at hand. These checklists do not take the place of the manufacturer's recommended checkout and start-up procedures or report. Some checklist procedures may be redundant of some checkout procedures that will be documented on typical factory field checkout sheets. Double documenting is required in those cases.

D. Refer to Section 01 91 13for additional requirements regarding pre-functional checklists, startup and initial checkout. Items that do not apply should be noted along with the reasons on the form. If this form is not used for documenting, one of similar rigor and clarity shall be used. Contractors assigned responsibility for sections of the checklist shall be responsible to see that checklist items by their subcontractors are completed and checked off. "Contr." column or abbreviations in brackets to the right of an item refer to the contractor responsible to verify completion of this item. A/E = architect/engineer, All = all contractors, CxA = commissioning agent, CC = controls contractor, EC = electrical contractor, GC = general contractor, MC = mechanical contractor, SC = sheet metal contractor, TAB = test and balance contractor.

Pre-functional Mechanical Checklist

Project : _SAMPLE

PC-_01_ AIR HANDLER UNIT, AHU – 11, 21, 31, 41

Components included: supply fans, coils, control valves, VFD, control dampers, safeties

1. Submittal / Approvals

Submittal. The above equipment and systems integral to them are complete and ready for functional testing. The checklist items are complete and have been checked off only by parties having direct knowledge of the event, as marked below, respective to each responsible contractor. This pre-functional checklist is submitted for approval, subject to an attached list of outstanding items yet to be completed. A Statement of Correction will be submitted upon completion of any outstanding areas. None of the outstanding items preclude safe and reliable functional tests being performed. ___ List attached.

_____ Mechanical Contractor	_____ Date	_____ Controls Contractor	_____ Date
_____ Electrical Contractor	_____ Date	_____ Sheet Metal Contractor	_____ Date
_____ TAB Contractor	_____ Date	_____ General Contractor	_____ Date

Pre-functional checklist items are to be completed as part of startup & initial checkout, preparatory to functional testing.

- This checklist does not take the place of the manufacturer's recommended checkout and startup procedures or report.
- Items that do not apply shall be noted with the reasons on this form (N/A = not applicable, BO = by others).
- If this form is not used for documenting, one of similar rigor shall be used.
- Contractors assigned responsibility for sections of the checklist shall be responsible to see that checklist items by their subcontractors are completed and checked off.
- "Contr." column or abbreviations in brackets to the right of an item refer to the contractor responsible to verify completion of this item. A/E = architect/engineer, All = all contractors, CA = commissioning agent, CC = controls contractor, EC = electrical contractor, GC = general contractor, MC = mechanical contractor, SC = sheet metal contractor, TAB = test and balance contract.

Check if Okay. Enter comment or note number if deficient.

Check Equip Tag-->	**AHU-11**	**AHU-21**	**AHU-31**	**AHU-41**		**Contr.**
Cabinet and General Installation						
Permanent labels affixed, including for fans						

Check if Okay. Enter comment or note number if deficient.

Check > Equip Tag-	AHU-11	AHU-21	AHU-31	AHU-41		Contr.
Casing condition good: no dents, leaks, door gaskets installed						
Access doors close tightly - no leaks						
Boot between duct and unit tight and in good condition						
Vibration isolation equipment installed & released from shipping locks						
Maintenance access acceptable for unit and components						
Sound attenuation installed						
Thermal insulation properly installed and according to specification						
Instrumentation installed according to specification (thermometers, pressure gages, flow meters, etc.)						
Clean up of equipment completed per contract documents						
Filters installed and replacement type and efficiency permanently affixed to housing--construction filters removed						
Valves, Piping and Coils (see full piping checklists)						
Pipe fittings complete and pipes properly supported						
Pipes properly labeled						
Pipes properly insulated						
Strainers in place and clean						
Piping system properly flushed						
No leaking apparent around fittings						
All coils are clean and fins are in good condition						
All condensate drain pans clean and slope to drain, per spec						
Valves properly labeled						
Valves installed in proper direction						
Controls properly located and secure (see attached control drawing)						
Motors: Efficiency verified.						
P/T plugs and isolation valves installed per drawings						
Fans and Dampers						
Supply fan and motor alignment correct						
Supply fan belt tension & condition good						
Supply fan protective shrouds for belts in place and secure						
Supply fan area clean						
Supply fan and motor properly lubricated						
Filters clean and tight fitting						
Filter pressure differential measuring device installed and functional (magnahelic, inclined manometer, etc.)						
Smoke and fire dampers installed properly per contract docs (proper location, access doors, appropriate ratings verified)						

Check if Okay. Enter comment or note number if deficient.

Check Equip Tag->	AHU-11	AHU-21	AHU-31	AHU-41		Contr.
All dampers close tightly						
All damper linkages have minimum play						
Low limit freeze stat sensor located to deal with stratification & bypass						
Ducts (preliminary check)						
Sound attenuators installed						
Duct joint sealant properly installed						
No apparent severe duct restrictions						
Turning vanes in square elbows as per drawings						
OSA intakes located away from pollutant sources & exhaust outlets						
Pressure leakage tests completed						
Branch duct control dampers operable						
Ducts cleaned as per specifications						
Balancing dampers installed as per drawings and TAB's site visit						
Electrical and Controls						
Pilot and service lights are in place and functioning						
Power disconnects in place and labeled						
All electric connections tight						
Proper grounding installed for components and unit						
Safeties in place and operable (Fan access kill switch, pressure relief door, Low limit thermostat, Water sensor, Duct mounted smoke detectors (supply & return)),						
Starter overload breakers installed and correct size						
Control system interlocks hooked up and functional						
All control devices, pneumatic tubing and wiring complete						
VFD						
VFD powered (wired to controlled equipment)						
VFD interlocked to control system						
All hardware, electrical and mechanical connections tight?						
Static pressure or other controlling sensor properly located and per drawings.						
Drive location not subject to excessive temperatures						
Drive location not subject to excessive moisture or dirt						
Drive size matches motor size						
Internal setting designating the model is correct						
Input of motor FLA represents 100% to 105% of motor FLA rating						
Appropriate Volts vs Hz curve is being used						

Check if Okay. Enter comment or note number if deficient.

Check Equip Tag->	AHU-11	AHU-21	AHU-31	AHU-41		Contr.
Accel and decel times are around 60-90 seconds, except for special applications. Actual decel = _____ Actual accel = _____						
Lower frequency limit at 25% for VAV fans. Actual = _____						
Upper frequency limit set at 100%, unless explained otherwise						
Unit is programmed with full written programming record on site						
TAB						
Installation of system and balancing devices to allow balancing to be completed per specifications and contract documents						
Final						
Smoke and fire dampers and unpowered TU's are open						
Startup report completed with this checklist attached						
Safeties installed and safe operating ranges for this equipment provided to the commissioning agent						
If unit is started and will be running during construction: have quality filters on RA grills, etc. to minimize dirt in the ductwork and coils and in any finished areas. Verify moisture migration is not a problem, due to improper pressures between spaces.						

- *The checklist items of Part 4 are all successfully completed for given trade.....___ YES ___ NO*
-

5. Operational Checks (This is not the functional performance testing.)

Check if Okay. Enter comment or note number if deficient.

Check Equip Tag->	AHU-11	AHU-21	AHU-31	AHU-41		Contr.
Supply fan rotation correct – VFD in Auto						
Supply fan rotation correct – VFD in Bypass						

Check if Okay. Enter comment or note number if deficient.

Check Equip Tag->	AHU-11	AHU-21	AHU-31	AHU-41		Contr.
Fans > 5 Hp Phase Checks (Measured at Full Speed): L1-L2 L2-L3 L3-L1 (%Imbalance = 100 x (avg. - lowest) / avg.) Record all 3 voltages in cell. Imbalance less than 2%?						
VFD Output Current (Measured at Full Speed): Phase A Phase B Phase C Record full load running amps for each fan. _____rated FL amps x _____srvc factor = _____ (Max amps). Running less than max?						
Output Current (Bypass): Phase A Phase B Phase C Record full load running amps for each fan. _____rated FL amps x _____srvc factor = _____ (Max amps). Running less than max?						
VFD is properly fused per the manual						
Supply fan has no unusual noise or vibration						
VFD is mounted per the Installation Manual.						
All dampers (OSA, RA, Fire/Smoke, etc.) stroke fully without binding and spans calibrated and BAS reading site verified (follow procedure in Calibration and Leak-by Test Procedures). List dampers checked: _____						
Valves stroke fully and easily and spanning is calibrated (follow procedure in Calibration and Leak-by Test Procedures). List each actuated valve here when spanned: _____						
Valves verified to not be leaking through coils when closed at normal operating pressure (follow procedure in Calibration and Leak-by Test Procedures).						
The HOA switch properly activates and deactivates the unit						
Specified sequences of operation and operating schedules have been implemented with all variations documented						
Specified point-to-point checks have been completed and documentation record submitted for this system						

- *The checklist items of Part 5 are all successfully completed for given trade.....___ YES ___ NO*

6. Sensor and Actuator Calibration [ ]

All field-installed temperature, relative humidity, CFM, CO_2, pressure sensors and gages, and all actuators (dampers and valves) on this piece of equipment shall be calibrated using the methods and tolerances given in the Calibration and Leak-by Test Procedures document. All test instruments shall have had a certified calibration within the last 12 months: Y/N_____. Sensors installed *in* the unit at the factory with calibration certification provided need not be field calibrated.

SECTION 23 08 13 - MECHANICAL FUNCTIONAL TEST PROCEDURES

PART 1 – GENERAL

1.1 DESCRIPTION

A. This section contains sample Functional performance Test procedures in a form format (FT).

1. The sample FT procedures displayed in a form format here are intended to provide the Subs and CA with an example of a format and an indication of the rigor of the required testing and documentation for various equipment types. They were not developed for this project. Other forms and formats are acceptable if they comply with the rigor, clarity and intent of all the commissioning specifications. The CA will use the functional testing requirements in Sections 23 08 11 and the testing protocols specified in Section 23 08 00 for developing site-specific functional test procedures and forms for this project. For illustrative purposes, sequences of operation associated with a few pieces of the equipment for which tests are included are also provided.

__ Air Handler
__ Chilled Water System
__ Heating Hot Water System
__ Ductwork

b. __ All control system functions for this and all interlocking systems are programmed and operable per contract documents, including final setpoints and schedules with debugging, loop tuning and sensor calibrations completed.

_____ _____
Controls Contractor Signature or Verbal Date

c. __ All A/E punch list items for this equipment corrected.
d. __ These functional test procedures reviewed and approved by installing contractor.
e. __ Safeties and operating ranges reviewed.
f. __ Test requirements and sequences of operation attached.

g. __ False loading equipment, system and procedures ready (preheat or reheat coils, control loops, over-ride on OSA dampers, etc.)
h. __ Control Program Review. Review the software control program(s) for this equipment. Parameters, setpoints and logic sequences appear to follow the specified written sequences.
i. __ Record of All Values for Current Setpoints (SP), Control Parameters, Limits, Delays, Lockouts, Schedules, Etc. Changed to Accommodate Testing:

Parameter	Pre-Test Values	Returned to Pre-Test Values √
Discharge Air Setpoint.		
Duct Static Pressure Setpoint		

Parameter	Pre-Test Values	Returned to Pre-Test Values √
Return air CO2 Setpoint		
Occupancy Schedule		

3. Verification of Misc. Pre-functional Checks.

Misc. site checks of the pre-functional checklist and startup reports completed successfully. Pass? Y / N _____

General Conditions of Test

_____
_____
_____

4. Functional Testing Record

Seq. ID From Specs [1]	Mode ID[2]	Test Procedure[3] (including special conditions)	Expected Response[4]	Pass Y/N	Note
1	FAN DOOR SWITCH	De-energize fan by turning HOA to OFF. Open fan access door. Turn HOA to Hand. Turn HOA to Auto. Repeat for each door fan kill switch on unit.	VFD should stay de-energized and show an alarm on the drive and at the GUI.		
2	FREEZE PROTECTION	With air unit fan off submerge freeze stat capillary tube in ice water (minimum of 1 foot) for a minimum of one minute. Remove capillary tube and close air unit doors. Turn HOA to Hand.	VFD should stay de-energized and show an alarm on the drive and at the GUI. Manually reset freezestat after test.		
3	SMOKE CONDITIONS	Interfacing with EC, simulate a fire mode with the Fire Alarm System	Verify that AHU System FAN is de-energized and that all smoke dampers are closed.		
4	SMOKE CONDITIONS	Interfacing with EC, clear fire mode with the Fire Alarm System	Verify that AHU System FAN is energized and that all smoke dampers are opened.		
5	EMERGENCY PAN WATER SENSOR	With air unit fan energized pour water in emergency pan to cover 18 inches (minimum) of the sensor rope.	VFD should stop and should show an alarm at VFD and GUI.		
6	FAN OFF	Standby Check. With Units Commanded off by BAS.	Verify by visual inspection that: Outside Air Dampers are closed. Return Air Dampers are open.		
7	UNIT STARTUP	With Units Commanded on by BAS	Fan ramps up slowly. Outside Air Dampers Open to their minimum positions. Chilled water valve modulates to maintain DAT at setpoint.		
8	CHILLED WATER VALVE CHECK	In cooling mode lower DAT setpoint to 3 deg. F below DAT.	Chilled water valve should be fully open.		
9	CHILLED WATER VALVE CHECK	In cooling mode raise DAT setpoint to 3 deg. F above DAT.	Chilled water valve should be fully closed.		

Seq. ID From Specs [1]	Mode ID[2]	Test Procedure[3] (including special conditions)	Expected Response[4]	Pass Y/N	Note
10	DEMAND CONTROL VENTILATION	Use test gas at 1000 ppm (or higher) on one CO2 space sensor.	Verify that controls are controlling CO2 from CO2 sensor with the highest CO2 level.		
11	DEMAND CONTROL VENTILATION	Reset CO2 setpoint to 150 ppm below actual.	Outside air damper should be at its maximum and return air dampers should be at its minimum. Verify maximum outside air CFM at GUI.		
12	DEMAND CONTROL VENTILATION	Reset CO2 setpoint to 150 ppm above actual.	Outside air damper should be at its minimum and return air dampers should be at its maximum. Verify minimum outside air CFM at GUI.		
13	STATIC PRESSURE CONTROL	Reset static pressure setpoint down by .5”WC.	Verify that the VFD modulates down. Verify at GUI that the new setpoint is maintained without hunting.		
14	STATIC PRESSURE CONTROL	Reset static pressure setpoint to down by 1.0”WC.	Verify that the VFD modulates up. Verify at GUI that the new setpoint is maintained without hunting.		
15	SUPPLY AIR RESET	Reset all VAV boxes on air unit to minimum demand for cooling.	Verify DAT setpoint reset to the high limit as shown at GUI.		
16	SUPPLY AIR RESET	Reset all VAV boxes on air unit to maximum demand for cooling.	Verify DAT setpoint reset to the low limit as shown at GUI.		
17	HIGH HUMIDITY OVERRIDE	Simulate high return air humidity above 52% RH.	Verify that DAT reset is disabled.		
18	OVER-RIDE	Schedule AHU to unoccupied. Push override button	Unit should energize when override push button is pushed.		
19	REVIEW	Review schedules, current setpoints and sequences with Specifications and Control Drawings prepared by CC	Submit approved differences to be incorporated into as-builts.		

Seq. ID From Specs [1]	Mode ID[2]	Test Procedure[3] (including special conditions)	Expected Response[4]	Pass Y/N	Note
20	TRENDING	Set all points to trend at the GUI	Print trends and submit to commissioning agent (2 weeks of data) Trend to begin following successful functional testing.		

Record Foot Notes
[1]Sequences of operation specified in Contract Documents (attached).
[2]Mode or function ID being tested from testing requirements section of the project Specifications.
[3]Step-by-step procedures for manual testing, trend logging or data-logger monitoring.
[4]Include tolerances for a passing condition.
[5]Record any permanently changed parameter values and submit to Owner.

A SUMMARY OF DEFICIENCIES IDENTIFIED DURING TESTING IS ATTACHED

Approvals. This filled-out checklist has been reviewed. Its completion is approved with the exceptions noted below.

END OF SECTION

SECTION 230900 - HVAC TEMPERATURE CONTROLS

PART 1 - GENERAL

1.1 SCOPE

A. The existing Terrebonne General Health System (TGHS) Facility Management System (FMS) is a "Metasys" system manufactured by Johnson Controls, Inc. The FMS and automatic temperature controls for this facility is to interface completely with the existing FMS system. All features and functions of the present system shall be fully supported. It is the responsibility of the contractor to include all required equipment, hardware, licensed software, backup data storage, labor and programming to have a completely installed system. The furnishing and installing of all items required for the FMS and automatic temperature controls system shall be by the Temperature Controls System Installer (TCSI), for a complete and fully operational system. The owner is not responsible for furnishing any licensed software as part of this project. The FMS and automatic temperature controls system shall be complete in all respects including labor, materials, equipment, and services necessary. This system shall be installed and adjusted by mechanics regularly employed by the TCSI. All equipment shall be of the manufacturer's first quality and of the full proportioning type. The complete Temperature Control system shall be a DDC with electronic sensors and electric/electronic actuation of valves and dampers.

B. The existing TGHS FMS is Johnson Controls, Inc. (JCI) Metasys system. The FMS and all temperature controls for this project shall interface completely with the existing FMS. The FMS shall communicate to the system in the building shall be able to be complete for full control and time schedules. In addition, this system shall use the available campus master graphics package for floor-plan graphics required for this work. This graphics system exists on the workstations on campus. Any specific graphics required by this building, but not presently resident on the master graphics package, shall be created by this Contractor and added to master graphics package for universal use. The format and form of the graphics must match the color, size and format appearance of the existing graphics. Additional workstations, computers, integrators, and servers to facilitate connection to the existing FMS system are not acceptable. Web accessed monitoring and control separate from the existing FMS system licensed software are not permitted as they do not provide a seamless connection into the existing system.

C. All points and sequences described herein shall be incorporated into the existing FMS at TGHS's main system. All new points shall be made visible and totally controllable by all means allowable through all FMS computers. All existing graphics shall be updated to include this projects floor-plans, equipment and control points, to match existing floor-plan graphics utilized for other buildings on campus. Graphics shall be updated on all computers where graphics are located.

D. Uploads and downloads of controllers shall be able to be performed at any existing workstation or from any network panel. Twenty-four hour point history shall be available for all points simply by double clicking the mouse on designated point. Scheduling of any point on the system shall be available from any workstation. All workstations shall be updated to display new network maps with new buildings, equipment, and points.

E. Each primary device (air handler, VAV boxes etc) shall have individual controllers. Grouping of equipment on one controller will not be acceptable.

F. Installation of a new operator workstation, server, software (other than licensed updates noted below), programming tools, integrator panel and graphics package for this project is not acceptable.

G. Contractor shall be responsible for updating licensed software (to the current version) and programming, as applicable, setup of schedules, trends, logs and alarms and connections.

H. All wiring required in the control system and all interlocking motor control wiring and start-stop control wiring shall be furnished and installed as part of the work of this section of Division 23. The control system shall include all interconnecting wiring and conduit as required for a fully operational system as specified. All line voltage wiring and low voltage wiring shall utilize methods and materials complying with the requirements of the Electrical Specifications, Division 26.

I. The control system shall consist of all thermostats, valves, dampers, transformers, relays and other necessary equipment to provide controls for all phases of the cooling, heating and ventilating systems as required; refer to drawings for additional requirements.

1.2 RELATED WORK SPECIFIED IN OTHER SECTIONS

A. Where work specified under other Sections of these Specifications connects to equipment or systems which are a part of this section, provide proper connection(s) to such equipment including trade coordination. The following sections may have direct links to the installation of the FMS system:
1. Section 230001 - General Conditions
2. Section 230113 – MISC. Mechanical Requirements
3. Section 233100 - Sheet Metal Work
4. Section 230503 - HVAC Piping
5. Section 232116 – Piping Specialties
6. Division 26 - Electrical Work
7. Additional related work as specified in Part 3 or as shown on the design drawings

1.3 QUALITY ASSURANCE

A. General:
1. The Facility Management System herein specified shall be fully integrated and installed as a complete package by the TCSI. The System shall include all wiring, piping, installation supervision, calibration, adjustments, and checkout necessary for a complete and fully operational system.
2. The TCSI shall be a factory authorized agency that is regularly engaged in the engineering, programming, installation and service of Facility Management Systems of similar size and complexity. The FMS supplier shall have a support facility within 25 miles of the site with technical staff, spare parts, and all necessary test/diagnostic equipment. The FMS supplier shall have a minimum of 10 years installation experience. Bids by wholesalers and non-franchised contractors shall not be acceptable.
3. The TCSI shall have a local branch facility. Emergency service shall be available on a 24-hour, 7-day-a-week basis.
4. The TCSI shall be responsible for all work fitting into place in a satisfactory and neat workmanlike manner acceptable to the Owner/Architect/Engineer.
5. The TCSI will coordinate with other trades regarding the location and size of pipes, equipment, fixtures, conduit, ducts, openings, switches, outlets, and so forth, in order to eliminate any delays in the progress of the job.

B. Experience Record:
1. The TCSI shall have experience with the complete, turnkey installation of Facility Management Systems of similar size and technical complexity.

2. The TCSI shall employ specialists in the field of Facility Management Systems including: Programming, Engineering, Field Supervision, and Installation. Specialists shall have experience with Facility Management Systems.

C. Products:

1. The Facility Management System architecture shall consist of the products of a manufacturer regularly engaged in the production of Facility Management Systems, and shall be the manufacturer's latest standard of design. Controllers and DDC (Direct Digital Control) system components shall be current production products.
2. All other equipment shall be the products of the FMS manufacturers or of an approved manufacturer regularly engaged in production of specialized Facility Management System materials or equipment.
3. Following is a list of acceptable Manufacturers: Johnson Controls, Inc. by local New Orleans branch office Contact Mike DiVincent @ 228-363-2238 or michael.divincent@jci.com.

1.4 WORK INCLUDED

A. Installation of Facility Management System (FMS):

1. The TCSI shall furnish and install a complete Facility Management System (FMS) for all mechanical systems and other facility systems as included in the project documents. The FMS will provide the functional features as defined in Part 1-General Requirements, Part 2-Products, and Part 3-Execution of these Specifications. The TCSI shall provide a complete and operational system to perform all sequences of operations stated within Part 3 or shown on the control drawings.
2. In addition, the following apply:
   a. The work under this Section shall include all materials and labor to perform all work required for the installation of the TCSI as specified.
   b. The drawings and Specifications are complementary to one another—meaning that what is called for on one is to be considered called for in both. Where conflicts exist between the Specifications and/or drawings, the more stringent requirement shall apply.
   c. The TCSI shall be responsible for field verification of site conditions and for gathering all necessary field data for all items to be provided under this contract prior to submitting his or her bid.
   d. Where work specified under other Sections of this Specification connects to equipment or systems that are listed and described in this Section, the TCSI shall provide proper connection(s) to such equipment, including trade coordination.

1.5 SUBMITTALS

A. Shop Drawings, Product Data, and Samples:

1. The TCSI shall submit within 60 days after award installation drawings and control strategies for review. During the submittal phase, the TCSI shall provide detailed diagrams to demonstrate the connection being used for communicating with the existing FMS Metasys system.
2. Each submittal shall have a cover sheet with the following information provided: submittal ID number; date; project name, address, and title; TCSI name, address and phone number; TCSI project manager, quality control manager, and project engineer names and phone numbers.
3. Each submittal shall include the following information.
   a. FMS riser diagram showing all DDC controllers, operator workstations, network repeaters, and network wiring.

b. One-line schematics and system flow diagrams showing the location of all control devices.
c. Points list for each DDC controller, including: Tag, Point Type, System Name, Object Name, Expanded ID, Display Units, Controller Type, Address, Cable Destination, Module Type, Terminal ID, Panel, Slot Number, Reference Drawing, and Cable Number.

4. Vendor's own written description for each sequence of operations, to include the following:
   a. Sequences shall reference input/output and software parameters by name and description.
   b. The sequences of operations provided in the submittal by the TCSI shall represent the detailed analysis needed to create actual programming code from the design documents.
   c. Points shall be referenced by name, including all software points such as programmable setpoints, range limits, time delays, and so forth.
   d. The sequence of operations shall cover normal operation and operation under the various alarm conditions applicable to that system.
   e. User interface functional outline. The outline shall include each display screen to be provided, data to be displayed, and links to other screens. The outline level hierarchy shall be:
      1) Site
      2) Building
      3) Floor
      4) System
   f. Detailed Bill of Material list for each panel, identifying: quantity, part number, description, and associated options.
   g. Control Valve Schedules. This spreadsheet type schedule shall include a separate line for each valve and a column for each of the valve attributes, including: Code Number, Configuration, Fail Position, Pipe Size, Valve Size, Body Configuration, Close off Pressure, Capacity, Valve CV, Calc CV, Design Pressure, Actual Pressure, and Actuator Type.
   h. Cataloged cut sheets of all equipment used. This includes, but is not limited to, the following: DDC panels, peripherals, sensors, actuators, dampers, control air system components, and so forth.
   i. Range and scale information for all transmitters and sensors. This sheet shall clearly indicate one device and any applicable options. Where more than one device to be used is on a single sheet, submit two sheets, individually marked.
   j. Hardware data sheets for all operator workstations, local access panels, and portable operator terminals.
   k. Licensed software manuals for all applications programs to be provided as a part of the operator workstations, portable operator terminals, programming devices, and so forth for evaluation for compliance with the performance requirements of this Specification.
   l. Initial project team Quality Assurance compliance report.
5. TCSI shall not order material or begin fabrication or field installation until receiving authorization to proceed in the form of an approved submittal. TCSI shall be solely responsible for the removal and replacement of any item not approved by submittal at no cost to the Owner.

1.6 O&M MANUALS

A. Submit three sets of each manual.

B. Include the following documentation in the Hardware Manual:
   1. General description and cut sheets for all components.
   2. Detailed wiring and installation illustrations and complete calibration procedures for each field and panel device.
   3. Complete trouble-shooting procedures and guidelines.
   4. Complete operating instructions for all systems.
   5. Maintenance Instructions: Document all maintenance and repair/replacement procedures.

C. Include the following documentation in the DDC Software Manual:
   1. Sequence of Operations
   2. Program Listing of Software Source Code OR Flow Chart Diagrams of Programming Objects.
   3. Printed listing of controller and operator workstation database files.
   4. Software Point Name Abbreviation List.. Include Name, Description, Controller Where Located, Point Type and Point ID.
   5. I/O Point List. Include Point Name, Controller Location, Point Number, Control Device, Range and Span.
   6. Printouts of all; Reports, Group Listings and Alarm Messages.
   7. Index of all DDC point names with documentation manual page number references.

D. Provide three copies of all manufacturers manuals covering the installed system. This shall include, as a minimum:
   1. System Engineering Manual
   2. System Installation Manual
   3. Programming Manual
   4. Engineering and Troubleshooting Bulletins
   5. Operator Workstation Licensed software Manual
   6. All other pertinent manuals published by the control system manufacturer.

E. All manuals shall be provided in hard copy format or on a single Compact Disk (CD) as part of an on-line documentation system through the operator workstation.

F. Record Drawings (i.e., control diagrams/schematics updated for As-Built conditions).

1.7 WARRANTY

A. Material: The Control System shall be free from defects in material and workmanship under normal use and service. If within twelve (12) months from the date of acceptance any of the equipment herein described is defective in operation, workmanship or materials, it will be replaced, repaired or adjusted at the option of the TCSI free of charge.

B. Installation: The Control System shall be free from defects in installation workmanship for a period of one year from acceptance. The TCSI shall, free of charge, correct any defects in workmanship within one week of notification in writing by the Owner.

PART 2 – PRODUCTS

2.1 GENERAL PRODUCT DESCRIPTION

A. The existing Metasys Facility Management System (FMS) shall integrate multiple building functions including equipment supervision and control, alarm management, energy management,

information management, and historical data collection and archiving. The use of additional servers, computers, and workstations is unacceptable. FMS licensed software shall be updated to latest version at project completion.

B. The facility management system shall consist of the following:
   1. Standalone Network Controllers
   2. Application specific controllers (HVAC etc.)
   3. Networked Thermostats

C. The system shall be modular in nature, and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, Network Controllers (see Network Controllers below), and operator devices, while re-using existing controls equipment.

D. System architectural design shall eliminate dependence upon any single device for alarm reporting and control execution. Each Network Controller shall operate independently by performing its own specified control, alarm management, operator I/O, and historical data collection. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices.

E. Network Controllers shall be able to access any data from, or send control commands and alarm reports directly to any other Network Controller or combination of panels on the network without dependence upon a central processing device, such as a central file server. Network Controllers shall also be able to send alarm reports to multiple operator workstations, terminals, and printers without dependence upon a central processing device or File Server.

2.2 SYSTEM ARCHITECTURE AND NETWORK CONTROL PANELS

A. Network:
   1. The first tier network shall be based on a PC industry standard of Ethernet TCP/IP. PC Workstation LAN controller cards shall be standard “off the shelf” products available through normal PC vendor channels.
   2. The FMS shall network multiple operator workstations, network controllers, system controllers, and application-specific controllers. The first tier network shall provide communications between operator workstations and first tier DDC (Direct Digital Control) controllers.
   3. All FMS devices on the network shall be capable of communicating at a communication speed of 100Mbps, with full peer to peer network communication.
   4. Network Controllers shall reside on the first tier.
   5. The first tier network will be compatible with other facility-wide networks. The first tier shall be connected to a facility network by way of standard networking practices.
   6. Second tier networks shall provide either “Peer-to-Peer,” Master-Slave, IEEE802.15.4, Supervised Token Passing communications, wireless, and shall operate at a minimum communication speed of 9600 baud.

B. Network Control Panel:
   1. The Network Control Panel (NCP) shall be a fully user-programmable, supervisory controller. The NCP shall monitor the network of distributed application-specific controllers, provide global strategy and direction, and communicate on a peer-to-peer basis with other Network Automation Engines.
   2. Automation network – The NCP shall reside on the automation network and shall support a subnet of system controllers.
   3. User Interface (UI) – All computers connected physically or virtually to the automation network shall have access to the UI. Systems that require a local copy of the system

database on the user's personal computer are not acceptable. The NCP shall support concurrent users. The user shall have the capability to access all system data through one NCP. Systems that require the user to address more than one NCP to access all system information are not acceptable.

4. Systems that support UI Graphics from a central database or require the graphics to reside on the user's personal computer are not acceptable.
5. The UI shall support the following functions:
    a. Configuration
    b. Commissioning
    c. Data Archiving
    d. Monitoring
    e. Commanding
    f. System Diagnostics
6. Systems that require workstation software or modified web browsers are not acceptable.
7. The NCP shall allow temporary use of portable devices without interrupting the normal operation of permanently connected modems.
8. Processor – The NCP shall be microprocessor-based with a minimum word size of 32 bits. The NCP shall be a multi-tasking, multi-user, and real-time digital control processor. Standard operating systems shall be employed. NCP size and capability shall be sufficient to fully meet the requirements of this Specification.
9. Memory – Each NCP shall have sufficient memory to support its own operating system, databases, and control programs, and to provide supervisory control for all control level devices.
10. Hardware Real Time Clock – The NCP shall include an integrated, hardware-Based, real-time clock.
11. The NCP shall include troubleshooting LED indicators to identify the following conditions:
    a. Power - On/Off
    b. Ethernet Connection Speed – 10 Mbps/100 Mbps
    c. Peer Communication – Data Traffic between NCP Devices
    d. Run – NCP Running/NCP in Startup/NCP Shutting Down/Software Not Running
    e. Bat Fault – Battery Defective, Data Protection Battery Not Installed
    f. Fault – General Fault
12. Communications Ports – The NCP shall provide the following ports for operation of operator Input/Output (I/O) devices, such as industry-standard computers, modems, and portable operator's terminals.
    a. USB port
    b. RS-232 serial data communication port
    c. RS-485 port
    d. Ethernet port
13. Diagnostics – The NCP shall continuously perform self-diagnostics, communication diagnosis, and diagnosis of all panel components. The Network Automation Engine shall provide both local and remote annunciation of any detected component failures, low battery conditions, or repeated failures to establish communication.
14. Power Failure – In the event of the loss of normal power, The NCP shall continue to operate for a user adjustable period of up to 10 minutes after which there shall be an orderly shutdown of all programs to prevent the loss of database or operating system software. During a loss of normal power, the control sequences shall go to the normal system shutdown conditions. All critical configuration data shall be saved into Flash memory. Upon restoration of normal power and after a minimum off-time delay, the controller shall automatically resume full operation without manual intervention through a normal soft-start sequence.
15. Certification – The NCP shall be listed by Underwriters Laboratories (UL).

2.3 OPERATOR INTERFACE – PLATFORMS - EXISTING

A. The present campus FMS has existing Metasys workstation(s) for command entry, information management, network alarm management, database management functions and all real-time control functions, including scheduling, history collection and alarming that shall be utilized for this project. Installation of a new PC workstation and/or new software for monitoring and controlling this building is not acceptable. Communication between building control panels and all workstations shall be over a high speed network. Application specific controllers shall be constantly scanned by the building's Network Control Panel(s) (NCP) to update point and alarm information. The Johnson Controls Metasys system (licensed software/hardware/graphics) shall remain in service and not be replaced and shall be updated to the current revision level at project completion.

B. TCSI shall update existing control application and graphics licensed software to include the new equipment and control points required for the equipment in this project. Provide dynamic floor-plan graphics for all systems.

2.4 DDC SYSTEM CONTROLLERS

A. Standalone DDC Panels:

1. Standalone DDC panels shall be microprocessor-based, multi-tasking, multi-user, real-time digital control processors. Each standalone DDC panel shall consist of modular hardware with plug-in enclosed processors, communication controllers, power supplies, and input/output modules. A sufficient number of controllers shall be supplied to fully meet the requirements of this Specification and the attached point list.
2. Point types – Each DDC panel shall support the following types of point inputs and outputs:
    a. Analog inputs shall monitor the following analog signals:
        1) 4-20 mA Sensors
        2) 0-10 VDC Sensors
        3) 1000ohm RTDs
    b. Binary inputs shall monitor dry contact closures. Input shall provide filtering to eliminate false signals resulting from input “bouncing.”
    c. Counter inputs shall monitor dry contact pulses with an input resolution of one HZ minimum.
    d. Analog outputs shall provide the following control outputs:
        1) 4.20 mA – Sink or Source
        2) 0-10 VDC
    e. Binary outputs shall provide SPDT output contacts rated for 2 amps at 24 VAC. Surge and noise suppression shall be provided on all pilot relays. Inductive loads (i.e. solenoids) shall be controlled by pilot relays.
    f. TriState outputs shall be paired binary outputs for use as Power Close/Power Open control output contacts rated for 2 amps at 24 VAC. Surge and noise suppression shall be provided on all pilot relays.
    g. Pneumatic outputs shall provide a 3-15 PSI pneumatic output. Gradual override capability and output pressure gauge shall be provided.
3. All DDC controllers shall communicate via BacNet MSTP. Bacnet IP is not acceptable.

2.5 APPLICATION SPECIFIC CONTROLLERS

1. General Purpose Equipment Controller (CGM controllers)

a. The General Purpose Equipment Controller shall be a fully programmable, digital controller. The CGM communicates via the BACnet MS/TP protocol.

    i. The CGM shall support BACnet Standard ANSI/ASHRAE 135.

        - The CGM shall be BTL listed/certified.
        - The CGM shall be tested and certified as a BACnet Advanced Application Controller (B-AAC).
        - A BACnet Protocol Implementation Conformance Statement shall be provided for the CGM.
        - The Conformance Statement shall be submitted 10 days prior to bidding.

b. The CGM shall employ finite state programming to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences. Suppliers using non-state based DDC shall provide separate control strategy diagrams for all controlled functions in their submittals.
c. CGM controllers shall be factory programmed with a continuous adaptive tuning algorithm that senses changes in the physical environment and continually adjusts loop tuning parameters appropriately. Controllers that require manual tuning of loops or perform automatic tuning on command only shall not be acceptable.
d. The CGM shall be assembled in a plastic housing with protection class IP20 (IEC529) and flammability rated to UL94-5VB.
e. The CGM shall include an integral real-time clock and support time-based tasks which enables these equipment controllers to monitor and control:

    i. Schedules
    ii. Calendars
    iii. Alarms
    iv. Trends

f. The CGM can continue time-based monitoring when offline for extended periods of time from a network.
g. The CGM can operate as a stand-alone controller in applications that do not require a networked supervisory device or for network applications where it is preferred to have the scheduling, alarming, and/or trending performed locally in the equipment controllers.
h. The CGM shall include troubleshooting LEDs to indicate the following conditions:

    i. Power – to indicate if the controller is powered or not powered
    ii. Fault – to indicate if the controller is in its default state, has no faults, has a device fault, is in startup or download mode, or has an SA Bus communication issue
    iii. SA Bus – to indicate if SA Bus communication is occurring and normal, is not occurring, or was occurring but has been lost and is waiting to rejoin
    iv. FC Bus – to indicate if FC Bus communication is occurring and normal, is not occurring, or was occurring but has been lost and is waiting to rejoin
    v. EOL – to indicate if the end-of-line termination switch is on or off

i. The CGM shall have the ability to transfer and apply firmware files to all SA Bus devices (XPM, IOM, and NS8000) connected to it.
j. The CGM shall include pluggable screw terminal blocks for all I/O, SA Bus communication, and power wiring connections. The CGM also includes a pluggable screw terminal block for FC bus communication.
k. The CGM shall accommodate the direct wiring of analog and binary I/O field points with the following resolution.

    i. Inputs – 24-bit analog-to-digital converter
    ii. Outputs – +/- 200 mV accuracy in 0-10 VDC applications

l. The CGM shall support the following types of inputs and outputs supplied in the amounts required for the specified applications:

   i. Universal Inputs – shall be configurable to monitor any of the following:

      - 0-10 VDC analog input
      - 4-20 mA analog input
      - 0-600k ohms analog input
      - Dry contact binary input

   ii. Binary Inputs – shall be configurable to monitor either of the following:

      - Dry Contact Maintained Mode
      - Pulse Counter Mode

   iii. Analog Outputs – shall be configurable to output either of the following:

      - 0-10 VDC analog output
      - 4-20 mA analog output

   iv. Binary Outputs – shall output the following:

      - 24 VAC Triac

   v. Configurable Outputs – shall be capable of the following:

      - 0-10 VDC analog output
      - 24 VAC Triac binary output

m. The CGM shall have the ability to reside on a Field Controller Bus (FC Bus).

   i. The FC Bus shall be a MS/TP Bus supporting BACnet Standard protocol SSPC-135.
   ii. The FC Bus shall support communications between the CGMs and the Network Engine.
   iii. The FC Bus shall also support peer-to-peer communications between non-supervisory devices, allowing these devices to communicate system data with each other directly, bypassing the supervisory network engine on the bus.
   iv. The FC Bus shall support a minimum of 100 equipment controllers and/or expansion modules in any combination.
   v. The FC Bus shall operate at a maximum distance of 15,000 Ft. between the CGM and the furthest connected device.

n. The CGM shall include three (3) decimal rotary dial switches for setting the BACnet MS/TP device address.

o. The CGM shall have the ability to monitor and control a network of sensors and actuators over a SA Bus.

   i. The SA Bus shall be a MS/TP Bus supporting BACnet Standard Protocol SSPC-135.
   ii. The SA Bus shall support a minimum of 10 devices per trunk.
   iii. The SA Bus shall operate at a maximum distance of 1,200 Ft. between the CGM/CGE and the furthest connected device.

p. The CGM shall have the capability to execute complex control sequences involving direct wired I/O points as well as input and output devices communicating over a MS/TP Bus.

q. The CGM shall support, but not be limited to, the following applications.

   i. Chilled central plant applications
   ii. Heating central plant applications.

iii. Built-up air handling units for special applications.
iv. Terminal & package units.
v. Special programs as required for systems control.

2. VAV Box Controller

a. The VAV Box Controller shall provide both standalone and networked DDC of pressure-independent, VAV terminal units.
b. The VAV Box Controller shall be a fully programmable, digital controller. The CVM communicates via BACnet MS/TP protocol. The CVE controller communicates via the BACnet/IP or BACnet/SC protocol.

iii. The CVM shall support BACnet Standard ANSI/ASHRAE 135.

- The CVM shall be BTL listed/certified.
- The CVM shall be tested and certified as a BACnet Advanced Application Controller (B-AAC).
- A BACnet Protocol Implementation Conformance Statement shall be provided for the CVM.
- The Conformance Statement shall be submitted 10 days prior to bidding.

c. The CVM shall include 14 preloaded single duct VAV box control applications to allow the controller to be made fully operational without the need to create a custom program.
d. The CVM shall employ finite state programming to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences. Suppliers using non-state based DDC shall provide separate control strategy diagrams for all controlled functions in their submittals.
e. CVM controllers shall be factory programmed with a continuous adaptive tuning algorithm that senses changes in the physical environment and continually adjusts loop tuning parameters appropriately. Controllers that require manual tuning of loops or perform automatic tuning on command only shall not be acceptable.
f. The CVM shall be assembled in a plenum-rated plastic housing with protection class IP20 (IEC529) and flammability rated to UL94-5VB.
g. The CVM shall include an integral real-time clock and support time-based tasks which enables these equipment controllers to monitor and control:

i. Schedules
ii. Calendars
iii. Alarms
iv. Trends

h. The CVM can continue time-based monitoring when offline for extended periods of time from a network.
i. The CVM shall include an integral differential pressure transducer and damper actuator. An additional configuration option shall be available that also includes an integral potentiometer for actual damper position feedback. All components shall be connected and mounted as a single assembly, removable as one piece.
j. The integral damper actuator shall be a fast response stepper motor capable of stroking 90 degrees in 60 seconds for quick damper positioning to speed commissioning and troubleshooting tasks.
k. The CVM shall determine airflow by a state-of-the-art, digital, non-flow pressure sensor that supports automatic correction for polarity on high- and low-pressure DP tube connections to eliminate high- and low-pressure connection mistakes.
l. The CVM shall have the ability to automatically calibrate the flow sensor to eliminate pressure transducer offset error due to ambient temperature / humidity effects.

m. The CVM can operate as a stand-alone controller in applications that do not require a networked supervisory device or for network applications where it is preferred to have the scheduling, alarming, and/or trending performed locally in the equipment controllers.
n. The CVM shall include troubleshooting LEDs to indicate the following conditions:

   i. Power – to indicate if the controller is powered or not powered
   ii. Fault – to indicate if the controller is in its default state, has no faults, has a device fault, is in startup or download mode, or has an SA Bus communication issue
   iii. SA Bus – to indicate if SA Bus communication is occurring and normal, is not occurring, or was occurring but has been lost and is waiting to rejoin
   iv. FC Bus – to indicate if FC Bus communication is occurring and normal, is not occurring, or was occurring but has been lost and is waiting to rejoin
   v. EOL – to indicate if the end-of-line termination switch is on or off

o. The CVM shall have the ability to transfer and apply firmware files to all SA Bus devices (XPM, IOM, and NS8000) connected to it.
p. The CVM shall include pluggable screw terminal blocks for all I/O, SA Bus communication, and power wiring connections. The CVM also includes a pluggable screw terminal block for FC bus communication.
q. The CVM shall accommodate the direct wiring of analog and binary I/O field points with the following resolution.

   iv. Inputs – 15-bit resolution on UIs
   v. Outputs – +/- 200 mV accuracy in 0-10 VDC applications

r. The CVM shall support the following types of inputs and outputs supplied in the amounts required for the specified applications:

   i. Universal Inputs – shall be configurable to monitor any of the following:

      - 0-10 VDC analog input
      - 4-20 mA analog input
      - 0-600k ohms analog input
      - Dry contact binary input

   ii. Binary Outputs – shall output the following:
      - 24 VAC Triac binary outputs
   iii. Configurable Outputs – shall be configurable of outputting the following:

      - 0-10 VDC analog output
      - 24 VAC Triac binary output

s. The CVM shall have the ability to reside on a Field Controller Bus (FC Bus).

   i. The FC Bus shall be a MS/TP Bus supporting BACnet Standard protocol SSPC-135.
   ii. The FC Bus shall support communications between the CVMs and the Network Engine.
   iii. The FC Bus shall also support peer-to-peer communications between non-supervisory devices, allowing these devices to communicate system data with each other directly, bypassing the supervisory network engine on the bus.
   iv. The FC Bus shall support a minimum of 100 equipment controllers and/or expansion modules in any combination.
   v. The FC Bus shall operate at a maximum distance of 15,000 Ft. between the CVM and the furthest connected device.

t. The CVM shall include three (3) decimal rotary dial switches for setting the BACnet MS/TP device address.

u. The CVM shall have the ability to monitor and control a network of sensors and actuators over a SA Bus.
    i. The SA Bus shall be a MS/TP Bus supporting BACnet Standard Protocol SSPC-135.
    ii. The SA Bus shall support a minimum of 10 devices per trunk.
    iii. The SA Bus shall operate at a maximum distance of 1,200 Ft. between the CVM/CVE and the furthest connected device.
v. The CVM shall have the capability to execute VAV box control sequences involving direct wired I/O points as well as input and output devices communicating over a MS/TP Bus.
w. The controller shall utilize a proportional plus integration (PI) algorithm for the space temperature control loops.
x. Each controller shall continuously, adaptively tune the control algorithms to improve control and controller reliability through reduced actuator duty cycle. In addition, this tuning reduces commissioning costs, and eliminates the maintenance costs of manually re-tuning loops to compensate for seasonal or other load changes.
y. The controller shall provide the ability to download and upload VAV box control application configuration files, both locally and via the communications network. Controllers shall be able to be loaded individually or as a group.
z. Control setpoint changes initiated over the network shall be written to the controller's non-volatile memory to prevent loss of setpoint changes and to provide consistent operation in the event of communication failure.
aa. The CVM controller firmware shall be flash-upgradeable remotely via the communications bus to minimize costs of feature enhancements.
bb. The CVM controller shall provide fail-soft operation if the airflow signal becomes unreliable, by automatically reverting to a pressure-dependent control mode.
cc. The CVM controller shall interface with balancer tools that allow automatic recalculation of box flow pickup gain ("K" factor), and the ability to directly command the airflow control loop to the box minimum and maximum airflow setpoints.
dd. The CVM controller shall have on-board diagnostics. These diagnostics shall consist of control loop performance measurements executing at each control loop's sample interval, which may be used to continuously monitor and document system performance. The CVM shall calculate Exponentially Weighted Moving Averages (EWMA) for each of the following metrics, which shall be available to the end user for efficient management of the VAV terminals.
    i. Absolute temperature loop error
    ii. Signed temperature loop error
    iii. Absolute airflow loop error
    iv. Signed airflow loop error
    v. Average damper actuator duty cycle
ee. The controller shall detect system error conditions to assist in managing the VAV zones. The error conditions shall consist of:
    i. Unreliable space temperature sensor
    ii. Unreliable differential pressure sensor
    iii. Starved box
    iv. Actuator stall
    v. Insufficient cooling
    vi. Insufficient heating
ff. The controller shall provide a flow test function to view damper position vs. flow in a graphical format. The information would alert the user to check damper position. The CVM would also provide a method to calculate actuator duty cycle as an indicator of damper actuator runtime.

gg. The CVM controller shall provide a compliant interface for ASHRAE Standard 62-1989 (indoor air quality) and shall be capable of resetting the box minimum airflow based on the percent of outdoor air in the primary air stream.
hh. The CVM controller shall comply with ASHRAE Standard 90.1 (energy efficiency) by preventing simultaneous heating and cooling, and where the control strategy requires reset of airflow while in reheat, by modulating the box reheat device fully open prior to increasing the airflow in the heating sequence.

3. XPM expansion I/O module
   a. The XPM provides additional input and output interfaces for use in digital controllers.
   b. The XPM shall communicate with controllers over the FC Bus or the SA Bus.
   c. The XPM shall support BACnet Standard ANSI/ASHRAE 135.
      i. The XPM shall be BTL listed/certified and carry the BTL Label.
      ii. The XPM shall be tested and certified as a BACnet Smart Actuator (B-SA).
      iii. A BACnet Protocol Implementation Conformance Statement shall be provided for the XPM.
      iv. The Conformance Statement shall be submitted 10 days prior to bidding.
   d. The XPM shall include pluggable screw terminal blocks for all I/O, SA/FC bus communication, and power wiring connections.
   e. The XPM shall include three (3) decimal rotary dial switches for setting the BACnet MS/TP device address.
   f. The XPM shall accommodate the direct wiring of analog and binary I/O field points with the following resolution:
      i. Inputs – 24-bit analog-to-digital converter
      ii. Outputs – +/- 200 mV accuracy in 0-10 VDC applications
   g. The XPM shall support the following types of inputs and outputs:
      i. Universal Inputs – shall be configured to monitor any of the following:
         - 0-10 VDC analog input
         - 4-20 mA analog input
         - 0-600k ohms analog input
         - Dry contact binary input
      ii. Binary Inputs – shall be configured to monitor either of the following:
         - Dry Contact Maintained Mode
         - Pulse Counter Mode
      iii. Analog Outputs – shall be configured to output either of the following:
         - 0-10 VDC analog output
         - 4-20 mA analog output
      iv. Binary Outputs – shall output the following:
         - 24 VAC Triac
      v. Configurable Outputs – shall be capable of the following:
         - 0-10 VDC analog output
         - 24 VAC Triac binary output
   h. The XPM shall include troubleshooting LEDs to indicate the following conditions:
      i. Power – to indicate if the device is powered or not powered
      ii. Fault – to indicate if the device is in its default state, has no faults, has a device fault, is in startup or download mode, or has an SA Bus communication issue
      iii. SA/FC Bus – to indicate if bus communication is occurring and normal, is not occurring, or was occurring but has been lost and is waiting to rejoin
      iv. EOL – to indicate if the end of line termination is on or off.

4. Network Thermostat

a. The network thermostat shall be capable of controlling two- or four-pipe fan coils, cabinet unit heaters, a pressure dependent VAV System, zoning type systems employing reheat including local hydronic reheat valves, or other similar equipment.
b. The Networked Thermostat shall communicate over the FC Bus using BACnet Standard protocol SSPC-135 or Johnson Controls N2 protocol.
    i. Communications shall be selectable locally at thermostat through the display.
c. The TEC shall be BTL listed/certified and carry the BTL Label.
    i. The TEC shall be tested and certified as a BACnet Advanced Application Controller (B-AAC).
    ii. A BACnet Protocol Implementation Conformance Statement shall be provided for the TEC.
    iii. The Conformance Statement shall be submitted 10 days prior to bidding.
d. The network thermostat shall include a 4.2 inch LED backlit touch screen with the following configurable icons.
    i. Home screen configurable icons include:
        - On/Off icon
        - Fan override icon
        - Zone temperature icon
        - Hold temperature icon
        - Zone humidity (on applicable models) icon
        - Occupancy status (on applicable models) icon
        - Temperature setpoint icon
        - Alarm icon
        - Unit status icon
        - Date/Time icon
        - Zone CO2 icon
    ii. Home screen non-configurable icon includes:
        - Menu icon
e. The network thermostat shall provide the flexibility to support any one of the following inputs:
    i. Integral indoor air temperature sensor.
    ii. Integral indoor occupancy sensor (PIR based)
    iii. Analog input for remote air temperature sensing that supports the following sensor types.
        - Nickel
        - Platinum
        - A99B PENN
        - 2.25k ohm NTC
        - 10k ohm NTC
        - 10k ohm NTC Type 3
    iv. Remote indoor air temperature sensor.
    v. Two configurable binary inputs with the following configurations:
        - Disabled
        - Occupancy
        - Override

- Remote PIR
- Dirty filter
- Service
- Fan Lock
- Open door
- Open window
- External interrupt

f. The network thermostat shall provide 4-digit passcode security.
g. The network thermostat shall employ nonvolatile EEPROM for all adjustable parameters.
h. The network thermostat shall have a temperature accuracy of ±0.9°F/±0.5°C at 70.0°F/21.0°C typical calibrated.
i. The network thermostat shall have a humidity accuracy of ±5% RH from 20 to 80% RH at 50 to 90°F (10 to 32°C.)
j. The network thermostat shall provide user equipment visibility from a mobile device through the MAP.
k. Where required by application and indicated on plans or room schedules provide the network thermostat with an integral Passive Infra-Red (PIR) occupancy sensor model.
l. On/off or floating fan coil and zoning applications:
    i. The network thermostat shall be capable of controlling two- or four-pipe fan coils, cabinet unit heaters, a pressure dependent VAV System, zoning type systems employing reheat including local hydronic reheat valves, or other similar equipment.
m. The network thermostat shall provide the flexibility to support any one of the following fan outputs:
    - Three speed fan control
    - Proportional speed fan control configurable from 0 to 10V
n. The network thermostat shall provide the flexibility to support any one of the following valve outputs:
    - Two on/off
    - Two floating
o. The network thermostat shall provide the flexibility to support High/Low voltage actuation with NO/NC configuration.
p. The network thermostat shall provide the flexibility to adjust the following control parameters:
    - Adjustable maximum setpoint offset from 0 to 20˚F
    - Adjustable fan on delay from 0 to 120 seconds
    - Adjustable fan off delay from 0 to 120 seconds
    - Adjustable minimum cooling on time from 0 to 360 seconds
    - Adjustable minimum cooling off time from 0 to 360 seconds
    - Adjustable minimum heating on time from 0 to 360 seconds
    - Adjustable minimum heating off time from 0 to 360 seconds
    - Adjustable minimum reheat on time from 0 to 360 seconds
    - Adjustable minimum reheat off time from 0 to 360 seconds
    - Adjustable stroke time from 5 to 300 seconds
    - Adjustable supply fan minimum command from 0 to 100%
    - Adjustable supply fan Medium command from 0 to 100%
    - Adjustable supply fan high command from 0 to 100%

- Adjustable reheat minimum damper position from 0 to 100%

2.6 SOFTWARE PROGRAMMING/TOOLS

A. Program Editor:

1. Existing programming tools shall be utilized for new controllers installed on this project.
2. Definition of operator device characteristics, DDC panels, individual points, applications, and control sequences shall be performed through fill-in-the-blank templates and a graphical programming approach.
3. All temperature and equipment control strategies and energy management routines shall be definable by the operator. System definition and modification procedures shall not interfere with normal system operation and control.
4. The programming environment shall provide context-sensitive help menus and instructions for each operation and/or application currently being performed, for all programming functions, and for the programming language itself.
5. Selection of a single menu item or tool bar button shall print any displayed program on the system printer or to a text archive file. For source code orientated languages, formatted text printouts shall be provided. For graphical object orientated languages, program flow charts of objects shall be provided, and shall include links between objects and parameter values.
6. Libraries of standard application modules shall be provided, such as temperature, humidity, and static pressure control. These modules may be used as “building blocks” in defining or creating new control sequences. In addition, the user shall have the capability to easily create and archive new modules and control sequences, as desired, via a word processing type format or visual object configuration type format.
7. A library of standard forms designed to facilitate definition of point characteristics shall be provided. Forms shall be self-prompting and incorporate a fill-in-the-blank approach for definition of all parameters. The system shall immediately detect an improper entry, and automatically display an error message explaining the nature of the mistake.
8. A licensed software tool shall be provided that allows a user to simulate control sequence execution and test strategies before they are actually applied to mechanical systems. Users shall be able to enter hypothetical input data and verify desired control response and calculation results via graphical displays and hardcopy printouts.
9. The capability to backup and store all system databases on the workstation hard disk shall be provided. In addition, all database changes shall be performed while the workstation is on-line without disrupting other system operations.
10. Database changes shall be recorded and downloaded to the appropriate controllers. The user shall also have the option to selectively download changes as desired.
11. A network, serial, or parallel port data connection shall be provided for the portable operator terminal to update its system database when specifically connected and activated by an operator.
12. A text-based programming language shall be provided to allow the user to define the licensed software configuration of DDC control logic for HVAC system control sequences, fan interlocks, pump interlocks, PID control loops, and other control relationships. The programming language shall conform to ANSI Basic. It shall be possible to edit and compile a program off-line, and upload or download the compiled program on-line.

2.7 INPUT DEVICES

A. General Requirements:

1. Installation, testing, and calibration of all sensors, transmitters, and other input devices shall be provided to meet the system requirements.

B. Temperature Sensors:

1. General Requirements:
   a. Sensors and transmitters shall be provided, as outlined in the input/output summary and sequence of operations.
   b. The temperature sensor shall be of the resistance type, and shall be either two-wire 1000 ohm nickel RTD, or two-wire 1000 ohm platinum RTD.
   c. The following point types (and the accuracy of each) are required, and their associated accuracy values include errors associated with the sensor, lead wire, and A to D conversion:

Point Type	Accuracy
Chilled Water	+ .5°F
Room Temp	+ .5°F
Duct Temperature	+ .5°F.
All Others	+ .75°F.

2. Room Temperature Sensors:
   a. Room sensors shall be constructed for either surface or wallbox mounting.
   b. Room sensors shall have the following options when specified:
      1) Setpoint reset slide switch providing a +3 degree (adjustable) range.
      2) Individual heating/cooling setpoint slide switches.
      3) A momentary override request push button for activation of after-hours operation.
      4) Analog thermometer.
3. Room Temperature Sensors with Integral Display:
   a. Room sensors shall be constructed for either surface or wallbox mounting.
   b. Room sensors shall have an integral LCD display and four button keypad with the following capabilities:
      1) Display room and outside air temperatures.
      2) Display and adjust room comfort setpoint.
      3) Display and adjust fan operation status.
      4) Timed override request push button with LED status for activation of after-hours operation.
      5) Display controller mode.
      6) Password selectable adjustment of setpoint and override modes.
4. Thermowells:
   a. When thermowells are required, the sensor and well shall be supplied as a complete assembly, including well head and Greenfield fitting.
   b. Thermowells shall be pressure rated and constructed in accordance with the system working pressure.
   c. Thermowells and sensors shall be mounted in a threadolet or ½" NFT saddle and allow easy access to the sensor for repair or replacement.
   d. Thermowells shall be constructed of 316 stainless steel.
5. Outside Air Sensors:
   a. Outside air sensors shall be designed to withstand the environmental conditions to which they will be exposed. They shall also be provided with a solar shield.
   b. Sensors exposed to wind velocity pressures shall be shielded by a perforated plate that surrounds the sensor element.
   c. Temperature transmitters shall be of NEMA 3R construction and rated for ambient temperatures.
6. Duct Mount Sensors:

a. Duct mount sensors shall mount in an electrical box through a hole in the duct, and be positioned so as to be easily accessible for repair or replacement.
b. Duct sensors shall be insertion type and constructed as a complete assembly, including lock nut and mounting plate.
c. For outdoor air duct applications, a weatherproof mounting box with weatherproof cover and gasket shall be used.

7. Averaging Sensors:
   a. For ductwork greater in any dimension that 48 inches and/or where air temperature stratification exists, an averaging sensor with multiple sensing points shall be used.
   b. For plenum applications, such as mixed air temperature measurements, a string of sensors mounted across the plenum shall be used to account for stratification and/or air turbulence. The averaging string shall have a minimum of 4 sensing points per 12-foot long segment.
   c. Capillary supports at the sides of the duct shall be provided to support the sensing string.

C. Humidity Sensors:
1. The sensor shall be a solid state type, relative humidity sensor of the Bulk Polymer Design. The sensor element shall resist service contamination.
2. The humidity transmitter shall be equipped with non-interactive span and zero adjustments, a 2-wire isolated loop powered, 4-20 mA, 0-100% linear proportional output.
3. The humidity transmitter shall meet the following overall accuracy, including lead loss and Analog to Digital conversion. [more information]
4. Outside air relative humidity sensors shall be installed with a rain proof, perforated cover. The transmitter shall be installed in a NEMA 3R enclosure with sealtite fittings and stainless steel bushings.
5. A single point humidity calibrator shall be provided, if required, for field calibration. Transmitters shall be shipped factory pre-calibrated.
6. Duct type sensing probes shall be constructed of 304 stainless steel, and shall be equipped with a neoprene grommet, bushings, and a mounting bracket.

D. Differential Pressure Transmitters:
1. General Air and Water Pressure Transmitter Requirements:
   a. Pressure transmitters shall be constructed to withstand 100% pressure over-range without damage, and to hold calibrated accuracy when subject to a momentary 40% over-range input.
   b. Pressure transmitters shall transmit a 0 to 5 VDC, 0 to 10 VDC, or 4 to 20 mA output signal.
   c. Differential pressure transmitters used for flow measurement shall be sized to the flow sensing device, and shall be supplied with Tee fittings and shut-off valves in the high and low sensing pick-up lines to allow the Test and Balance Agency and Owner permanent, easy-to-use connection.
   d. A minimum of a NEMA 1 housing shall be provided for the transmitter. Transmitters shall be located in accessible local control panels wherever possible.
2. Low Differential Water Pressure Applications (0” - 20” w.c.):
   a. The differential pressure transmitter shall be of industrial quality and transmit a linear, 4 to 20 mA output in response to variation of flow meter differential pressure or water pressure sensing points.
   b. The differential pressure transmitter shall have non-interactive zero and span adjustments that are adjustable from the outside cover and meet the following

performance specifications:

1) .01-20" w.c. input differential pressure range.
2) 4-20 mA output.
3) Maintain accuracy up to 20 to 1 ratio turndown.
4) Reference Accuracy: +0.2% of full span.

c. Medium to High Differential Water Pressure Applications (Over 21" w.c.):

1) The differential pressure transmitter shall meet the low pressure transmitter specifications with the following exceptions:
   a) Differential pressure range 10" w.c. to 300 PSI.
   b) Reference Accuracy: +1% of full span (includes non-linearity, hysteresis, and repeatability).
2) Standalone pressure transmitters shall be mounted in a bypass valve assembly panel. The panel shall be constructed to NEMA 1 standards. The transmitter shall be installed in the panel with high and low connections piped and valved. Air bleed units, bypass valves, and compression fittings shall be provided.

d. Building Differential Air Pressure Applications (-1" to +1" w.c.):

1) The differential pressure transmitter shall be of industrial quality and transmit a linear, 4 to 20 mA output in response to variation of differential pressure or air pressure sensing points.
2) The differential pressure transmitter shall have non-interactive zero and span adjustments that are adjustable from the outside cover and meet the following performance specifications:
   a) -1.00 to +1.00 w.c. input differential pressure ranges. (Select range appropriate for system application)
   b) 4-20 mA output.
   c) Maintain accuracy up to 20 to 1 ratio turndown.
   d) Reference Accuracy: +0.2% of full span.

E. Smoke Detectors:

1. Ionization type air duct detectors shall be furnished as specified elsewhere in Division 27 for installation under Division 23. All wiring for air duct detectors shall be provided under Division 27, Fire Alarm System.

F. Status and Safety Switches:

1. General Requirements:
   a. Switches shall be provided to monitor equipment status, safety conditions, and generate alarms at the FMS when a failure or abnormal condition occurs. Safety switches shall be provided with two sets of contacts and shall be interlock wired to shut down respective equipment.
2. Current Sensing Switches:
   a. The current sensing switch shall be self-powered with solid state circuitry and a dry contact output. It shall consist of a current transformer, a solid state current sensing circuit, adjustable trip point, solid state switch, SPDT relay, and an LED indicating the on or off status. A conductor of the load shall be passed through the window of the device. It shall accept over-current up to twice its trip point range.
   b. Current sensing switches shall be used for run status for fans, pumps, and other miscellaneous motor loads.
   c. Current sensing switches shall be calibrated to show a positive run status only when the motor is operating under load. A motor running with a broken belt or coupling shall indicate a negative run status.
3. Air Filter Status Switches:

a. Differential pressure switches used to monitor air filter status shall be of the automatic reset type with SPDT contacts rated for 2 amps at 120VAC.
b. A complete installation kit shall be provided, including: static pressure tops, tubing, fittings, and air filters.
c. Provide appropriate scale range and differential adjustment for intended service.

4. Air Flow Switches:
   a. Differential pressure flow switches shall be bellows actuated mercury switches or snap acting micro-switches with appropriate scale range and differential adjustment for intended service.
5. Air Pressure Safety Switches:
   a. Air pressure safety switches shall be of the manual reset type with SPDT contacts rated for 2 amps at 120VAC.
   b. Pressure range shall be adjustable with appropriate scale range and differential adjustment for intended service.
6. Low Temperature Limit Switches:
   a. The low temperature limit switch shall be of the manual reset type with Double Pole/Single Throw snap acting contacts rated for 16 amps at 120VAC.
   b. The sensing element shall be a minimum of 15 feet in length and shall react to the coldest 18-inch section. Element shall be mounted horizontally across duct in accordance with manufacturers recommended installation procedures.
   c. For large duct areas where the sensing element does not provide full coverage of the air stream, additional switches shall be provided as required to provide full protection of the air stream.
7. High Limit Thermostats:
   a. High limit thermostats (firestats) shall be furnished and installed in the inlet air stream of each air moving device handling more than 600 CFM (with manual reset). Thermostats shall turn off the fans if the inlet temperature exceeds 125°F.

G. Water Meters - Chilled Water and Heating Water:
1. Water flow meters shall be a badger mag meter style flow meters which translate liquid motion into electronic output signals proportional to the flow sensed. Flow sensing turbine rotors shall be non-metallic and not impaired by magnetic drag. Flow meters shall be "insertion" type complete with "hot-tap" isolation valves to enable sensor removal without water supply system shutdown. Accuracy shall be ±2% of actual reading from 0.4 to 20 feet per second flow velocities.

H. Gas Meter:
1. The meter for the natural gas supply is to be a solid-state type suitable for commercial and industrial gas measurement applications, built upon an electronics platform that includes a solid-state thermal sensor, built-in temperature compensation and data logging capabilities. The flow measuring capability of the meter shall utilize fluidic oscillation technology (without moving parts). For operational safety, the meter cannot "lock-up" or stop gas flow upon malfunction of the electronics platform. The included battery for operating the electronics platform shall have a rated life expectancy of nine years (minimum). The body of the meter shall be a flanged faced wafer assembly, rated for 150 PSIG working pressure. The meter assembly shall be approved per UL 913 Class 1 Div. 1. The electronic output of the meter shall be equipped with four pulse output channels utilizing a provided 20 foot length output cable with mating binder connector. Gas meter shall Onicon or equal.

I. Domestic Water Flow Meter:

1. Domestic water flow meter shall be Elster Model C700, Badger or equal oscillating piston style positive displacement totalizing meter with bronze body construction; meter shall comply with AWWA C700 (latest revision), and shall be 2" size with 98.5 to 101.5% accuracy at 8 to 160 GPM flow rate. Meter shall include electronic register, Elster, Badger or equal. Install meter per manufacturer's requirements.

J. Outside Air Flow Control Modules:
1. Outside Air Flow Control Modules shall be capable of direct measurement of airflow through an outside air inlet and produce dual outputs; one representing the measured airflow, and the other to control the inlet damper.
2. Outside Air Flow Control Modules shall contain an integral multi-line liquid crystal display for use during the configuration and calibration processes. All configuration, output scaling, calibration, and controller tuning will be performed digitally in the on-board microprocessor via input pushbuttons.
3. Outside Air Flow Control Modules shall measure inlet airflow with an accuracy of ±5% of reading over a range of 150-600 FPM, 250-1,000 FPM, 150-2,000 FPM, and 500-2,000 FPM and not have its reading affected by the presence of directional or gusting wind. Measured airflow shall be density corrected for ambient temperature variances, and atmospheric pressure due to site altitude.
4. Outside Air Flow Control Modules shall interface with the building automation systems (BMCS), accepting inputs for fan system start and an external controller setpoint, and provide flow deviation alarm outputs.
5. The sensors shall be constructed of materials that resist corrosion due to the presence of salt or chemicals in the air; all non-painted surfaces shall be constructed of stainless steel. Sensors shall be factory mounted in an airflow station constructed of a 14 ga. galvanized steel, 6" deep welding casing with 90º connecting flanges and a galvanized expanded metal sheet. The electronics enclosure shall be NEMA 1
6. Outside Air Flow Control Modules shall be thermal dispersion type by Ebtron silver series.
7. The control dampers shall consist of a 16 ga galvanized steel channel frame with 5 in depth; airfoil shaped, galvanized steel double skin construction blades (14 ga equivalent thickness); blades shall be completely symmetrical relative to their axle pivot point, presenting identical resistance to airflow in either direction or pressure on either side of the damper; 0.5 in dia. plated steel axles turning in synthetic (acetal) sleeve bearings; extruded silicone rubber blade seals for 300 F maximum temperature; 304 SS flexible jamb seals; and external (out of the airstream) blade-to-blade linkage.
8. Damper manufacturer's printed application and performance data including pressure, velocity and temperature limitations shall be submitted for approval showing damper suitable for pressures to 8 in wg, velocities to 4,000 ft/min and temperatures to 180 F. Testing and ratings to be in accordance with AMCA Standard 500.

2.8 OUTPUT DEVICES

A. Actuators:
1. General Requirements: Damper and valve actuators shall be electronic and/or pneumatic, as specified in the System Description section.
2. Electronic Damper Actuators:
   a. Electronic damper actuators shall be direct shaft mount.
   b. Modulating and two-position actuators shall be provided as required by the sequence of operations. Damper sections shall be sized based on actuator manufacturer’s recommendations for face velocity, differential pressure and damper type. The actuator mounting arrangement and spring return feature shall permit normally open or normally closed positions of the dampers, as required. All actuators (except terminal units) shall be furnished with mechanical

spring return unless otherwise specified in the sequences of operations. All actuators shall have external adjustable stops to limit the travel in either direction, and a gear release to allow manual positioning.

c. Modulating actuators shall accept 24 VAC or VDC power supply, consume no more than 15 VA, and be UL listed. The control signal shall be 2-10 VDC or 4-20 mA, and the actuator shall provide a clamp position feedback signal of 2-10 VDC. The feedback signal shall be independent of the input signal and may be used to parallel other actuators and provide true position indication. The feedback signal of one damper actuator for each separately controlled damper shall be wired back to a terminal strip in the control panel for trouble-shooting purposes.

d. Two-position or open/closed actuators shall accept 24 or 120 VAC power supply and be UL listed. Isolation, smoke, exhaust fan, and other dampers, as specified in the sequence of operations, shall be furnished with adjustable end switches to indicate open/closed position or be hard wired to start/stop associated fan. Two-position actuators, as specified in sequences of operations as "quick acting," shall move full stroke within 20 seconds. All smoke damper actuators shall be quick acting.

2. Electronic Valve Actuators:

a. Electronic valve actuators shall be manufactured by the valve manufacturer.

b. Each actuator shall have current limiting circuitry incorporated in its design to prevent damage to the actuator.

c. Modulating and two-position actuators shall be provided as required by the sequence of operations. Actuators shall provide the minimum torque required for proper valve close-off against the system pressure for the required application. The valve actuator shall be sized based on valve manufacturer's recommendations for flow and pressure differential. All actuators shall fail in the last position unless specified with mechanical spring return in the sequence of operations. The spring return feature shall permit normally open or normally closed positions of the valves, as required. All direct shaft mount rotational actuators shall have external adjustable stops to limit the travel in either direction.

d. Modulating Actuators shall accept 24 VAC or VDC and 120 VAC power supply and be UL listed. The control signal shall be 2-10 VDC or 4-20 mA and the actuator shall provide a clamp position feedback signal of 2-10 VDC. The feedback signal shall be independent of the input signal, and may be used to parallel other actuators and provide true position indication. The feedback signal of each valve actuator (except terminal valves) shall be wired back to a terminal strip in the control panel for trouble-shooting purposes.

e. Two-position or open/closed actuators shall accept 24 or 120 VAC power supply and be UL listed. Butterfly isolation and other valves, as specified in the sequence of operations, shall be furnished with adjustable end switches to indicate open/closed position or be hard wired to start/stop the associated pump or chiller.

B. Control Dampers:

1. All dampers used for throttling airflow shall be of the opposed blade type arranged for normally open or normally closed operation, as required. The damper is to be sized so that, when wide open, the pressure drop is a sufficient amount of its close-off pressure drop to shift the characteristic curve to near linear.

2. All dampers used for two-position, open/close control shall be parallel blade type arranged for normally open or closed operation, as required.

3. Damper frames and blades shall be constructed of either galvanized steel or aluminum. Maximum blade length in any section shall be 48". Damper blades shall be 16-gauge

minimum and shall not exceed six (6) inches in width. Damper frames shall be 16-gauge minimum hat channel type with corner bracing. Additional stiffening or bracing shall be provided for any section exceeding 48" in height. All damper bearings shall be made of stainless steel or oil-impregnated bronze. Dampers shall be tight closing, low leakage type, with synthetic elastomer seals on the blade edges and flexible stainless steel side seals. Dampers of 48"x 48" size shall not leak in excess of 8.5 cfm per square foot when closed against 4" w.g. static pressure when tested in accordance with AMCA Std. 500.

4. Air foil blade dampers of double skin construction with linkage out of the air stream shall be used whenever the damper face velocity exceeds 1500 FPM or system pressure exceeds 2.5" w.g., but no more than 4000 FPM or 6" w.g.
5. One piece rolled blade dampers with exposed or concealed linkage may be used with face velocities of 1500 FPM or below.
6. Multiple section dampers may be jack-shafted to allow mounting of piston pneumatic actuators and direct connect electronic actuators. Each end of the jack shaft shall receive at least one actuator to reduce jack shaft twist.

C. Control Relays:
   1. Control Pilot Relays:
      a. Control pilot relays shall be of a modular plug-in design with retaining springs or clips.
      b. Mounting bases shall be snap-mount.
      c. DPDT, 3PDT, or 4PDT relays shall be provided, as appropriate for application.
      d. Contacts shall be rated for 10 amps at 120VAC.
      e. Relays shall have an integral indicator light and check button.

D. Control Valves:
   1. All automatic control valves shall be fully proportioning and provide near linear heat transfer control. The valves shall be quiet in operation and fail-safe open, closed, or in their last position. All valves shall operate in sequence with another valve when required by the sequence of operations. All control valves shall be sized by the control manufacturer, and shall be guaranteed to meet the heating and cooling loads, as specified. All control valves shall be suitable for the system flow conditions and close against the differential pressures involved. Body pressure rating and connection type (sweat, screwed, or flanged) shall conform to the pipe schedule elsewhere in this Specification.
   2. Chilled water control valves shall be modulating plug, ball, and/or butterfly, as required by the specific application. Modulating water valves shall be sized per manufacturer's recommendations for the given application. In general, valves serving air handling unit coils shall be 2-way pattern, sized for a pressure drop equal to the actual coil pressure drop, but no less than 5 PSI. Where indicated on drawings for specified air handling units, control valves shall be 3-way pattern mixing type sized for a pressure drop equal to 25% the actual coil pressure drop, but no less than 2 PSI. Mixing valves (3-way) serving secondary water circuits shall be sized for a pressure drop of no less than 5 PSI. Valves for terminal reheat coils shall be 2-way pattern, sized for a 2 PSIG pressure drop, but no more than a 5 PSI drop.
   3. Modulating plug water valves of the single-seat type with equal percentage flow characteristics shall be used for all hot and chilled water applications, except those described hereinafter. The valve discs shall be composition type. Valve stems shall be stainless steel.
   4. Ball valves shall be acceptable for water terminal reheat coils, radiant panels, unit heaters, package air conditioning units, and fan coil units.
   5. Butterfly valves shall be acceptable for modulating large flow applications greater than modulating plug valves, and for all two-position, open/close applications. In-line and/or

three-way butterfly valves shall be heavy-duty pattern with a body rating comparable to the pipe rating, replaceable lining suitable for temperature of system, and a stainless steel vane. Valves for modulating service shall be sized and travel limited to 50 degrees of full open. Valves for isolation service shall be the same as the pipe. Valves in the closed position shall be bubble-tight.

E. Local Control Panels:

1. All control panels shall be factory constructed, incorporating the FMS manufacturer's standard designs and layouts. All control panels shall be UL inspected and listed as an assembly and carry a UL 508 label listing compliance. Control panels shall be fully enclosed, with sub-panel, hinged door, and key-locking latch.
2. In general, the control panels shall consist of the DDC controller(s), display module, and I/O devices—such as relays, transducers, and so forth—that are not required to be located external to the control panel due to function. The display module shall be flush mounted in the panel face unless otherwise noted.
3. All I/O connections on the DDC controller shall be extended to a numbered, color-coded, and labeled terminal strip for ease of maintenance and expansion. Wiring to I/O devices shall be made from this terminal strip.
4. All other wiring in the panel, internal and external, shall be made to additional line or low voltage color-coded and labeled terminal strips. Low and line voltage wiring shall be segregated. All terminal strips and wiring shall be UL listed, 300-volt service and provide adequate clearance for field wiring.
5. All wiring for every control panel shall follow a common color-coded format. All terminal strip color coding and numbering shall follow a common format. All wiring shall be neatly installed in plastic trays or tie-wrapped.
6. A convenience 120 VAC duplex receptacle shall be provided in each enclosure, fused on/off power switch, and required transformers.

PART 3 – PERFORMANCE / EXECUTION

3.1 INSTALLATION PRACTICES

A. HVAC Control System Wiring:

1. All conduit, wiring, accessories and wiring connections required for the installation of the Facility Management System, as herein specified, shall be provided by the TCSI unless specifically shown on the Electrical Drawings under Division 26 Electrical. All wiring shall comply with the requirements of applicable portions of Division 26 and national electric codes, unless otherwise specified in this section.
2. All system input wiring shall be twisted shielded pair, minimum 18 gauge wire. All system analog output wiring shall be twisted shielded pair/3-wire as required, minimum 18 gauge wire. Preconfigured cables between Terminal Unit Controllers and Thermostats are acceptable, minimum 24 gauge.
3. All internal panel device wiring for binary outputs and pilot relay shall be minimum 16 gauge wire.
4. All Class 2 wiring (24vac or less) wiring shall be installed in conduit unless otherwise specified.
   a. Class 2 wiring above concealed accessible locations shall be supported every 5' from the building structure utilizing j-hooks designed for this application.
5. Low voltage control wiring and 24VAC can be run in the same conduit.
6. All wiring in mechanical rooms and exposed locations shall be in conduit. Rough-ins for wall mounted thermostats shall have a back-box installed with conduit turned out above the ceiling. Minimum control wiring conduit size 1/2".

7. DDC System Multi-conductor Instrumentation and Communication Cabling:
   a. Analog Input, Analog Output, Binary Input, Binary Output, 24 VAC and General Purpose Cabling
      1) Cable shall consist of copper conductors not less No. 18 AWG-stranded.
      2) Shall be 2 or 3 conductor twisted cable with a drain wire
      3) Cable shall have a 100% overall shield.
      4) Cable shall be a plenum-rated.
      5) Cable shall meet or exceed NEC voltage rating of 300V.
      6) Cable shall be NEC type CMP.
      7) Cable shall meet or exceed UL temperature rating of +60 degrees C.
   b. Primary and Secondary Communications Network Cabling
      1) Cable shall be of type recommend by the DDC System Manufacturer.
      2) Cable shall be shielded.
      3) Cable shall be a plenum-rated.
      4) Cable shall meet or exceed NEC voltage rating of 150V.
      5) Cable shall meet or exceed UL temperature rating of +60 degrees C.
   c. Room Sensor Cabling
      1) Cable shall consist of copper conductors not less No. 24 AWG.
      2) Shall be multi-paired (at least two pairs) twisted cable.
      3) Cable shall have a 100% overall shield.
      4) Cable shall be a plenum-rated.
      5) Cable shall meet or exceed NEC voltage rating of 300V.
      6) Cable shall be NEC type Article 800-CMP.
      7) Cable shall meet or exceed UL temperature rating of +75 degrees C.

B. Identification and Naming Standards:
   1. Controller Identification. All controllers shall be identified according to standard name conventions. This contractor shall schedule a meeting prior to installation of controls to coordinate with Facility Services dept the equipment and tag names required to match this project. The naming scheme is to match with the equipment inventory system.
   2. Point Naming. All controllers shall be identified according to standard name conventions. This contractor shall schedule a meeting prior to installation of controls to coordinate with Facility Services Dept the point naming standards to match existing.
   3. Panel Identification. All local control panels shall be identified by a plastic engraved nameplate securely fastened to the outside of the controller enclosure.
   4. Raceway Identification. All the covers to junction and pull boxes of the control system raceways shall be painted blue or have identification labels stating “Control System Wiring” affixed to the covers. Labels shall be typed, not hand written.
   5. Wire Identification. All low and line voltage control wiring shall be identified by a number, as referenced to the associated control diagram, at each end of the conductor or cable. Identification number shall be permanently secured to the conductor or cable and shall be typed. All control wiring shall be identified by appropriate label (analog input, analog output, binary input, binary output,) every five feet.

C. Digital Controller Systems:
   1. Each system will be provided with its own dedicated direct digital controller or application specific controller. Mechanical systems such as AHUs, VAVs or Packaged system shall not be controlled from more than 1 application specific controller.
   2. Systems that use second tier controllers as point expansion for system controllers shall only be allowed under when the I/O points are directly controlled by the CPU of the local application specific controller.

D. Input Devices:

1. All Input devices shall be installed per the manufacturers recommendation. All in-line devices such as temperature wells, pressure taps, duct smoke detectors, air flow stations, etc. bleed units and control valves are to be mounted (to the appropriate mechanical piping/duct systems) by the installer of the mechanical piping/duct system, as applicable.

E. Output Devices:
1. All output devices shall be installed per the manufacturers recommendation. The mechanical contractor shall install all in-line devices such as control valves, dampers, etc.
2. Actuators: All control actuators shall be sized capable of closing against the maximum system shut-off pressure. The actuator shall modulate in a smooth fashion through the entire stroke.
3. Control Dampers: Shall be opposed blade for modulating control of air flows. Parallel blade dampers shall be installed for two position applications.
4. Control Valves: Shall be sized for proper flow control with equal percentage valve plugs. The maximum pressure drop for water applications shall be 5 PSI. The maximum pressure drop for steam applications shall be 7 PSI.

3.2 COMMISSIONING

A. Commissioning the Facility Management System is a mandatory documented performance requirement of the selected TCSI for all control systems detailed in this Specification and sequence of operations. Commissioning shall include verification of proper installation practices by the TCSI and subordinate installers, point verification and calibration, system/sequence of operation verification with respect to specified operation, and network/workstation verification. Documentation shall be presented upon completion of each commissioning step and final completion to ensure proper operation of the Facility Management System.

B. Acceptance Check List: An acceptance checklist shall be completed that documents compliance with each item of this Specification.

C. Testing Procedure: Upon completion of the installation, the TCSI shall start-up the system and perform all necessary testing and run diagnostic tests to ensure proper operation. The TCSI shall be responsible for generating all software and entering all database information necessary to perform the sequences of control herein specified.

D. Testing Documentation: Prior to acceptance testing, TCSI shall create, on an individual system basis, trend logs of input and output points, or have an automatic Point History feature for documentation purposes.

E. Field Points Testing:
1. This step shall verify that all of the installed points receive or transmit the correct information prior to loading/activating the system software.
2. ON/OFF commands from the workstation shall be performed in order to verify each binary output point.
3. All binary input points are to be tested using the HAND/OFF/AUTOMATIC selector switch on the associated motor control center or by manually jumpering across the field device contacts.
4. All analog output points providing pneumatic output control shall be tested using a command from the workstation to modulate the output from minimum calibrated signal to maximum calibrated signal. Analog Output values to Pneumatic transducers shall be displayed so that a 0 percent display value corresponds to the pressure required to set the pneumatic actuator to minimum position, and a 100 percent display value corresponds to the pressure required to set the pneumatic actuator to the maximum position.

5. All analog output points shall be tested using a command from the workstation to modulate the output device from minimum calibrated signal to maximum calibrated output.
6. All analog input points are to be tested by comparing the reading obtained through the workstations or portable terminal to the value of an independent testing meter.

F. VAV box performance verification and documentation:
1. As part of the commissioning of the terminal unit control and air distribution system, the Installer shall initiate an automated test where the dampers in one half of a group of boxes are stepped towards full open while the other half are stepped towards full closed. At each step, after a settling time, box airflows and damper positions will be sampled. Following the cycle, a pass/fail report indicating results shall be produced. Possible results are Pass, No change in flow between full open and full close, Reverse operation, or Maximum flow not achieved. The report shall be submitted as documentation of the installation.
2. The TCSI shall issue a report based on a sampling of the CVM calculated loop performance metrics. The report shall indicate performance criteria, include the count of conforming and non-conforming boxes, list the non-conforming boxes along with their performance data, and shall also include graphical representations of performance. The sampling shall take place after completion of Test and Balance, when design cooling and heating media have been available and occupied conditions approximated for five consecutive days.

G. Noncompliant Items:
1. The Installer shall remove and replace, at its expense, all items that are not in compliance with the Specification requirements.

3.3 SYSTEM FMS SPECIFIC REQUIREMENTS

A. FMS Remote Access:
1. The Facility Management System provided shall include the capability for multiple users to access the FMS simultaneously from remote locations. Interface shall be to the entire FMS and provide the capability to monitor all I/O and adjust parameters.

3.4 ALARM MANAGEMENT

A. Alarm management shall be provided to monitor, buffer, and direct alarm reports to operator devices and memory files. Each DDC panel shall perform distributed, independent alarm analysis and filtering to minimize operator interruptions due to non-critical alarms, to minimize network traffic, and to prevent alarms from being lost. At no time shall the DDC panel's ability to report alarms be affected by either operator activity at a PC Workstation or local I/O device, or communications with other panels on the network.

B. Point Change Report Description:
1. All alarm or point change reports shall include the point's English language description, and the time and date of occurrence.

C. Prioritization:
1. The installer shall set up all system analog points with high and low alarm limits. All digital system points shall be associated with a status feedback point and all exceptions shall be reported as alarms. The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized and filtered to minimize nuisance reporting and to speed operator response to critical alarms.
2. The user shall also be able to define under which conditions point changes need to be

acknowledged by an operator, and/or sent to follow-up files for retrieval and analysis at a later date.

D. Critical and Non-Critical Alarm Routing:
1. Critical alarms shall be defined as chiller, boiler, generator, critical space temperature or humidity, and kilowatt demand approaching threshold. Critical alarms shall be displayed at the workstation and an email will be sent to the list of users. The alarms will have the ability to be set by priority for escalation.
2. All other alarms shall be considered non-critical and shall be displayed and acknowledged before being sent to the alarm log.

E. Report Routing:
1. Alarm reports, messages, and files will be directed to a user-defined list of operator devices, or PCS used for archiving alarm information. Alarms shall also be automatically directed to a default device in the event a primary device is found to be off-line.

F. Alarm Messages:
1. In addition to the point's descriptor and the time and date, the user shall be able to print, display, or store a 65-character alarm message to more fully describe the alarm condition or direct operator response.
2. Each standalone DDC panel shall be capable of storing a library of at least 250 Alarm Messages. Each message may be assignable to any number of points in the panel.

G. Auto-Dial Alarm Management:
1. In Dial-up applications, only critical alarms shall initiate a call to a remote operator device. In all other cases, call activity shall be minimized by time-stamping and saving reports until an operator scheduled time, a manual request is made, or until the buffer space is full. The alarm buffer must store a minimum of 50 alarms.

3.5 DYNAMIC ANIMATED COLOR GRAPHIC DISPLAYS

A. TCSI shall update and utilize the existing floor-plan graphics licensed software to include the new equipment and control points required for this project.

B. Color graphic floor plan displays, and system schematics for each piece of mechanical equipment (including air handling units, variable air volume boxes, fan coils, unit ventilators, cabinet heaters, exhaust fans, fin tube radiation, chilled water systems, hot water boiler systems, and so forth as required) shall be provided, as specified in the point list portion of this Specification, in order to optimize system performance analysis, speed alarm recognition, and simplify user interaction. The TCSI shall fully configure the color graphics and plot all associated control/monitoring points on the screen. Copies of all color graphics screens shall be provided as color printouts to the engineer for approval.

C. System Selection/Penetration:
1. The operator interface shall allow users to access the various system schematics and floor plans via a graphical penetration scheme, menu selection, or test-based commands. Floor plans shall display room numbers and each zone shall be color-coded. The operator shall be able to point and click on a room or zone of rooms (in the case of an air handler that serves more than one zone). The room or zone will display an animated flow diagram of the mechanical equipment that serves that zone, with all control and monitoring points associated with that piece of equipment, including setpoints. Setpoints shall be overridden or modified from this screen.

D. Dynamic Animated Data Displays:
   1. Dynamic temperature values, humidity values, flow values, and status indication shall be shown in their actual respective locations, and shall automatically update to represent current conditions without operator intervention. Damper and valve positions, air and water flow shall be animated and shall represent actual, current conditions.

E. Windowing:
   1. The windowing environment of the PC Operator Workstation shall allow the user to simultaneously view several graphics at the same time to analyze total building operation, or to allow the display of a graphic associated with an alarm to be viewed without interrupting work in progress.

F. Alarm Annunciation:
   1. Any point in a state of alarm shall change the color of its symbol to red until it is no longer in alarm.

3.6 WARRANTY RESPONSE/TRAINING

A. Response to all warranty request shall be made by the TCSI. TCSI shall warrant labor and material for one year from date of acceptance. TCSI shall verify proper operation of the DDC controls system and identify items requiring repair and/or replacement. TCSI shall repair and/or replace any and all FMS items.

B. Provide (2) four hour training sessions on the system.

3.7 SYSTEM COMPLETION

A. Upon completion of installation, TCSI shall start up the system shall start up the system and perform all necessary testing and run diagnostics to ensure proper operation. An acceptance test shall with a owners representative and the engineer shall be performed at the completion of the project. The test shall consist of a point to point checkout to ensure proper operation of all systems components, sequence of operations, verify graphics and verify proper naming conventions per standards. Provide a checklist with each point verified by the control contractors prior to the acceptance test. When the system performance is deemed 100% complete by the engineer and owners rep, the system will be accepted.

PART 4 - SEQUENCE OF OPERATIONS

CHILLED WATER SYSTEM/CONDENSER WATER - SEQUENCE OF OPERATION

SYSTEM ENABLE:
The cooling system will automatically start when the system enable (SYSTEM-EN) is "ON". When the system enable is "OFF", the cooling system will be disabled.

CHILLER CONTROL:
This system consists of three chillers. The chillers shall be controlled via their own internal controls to maintain a chilled water supply temperature. Each chiller (CHx-EN) will be staged on and off in order to meet the chiller load as measured by the percent of full load amps (CHx-%FLA). The chiller isolation valves (CHxCHWISO-C & CHxCWISO-C) will be commanded open prior to starting the pump and kept open long enough for the pump to coast down. If the status (CHxCHWISO-S) of the chiller isolation valve fails to match the command (CHxCHWISO-C), an alarm will be generated and the next chiller in sequence will be enabled.

CHILLED WATER PUMP CONTROL:
When enabled, a pump (PCHWPx-C) for each chiller will be started. After the chiller is commanded off, the pump (PCHWPx-C) will continue to run for a short time to allow the equipment to coast down. If the pump status (PCHWPx-S) does not match the command (PCHWPx-C), an alarm will be generated and the pump will be stopped. Upon loss of status (PCHWPx-S), the pump (PCHWPx-C) will restart after the system reset (SYS-RESET) is activated. Each pump has a variable frequency drive (PCHWPx-O) that will modulate in unison to maintain differential pressure setpoint (CHWDP-SP) as sensed by the primary loop pressure sensor (CHW-DP). A bypass valve (CHWBYPV-O) will be modulated to maintain primary flow sensor (PCHW-F) to calculated chiller minimum flow setpoint based on the number of chillers running.

CONDENSER WATER PUMP CONTROL:
When enabled, a pump (CWPx-C) for each chiller will be started. If the pump status (CWPx-S) does not match the command (CWPx-C), an alarm will be generated and the pump will be stopped. Upon loss of status (CWPx-S), the pump (CWPx-C) will restart after the system reset (SYS-RESET) is activated. After the chiller is commanded off, the pump (CWPx-C) will continue to run for a short time to dissipate the heat.

CONDENSER WATER SYSTEM:
This system consists of three variable speed (CTx-C, CTx-O) cooling towers. The system also has a tower water bypass valve (CTV-O) that shall modulate to full water flow over the towers, then the cooling towers will be staged (CTx-C) on and off to maintain a condenser supply water temperature setpoint (CW-SP). When an additional cooling tower (CTx-C) is required, the tower (CTx-C) with the lowest runtime total shall be enabled to run. If the tower fan status (CTx-S) does not match the command (CTx-C), an alarm will be generated and the tower fan will be stopped. Upon loss of status (CTx-S), the tower fan (CTx-C) will restart after the system reset (SYS-RESET) is activated. The tower isolation valve (CTxISO-C) will be commanded open prior to starting the pump and kept open long enough for the pump to coast down. If the status (CTxISO-S) of the tower isolation valve fails to match the command (CTxISO-C), an alarm will be generated and the next tower in sequence will be enabled.

HEATING HOT WATER SYSTEM - SEQUENCE OF OPERATION

SYSTEM ENABLE:
The heating system will automatically start when the outside air temperature (OA-T) falls below the system enable setpoint (HTGOATLOCKOUT-SP) while the system enable (SYSTEM-EN) is "ON". When the outside air temperature (OA-T) rises above this setpoint (HTGOATLOCKOUT-SP) or the system enable (SYSTEM-EN) is "OFF", the heating system will be disabled.

SYSTEM SHUTDOWN:
When the emergency shutdown switch (EMER-STOP) is activated, the heating system will be shutdown. A gas shutoff valve will be provided on the incoming gas main to the central plant. If the emergency shutdown switch is activated, the gas shutoff valve will close.

BOILER CONTROL:
This system consists of three boilers (BLRx-EN). The burners shall be controlled via their own internal controls. The outdoor air temperature (OA-T) shall determine the number of boilers running. When an additional boiler is required, the boiler with the lowest runtime total shall be enabled to run. The boiler isolation valve (BLRxISO-C) will be commanded open prior to starting the pump and kept open long enough for the pump to coast down. If the status (BLRxISO-S) of the boiler isolation valve fails to match the command (BLRxISO-C), an alarm will be generated and the next boiler in sequence will be enabled.

HOT WATER PUMP CONTROL:
When enabled, pumps (PHWPx-C) will be started so that minimum flow is maintained to the boilers that are running. After the boiler is commanded off, the pump (PHWPx-C) will continue to run for a short time to dissipate the heat. If the pump status (PHWPx-S) does not match the command (PHWPx-C), an alarm will be generated and the pump will be stopped. Upon loss of status (PHWPx-S), the pump (PHWPx-C) will restart after the system reset (SYS-RESET) is manually activated.

PRIMARY LOOP PRESSURE CONTROL:
When a pump status (PHWPx-S) is verified, the pump will modulate (PHWPx-O) to maintain the system differential pressure (HW-DP) of the system. If the primary flow (PHW-F) below the minimum flow setpoint the system bypass valve (BYPV-O) will modulate open to provide more flow thru the boilers.

ADDITIONAL POINTS MONITORED BY THE BAS:
- Boiler n Status (BLRn-S)
- Boiler n Alarm (BLRn-A)
- Boiler n Leaving Water Temperature (BLRnLW-T)
- Loop Differential Pressure Sensor (HW-DP)
- Primary HW Supply Temperature (PHWS-T)
- Primary HW Return Temperature (PHWR-T)

COOLING ONLY VAV AHU – SEQUENCE OF OPERATION

SUPPLY FAN CONTROL:
The variable speed supply fan (SF-C) will be started based on occupancy schedule (OCC-SCHEDULE). When the supply fan status (SF-S) indicates the fan started, the control sequence will be enabled. The supply fan (SF-O) will modulate to maintain the discharge static pressure (DA-P) at setpoint (DAP-SP). Upon a loss of airflow (SF-S), the system will attempt to automatically restart until positive status is received. If positive status is not received after 5 minutes (adjustable), an alarm shall be generated on the BAS.

ECONOMIZER CONTROL:
When the outdoor air (OA-T) is cooler than the economizer setpoint, the economizer will act as the initial stage of cooling, working in sequence with the cooling coil.

OA CONTROL:
The outdoor air damper will modulate to maintain the outdoor airflow (OA-F) via a thermal dispersion airflow measuring station located in the outdoor air duct.

MINIMUM OA CONTROL:
The fresh air intake of the unit will be limited to prevent the mixed air temperature (MA-T) from falling below the low limit setpoint (OALT-SP).

COOLING COIL:
The chilled water valve (CLG-O) will modulate to maintain the temperature setpoint of 55 degrees off the leaving side of the chilled water coil. When the condensate float switch is in "Alarm" (COND-A), the cooling control sequence will be disabled and an alarm will be generated on the BAS.

DEHUMIDIFICATION:
On a rise in the return air humidity (RA-H), the chilled water valve will be overridden to 100% to maintain the return air humidity below the return air dehumidification setpoint (DEHUM-SP) of 60% relative humidity. The reheat control at the VAV boxes will maintain the temperature at space setpoint.

UNIT PROTECTION:

- Low Temperature Alarm (LT-A) - When in "Alarm", the control sequence will stop running, the valve(s) will open and the fan(s) will be disabled via a hard wired shutdown circuit.
- Discharge Air Smoke Detector (DA-SD) - Disables the fan(s) via a hard wired shutdown circuit.
- Return Air Smoke Detector (RA-SD) - Disables the fan(s) via a hard wired shutdown circuit.

ADDITIONAL POINTS MONITORED BY THE BAS:

- Supply Fan Output Frequency (SF-HZ)
- Return Air Temperature (RA-T)
- Prefilter Diff Pressure (PFILT-DP)
- Discharge Air Smoke Alarm (DA-SD)
- Return Air Smoke Alarm (RA-SD)
- Outdoor Air Damper Position (OAD-POS)
- Return Air Damper Position (RAD-POS)
- Cooling Position (CLG-POS)

CHW VAV AHU W/PREHEAT - SEQUENCE OF OPERATION

SUPPLY FAN CONTROL:

The variable speed supply fan (SF-C) will be started based on occupancy schedule (OCC-SCHEDULE). When the supply fan status (SF-S) indicates the fan started, the control sequence will be enabled. The supply fan (SF-O) will modulate to maintain the discharge static pressure (DA-P) at setpoint (DAP-SP). Upon a loss of airflow (SF-S), the system will attempt to automatically restart until positive status is received. If positive status is not received after 5 minutes (adjustable), an alarm shall be generated on the BAS.

ECONOMIZER CONTROL:

When the outdoor air (OA-T) is cooler than the economizer setpoint, the economizer will act as the initial stage of cooling, working in sequence with the cooling coil.

OA CONTROL:

The outdoor air damper will modulate to maintain the outdoor airflow (OA-F) via a thermal dispersion airflow measuring station located in the outdoor air duct.

MINIMUM OA CONTROL:

The fresh air intake of the unit will be limited to prevent the mixed air temperature (MA-T) from falling below the low limit setpoint (OALT-SP).

PREHEAT COIL:

The preheat control valve (PH-O) will modulate to maintain the temperature setpoint of 55 degrees on the leaving side of the preheat coil. When the unit is shutdown, the preheat control valve will fully close. The preheat coil will be locked out on a rise in outdoor air temperature (OA-T) above the lockout setpoint (HTGOATLOCKOUT-SP) of 50 degrees. Upon a loss of airflow (SF-S), the preheat control valve will fully close. If the preheat temperature falls below 40 degrees for 5 minutes, an alarm shall be generated on the BAS.

COOLING COIL:

The chilled water valve (CLG-O) will modulate to maintain the temperature setpoint of 55 degrees off the leaving side of the chilled water coil. When the unit is shutdown, the chilled water valve will be commanded to a preset position should the outdoor air temperature (OA-T) fall below the low outdoor air temperature setpoint (OALT-SP).

Upon a loss of airflow (SF-S), the chilled water valve will fully close. When the condensate float switch is in "Alarm" (COND-A), the cooling control sequence will be disabled and an alarm will be generated on the BAS.

DEHUMIDIFICATION:
On a rise in the return air humidity (RA-H), the chilled water valve will be overridden to 100% to maintain the return air humidity below the return air dehumidification setpoint (DEHUM-SP) of 60% relative humidity. The reheat control at the VAV boxes will maintain the temperature at space setpoint.

UNIT PROTECTION:
- Low Temperature Alarm (LT-A) - When in "Alarm", the control sequence will stop running, the valve(s) will open and the fan(s) will be disabled via a hard wired shutdown circuit.
- Discharge Air Smoke Detector (DA-SD) - Disables the fan(s) via a hard wired shutdown circuit.
- Return Air Smoke Detector (RA-SD) - Disables the fan(s) via a hard wired shutdown circuit.

ADDITIONAL POINTS MONITORED BY THE BAS:
- Supply Fan Output Frequency (SF-HZ)
- Return Air Temperature (RA-T)
- Prefilter Diff Pressure (PFILT-DP)
- Discharge Air Smoke Alarm (DA-SD)
- Return Air Smoke Alarm (RA-SD)
- Outdoor Air Damper Position (OAD-POS)
- Return Air Damper Position (RAD-POS)
- Cooling Position (CLG-POS)
- Preheat Position (PH-POS)

CHW VAV AHU W/REHEAT - SEQUENCE OF OPERATION

SUPPLY FAN CONTROL:
The variable speed supply fan (SF-C) will be started based on occupancy schedule (OCC-SCHEDULE). When the supply fan status (SF-S) indicates the fan started, the control sequence will be enabled. The supply fan (SF-O) will modulate to maintain the discharge static pressure (DA-P) at setpoint (DAP-SP). Upon a loss of airflow (SF-S), the system will attempt to automatically restart until positive status is received. If positive status is not received after 5 minutes (adjustable), an alarm shall be generated on the BAS.

ECONOMIZER CONTROL:
When the outdoor air (OA-T) is cooler than the economizer setpoint, the economizer will act as the initial stage of cooling, working in sequence with the cooling coil.

OA CONTROL:
The outdoor air damper will modulate to maintain the outdoor airflow (OA-F) via a thermal dispersion airflow measuring station located in the outdoor air duct.

MINIMUM OA CONTROL:
The fresh air intake of the unit will be limited to prevent the mixed air temperature (MA-T) from falling below the low limit setpoint (OALT-SP). If the mixed air temperature falls below 40 degrees for 5 minutes, an alarm shall be generated on the BAS.

COOLING COIL:
The chilled water valve (CLG-O) will modulate to maintain the temperature setpoint of 55 degrees off the leaving side of the chilled water coil. When the unit is shutdown, the chilled water valve will be commanded to a preset

position should the outdoor air temperature (OA-T) fall below the low outdoor air temperature setpoint (OALT-SP). Upon a loss of airflow (SF-S), the chilled water valve will fully close. When the condensate float switch is in "Alarm" (COND-A), the cooling control sequence will be disabled and an alarm will be generated on the BAS.

REHEAT COIL:
The reheat control valve (RH-O) will modulate to maintain the space temperature setpoint sensed by the zone sensor. When the unit is shutdown, the reheat control valve will fully close. Upon a loss of airflow (SF-S), the reheat coil will remain in control.

DEHUMIDIFICATION:
On a rise in the return air humidity (RA-H), the chilled water valve will be overridden to 100% to maintain the return air humidity below the return air dehumidification setpoint (DEHUM-SP) of 60% relative humidity. The reheat control at the VAV boxes will maintain the temperature at space setpoint.

UNIT PROTECTION:
- Low Temperature Alarm (LT-A) - When in "Alarm", the control sequence will stop running, the valve(s) will open and the fan(s) will be disabled via a hard wired shutdown circuit.
- Discharge Air Smoke Detector (DA-SD) - Disables the fan(s) via a hard wired shutdown circuit.
- Return Air Smoke Detector (RA-SD) - Disables the fan(s) via a hard wired shutdown circuit.

ADDITIONAL POINTS MONITORED BY THE BAS:
- Supply Fan Output Frequency (SF-HZ)
- Return Air Temperature (RA-T)
- Prefilter Diff Pressure (PFILT-DP)
- Discharge Air Smoke Alarm (DA-SD)
- Return Air Smoke Alarm (RA-SD)
- Outdoor Air Damper Position (OAD-POS)
- Return Air Damper Position (RAD-POS)
- Cooling Position (CLG-POS)
- Reheat Position (RH-POS)

VAV BOX - SEQUENCE OF OPERATION

OCCUPIED MODE:
When the zone temperature (ZN-T) is between the occupied heating (EFFHTG-SP) and cooling (EFFCLG-SP) setpoints, the primary air damper (DPR-O) will be at the minimum CFM (SA-F) and there will be no mechanical heating. On a rise in zone temperature (ZN-T) above the cooling setpoint (EFFCLG-SP), the primary air damper (DPR-O) will increase the CFM (SA-F) and there will be no mechanical heating. On a drop in zone temperature (ZN-T) below the heating setpoint (EFFHTG-SP), the heating water control valve will modulate to maintain the zone temperature (ZN-T) and the damper (DPR-O) is controlled to provide a minimum CFM (SA-F).

UNOCCUPIED MODE:
When in this mode, while the zone temperature (ZN-T) is between the unoccupied heating (EFFHTG-SP) and cooling (EFFCLG-SP) setpoints, the primary air damper (DPR-O) will be at the minimum CFM (SA-F) and there will be no mechanical heating. On a rise in zone temperature (ZN-T) above the unoccupied cooling setpoint (EFFCLG-SP), the primary air damper (DPR-O) will increase the CFM (SA-F) (if available) and there will be no mechanical heating. On a drop in zone temperature (ZN-T) below the unoccupied heating setpoint (EFFHTG-SP), the heating water control valve will modulate to maintain the zone temperature (ZN-T) and the primary air damper (DPR-O) will be at the minimum CFM (SA-F).

DISCHARGE AIR TEMP SENSOR:
A discharge air temp (DA-T) sensor is provided on each box for monitoring purposes.

UNIT ENABLE:
A network unit enable (UNITEN-MODE) signal will control the mode of the box.

NETWORK WARMUP-COOLDOWN:
Warm-up and Cooldown modes will be activated by a network command (WC-C). When the zone temperature (ZN-T) is below the effective heating setpoint (EFFHTG-SP), the box damper will be modulated to allow warm air flow, then reheat coil to maintain the zone temperature (ZN-T). When the box effective heating setpoint is satisfied the flow will remain at the warm-up minimum position until the warm command has been removed.

FAN COIL UNIT - SEQUENCE OF OPERATION

SUPPLY FAN CONTROL:
When the thermostat fan mode is set to on, the supply fan will run continuously. When the thermostat fan mode is set to auto, the supply fan will run anytime there is a call for heating or cooling. The air proof switch will shut down control if no airflow is detected.

TEMPERATURE CONTROL:
The unit will control to maintain the zone temperature setpoint as sensed by the zone temperature sensor.

HUMIDITY CONTROL:
When the zone humidity exceeds the humidity setpoint, the cooling output will be overridden to provide dehumidification. The heating coil will be utilized as required to maintain zone temperature. Dehumidification does not operate when heating. And stops if the zone temperature drops below heating setpoint. While in the dehumidification mode, the fan runs at it lowest possible speed.

OCCUPIED MODE:
The occupancy mode will be controlled via a network input.

COOLING COIL:
The cooling coil will be modulated to maintain the temperature setpoint.

HEATING COIL:
The heating coil will be modulated to maintain the temperature setpoint.

ADDITIONAL POINTS MONITORED BY THE BAS:
- Supply Fan Status (SF-S)
- Discharge Air Temperature (DA-T)

Pool/Pool Equipment and General Exhaust Fans (EF-1 thru 12 and EF-16 thru 19) - Sequence of Operation
The exhaust fan will run continuously. The building automation system shall start/stop and monitor the exhaust fan via a current sensing relay. An alarm will be generated upon loss of status.

Refrigerant Purge Exhaust Fan (EF-13) - Sequence of Operation
Ceiling mounted exhaust fan will be enabled by the refrigerant monitor upon detection of refrigerant. A strobe shall be mounted above each doorway entering the chiller room and shall be on whenever the refrigerant monitor

is in alarm. The building automation system shall monitor the status of the refrigerant monitor trouble/alarm contacts and the exhaust fan. An alarm will be generated if the refrigerant monitor is in alarm but the exhaust fan status is off.

Dishwasher Exhaust Fan (EF-14) - Sequence of Operation

The exhaust fan shall be interlocked to run when the dishwasher is on. The building automation system shall monitor the exhaust fan via a current switch.

MRI Room Exhaust Fan (EF-15) - Sequence of Operation

An oxygen (O2) monitor will be installed to sense the oxygen level in the MRI room. The exhaust fan shall be enabled when the O2 monitor goes into alarm at 19.5% (field adjustable). An emergency pushbutton shall be provided in the space to override the exhaust fan to enable. A strobe shall be mounted above each doorway entering the MRI room and shall be on whenever the O2 monitor is in alarm. The building automation system shall monitor the status of the O2 monitor's alarm contact and the exhaust fan. An alarm will be generated if the O2 monitor is in alarm but the exhaust fan status is off.

HEATING HOT WATER TO DOMESTIC HOT WATER HEAT EXCHANGER (HEX-1) - SEQUENCE OF OPERATION

The heat exchanger recirculating pump will run continuously. The BAS will start/stop and monitor the recirculating pump via a current sensing relay. A modulating control valve on the heating hot water return will modulate to maintain 140 degree LWT on the domestic hot water supply. A temperature sensor will be installed in the supply and return heating hot water lines. A temperature sensor will be installed in the return domestic hot water line. A flow meter will be installed in the supply line of the heating hot water. A flow calculation shall be programmed in the BAS to show BTU usage on the heating hot water side of the heat exchanger.

END OF SECTION 23 09 00

SECTION 23 09 05 - AUTOMATIC TEMPERATURE CONTROLS – COMMISSIONING

PART 1 - GENERAL

1.1 COMMISSIONING AND QUALITY ASSURANCE

A. Quality Assurance. Quality assurance for automatic controls systems shall be accomplished through the commissioning process consisting of submittal review of system engineering work, documented pre-functional testing and initial checkout, documented functional performance testing, operator training and O&M documentation. In addition there will be a qualification procedure for the manufacturer and lead installation technician.

B. Related Sections. The general commissioning process procedures and requirements are given in Section 01 91 13 with responsibilities unique to Division 23 included in Section 23 08 10, including O&M manual documentation and training requirements. The common process requirements for initial system checkout are found in Section 23 08 12. Specific functional testing requirements are identified in Section 23 08 11.

1.2 QUALIFICATION OF MANUFACTURER AND LEAD INSTALLING TECHNICIAN

A. Manufacturer and Vendor. Within 14 days after notice to proceed, the controls contractor shall submit to the GC, CM and PM a certified statement, signed by an officer of the manufacturer and vendor which includes the following: name and address of company; name, address and telephone number of the local representative; a general sales bulletin covering the full line of products manufactured; a certification that the products proposed for this contract have been in continuous and successful use for at least 1 year, not including beta testing, and general information covering the functions and characteristics of the systems proposed. In addition, provide a list of four projects which the vendor has installed that are similar in size and complexity to this contract, with the name and telephone number of the contracting officer and facility administrator, size of project, location and brief description and date of completion.

B. Lead Programmer (LP). The majority of the programming for this project will be completed by the lead programmer. The LP will personally review and approve all programming by others. Within 14 days after notice to proceed, the controls contractor shall submit the following regarding the LP: name; address; telephone number; certification of training on this system; list of two projects of similar size and complexity to this contract which were primarily programmed by the LP; and for each project the project name, location, description, cost, name and telephone number of the contracting officer and current facility administrator and date of completion. A replacement to the LP must be approved in writing by the Owner.

C. Lead Installation Technician (LIT). The automatic controls will be installed under the direct and continuous supervision of a lead technician authorized by the manufacturer. Within 14 days after notice to proceed, the controls contractor shall submit the following regarding the LIT: name; address; telephone number; certification of training on this system; list of two projects of similar size and complexity to this contract which were directly supervised by the LIT; and for each project the project name, location, description, cost, name and telephone number of the contracting officer and current facility administrator and date of completion. A replacement to the LIT must be approved in writing by the Owner.

D. Acceptance. A review of the qualifications and action upon the acceptance of the manufacturer and the LIT and LP will be completed by the Owner. If the manufacturer, the proposed product line or the qualifications of the LIT or LP are not in accordance with the Contract Documents or, in the opinion of the Owner, will not result in a satisfactory completed product, alternatives must

be submitted for approval.

PART 2 – PRODUCTS

2.1 TREND LOGGING CAPABILITIES

A. The control system installed shall be capable of and set up to readily trend data with the following minimum features.

1. Any point, physical or calculated may be designated for trending. Any point, regardless of physical location in the network, may be collected and stored in each DDC controller's point group.

2. Collection may be by either pre-defined time interval or upon a pre-defined change of value (COV).

3. Each DDC controller panel shall have a dedicated RAM-based buffer for trend data and shall be capable of storing at least 10,000 samples.

4. At least six columns of data can be viewed on the screen at once and can be graphed using a graphing program integral to the control system, with at least four parameters graphed against time on the same graph. The columnar format shall have time down the left column with columns of data to the right (one column for each parameter).

5. The system shall have the ability to graph real-time data of up to four points on the EMS at once, giving each point its own scale.

6. Without any special or difficult conversions, this data shall be able to be designated to be stored as an ASCII delimited file in the same columnar format for use in graphing with normal commercial spreadsheet software.

7. The trend log data is automatically downloaded at appropriate intervals onto the hard drive when space in the field cabinets becomes full, so that no data is lost. This is done without the user having to calculate the size of the trends and download frequency.

8. Any limitations in the trending as to speed of sampling vs number of sampled points in a given trend, and the effect on actual sampling rate and simultaneousness of the sampling across parameters shall be clearly explained in writing. Programming and trending setup examples of all representative situations shall be provided.

9. The trends shall be capable of being set up to start sampling all trended points in a given trend or group of trends at the same exact time.

10. Specifications for standard trends shall be able to be set up by the user and be saved by a name and initiated by only recalling the name. The control contractor shall assist the operators in setting up at least six standard trends during training.

11. A key for the names and definitions of all point abbreviations (both physical and virtual) shall be provided.

12. The system shall have the ability to automatically accumulate and store run-time hours of digital input and output points and to count events (totalization and counting functions).

13. Ideal, but not required, shall be the capability to graph with the control system software, one or more points against another, rather than just against time.

2.2 TEMPORARY PROGRAMMING AND TESTING TERMINAL

A. If the permanent terminal and display is graphical for viewing values and setpoints, and the update time for the graphical display is considered by the CxA to be too slow, the controls contractor shall provide and set up, during the entire functional testing process, a second input and output terminal with a text based format (in addition to the graphics-capable permanent terminal), which will significantly speed up the point readout update time. Both terminals will be simultaneously active.

2.3 GLOBAL COMMAND CAPABILITY

A. The system shall be capable of executing from the central control terminal, temporary or permanent global commands, such as a change in space temperature setpoint.

2.4 COMMISSIONING AND MONITORING POINTS

A. All control points of the central building automation system, required to automatically control the equipment specified in the Contract Documents and to execute all specified control sequences, shall be installed and be able to be monitored.

PART 3 – EXECUTION

3.1 SUBMITTALS

A. The controls contractor shall submit the manufacturer and lead installation technician data according to Part 1 of this section. Upon acceptance, proceed with shop drawings and other submittal data.

B. The controls contractor shall follow the other submittal requirements in Section 23 08 10 and 01 91 13.

END OF SECTION

SECTION 23 21 13 - HYDRONIC PIPING

PART 1 GENERAL

1.1 WORK INCLUDED

A. Pipe and Pipe Fittings

B. Heating Water Piping System

C. Chilled Water Piping System

1.2 RELATED WORK

A. Section 23 00 00 - General Provisions

B. Section 23 05 16 - Expansion Compensation

C. Section 23 05 29 – Supports and anchors

D. Section 23 05 53 - Mechanical Identification

E. Section 23 07 00 - Piping and Equipment Insulation

1.3 REFERENCES

A. ASTM A53 - Pipe, Steel, Black and Hot-Dipped Galvanized, Welded and Seamless.

B. ASTM A234 - Pipe Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and Elevated Temperatures.

1.4 REGULATORY REQUIREMENTS

A. Conform to ANSI/ASME B31.9.

1.5 QUALITY ASSURANCE

A. Valves: Manufacturer’s name and pressure rating marked on valve body.

B. Welding Materials and Procedures: Conform to ANSI/ASME Sec. and applicable State Labor Regulations.

1.6 SUBMITTALS

A. Submit shop drawing and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Include data on pipe materials, pipe fittings, valves, and accessories.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to site under provisions of Section 01 60 00 – Materials and equipment.

B. Store and protect products under provisions of Section 01 60 00 – Materials and Equipment.

PART 2 PRODUCTS

2.1 HEATING WATER PIPING

A. Steel Pipe: ASTM A53, Schedule 40 ERW.

B. Piping terminal heating coils (3' max.) Type M hard drawn copper, ASTM 88, wrought copper fittings.

2.2 CHILLED WATER PIPING - (ABOVE GROUND)

A. Steel pipe: ASTM A53, Schedule 40, ERW.

2.3 EQUIPMENT DRAINS AND OVERFLOWS

A. For piping materials see piping section.

B. All A.H. unit drains shall have cleanouts.

C. All A.H. unit auxiliary drains shall be piped separately from primary drains to floor drains.

D. Drain piping (A.H. units) copper tubing type M, hard drawn, ASTM 88 wrought copper fittings.

2.4 FLANGES, UNIONS, AND COUPLINGS

A. Pipe Size 2 inches and under: 150 psig malleable iron unions for threaded ferrous piping; bronze unions for copper pipe, soldered joints.

B. Pipe size over 2 inches: 150 psig forged steel slip-on flanges for ferrous piping; bronze flanges for copper piping; 1/16 inch thick preformed neoprene.

2.5 VALVES

A. For valves in hydronic systems, see Valve Section 23 05 23.

2.6 RELIEF VALVES

A. Bronzed body, teflon seat, stainless steel stem and springs, automatic.

PART 3 EXECUTION

3.1 PREPARATION

A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.

B. Remove scale and dirt on inside and outside before assembly.

C. Prepare piping connections to equipment with flanges or unions.

D. After completion, fill, clean, and treat systems.

3.2 INSTALLATION

A. Route piping in orderly manner, plumb and parallel to building structure, and maintain gradient.

B. Install piping to conserve building space, and not interfere with use of space and other work.

C. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.

D. Provide clearance for installation of insulation, and access to valves and fittings.

E. Provide access where valves and fittings are not exposed.

F. Slope piping and arrange systems to drain at low points. Use eccentric reducers to maintain top of pipe level.

G. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welding.

H. Prepare pipe and fittings, supports, and accessories for finish painting. Refer to Section 09 91 23 – Interior Painting.

3.3 APPLICATION

A. Install brass male adapters each side of valves in copper piped system. Sweat solder adapters to pipe.

B. Install ball or butterfly valves for throttling, bypass, or manual flow control services.

C. Provide spring loaded check valves on discharge of condenser water pumps.

D. Use plug cocks for throttling service. Use non-lubricated plug cocks only when shut-off or isolating valves are also provided.

E. Use lug end butterfly valves to isolate equipment.

F. Provide 3/4 inch ball drain valves at main shut-off valves, low points of piping, bases of vertical risers, and at equipment. Pipe to drain if specified on drawings.

END OF SECTION 23 21 13

SECTION 23 21 16 - HYDRONIC SPECIALITIES

PART 1 GENERAL

1.1 WORK INCLUDED

A. Air vents.

B. Flow indicators, controls, meters.

1.2 RELATED WORK

A. Section 23 21 13 - Hydronic Piping

1.3 REFERENCES

A. ANSI/ASME - Boilers and Pressure Vessels Code.

1.4 REGULATORY REQUIREMENTS

A. Conform to ANSI/ASME Boilers and Pressure Vessels code Section 8D for manufacturer of tanks.

1.5 QUALITY ASSURANCE

A. Manufacturer: For each product specified, provide components by same manufacturer throughout.

1.6 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Submit shop drawings and product data for manufactured products and assemblies required for this project.

C. Include component sizes, rough-in requirements, service sizes, and finishes. Include product description, model and dimensions.

1.7 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data under provisions of Section 01 78 23 Operation and maintenance Data.

B. Include installation instruction, assembly views, lubrication instructions, and replacement parts lists.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to site under provisions of Section 01 60 00 – Material and Equipment.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Certain items in this Specification are listed by manufacturer and/or manufacturer's model number to establish general style, type, character, and quality of product desired. Similar items manufactured by other than those listed will be considered, providing submittals are

made according to Pre-Bid Approval requirements of Instructions to Bidders, page IB-3, Paragraph 4.3.

B. Where no manufacturer or model number are given, any product meeting performance or design criteria, or referenced trade association standard may be used but Pre -Bid Approval is required.

2.2 AIR VENTS

A. Manual Type: Short vertical sections of 2 inch diameter pipe to form air chamber, with 1/8" brass needle valve at top of chamber.

B. Float Type: Brass or semi-steel body, copper float, stainless steel valve and valve seat; suitable for system operating temperature and pressure, with isolating valve.

C. Washer Type: Brass with hydroscopic fiber discs, vent ports, adjustable cap for manual shut-off, and integral spring loaded ball check valve.

2.3 STRAINERS

A. Size 2" inch and under: Screwed brass or iron body for 175 psig working pressure, Y pattern with 1/32 inch stainless steel perforated screen.

B. Size 2-1/2" to 4" flanged iron body for 175 psig working pressure, Y pattern with 1/8" stainless steel perforated screen.

C. Size 5 inch and larger: Flanged iron body for 175 psig working pressure, Y pattern with 1/8" stainless steel perforated screen.

2.4 FLOW METERS

A. Heavy duty, 316 stainless steel pitot tube type flow measuring sensor with instrument connections with valves 1/4" SAE flare by 1/8" female NPT brass valves on 1/8" male NPT fittings.

B. Portable meter consisting of case containing one, 3 percent accuracy pressure gauge with 0-60 feet pressure range; two, 3 percent accuracy pressure gauges with 0-135 inches and 0-60 feet pressure ranges for 500 psig maximum working pressure, color coded hoses for low and high pressure connections, and connectors suitable for connection to read-out valves.

2.5 ACCEPTABLE MANUFACTURERS

A. Annubar with Eagle Eye flow meter or approved equal.

B. PRESCO Annular with model GM meter or approved equal.

PART 3 EXECUTION

3.1 INSTALLATION AND APPLICATION

A. Install specialties in accordance with manufacturer’s instructions to permit intended performance.

B. Where large air quantities can accumulate, provide enlarged air collection standpipes.

C. Provide manual air vents at system high points and as indicated.

D. For automatic air vents in ceiling spaces or other concealed locations, provide vent tubing to

nearest drain.

E. Provide valved drain and hose connection on strainer blow down connection.

END OF SECTION 23 21 16

SECTION 23 21 23 - PUMPS

PART 1 GENERAL

1.1 WORK INCLUDED

A. This section includes all pumps except where integral with manufactured piece of equipment.

1.2 RELATED WORK

A. Section 23 21 13 - Hydronic Piping

B. Section 23 05 23 - Valves

C. Section 23 05 29 - Supports and Anchors

D. Section 23 07 00 - Piping and Equipment Insulation

E. Section 22 10 00 - Plumbing Piping

1.3 REFERENCES

1.4 SUBMITTALS

A. Submit shop drawings under provisions of Sections 01 33 00 – Submittal Procedures & 23 00 00 – General Mechanical.

B. Submit certified pump curves showing pump performance characteristics with pump and system operating point plotted. Include NPSH curve when applicable.

PART 2 PRODUCTS

2.1 ACCEPTABLE MANUFACTURER'S FRAME MOUNTED END SUCTION PUMPS

A. Aurora 340 Series

B. Bell & Gossett Model 1510

C. Taco KV/KS Series

D. Paco LF Series

E. Armstrong 4030 Series

F. Patterson VIL Series

G. Pump supplier shall be an authorized factory distributor for equipment supplied.

2.2 GENERAL

A. Statically and dynamically balance rotating parts.

B. Construction to permit complete servicing without breaking piping or motor connections.

C. Pumps to operate at 1750 rpm unless specified otherwise.

D. Pump connections to be flanged.

2.3 BASE MOUNTED PUMPS (Hot water heating)

A. Type: Centrifugal, single stage, direct connected.

B. Casing: Cast iron, split volute, single or double suction, renewable bronze wearing rings, flanged suction and discharge.

C. Impeller: Bronze, fully enclosed, keyed to shaft.

D. Shaft: High grade alloy steel with copper, bronze or stainless steel shaft sleeves.

E. Bearing: Oil lubricated roller or ball bearings with oil reservoirs. Provide oil seal and integral dirt and water seal at each end of reservoir.

F. Drive: Flexible coupling with coupling guard.

G. Seals: Pumps shall have mechanical seals and hardened 316 stainless steel short sleeve.

H. Baseplate: High grade heat treated cast iron or reinforced heavy steel with integral drain rim grout base.

I. Non overloading.

J. Bearing shall be grease proof bearing cartridges. Shaft deflection shall not exceed .002 at stuffing box.

K. Bearings shall be designed for average life of ten years and bearing arms are to be cast integral with lower half of casing to assure proper bearing alignment.

L. Pumps shall be horizontal split case with casing suitable for 250 psi case wearing pressure. (Chilled water, heating water pumps - end suction type).

M. Impellers shall not exceed 90% of maximum published diameter.

N. Furnish two (2) spare seals for each pump.

O. Pump impeller diameter shall be selected such that break hp will not exceed specified hp at any operating point which exists on that particular impeller diameter pump curve.

PART 3 EXECUTION

3.1 INSTALLATION

A. Provide drains for bases and stuffing boxes piped to and discharging into floor drains.

B. Provide air cock and drain connection and horizontal pump casings.

C. Decrease from line size, with long radius reducing elbows or reducers. Support piping adjacent to pump such that no weight is carried on pump casings. Provide supports under elbows on pump suction and discharge line sized 4 inches and over.

D. Ensure pumps operate at specified system fluid temperatures without vapor binding and cavitation, are maximum efficiency curve.

E. Qualified millwright to check, align, and certify base mounted pumps prior to start-up.

3.2 PUMP SCHEDULE: See Plans.

END OF SECTION 23 21 23

SECTION 23 25 00 - CHEMICAL (WATER) TREATMENT

PART 1 GENERAL

1.1 WORK INCLUDED

A. Cleaning of piping systems.

B. Chemical feeder equipment.

C. Treatment for closed systems.

D. Treatment for open system.

1.2 PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION

A. Section 23 21 13 - Hydronic Piping: Water coupon rack, by-pass (pot) feeder.

1.3 RELATED SECTIONS

A. Section 23 21 13 - Hydronic Piping

B. Section 23 21 16 - Hydronic Specialties

1.4 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Submit shop drawings indicating system schematics, equipment locations, and controls schematics.

C. Submit product data indicating chemical treatment materials, chemicals, and equipment.

D. Submit manufacturer's installation instructions under provision of Section 01 33 00 – Submittal Procedures.

E. Submit reports indicating start-up of treatment systems are completed and operating properly.

F. Submit reports indicating analysis of system water after cleaning and after treatment.

1.5 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data under provisions of Section 01 78 23 – Operation and Maintenance Data.

B. Include data on chemical feed pumps, agitators, and other equipment including spare parts lists, procedures, and treatment programs.

C. Include step by step instructions on test procedures including target concentration.

1.6 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing the products specified in this Section. Company shall have local representatives with water analysis laboratories and full time service personnel.

1.7 REGULATORY REQUIREMENTS

A. Conform applicable EPA code for addition of non-potable chemical to building mechanical systems, and for delivery to public sewage systems.

1.8 MAINTENANCE SERVICE

A. Furnish service and maintenance of treatment systems for one (1) year from date of Substantial Completion.

B. Provide monthly technical service visits to perform field inspection and make water analysis on site. Detail findings in writing on proper practices, chemical treating requirements, and corrective actions needed. Submit two (2) copies of field service report after each visit.

C. Provide laboratory and technical assistance service for warranty period.

D. Include two hour training course for operating personnel, instructing them on installation, care, maintenance, testing, and operation of water treatment systems. Arrange course at start-up of systems.

E. Provide on site inspections of equipment during scheduled or emergency shutdown to properly evaluate success of water treatment program, and make recommendations in writing based upon these inspections.

1.9 MAINTENANCE MATERIALS

A. Submit maintenance materials under provisions of Section 01 78 23 – Operation and Maintenance Data.

B. Provide sufficient chemicals for treatment and testing during warranty period.

1.10 APPROVAL OF PRODUCT PRIOR TO BIDDING

A. Refer to Section 01 60 00, Material and Equipment, paragraph, 1.4, 1.4A and 1.4B for product prior approval requirements.

B. Contractor must coordinate with TGHS prior to ordering any equipment.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Certain items in this Specification are listed by manufacturer and/or manufacturer's model number to establish general style, type, character, and quality of product desired. Similar items manufactured by other than those listed will be considered, providing submittals are made according to Pre-Bid Approval requirements of Instructions to Bidders.

B. Where no manufacturer or model number are given, any product meeting performance or design criteria, or referenced trade association standard may be used and Pre-Bid approval is not required.

2.2 MATERIALS

A. System Cleaner:
   1. Liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products.
   2. Algicide.

B. Closed System Treatment (Water):
1. Sequestering agent to reduce deposits and adjust ph (polyphosphate).
2. Corrosion inhibitors: (liquid) boron-nitrite and borax, sodium totyltriazole, low molecular weight polymers, phosphonates, sodium molybdate, or sulphites.
3. Conductivity enhancers: phosphates or phosphonates.

C. Condenser Water System Treatment (Cooling Towers)
1. Sequestering agent to inhibit scaling; phosphonates, sodium polyphosphates, lignin derivatives, synthetic polymer polyelectrolytes, or organite phosphates.
2. Acid to reduce alkalinity and ph.
3. Corrosion inhibitor: Zinc-phosphate, phosphonate-phosphate, phosphonate-molybdate and phosphonate silicate, sodium tolyltriazole, or low molecular weight polymers.
4. Algicide: Chlorine release agents such as sodium hypochlorite or calcium hypochlorite, or microbiocides such as quaternary ammonia compounds, tributyl tin oxide, methylene bis (thiocyanate), or isothiazolones.

2.3 EQUIPMENT

A. By-pass pot feeder: Quick opening for working pressure of 175.

B. Drip Feeder: Plastic reservoir with coil of capillary tubing with probe, weight, charging syringe, and clip.

C. Solution Metering Pump: Positive displacement, diaphragm pump with adjustable flow rate, thermoplastic construction, continuous-duty fully enclosed electric motor and drive, and built in relief valve.

D. Solution Tanks: 50 gallon capacity, polyethylene, self-supporting, 5 gallon 3.8 graduated Markings; molded fiberglass cover with recess for mounting pump, agitator, and liquid level switch.

E. Agitator: Totally enclosed, explosion proof electric motor, stainless steel clamp and motor mount, 5/8 inch diameter Type 316 stainless steel propeller.

F. Liquid Level Switch: Polypropylene housing with integrally mounted PVC air trap, receptacles for connection to metering pump, and low level alarm.

G. Conductivity Controller: Packaged monitor controller with solid state circuiting, five percent accuracy, linear dial adjustment, built-in calibration switch, on-off switch and circuit and recorder.

H. Water Meter: Displacement type cold water meter with sealed, tamper-proof magnetic drive, impulse contact register, single pole, double throw dry contact switch.

I. Solenoid Valves: Forged brass body globe pattern, normally open or closed as required, general purpose solenoid enclosure, and continuous duty coil.

J. Timers: Electronic timers, infinitely adjustable over full range, 150 second and five minute range, mounted together in cabinet with hands-off-automatic switches and status lights.

2.4 TEST EQUIPMENT

A. Provide white enamel test cabinet with local and fluorescent light, capable of accommodating 4-10 zeroing titrating burettes and associated reagents.

B. Provide the following test kits:
1. Alkalinity titration test kit.
2. Chloride titration test kit.
3. Sulphite hardness titration test kit.
4. Total hardness titration test kit.
5. Low phosphate test kit.
6. Conductivity bridge, range 0-10,000 microhms.
7. Creosol red ph slide complete with reagent.
8. Portable electronic conductivity meter.
9. High nitrite test kit.

PART 3 EXECUTION

3.1 PREPARATION

A. Systems shall be operational, filled, started, and vented prior to cleaning. Use water meter to record capacity in each system.

B. Place terminal control valves in open position during cleaning.

3.2 CLEANING SEQUENCE

A. Add cleaner to closed systems at concentration as recommended by manufacturer.

B. Hot Water Heating Systems: Apply heat while circulation slowly raising temperature to 160 degree F and maintain for 12 hours minimum. Remove heat and circulate to 100 degrees F or less; drain systems as quickly as possible and refill with clean water. Circulate for 6 hours at design temperatures, then drain. Refill with clean water and repeat until system cleaner is removed.

C. Chilled Water Systems: Circulate for forty eight hours, then drain systems as quickly as possible. Refill with clean water, circulate for 24 hours, then drain. Refill with water and repeat until system cleaner is removed.

D. Use neutralizer agents on recommendation of system cleaner supplier and approval of Architect.

E. Flush open systems with clean water for one hour minimum. Drain completely and refill.

F. Remove, clean, and replace strainer screens.

G. Inspect, remove sludge, and flush low points with clean water after cleaning process is completed. Include disassembly of components as required.

3.3 INSTALLATION

A. Install in accordance with manufacturer's instructions.

3.4 CLOSED SYSTEM TREATMENT

A. Provide one bypass feeder on each system. Install isolating and drain valves and necessary piping. Install around globe valve downstream of circulating pumps unless indicated otherwise.

B. Introduce closed system treatment through bypass feeder when required or indicated by test.

C. Provide 3/4 inch water coupon rack around circulating pumps with space for 4 test specimens.

3.5 CONDENSER WATER SYSTEMS (COOLING TOWERS)

A. Provide automatic condenser water control systems for inhibitor feed, blowdown and biocide feeds. Inhibitor application shall be meter activated, blowdown shall be conductivity activated, and biocide shall be meter fed with blowdown locked out to insure biocide retention time.

B. Control system shall incorporate solid state integrated circuits and digital LED displays, in NEMA-12 steel enclosure. Provide gasketed and lockable door.

C. Base dissolved solids control on conductivity and include:
1. LED digital readout display (microhm/cm).
2. Temperature compensated sensor probe adaptable to sample stream manifold.
3. High, low, normal conductance indicator lights (LED).
4. High or low conductance alarm light (flash or steady switch shall have silence position.
5. Illuminated legend shall indicate "ALARM" whenever alarm condition exists.
6. Hand-off-automatic switch for solenoid bleed valves.
7. Illuminated legend shall indicate "BLEED" when valve is operated.
8. Adjustable hysteresis or dead-band (internal).

D. Base inhibitor feed control on make-up volume and include:
1. Solid state counter (1-125 field selectable).
2. Solid state timer (adjustable 1/4 to 5 minutes).
3. Test switch.
4. Hand-off-automatic switch for chemical pump.
5. Illuminated legend shall indicate "FEED" when pump is activated.
6. Solid state lock-out timer (adjustable 1/4 to 3 hours) and indicator light. Lock-out timer shall deactivate the pump and activate alarm circuits.
7. Panel totalizer (amount of makeup), electro-mechanical type.

E. Biocide programmer to include:
1. 24 hour timer with 14 day skip feature to permit activation any hour of the day.
2. Precision solid state bleed lock-out timer (0-9 hours) and biocide pump timer (0 - 2 - 1\4 hours), clock controlled.
3. Solid state alternator to enable the use of two different formulations.
4. Digital display of the time of day (24 hours).
5. LED display of day of week (14 days).
6. Fast and slow clock set controls (internal).
7. Battery back-up so clock is not disturbed by power outages, quartz timekeeping accuracy.
8. Hand-off-automatic switches for biocide pumps.
9. Illuminated legend shall indicate "BIOCIDE A" or "BIOCIDE B" when pump is activated.

F. Provide water meter on system make-up, wired to control system.

G. Provide solution pumps to feed sequestering agent and corrosion inhibitor from solution tank into condenser water supply to tower. Provide agitator as required.

H. Provide conductivity controller to sample condenser water and operate 11 inch solenoid bleed valve and piping to blow down controller sampler wired to open when condensing water pump is operating.

I. Introduce algicide to tower by intermittent slug feed.

J. Provide liquid level switch in each solution tank to deactivate solution pump and agitator, and sound local alarm bell.

K. Provide 3/4 inch water coupon rack around circulating pumps with space for 4 test specimens.

END OF SECTION 23 25 00

SECTION 23 31 00 – DUCTWORK

PART 1 GENERAL

1.1 WORK INCLUDED

A. Low pressure duct.

B. Medium and high pressure duct.

C. Fire and Smoke Dampers

1.2 RELATED WORK

A. Section 23 05 23 - Supports and Anchors

B. Section 23 07 00 - Piping and Equipment Insulation

C. Section 23 36 00 - Air Terminal Units

D. Section 23 37 00 - Air Outlets and Inlets

E. Section 23 05 93 - Testing Adjusting and Balance

1.3 REFERENCES

A. ASHRAE, 2009 Fundamentals, Chapter 21.

B. ASHRAE, 2008 Equipment, Chapter 18.

C. NFPA 90A, 90B.

D. H.V.A.C. Duct Construction Standards - SMACNA 1995.

1.4 DEFINITIONS

A. Duct sizes: Inside clear dimensions for wrapped ducts, maintain sizes inside lining. Metal to metal sizes for internally lined ductwork.

B. Low Pressure: Three pressure classifications: 1/2" WG positive or negative static pressure and velocities less than 2,000 fpm, 1" WG positive or negative static pressure and velocities less than 2,500 fpm and 2" WG positive or

C. Medium Pressure: Three pressure classifications: 3 inch WG positive or negative static pressure and velocities less than 4,000 fpm, 4" WG positive static pressure and velocities greater than 2,000 fpm. 6" WG positive static pressure and velocities greater than 2,000 fpm.

1.5 REGULATORY REQUIREMENTS

A. Construct ductwork to NFPA 90A and NFPA 90B Standards.

B. Store and protect products under provisions of Section 01 60 00 Materials and Equipment.

C. Construct ductwork to International Mechanical Code Standards

PART 2 PRODUCTS

2.1 MEDIUM PRESSURE DUCTWORK

A. All ductwork on high velocity systems shall be flat oval and/or round type constructed as per latest edition of ASHRAE Guide and as shown on the plans, and shall be absolutely air tight. Round ductwork as shown and required shall be furnished.

B. Metal gauges for single wall round and flat oval duct shall be as follows:

1. ROUND DUCTS

Duct diameter Longitudinal	Spiral Pipe	Fittings and seam pipe
3" thru 14"	26	24
15" thru 26"	24	22
27" thru 36"	22	20
37" thru 50"	20	20

2. FLAT OVAL DUCTS

Major Dimension Longitudinal	Spiral Pipe	Fittings and seam pipe
Up to 24"	24	20
25" thru 36"	22	20
37" thru 48"	22	18
49" thru 60"	20	18
61" thru 70"	20	16

C. Longitudinal joints shall be grooved seam type; and joints shall be male and female slip type, with maximum tolerance of 1/64" between outside diameter of male and inside diameter of female end.

D. Interior of all ductwork shall be smooth and each length shall be carefully inspected after construction and any defects removed.

E. Forty-five (45) degree elbows shall be of the three-piece construction. Ninety degree (90) elbows shall be five-piece construction. Center line radius of elbows shall not be less than 1-1/2 times the pipe diameter.

F. As shown on plans, take-off to mixing boxes are 45 degree take-off.

G. Ample length of duct, branch connection, tees, 45 degree and 90 degree elbows shall be submitted for approval of design and workmanship before any construction is commenced.

H. Mastic shall be applied to male duct end, joints pushed together surplus mastic removed and the joint finished with hard cast "iron grip".

I. All connections between ductwork and attenuating chambers shall be made with pre-insulated flexible air duct, minimum 24" in length.

J. Flexible duct shall be clamped to round pipe of branch connections and attenuator chamber stub with clamps, with mastic or tape applied to the male ends of the stubs before insertion into the flexible duct. Mastic and tape must comply with UL181A & UL181B.

K. All ductwork shall be thoroughly supported and braced according to latest edition of ASHRAE Guide & SMACNA Manual.

L. On completion of medium pressure duct and before connection of mixing boxes to system, all open ends shall be tightly closed and air pumped into duct system until an air pressure of one and a half times external static pressure specified for the air handling unit serving this ductwork is obtained.

M. This pressure shall be maintained until all joints are inspected and examined for leaks.

N. All leaks shall be repaired immediately.

O. The above work shall be completed before any furring or ceiling work is started by General Contractor.

P. Flexible connections shall be provided in high pressure supply ductwork between the duct and equipment.

Q. All supply flat oval ductwork thru first 20 feet of A.H. units shall be double wall insulated with perforated liner sound attenuating duct and fittings. (VAV Units only)

R. All medium and high pressure duct shall be spiral ductwork with anti-microbial coating from factory.
1. All spiral ductwork surfaces shall have a factory applied antimicrobial coating, which complies with all items in this section.
2. The active agent of the antimicrobial coating must be registered with the Environmental Protection Agency (EPA) specifically for internal use in HVAC systems. Submittals must include a copy of the EPA certification with MSDS reports.
3. Applied coating must be tested at an independent laboratory for efficacy and show effectiveness against fungi and bacteria.
4. Products should be independently tested to show compliance with applicable fire codes, ASTM and UL codes.
   a. Antimicrobial coating for duct systems must meet or exceed the following ratings as tested to UL-723.
      1) Smoke Developed = 0
      2) Flame spread = 0
5. Coating shall be non-toxic and shall not release active ingredient into the air stream.
6. Antimicrobial coating shall be uniformly, factory applied to ensure complete (100%) coverage on the specified surface. No bare un-coated surfaces will be accepted.
7. All excess metal and non-metal materials with antimicrobial coating must be capable of disposal without requiring and hazardous waste permit.
8. Blemishes over ¼" wide shall be recoated at job site provided field touch-up coating maintains full antimicrobial performance.
9. Acceptable antimicrobial coating products are; AVRON46.
10. Insulating materials used in the HVAC system will be independently tested to resist the growth of mold and bacteria.
11. Products stored on the job site should be properly protected to reduce the likelihood of contamination prior to installation.
12. Joining compounds such as caulks and mastics shall be UL listed per UL-181.

S. All ductwork delivered to the job site shall have the ends covered with visqueen and taped to maintain the cleanliness of the interior of the ductwork.

2.2 INSULATED MEDIUM AND HIGH PRESSURE FLEXIBLE DUCT

A. Provide where indicated on drawings Flexmaster Type 4M UL181 Class I Air Duct. Approved equal:

Thermaflex model MK-C or prior approved equal with sample submitted during prior approval stage.

B. The duct shall be constructed of a heavy coated fiberglass cloth fabric supported by helical wound galvanized steel. The fabric shall be mechanically locked to the steel helix without the use of adhesives or chemicals.

C. The internal working pressure rating shall be at least 12" w.g. positive and 5" w.g. negative with a bursting pressure of at least 2½ time the working pressure.

D. The duct shall be rated for a velocity of at least 5500 feet per minute.

E. The duct must be suitable for continuous operation at a temperature range of -20° F to +250°

F. Factory insulate the flexible duct with fiberglass insulation. The R value shall be at least 5 minimum (R-4.2 is not acceptable) at a mean temperature of 75° F.

G. Cover the insulation with a fire retardant metalized vapor barrier jacket reinforced with crosshatched scrim having a permeance of not greater than 0.05 perms when tested in accordance with ASTM E96, Procedure A.

H. Maximum length to be 2’-0”.

2.3 LOW PRESSURE DUCTWORK

A. Furnish and install all ducts for the air conditioning, heating and ventilating systems. Ductwork shall be complete with grilles, vanes splitters, flashings, hangers, flexible connections, manual dampers, fresh air inlet louvers, reinforcing angles, transitions to equipment, etc.

B. All low pressure ductwork (mean velocity less than 2,000 FPM and static pressure in duct 2" of water or less) shall be constructed as per SMACNA Standards, 1995 Edition, Chapter 1, and shall be of the gauge metal and reinforced as per SMACNA Standards, 1995 Edition.

C. Flashing shall be of the same material as specified under the roofing and flashing section of these specifications, or of 16-ounce sheet copper and shall be furnished and installed around all outside openings used for ducts or fans where required. Roof flashing shall extend at least 8" above roof. Cooperate with roofing contractor when installing flashing.

D. All duct connections to equipment shall be made with fire and mildew resistant flexible connections of canvas or other acceptable materials. Connections shall have suitable metal collar frames at each end and shall not be less than 4" long with at least 1" of slack in the connection. Flexible connections shall be heat resistant to 500 degrees F continuously.

E. Duct dimensions shown are metal sizes. All edges shall be straight and true.

F. All flexible connections, duct liner and adhesives shall be U.L. listed as having a maximum flame spread of 50, fuel contribution of 25 and smoke contribution of 25.

G. This Contractor shall furnish and install in ductwork all dampers, vanes splitters, etc.. as shown on the drawings or necessary to make the system complete. Where dampers or splitters can not be accessed through lay in ceiling, Contractor shall provide lockable 24” x 24” access door. Contractor shall coordinate location with Architect.

H. Shafts shall be marked to show position of dampers, vanes, splitters, etc.

I. Ductwork shall be supported in accordance with SMACNA Plate No. 17 and No. 18, up to and including band iron hangers attached to duct by means of screws or rivets per hanger.

J. Access doors shall be provided in ductwork for all automatic dampers and each manual damper 3 square feet in area or larger, and shall be so located that damper can be completely serviced through the access door. Access door shall be provided with felt gaskets and suitable hinges and locks. Where access doors occur in insulated duct, double skin insulated doors shall be used.

K. Where square ducts are shown, provide single vane elbows as per Plate 22, Figure A, SMACNA Standards, 1995 Edition. For all ductwork over 18" provide double vane square elbow as shown in Figure C of the Plate.

L. All low pressure ductwork joints shall be sealed with hard cast "iron grip".

M. Flexible air duct for connections between low pressure rectangular duct and ceiling diffusers shall be pre- insulated and listed by Underwriters Laboratories under U.L Standard 181 as a Class 1 flexible air duct and complying with NFPA Standards 90A and 90B.

N. All flex duct 45 degree and 90 degree turns shall be metal hard duct.

O. All ductwork and accessories associated with any pool air condition unit or pool exhaust shall be aluminum.

2.4 INSULATED ACOUSTICAL LOW PRESSURE FLEXIBLE DUCT

A. The duct shall be constructed of a CPE fabric supported by helical wound galvanized steel.

B. Provide where indicated on drawings Flexmaster Type 8M UL181 Class I Air Duct.

C. Fabric shall be mechanically locked to the steel helix without the use of adhesives or chemicals.

D. The internal working pressure rating shall be at least 6" w.g. positive and 4" w.g. negative with a bursting pressure of at least 2½ time the working pressure.

E. The duct shall be rated for a velocity of at least 4000 feet per minute.

F. The duct must be suitable for continuous operation at a temperature range of -20° F to +250°

G. Acoustical performance, when tested by an independent laboratory in accordance with the Air Diffusion Council's Flexible Air Duct Test Code FD 72-R1, Section 3.0, Sound Properties, shall be as follows:

The insertion loss (dB) of a 10 foot length of straight duct when tested in accordance with ASTM 477, at a velocity of 2500 feet per minute, shall be at least:

Octave Band	2	3	4	5	6	7
Hz.	125	250	500	1000	2000	4000
6" diameter	7	31	40	38	40	27
8" diameter	13	29	36	35	38	22
12" diameter	21	28	29	33	26	12

The radiated noise reduction (dB) of a 10 foot length of straight duct when tested in accordance with ASTM E477, at a velocity of 2500 feet per minute, shall be at least:

Octave Band	2	3	4	5	6	7
Hz.	125	250	500	1000	2000	4000
6" diameter	5	8	7	8	11	15
8" diameter	10	7	7	8	10	13
12" diameter	9	6	6	5	9	13

The self generated sound power levels (LW) dB re 10^{-12} Watt of a 10 foot length of straight duct for an empty sheet metal duct when tested in accordance with ASTM E477, at a velocity of 1000 feet per minute, shall not exceed:

Octave Band	2	3	4	5	6	7
Hz.	125	250	500	1000	2000	4000
6" diameter	42	31	23	18	17	21
8" diameter	41	34	27	19	18	21
12" diameter	54	45	38	31	27	23

Factory insulate the flexible duct with fiberglass insulation. The R value shall be at least 5.0 at a mean temperature of 75° F. (R-4.2 is not acceptable)

H. Cover the insulation with a fire retardant metalized vapor barrier jacket reinforced with crosshatched scrim having a permeance of not greater than 0.05 perms when tested in accordance with ASTM E96, Procedure A.

I. Maximum length to be 3’-0

ALL FLEX CONNECTIONS TO CEILING DIFFUSERS MUST BE FACTORY DESIGNED TO HAVE NO DIMENSIONAL CONTORTION WHEN CONNECTED TO THE DIFFUSER.

2.5 FIRE AND SMOKE DAMPERS

A. Round and oval fire dampers shall be designed for high pressure duct systems.

B. Rectangular fire dampers shall be designed for low pressure duct systems.

C. All fire dampers must be NFPA 90A and UL approved.

D. Furnish and install access doors in ductwork, walls, and ceilings where required to service all fire dampers, smoke dampers and detectors. All fire and smoke dampers shall be installed by the sheet metal contractor. All smoke detectors shall be furnished by the electrical Sub-contractor. Control of smoke dampers shall be coordinated with fire alarm system and building automation system.

E. Rectangular Smoke Dampers - Louvers Dampers Inc. Model SD-400-UD or Ruskin FSD-35 tight seal parallel blade smoke dampers with low leakage and felted blades.

F. Round and Oval Smoke Dampers - Shall be same as above but complete with welded round or oval

collars. Units shall be capable of handling pressures up to 6" W.G.

G. Smoke dampers shall be Class I rated as per UL 555.

H. Sheet metal contractor shall provide and install all smoke dampers and actuators. Dampers shall be provided with end switches

I. Approved Manufacturers: Pottorff, Ruskin, Price, Nailor Industries, Greenheck, or prior approved equal.

2.6 LOW LOSS TAP

A. All round low pressure connections to rectangular ducts shall be made with a factory fabricated 45 degree low loss entry “shoe” tap with damper constructed of minimum 26 gage galvanized steel. The damper shall have a 2” raised handle with a high quality locking quadrant. A 3/8” continuous rod with “U” bolts connects the damper to the rod. Nylon end bearings are required where the rod penetrates the spin collar barrel.

B. Provide Flexmaster #STOD-BO3, Dace # 26 ga STOD-C03, or prior approved equal.

C. For medium pressure systems where used upstream of VAV terminals, the damper can be eliminated (use Flexmaster #STO or Dace 24 ga STO). Gauge shall be 24 gauge on medium pressure systems.

2.9 DUCT AIR LEAKAGE TESTING

A. Ductwork that is designed to operate at static pressures exceeding 3 inches water column and all ductwork located outdoors shall be leak-tested in accordance with SMACNA HVAC Air Duct Leakage Test Manual. Positive pressure testing is acceptable for negative pressure ductwork. The maximum permitted duct leakage shall be in accordance with Equation 6-7.

PART 3 EXECUTION

3.1 INSTALLATION

A. See details of ductwork symbols and connections on drawings.

END OF SECTION 23 31 00

SECTION 23 34 10 - GENERAL EXHAUST SYSTEM

PART 1 GENERAL

1.1 SCOPE

A. This Section includes general and exhaust fans with accessories.

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Requirements of the following Division 23 Sections apply to this section:
1. "GENERAL MECHANICAL ."
2. "BASIC MATERIALS AND METHODS."

C. Related Sections: The following sections contain requirements that relate to this section:
1. Division 23, Section 23 05 93 "TESTING, ADJUSTING, AND BALANCING" for air-handling systems testing, adjusting, and balancing requirements and procedures.
2. Division 23 Section 23 09 00 – HVAC TEMPERATURE CONTROLS

1.3 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 Submittal Procedures.

B. Product data for selected models, including specialties, accessories, and the following:
1. Fan performance curves with system operating conditions indicated.
2. Fan sound power ratings.
3. Motor ratings and electrical characteristics plus motor and fan accessories.
4. Materials gages and finishes.
5. Dampers, including housings, linkages, and operators.

C. Shop drawings from manufacturer detailing equipment assemblies and indicating dimensions, weights, required clearances, components, and location and size of field connections.

D. Maintenance data for inclusion in Operating and Maintenance Manual.

1.4 QUALITY ASSURANCE

A. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

B. Electrical Component Standard: Components and installation shall comply with NFPA 70 "National Electrical Code."

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Certain items in this Specification are listed by manufacturer and/or manufacturer’s model number to establish general style, type, character, and quality or product desired. Similar items manufactured by other than those listed will be considered, providing submittals are made according to Pre-Bid approval requirements of Instruction to Bidders.

B. Where no manufacturer or model number are given, any product meeting performance or design criteria, or referenced trade association standard may be used and Pre-Bid Approval is not required.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. General Exhaust Fans:
a. Greenheck GB Series
b. Acme PL Series
c. PENN/Barry
d. Twin City

2.3 SOURCE QUALITY CONTROL

A. Testing Requirements: The following factory tests are required:
1. Sound Power Level Ratings for General Exhaust Fans: Comply with AMCA Standard 301 "Method for Calculating Fan Sound Ratings From Laboratory Test Data." Test fans in accordance with AMCA Standard 300 "Test Code For Sound Rating." General exhaust fans shall be licensed to bear the AMCA Certified Sound Ratings Seal.
2. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency shall be factory tested and ratings in accordance with AMCA Standard 210/ASHRAE STANDARD.

2.4 DIRECT AND BELTED SPUN ALUMINUM POWER ROOF VENTILATORS

A. General Description:
1. Direct Drive: Roof exhaust fans shall be centrifugal direct drive type.
2. The fan wheel shall be centrifugal backward incline, constructed of aluminum and shall include a wheel cone carefully matched to the inlet cone for precise running tolerances. Wheels shall be statically and dynamically balanced.
3. The fan housing and schroud shall be constructed of heavy gauge aluminum with a ridged internal support structure. The fan shroud shall have a rolled bead for added strength.
4. Motors shall be out of the air stream on vibration isolators. Fresh air for motor cooling shall be drawn into the motor compartment from an area free of discharge contaminants. Motors shall be readily accessible for maintenance.
5. A disconnect switch shall be factory installed and wired from the fan motor to a junction box within the motor compartment. A conduit chase shall be provided through the curb cap to the motor compartment for ease of electrical wiring.

B. GENERAL DESCRIPTION: Belt Drive
1. Belt Drive Centrifugal Roof Exhausters shall have centrifugal forwardly inclined wheels, constructed of aluminum and shall include a wheel cone carefully matched to the inner cone for precise tower running. Wheels shall be statistically and dynamically balanced.
2. The fan housing shall be constructed of heavy gauge aluminum with a rigid internal support structure. The fan schroud shall have a rolled beam for added strength.
3. Motors shall be heavy duty ball bearing type carefully matched to the fan mode and furnished at the specified voltage, phase and enclosure. Motors and drive shall be mounted on vibration isolators, out of the air stream. Fresh air for motor shall be drawn in the motor compartment from an area free of discharge contaminants. Motors shall be accessibly for maintenance.
4. Drive frame assembly shall be constructed of heavy gauge steal and mounted on vibration isolators
5. Precision ground and polished fan shafts shall be mounted in permanently sealed, lubricated pillow block ball bearings. Bearings shall be selected for a minimum (L50) life in access of

200,000 hours at maximum catalog operating speed.

6. Drives shall be sized for a minimum of 150% of driven horsepower. Pulleys shall be of the fully matched cast iron type, keyed and securely attached to the wheel and motor shaft. Motor pulleys shall be adjustable for final system balance.
7. A disconnect switch shall be factory installed and wired from the fan motor to a junction box installed within the motor compartment. A fan conduit chase shall be provided through the curb cap to the motor compartment for ease of installation.
8. All fans shall bear AMCA Certified Ratings Seal for sound and air performance.
9. Each fan shall bear a permanently affixed manufacturer's name plate containing the model number and individual serial number for future identification.

END OF SECTION 23 34 10

SECTION 23 34 23 - POWER VENTILATORS

PART 1 GENERAL

1.1 WORK INCLUDED

A. In-line Exhaust Fans

1.2 RELATED WORK

A. Section 23 05 13 - Motors

B. Section 23 31 00 - Ductwork

1.3 REFERENCES

A. AMCA 99 - Standards Handbook

B. AMCA 210 - Laboratory Methods of Testing Fans for Rating Purposes

C. AMCA 300 - Method of Publishing Sound Ratings for Air Moving Devices

D. AMCA 301 - Method of Publishing Sound Ratings for Air Moving Devices

E. SMACNA - Low Pressure Duct Construction Standard

1.4 QUALITY ASSURANCE

A. Performance Ratings: Conform to AMCA 210 and bear the AMCA Certified Sound Rating Seal.

B. Sound Rating: AMCA 301, tested to AMCA 210 and bear the AMCA Certified Sound Rating Seal.

C. Fabrication: Conform to AMCA 99.

1.5 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Provide product data on wall and roof exhausters, and ceiling and cabinet fans.

C. Provide fan curves with specified operating point clearly plotted.

D. Submit sound power levels for both fan inlet and outlet at rated capacity.

E. Submit manufacturer's installation instructions under provisions of Section 01 33 00 – Submittal Procedures.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Certain items in this Specification are listed by manufacturer and/or manufacturer’s model number to establish general style, type, character, and quality of product desired. Similar items manufactured by other than those listed will be considered, provided submittals are made according to Pre-Bid Approval requirements of Instructions to Bidders, Page IB-3,

Paragraph 4.3.

B. Where no manufacturer or model number are given, any product meeting performance or design criteria, or referenced trade association standard may be used and Pre-Bid Approval is not required.

2.2 ACCEPTABLE MANUFACTURERS

A. Greenheck, Model BSQ

B. Cook, Model SQN

C. Substitutions: Under provisions of Section 01 33 00 Submittal Procedures.

2.3 ACCESSORIES

A. Exhaust fans shall have backdraft dampers.

B. ECM Motors.

C. Speed controller is no on VFD.

D. Direct drive.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

3.2 SCHEDULE – see plans

END OF SECTION 23 34 23

SECTION 23 36 00 - AIR TERMINAL UNITS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Variable volume terminal units.

B. Variable volume regulators.

C. Integral heating coils.

D. Integral damper motor operators.

1.2 PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION

A. Section 23 09 00 – HVAC Temperature Controls

1.3 RELATED SECTIONS

A. Section 23 31 00 - Ductwork

1.4 REFERENCES

A. NFPA 90A - Installation of Air Conditioning and Ventilation Systems.

B. UL 181 - Factory-Made Air Ducts and Connectors.

C. ARI 880 - Air-Conditioning and Refrigeration Institute Standard Rating Conditions for Air Terminals

D. UL - Shutoff terminal must be UL listed as a Room Air Terminal.

E. ASTM A653/A653M, A924/A924M Steel Sheet, Zinc Coated Galvanized.

F. NFPA 90A, Lining

1.5 SUBMITTALS

A. Submit shop drawings and product data sheets indicating configuration, general assembly, and materials used in fabrication.

B. Submit product data indicating configuration, general assembly, and materials used in fabrication. Include catalog performance ratings which indicate air flow, static pressure, and radiated sound power levels (2nd through 7th octave bands) at design maximum operating conditions. Also submit Radiated Sound NC values shall be calculated at design conditions with the following path attenuation credits:

Correction to Octave Band Sound Power Value

	2	3	4	5	6	7
ENV. ADJ.	-3	-2	-1	-1	-1	-1
Mineral Fiber Ceiling Tile	-9	-10	-12	-14	-15	-15
Space Effect Factor	-10	-11	-12	-13	-13	-14

This transfer function represents modeling assumptions based on ARI 885-90.

C. Submit manufacturer's installation instructions.

1.6 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data.

B. Include manufacturer's descriptive literature, operating instructions, maintenance, and repair data.

C. Include directions for resetting all DDC controls.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing the products specified in this section.

1.8 SYSTEM RESPONSIBILITY

A. The contractor shall be responsible for any and all costs associated with any and all changes resulting from the use of a supplier other than the one used as "basis of design".

1.9 WARRANTY

A. Provide one year manufacturer's labor & parts warranty.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. General
1. Manufacturers must participate in the ARI Certification program. Unit performance data must be Rated in Accordance with ARI Standard 880, and must display the ARI Symbol on all standard units.
2. Shutoff terminals must be UL listed as a Room Air Terminal.

B. Specified Manufacturers
1. JCI
2. TITUS
3. Enviro-TEC
4. Nailor Industries
5. Krueger
6. Price

2.2 MANUFACTURED UNITS

A. Air volume supply air control terminals for connection to single medium pressure duct.

B. Identify each terminal unit with clearly marked identification label and airflow indicator. Label shall include unit nominal air flow, maximum factory set air flow, minimum factory set air flow, and coil type.

C. VAV box manufacturer shall provide enclosure, transformer and factory mounting and wiring of VAV box controls provided by temperature controls contractor.

2.3 FABRICATION

A. Casings. Units shall be completely factory assembled, manufactured of corrosion protected welded screwed steel, and fabricated with a minimum of 18-gauge metal on the high pressure

(inlet) side of the VAV damper and 22-gauge metal on the low pressure (outlet) side and unit casing.

B. INSULATION - Matt - Interior surface of unit casing acoustically and thermally Insulated with a minimum of 1-1/2 inch, R-Value 2.1 1.9 lb./cu. ft. density glass fiber with galvanized sheet metal liner (no exposed fiberglass. Insulation shall be UL listed and meet NFPA-90A and UL 181 requirements. C. Assembly: Air volume damper, and controls shall be in a single cabinet.

2.4 VOLUME DAMPER

A. Locate air volume damper assembly inside unit casing. Construct from extruded aluminum or a minimum of 20 gauge (0.9 mm) galvanized steel components. Key damper blades into shaft with nylon fitted pivot points. Flow sensor must be provided regardless of control chosen. Flow sensor must be a ring or cross. Bar or single point sensing device is not acceptable.

B. Air volume control damper shall be factory calibrated assembly consisting of air valve with integral actuator. All VAV boxes shall be double wall.

C. All VAV boxes shall be double wall. No insulation in air stream

2.5 SEQUENCE OF OPERATION, AIR TERMINAL UNITS

2.6 TESTS

A. Factory set and check all controllers to within 5% of scheduled maximum and minimum settings. Base performance on tests conducted in accordance with ARI 880.

B. Maximum Casing Leakage: 1 percent of nominal air flow at 0.5 in wg inlet static pressure.

C. Maximum Damper Leakage: 1 percent of design air flow at 4 in wg inlet static pressure.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

3.2 ADJUSTING

A. Reset volume with damper operator attached to assembly allowing flow range modulation from 100 percent of design air flow to 25 percent nominal air flow. Set units with heating coils for minimum 30 percent full flow.

END OF SECTION 23 36 00

SECTION 23 37 00 - AIR OUTLETS AND INLETS

PART 1 GENERAL

1.1 WORK INCLUDED

A. Diffuser boots.

B. Registers/grilles.

C. Louvers.

1.2 RELATED WORK

A. See Mechanical Plans for wall louvers.

1.3 REFERENCES

A. ADC 1062 - Certification, Rating and Test Manual.

B. AMCA 500 - Test Method for Louvers, Dampers, and Shutters.

C. ANSI/NFPA 90A - Installation of Air Conditioning and Ventilating Systems.

D. ARI 650 - Air Outlets and Inlets.

E. ASHRAE 70 - Method of Testing for Rating the Air Flow Performance of Outlets and Inlets.

F. SMACNA - Low Pressure Duct Construction Standard.

1.4 QUALITY ASSURANCE

A. Test and rate performance of air outlets and inlets in accordance with ADC Equipment Test Code 1062 and ASHRAE 70.

B. Test and rate performance of louvers in accordance with AMCA 500.

1.5 REGULATORY REQUIREMENTS

A. Conform to ANSI/NFPA 90A.

1.6 SUBMITTALS

A. Submit shop drawings and product data under provisions of Section 01 33 00 – Submittal Procedures.

B. Provide product data for items required for this project.

C. Submit schedule of outlets and inlets indicating type, size, application, and noise level.

D. Review requirements of outlets and inlets as to size, finish, and type of mounting prior to submitting product data and schedules of outlets and inlets.

E. Submit diffuser, grille and register color data to Architect for approval.

PART 2 PRODUCTS

2.1 GENERAL

A. See mechanical schedules and drawings for diffuser types, sizes and configuration. See architectural plans - room finish schedules for type of ceiling and wall construction.

B. Substitutions: Under provisions of Instructions To Bidders, Page IB-3, Paragraph 4.3.

C. All diffusers, grilles, and louvers located in pool area shall be aluminum.

2.2 ACCEPTABLE MANUFACTURERS - Ceiling Diffusers

A. Titus TMSA Series, Krueger Series 1400 Adjustable

B. All diffusers shall have opposed blade volume dampers and adjustable horizontal to vertical four way throw operable from face of grille. All diffusers must be aluminum.

2.3 ACCEPTABLE MANUFACTURERS - Ceiling Exhaust Grilles

A. Titus - Model 50F Code C 1/2" x 1/2" x 1" Cube Core, Krueger EGC-10, Nailor Industries Model 51EC

B. All exhaust registers shall have opposed blade dampers.

C. Grilles shall have baked enamel white finish.

D. All dampers shall be operable from grille face.

2.4 ACCEPTABLE MANUFACTURERS - Ceiling Return Air Grilles

A. Titus - 50F Code C, Krueger EGC-10, Nailor Industries

B. All return air shall have opposed blade dampers. See plans for filter backed grille requirements.

2.5 ACCEPTABLE MANUFACTURERS - Wall Supply Registers.

A. Titus 1700 Series, Krueger ULTRA-FLO

B. All registers shall have adjustable blade dampers on all registers.

C. Furnish and install opposed blade damper on all registers.

D. Finish to be approved by Architect.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install items in accordance with manufacturer’s instructions.

B. Check location of outlets and inlets and make necessary adjustments in position to conform with architectural features, symmetry, and lighting arrangement.

C. Install diffusers to ductwork with air tight connection.

D. Provide balancing dampers on duct take-off to diffusers, and grilles and register, regardless of whether dampers are specified as part of the diffuser, or grille and register assembly.

E. Furnish and install necessary frames, bucks, sponge rubber gasketed, etc. to make a neat setting job.

F. Diffusers shall be placed to insure that air does not blast against columns and lights.

G. All diffusers, registers, etc. shall have external volume controls and deflecting grids.

H. Ceilings in areas where plaster or gypsum board ceiling are used, shall be surface mounted.

END OF SECTION 23 37 00

SECTION 23 61 10 - VARIABLE SPEED WATER-COOLED SCREW CHILLERS

Part 1 — GENERAL

1.1 SYSTEM DESCRIPTION

A. Microprocessor-controlled liquid chiller shall use a semi-hermetic screw compressor using refrigerant HFC-513A only.

B. Approved Manufacturers: Carrier Corp 23XRV

1.2 QUALITY ASSURANCE

A. Chiller performance shall be rated in accordance with AHRI (Air-Conditioning, Heating and Refrigeration Institute) Standard 550/590, latest edition.

B. Equipment and installation shall be in compliance with ANSI/ASHRAE 15 (latest edition).

C. Evaporator and condenser refrigerant side shall include ASME ‘U’ stamp and nameplate certifying compliance with ASME Section VIII, Division 1 code for unfired pressure vessels.

D. A manufacturer’s data report is required to verify pressure vessel construction adherence to ASME vessel construction requirements. Form U-1 as required per ASME code rules is to be furnished to the owner. The U-1 Form must be signed by a qualified inspector, holding a National Board Commission, certifying that construction conforms to the latest ASME Code Section VIII, Div. 1 for pressure vessels. The ASME symbol “U” must also be stamped on the heat exchanger. Vessels specifically exempted from the scope of the code must come with material, test, and construction methods certification and detailed documents similar to ASME U-1; further, these must be signed by an officer of the company.

E. Chiller shall be designed and constructed to meet UL and UL of Canada requirements and have labels appropriately affixed.

F. The management system governing the manufacture of this product is ISO (International Organization for Standardization) 9001:2015 certified.

G. Each compressor assembly shall undergo a mechanical run-in test to verify vibration levels, oil pressures, and temperatures are within acceptable limits. Each compressor assembly shall be proof tested at a minimum 204 psig (1407 kPa) and leak tested at 185 psig (1276 kPa) with a tracer gas mixture.

H. Entire chiller assembly shall be proof tested at 204 psig (1407 kPa) and leak tested at 185 psig (1276 kPa) with a tracer gas mixture on the refrigerant side. The leak test shall not allow any leaks greater than 0.5 oz (14.78 mL) per year of refrigerant. The water side of each heat exchanger shall be hydrostatically tested at 1.3 times rated working pressure.

I. Prior to shipment, the chiller automated controls test shall be executed to check for proper wiring and ensure correct controls operation.

J. Chillers shall have factory-mounted, factory-wired and factory-tested unit-mounted variable frequency drive (VFD). Proper VFD operation shall be confirmed prior to shipment.

1.3 DELIVERY, STORAGE AND HANDLING

A. Unit shall be stored and handled in accordance with manufacturer’s instructions.

B. Unit shall be shipped with all refrigerant piping and control wiring factory installed.

C. Unit shall be shipped charged with oil and full charge of refrigerant HFC-513A.

D. Unit shall be shipped with firmly attached labels that indicate name of manufacturer, chiller model number, chiller serial number, and refrigerant used.

E. If the unit is to be exported, the manufacturer shall provide sufficient protection against sea water corrosion, making the unit suitable for shipment in a standard open top ocean shipping container.

F. Chiller and starter shall be stored indoors, protected from construction dirt and moisture. Chiller shall be inspected under shipping tarps, bags, or crates to be sure water has not collected during transit. Protective shipping covers shall be kept in place until machine is ready for installation. The inside of the protective cover shall meet the following criteria:
   1. Temperature is between 40°F (4.4°C) and 120° F (48.9°C).
   2. Relative humidity is between 10% and 80% non-condensing.

1.4 WARRANTY

A. Warranty shall include complete parts and labor for one year after start-up or 18 months from shipment, whichever occurs first.

B. Extended warranty shall include parts and labor for four years beyond the first year of operation for a total of five years.

Part 2 — PRODUCTS

2.1 EQUIPMENT

A. General: Factory-assembled, single piece, liquid chiller shall consist of compressor, motor, VFD, lubrication system, evaporator, condenser, initial oil and refrigerant operating charges, microprocessor control system, and documentation required prior to start-up.

B. Compressor:
   1. One variable speed screw compressor of the high performance type.
   2. Compressor and motor shall be hermetically sealed into a common assembly and arranged for easy field servicing.
   3. The compressor motor shall be accessible for servicing without removing the compressor base from the chiller. Connections to the compressor casing shall use O-rings and gaskets to reduce the occurrence of refrigerant leakage. Connections to the compressor shall be flanged or bolted for easy disassembly.
   4. Compressor bearings must have individual design life of 50 years or greater when operating at AHRI conditions.
   5. Compressor shall provide capacity modulation from 100% to 15% capacity without the use of hot gas bypass or mechanical unloaders.
   6. Compressor shall be provided with a factory-installed positive pressure lubrication system to deliver oil under pressure to bearings and rotors at all operating conditions. Lubrication system shall include:
      a. Oil pump with factory-installed motor contactor with overload protection.
      b. Oil pressure sensor with differential readout at main control center.
      c. Oil pressure regulator.
      d. Oil filter with isolation valves to allow filter change without removal of refrigerant charge.
      e. Oil sump heater [115 v, 50 or 60 Hz] controlled from unit microprocessor.
      f. Oil reservoir temperature sensor with main control center digital readout.
      g. All wiring to oil pump, oil heater, and controls shall be pre-wired in the factory and power shall be applied to check proper operation prior to shipment.

7. Compressor shall be fully field serviceable. Compressors that must be removed and returned to the factory for service shall be unacceptable.
8. Acoustical attenuation shall be provided as required, to achieve a maximum (full load) sound level, measured per AHRI Standard 575 (latest edition).

C. Motor:
1. Compressor motor shall be of the semi-hermetic, liquid-refrigerant-cooled, squirrel-cage, induction-type suitable for voltage shown on the equipment schedule.
2. If an open (air-cooled) motor is provided, a compressor shaft seal leakage containment system shall be provided:
   a. An oil reservoir shall collect oil and refrigerant that leaks past the seal.
   b. A float device shall be provided to open when the reservoir is full, directing the refrigerant/oil mixture back into the compressor housing.
   c. A refrigerant sensor shall be located next to the open drive seal to detect leaks.
3. Motors shall be suitable for operation in a refrigerant atmosphere and shall be cooled by atomized refrigerant in contact with the motor windings.
4. Motor stator shall be arranged for service or removal with only minor compressor disassembly and without removing main refrigerant piping connections.
5. Full load operation of the motor shall not exceed nameplate rating.
6. One motor winding temperature sensor (and one spare) shall be provided.

D. Evaporator and Condenser:
1. Evaporator and condenser shall be of shell and tube type construction, each in separate shells. Units shall be fabricated with high-performance tubing, steel shell and tube sheets with waterboxes. Waterboxes shall be nozzle-in-head type with stub out nozzles having Victaulic grooves to allow for use of Victaulic couplings.
2. Tubing shall be copper, high-efficiency type, with integral internal and external enhancement unless otherwise noted. Tubes shall be nominal 3/4-in. outside diameter (OD) with nominal wall thickness of 0.025 in. measured at the root of the fin unless otherwise noted. Tubes shall be rolled into tube sheets and shall be individually replaceable. Tube sheet holes shall be double grooved for joint structural integrity. Intermediate support sheet spacing shall not exceed 36 in. (914 mm).
3. Waterboxes and nozzle connections shall be designed for 150 psig (1034 kPa) minimum working pressure unless otherwise noted. Nozzles should have grooves to allow use of Victaulic couplings.
4. The tube sheets of the evaporator and condenser shall be bolted together to allow for field disassembly and reassembly.
5. The vessel shall display an ASME nameplate that shows the pressure and temperature data and the ‘U’ stamp for ASME Section VIII, Division 1. A re-seating pressure relief valve(s) shall be installed on each heat exchanger. If a non-reseating type is used, a backup reseating type shall be installed in series.
6. Waterboxes shall have vents, drains, and covers to permit tube cleaning within the space shown on the drawings. A thermistor-type temperature sensor with quick connects shall be factory installed in each water nozzle.
7. Evaporator shall be designed to prevent liquid refrigerant from entering the compressor. Devices that introduce pressure losses (such as mist eliminators) shall not be acceptable because they are subject to structural failures that can result in extensive compressor damage.
8. Tubes shall be individually replaceable from either end of the heat exchanger without affecting the strength and durability of the tube sheet and without causing leakage in adjacent tubes.
9. The subcooler, located in the bottom of the condenser, shall increase the refrigeration effect by cooling the condensed liquid refrigerant to a lower temperature, thereby reducing compressor power consumption.

E. Refrigerant Flow Control: The variable flow control system regulates refrigerant flow according to load conditions, providing a liquid seal at all operating conditions, eliminating unintentional hot gas bypass.

F. Automatic Hot Gas Bypass: Hot gas bypass valve and piping shall be factory-furnished to permit chiller operation for extended periods of time.

G. Controls, Safeties, and Diagnostics:
1. Controls:
a. The chiller shall be provided with a factory-installed and factory-wired microprocessor control center. The microprocessor can be configured for either English or SI units.
b. All chiller and starter monitoring shall be displayed at the chiller control panel.
c. The controls shall make use of non-volatile memory.
d. The chiller control system shall have the ability to interface and communicate directly to the building control system.
e. The default standard display screen shall simultaneously indicate the following minimum information:
1) date and time of day
2) 24-character primary system status message
3) 24-character secondary status message
4) chiller operating hours
5) entering chilled water temperature
6) leaving chilled water temperature
7) evaporator refrigerant temperature
8) entering condenser water temperature
9) leaving condenser water temperature
10) condenser refrigerant temperature
11) oil supply pressure
12) oil sump temperature
13) percent motor rated load amps (RLA)
f. In addition to the default screen, status screens shall be accessible to view the status of every point monitored by the control center including:
1) evaporator pressure
2) condenser pressure
3) bearing oil supply temperature
4) compressor discharge temperature
5) motor winding temperature
6) number of compressor starts
7) control point settings
8) discrete output status of various devices
9) compressor motor starter status
10) optional spare input channels
11) current and voltage for each phase
12) frequency
g. Schedule Function: The chiller controls shall be configurable for manual or automatic start-up and shutdown. In automatic operation mode, the controls shall be capable of automatically starting and stopping the chiller according to a stored user programmable occupancy schedule. The controls shall include built-in provisions for accepting:
1) A minimum of two 365-day occupancy schedules.
2) Minimum of 8 separate occupied/unoccupied periods per day.
3) Daylight savings start/end.
4) Minimum of 18 user-defined holidays.
5) Means of configuring an occupancy timed override.

6) Chiller start-up and shutdown via remote contact closure.

h. Service Function: The controls shall provide a password protected service function which allows authorized individuals to view an alarm history file which shall contain the last 25 alarm/alert messages with time and date stamp. These messages shall be displayed in text form, not codes.

i. Network Window Function: Each chiller control panel shall be capable of viewing multiple point values and statuses from other like controllers connected on a common network, including controller maintenance data. The operator shall be able to alter the remote controller's set points or time schedule and to force point values or statuses for those points that are operator forcible. The control panel shall also have access to the alarm history file of all like controllers connected on the network.

j. Pump Control: Upon request to start the compressor, the control system shall start the chilled water pump, condenser water pumps and verify that flows have been established.

k. Ramp Loading: A user-configurable ramp loading rate, effective during the chilled water temperature pulldown period, shall control the rate of guide vane opening to prevent a rapid increase in compressor power consumption. The controls shall allow configuration of the ramp loading rate in either degreesminute of chilled water temperature pulldown or percent motor amps/minute. During the ramp loading period, a message shall be displayed informing the operator that the chiller is operating in ramp loading mode.

l. Chilled Water Reset: The control center shall allow reset of the chilled water temperature set point based on any one of the following criteria:
   1) Chilled water reset based on an external 4 to 20 mA signal.
   2) Chilled water reset based on a remote temperature sensor (such as outdoor air).
   3) Chilled water reset based on water temperature rise across the evaporator.

m. Demand Limit: The control center shall limit amp draw of the compressor to the rated load amps or to a lower value based on one of the following criteria:
   1) Demand limit based on a user input ranging from 40% to 100% of compressor rated load amps.
   2) Demand limit based on external 4 to 20 mA signal.

n. Controlled Compressor Shutdown: The controls shall be capable of being configured to soft stop the compressor. When the stop button is pressed or remote contacts open with this feature active, the guide vanes shall close to a configured amperage level and the machine shall then shut down. The display shall indicate "shutdown in progress."

o. BACnet™[1] Communication: Allows integration with i-Vu® Open control system or a BACnet building automation system.

2. Safeties:
   a. Unit shall automatically shut down when any of the following conditions occur (each of these protective limits shall require manual reset and cause an alarm message to be displayed on the control panel screen, informing the operator of the shutdown cause):
      1) Motor overcurrent

[1]Third-party trademarks and logos are the property of their respective owners.

2) Over voltage[2]
3) Under voltage**Error! Reference source not found.**
4) Single cycle dropout**Error! Reference source not found.** (LF-2 VFDs only)
5) Low oil sump temperature
6) Low evaporator refrigerant temperature
7) High condenser pressure
8) High motor temperature
9) High compressor discharge temperature
10) Low oil pressure
11) Prolonged stall
12) Loss of evaporator water flow
13) Loss of condenser water flow
14) Variable frequency drive fault
15) High variable frequency drive temperature

b. The control system shall detect conditions that approach protective limits and take self-corrective action prior to an alarm occurring. The system shall automatically reduce chiller capacity when any of the following parameters are outside their normal operating range:
1) High condenser pressure
2) High motor temperature
3) Low evaporator refrigerant temperature
4) High motor amps
5) High VFD inverter temperature

c. During the capacity override period, a pre-alarm (alert) message shall be displayed, informing the operator which condition is causing the capacity override. Once the condition is again within acceptable limits, the override condition shall be terminated and the chiller shall revert to normal chilled water control. If during either condition the protective limit is reached, the chiller shall shut down and a message shall be displayed informing the operator which condition caused the shutdown and alarm.

d. Internal built-in safeties shall protect the chiller from loss of water flow. Differential pressure switches shall not be allowed to be the only form of freeze protection.

3. Diagnostics and Service:
a. A self-diagnostic controls test shall be an integral part of the control system to allow quick identification of malfunctioning components.

b. Once the controls test has been initiated, all pressure and temperature sensors shall be checked to ensure they are within normal operating range. A pump test shall automatically energize the chilled water pump, condenser water pump, and oil pump. The control system shall confirm that water flow and oil pressure have been established and require operator confirmation before proceeding to the next test.

c. In addition to the automated controls test, the controls shall provide a manual test, which permits selection and testing of individual control components and inputs. A thermistor test and transducer test shall display on the PIC6 screen the actual reading of each transducer and each thermistor installed on the chiller. All out-of-range sensors shall be identified. Pressure transducers shall be serviceable without the need for refrigerant charge removal or isolation.

H. Electrical Requirements:
1. Electrical contractor shall supply and install main electrical power line, disconnect switches, circuit breakers, and electrical protection devices per local code require-

[2]Shall not require manual reset or cause an alarm if auto-restart after power failure is enabled.

ments and as indicated necessary by the chiller manufacturer.

2. Electrical contractor shall wire the chilled water pump and flow, condenser water pump and flow, and tower fan control circuit to the chiller control circuit.
3. Electrical contractor shall supply and install electrical wiring and devices required to interface the chiller controls with the building control system if applicable.
4. Electrical power shall be supplied to the unit at the voltage, phase, and frequency listed in the equipment schedule.

I. Piping Requirements — Instrumentation and Safeties:

1. Mechanical contractor shall supply and install pressure gauges in readily accessible locations in piping adjacent to the chiller such that they can be easily read from a standing position on the floor. Scale range shall be such that design values shall be indicated at approximately mid-scale.
2. Gauges shall be installed in the entering and leaving water lines of the evaporator and condenser.

J. Vibration Isolation: Chiller manufacturer shall furnish neoprene isolator pads for mounting equipment on a level concrete surface.

K. Start-Up:

1. The chiller manufacturer shall provide a factory-trained representative, employed by the chiller manufacturer, to perform the start-up procedures as outlined in the Start-Up, Operation and Maintenance manual provided by the chiller manufacturer.
2. Manufacturer shall supply the following literature:
   a. Start-up, operation and maintenance instructions.
   b. Installation instructions.
   c. Field wiring diagrams.
   d. One complete set of certified drawings.

L. Special Features:

1. Refrigerant Charge: The chiller shall ship from the factory fully charged with HFC/HFO-513A refrigerant and oil.
2. Thermal Insulation: Unit manufacturer shall insulate the evaporator shell, economizer, suction elbow, motor shell, and motor cooling lines. Insulation shall be 1 in. (25.4 mm) thick with a thermal conductivity not exceeding

$$0.28 \ \frac{(\text{Btu} \cdot \text{in.})}{\text{hr. Ft}^2\ \text{F}} \ \left(0.0404 \ \frac{\text{W}}{\text{m C}} \right)$$

   and shall conform to UL standard 94, classification 94 HF-1.
3. Evaporator and Condenser Tubes: Contact your local Carrier Representative for other tube offerings.
4. Evaporator and Condenser Passes: Unit manufacturer shall provide the evaporator and/or condenser with 2-pass configurations on the water side.
5. Compressor Discharge Isolation Valve and Liquid Line Ball Valve: These items shall be factory installed to allow isolation of the refrigerant charge in the condenser for servicing the compressor.
6. Unit-Mounted Variable Frequency Drive (VFD):
   a. Design:
      1) VFD shall be air or refrigerant cooled, microprocessor-based, pulse width modulated design. Water-cooled designs are not acceptable.
      2) Output power devices shall be insulated gate bipolar transistors (IGBTs).
      3) Converter section with full-wave fixed diode bridge rectifier shall convert
      4) incoming fixed voltage/frequency to fixed DC voltage.

5) DC link shall filter and smooth the converted DC voltage.
6) Transistorized inverter and control regulator shall convert fixed DC voltage to a sinusoidal PWM waveform.
7) Integrated controls shall coordinate the motor speed to optimize chiller performance over a wide variety of operating conditions.

b. Enclosure:
1) Pre-painted, unit-mounted NEMA 1 cabinet shall include hinged, lockable doors and removable lifting lugs.
2) VFD shall have a short circuit current rating of at least 65,000 amps (100,000 amps is optional).
3) Provisions to padlock main disconnect handle in the “Off” positions shall be provided. Mechanical interlock to prevent opening cabinet door with disconnect in the “On” position or moving disconnect to the “ON” position while the door is open shall be provided.
4) Provisions shall be made for top entry of incoming line power cables.

c. Heat Sink:
1) The heat sink (frame sizes 3, 4, 5 heat exchangers only) shall be refrigerant cooled. Heat sink and mating flanges shall be suitable for ASME design working pressure of 185 psig (1276 kPa).
2) Refrigerant cooling shall be metered by integrated standard controls to maintain heat sink temperature within acceptable limits for ambient temperature.

d. VFD Rating:
1) Drive shall be suitable for nameplate voltage ±10%.
2) Drive shall be suitable for continuous operation at 100% of nameplate amps and 150% of nameplate amps for 3 seconds.
3) Drive shall comply with applicable UL, CE, and NEMA standards.
4) Drive shall be suitable for operation in ambient temperatures between 40 and 104 F (4.4 and 40 C), 95% humidity (non-condensing) for altitudes up to 3300 ft (1006 m) above sea level. Specific drive performance at jobsite ambient temperature and elevation shall be provided by the manufacturer in the bid.

e. User Interface: Displays shall provide interface for programming and display of VFD and chiller parameters. Viewable parameters include:
1) Operating, configuration and fault messages
2) Frequency in Hz
3) Load side voltage and current (at the VFD)
4) kW (on the VFD interface)

f. VFD Performance:
1) VFD full load efficiency shall meet or exceed 97% at 100% VFD Rated Ampacity.
2) Base motor frequency shall be either 50 or 60 Hz.

g. VFD Electrical Service (single point power):
1) VFD shall have input circuit breaker with minimum 65,000 amp interrupt capacity.
2) VFD shall have standard 15 amp branch oil pump circuit breaker to provide power for chiller oil pump.
3) VFD shall have standard 4 KVA control power transformer with circuit breaker to provide power for oil heater, VFD controls, and chiller controls.
4) The branch oil pump circuit breaker and control power transformer shall be factory wired.
5) Input power shall be 380/480 vac, ±10 percent, 3 phase, 50/60 Hz, ±3 Hz.

h. Discrete Outputs: 115-v discrete contact outputs shall be provided for:

1) Chilled water pump
2) Condenser water pump
3) Alarm status.

i. Analog Output: An analog (4 to 20 mA) output for head pressure reference shall be provided. This signal shall be suitable to control a 2-way or 3-way water regulating valve in the condenser piping.

j. Protection (the following shall be supplied):
1) Under-voltage
2) Over voltage
3) Phase loss
4) Phase unbalance protection
5) Programmable auto re-start after loss of power
6) Motor overload protection (NEMA Class 10)
7) Motor over temperature protection

k. VFD Testing: The VFD shall be factory mounted, wired, and tested on the chiller prior to shipment.

END OF SECTION 23 61 10

SECTION 23 65 00 - INDUCED DRAFT COOLING TOWER

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Cooling Tower package.

B. Controls and control connections.

C. Condenser water connections.

E. Domestic Water makeup.

F. Starters.

G. Electrical power connections.

1.2 RELATED SECTIONS

A. Section 23 21 13 - Hydronic Piping.

B. Section 23 21 16 - Hydronic Specialties.

1.3 REFERENCES

A. ANSI/ASHRAE STANDARD 15-1992 - Safety Code for Mechanical refrigeration.

B. ANSI/ASHRAE 90.1 - Energy Efficient Design of New Buildings.

C. ANSI/ASME SEC VIII - Boiler and Pressure Vessel Code.

D. ANSI/ASME B31.S-1983 ASME Code for Pressure Piping and Refrigeration Piping.

E. ANSI/UL 1995 - Central Cooling Air Conditioners.

F. CTI – Cooling Tower Institute.

G. ANSI/ARI 550/590-98 - Standard for Water Chilling Packages using the Vapor Compression Cycle.

H. ARI STANDARD 575-87 - Method of Measuring Machinery Sound Within Equipment Rooms.

1.4 SUBMITTALS

A. Submit drawings indicating components, assembly, dimensions, weights and loadings, required clearances, and location and size of field connections. Indicate equipment, piping and connections, valves, strainers, and thermostatic valves required for complete system.

B. Submit product data indicating rated capacities, full load and part load performance, weights, specialties and accessories, electrical requirements and wiring diagrams.

C. Submit manufacturer's installation instructions.

1.5 OPERATION AND MAINTENANCE DATA

A. Include start-up instructions, operation data, maintenance data, controls, and accessories. Include trouble-shooting guide.

1.6 VERIFICATION OF CAPACITY AND EFFICIENCY

A. All proposals for cooling tower performance must include a CTI approved selection method. Verification of date and version of computer program selection or catalog is available through the Vice President, Engineering, CTI.

1.7 REGULATORY REQUIREMENTS

A. Conform to ARI Standard 550/590-98 for rating and certified testing.

B. Conform to ANSI/UL 1995 - Standard for Heating and Cooling Equipment, Safety Standard .

C. Conform to CTI Standards

D. Conform to ANSI/ASHRAE STANDARD 15-1992 safety code for mechanical refrigeration.

1.8 HANDLING

A. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

B. Protect units from physical damage. Leave factory shipping covers in place until installation.

1.9 WARRANTY

A. Manufacturer shall provide a 5-year parts warranty.

B. Manufacturer shall provide whole unit labor warranty for the duration of 5 year.

1.10 MAINTENANCE SERVICE

A. Preventive maintenance procedures must be adhered to, including required periodic inspections as prescribed in the manufacturers published operation and maintenance literature. Records of these procedures and inspections must be retained.

PART 2 PRODUCT

2.1 COOLING TOWER

A. General: Furnish and install two (2) factory-assembled, induced draft, crossflow cooling tower(s) with vertical air discharge conforming in all aspects to the specifications, schedules and as shown on the plans. Cooling towers shall be as manufactured by Baltimore Aircoil Company or Marley.

B. Thermal Capacity: The cooling tower(s) shall be warranted by the manufacturer to cool the required gpm of water in accordance with the cooling tower schedule. Additionally, the thermal performance shall be certified by the Cooling Technology Institute in accordance with CTI Certification Standard STD-201. Lacking such certification, a field acceptance test shall be conducted within the warranty period in accordance with CTI Acceptance Test Code ATC-105, by the Cooling Technology Institute or other qualified independent third party testing agency. A manufacturer’s performance guarantee or performance bond without CTI Certification or independent field thermal performance test shall not be accepted. The cooling tower shall comply with the energy efficiency requirements of ASHRAE Standard 90.1.

C. Corrosion Resistant Stainless Steel Construction: All steel panels and structural members, including the casing panels, hot and cold water basins, distribution covers, fan deck and fan cylinder shall be constructed of Type 304 stainless steel and assembled with Type 304 stainless steel nut and bolt fasteners. All factory seams in the cold water basin shall be welded to ensure watertight assembly and shall be unconditionally warranted against leaks for five (5) years from substantial completion. Bolted stainless steel basins will not be acceptable.

D. Quality Assurance:The cooling tower manufacturer shall have a Management System certified by an accredited registrar as complying with the requirements of ISO-9001 to ensure consistent quality of products and services. Cooling tower manufacturers that are not ISO-9001:2000 certified shall provide an additional year of warranty to the customer at no additional cost.

2.2 CONSTRUCTION DETAILS

A. Cold Water Basin: The cold water basin shall be constructed of heavy-gauge Type 304 stainless steel panels and structural members. The basin shall include a depressed section with drain/clean-out connection. The basin area under the wet deck surface shall be sloped toward the depressed section to facilitate cleaning. Standard basin accessories shall include a brass make-up valve with large diameter plastic float for easy adjustment of the operating water level. All factory seams in the cold water basin shall be welded to ensure water-tight assembly and be unconditionally warranted against leaks for five (5) years from Substantial Completion. Bolted stainless steel basins will not be acceptable.

B. Water Outlet: The cooling tower basin outlet shall be beveled for welding and grooved for mechanical coupling or a bolt hole circle to accept an ASME Class 150 flat face flange. The outlet shall be provided with large area lift out strainers with perforated openings sized smaller than the water distribution nozzles and an anti-vortexing device to prevent air entrainment. The strainer and vortex device shall be constructed of the same materials as the cold water basin to prevent dissimilar metal corrosion.

C. Water Distribution System: The distribution system shall be furnished with a single water inlet. The pipe stub connection shall be beveled for welding and grooved for mechanical coupling. The hot water distribution basin shall be open gravity type and constructed of heavy-gauge 304 stainless steel. Plastic metering devices shall be provided to ensure the uniform distribution of water over the wet deck surface. Lift-off distribution covers shall be constructed of heavy gauge 304 stainless steel.

2.3 MECHANICAL EQUIPMENT

A. Fan(s): Fan(s) shall be axial flow with aluminum alloy blades selected to provide optimum cooling tower thermal performance with minimal sound levels. Air shall discharge through a fan cylinder designed for streamlined air entry and minimum tip clearance for maximum fan efficiency. The top of the fan cylinder shall be equipped with a conical, non-sagging removable fan guard.

B. Bearings: Fan(s) and shaft(s) shall be supported by heavy-duty, self-aligning, grease packed ball bearings with moisture proof seals and integral slinger collars, designed for a minimum L10 life of 40,000 hours (280,000 Hr. Avg. Life).

C. Fan Drive: The fan(s) shall be driven by a one-piece, multi-groove, solid back V-type powerband with taper lock sheaves designed for 150% of the motor nameplate horsepower. The powerband shall be constructed of neoprene reinforced polyester cord and be specifically designed for cooling tower service.

D. Sheaves: Fan and motor sheave(s) shall be fabricated from corrosion-resistant materials to minimize maintenance and ensure maximum drive and powerband operating life.

E. Fan Motor: Fan motor(s) shall be totally enclosed air over (TEAO), reversible, squirrel cage, ball bearing type designed specifically for cooling tower service. The motor shall be furnished with special moisture protection on winding, shafts, and bearings. Fan motors shall be inverter duty type designed per NEMA Standard MG1, Section IV Part 31.

F. Mechanical Equipment Warranty: The fan(s), fan shaft(s), bearings, mechanical equipment support, and fan motor shall be warranted against defects in materials and workmanship for a period of five (5) years from substantial completion.

2.4 WET DECK SURFACE AND DRIFT ELIMINATORS

A. Wet Deck Surface and Drift Eliminators: The wet deck surface and integral drift eliminators shall be formed from self-extinguishing (per UL94 HB and UL94 V-0 testing) polyvinyl chloride (PVC) having a flame spread rating of 5 per ASTM E84 and shall be impervious to rot, decay, fungus and biological attack. The wet deck surface shall be manufactured, tested, and rated by the cooling tower manufacturer and shall be elevated above the cold water basin to facilitate cleaning.

2.5 AIR INLET LOUVERS

A. Air Inlet Louvers: Air inlet louvers shall prevent water splash-out during fan cycling and be constructed of maintenance free, corrosion resistant, UV protected, fiberglass reinforced polyester (FRP) or PVC.

2.6 ACCESS

A. Plenum Access: Hinged access doors shall be provided on two sides of the tower for access into plenum section. Additionally, an external service platform constructed of galvanized steel shall be provided on the air inlet side of the cooling tower complete with handrails, aluminum ladder and safety cage per OSHA standards.

2.7 ACCESSORIES

A. Additional accessories which are to be provided with the cooling tower include:
   1. Mechanical vibration cutout switch with local reset
   2. Electric pan heater with electric heating elements, low level cutout, thermostat, and NEMA rated control panel housing contactors for the heating elements.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Provide for connection to electrical service.

C. Furnish and install necessary auxiliary sump heater.

D. Arrange piping for easy tower cleaning.

END SECTION 23 65 00

SECTION 23 70 00 - CENTRAL STATION AIR HANDLER

PART 1 GENERAL

1.1 WORK INCLUDED

A. Applied Air Handling Units.

1.2 RELATED SECTIONS

A. Section 23 05 16 - Expansion Compensation.

1.3 REFERENCES

A. AMCA 300 - Reverberant Method for Sound Testing of Fans.

B. AMCA 301 - Method for Publishing Sound Ratings for Air Moving Devices.

C. ANSI/AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings.

D. ANSI/UL 900 - Test Performance of Air Filter Units.

E. ARI 260 - Standard for Sound Rating of Ducted Air Moving and Conditioning Equipment

F. ARI 410 - Standard for Forced Circulation Air-Cooling and Air-Heating Coils.

G. ARI 430 - Standard for Central Station Air Handling Units.

H. ARI 1060 Air-To-Air Energy Recovery Ventilation Equipment

I. ASHRAE 68 - Laboratory Method of Testing In-Duct Sound Power Measurement Procedure for Fans.

J. ASTMB 117 - Standard Practice for Operation Salt Spray Apparatus

K. NEMA MG1 - Motors and Generators

L. NFPA 90 A & B - Installation of Air Conditioning and Ventilation Systems and Installation of Warm Air Heating and Air Conditioning Systems.

M. SMACNA - HVAC Duct Construction Standards.

N. UL 1995 - Heating and Cooling Equipment

1.4 QUALITY ASSURANCE

A. Air Coils: Certify capacities, pressure drops and selection procedures in accordance with current ARI 410 Standard.

B. Certify air-handling units in accordance with ARI 430.

C. ISO 9001 Certification.

1.5 SUBMITTALS

A. Submit unit performance including: capacity, nominal and operating performance.

B. Submit Mechanical Specifications for unit and accessories describing construction,

components and options.

C. Submit shop drawings indicating overall dimensions as well as installation, operation and service clearances. Indicate lift points and recommendations. Indicate unit shipping split locations, and split dimensions, installation and operating weights including dimensions.

D. Provide fan curves with specified operating point clearly plotted.

E. Submit data on electrical requirements. Include safety and start-up instructions.

F. Submit sound data certified to ARI 260.

1.6 REGULATORY REQUIREMENTS

A. Unit shall be manufactured to conform to UL 1995 Standard and shall be listed by either UL/CUL or ETL. Units shall be provided with listing agency label affixed to unit. In the event the unit is not UL/CUL or ETL approved, the contractor shall, at his/her expense provide for a field inspection by a UL/CUL or ETL representative to verify conformance. If necessary, contractor shall perform modifications to the unit to comply with UL/CUL or ETL as directed by the representative, at no additional expense to the owner.

B. Certify air-handling units in accordance with ARI 430. If air-handling units are not certified in accordance with ARI 430, contractor shall be responsible for expenses associated with testing of units after installation to verify performance of fan(s). Any costs incurred to adjust fans to meet scheduled capacities shall be the sole responsibility of the contractor.

C. Certify air-handling coils in accordance with ARI 410. If air-handling coils are not certified in accordance with ARI 410, contractor shall be responsible for expenses associated with testing of coils after installation to verify performance of coil(s). Any costs incurred to adjust coils to meet scheduled capacities shall be the sole responsibility of the contractor.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

B. Units shall ship fully assembled up to practical shipping and rigging limitations. Units not shipped fully assembled shall have tags and airflow arrows on each section to indicate location and orientation in direction of airflow. Shipping splits shall be clearly defined on submittal drawings. Cost associated with non conformance to shop drawings shall be the responsibility of the manufacturer. Each section shall have lifting lugs or shipping skid to allow for field rigging and final placement of section.

C. Deliver units to jobsite with fan motor(s), sheave(s), and belt(s) completely assembled and mounted in units.

D. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

1.8 START-UP AND OPERATING REQUIREMENTS

A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters in place, bearings lubricated (if applicable), condensate properly trapped, piping connections verified and leak-tested, belts aligned and tensioned, all shipping braces removed, bearing set screws torque, and fan has been test run under observation.

1.9 WARRANTY

A. The equipment manufacturer shall provide, at no additional cost, a standard parts warranty that covers a period of five year from substantial completion, whichever occurs first. This warrants that all products are free from defects in material and workmanship and shall meet the capacities and ratings set forth in the equipment manufacturer's catalog and bulletins.

PART 2 PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Manufacturers not pre-approved, must obtain pre-approval in writing from consulting engineer prior to bid day. Alternates must comply with all performance and features as called for in this specification.

B. Manufacturer must clearly define any exceptions made to Plans and Specifications. Any deviations in layout or arrangement shall be submitted to consulting engineer prior to bid date. Acceptance of deviation(s) from specifications shall be in the form of written approval from the consulting engineer. Mechanical Contractor is responsible for expenses that occur due to exceptions made.

C. Approved Manufacturers:
1. Trane
2. York
3. McQuay Vision

2.2 GENERAL

A. Unit layout and configuration shall be as defined in project plans and schedule.

B. Provide factory-installed external support kit (minimum height of 6”) on the base of the unit. External support kit shall be used for ceiling suspension, external isolation, or with housekeeping pad. Contractor will be responsible for providing a housekeeping pad when unit mounting device is not of sufficient height to properly trap unit. Unit mounting devices not constructed of galvanized steel shall be chemically cleaned and coated with both a rust-inhibiting primer and finished coat of rust-inhibiting enamel.

2.3 UNIT CASING

A. Unit shall be constructed of a complete structural frame with removable panels. Unit manufacturer shall ship separate segments so unit can be broken down for ease of installation in tight spaces. The entire air handler shall be constructed of galvanized steel with the exception of in panel. Inside panel shall be stainless steel. Casing finished to meet ASTMB 117 250-hour salt-spray test. The removal of side panels shall not affect the structural integrity of the unit. All removable panels shall be gasketed to minimize air leakage. All doors shall have gasketing around full perimeter to prevent air leakage. Contractor shall be responsible to provide connection flanges and all other framework that is needed to properly support the unit.

B. Construct casing sections capable of operating from -4"wg to +6"wg .

C. Access panels and/or access doors shall be available on both sides of the unit in all sections to allow easy access to drain pan, coil(s), motor, drive components and bearings for cleaning, inspection, and maintenance. If panels are not removable, then manufacturer shall provide access sections with doors between all internal components to ensure access and clean ability of the air handler.

D. Access doors shall be double wall construction to prevent damage to insulation during routine maintenance.

E. Access panels and doors shall be fully removable without the use of specialized tools to allow complete access of all interior surfaces.

F. Door hardware shall be surface mounted to minimize penetrations in the door casing that could lead to air leakage paths. All access door hinges shall be constructed of metal. Plastic or rubber hinges are not acceptable.

G. All joints between exterior panels and structural frames, as well as joints between module frames, shall be properly sealed and gasketed to provide an air seal.

H. Insulation - High density - Insulation shall be encased in double-wall casing between exterior and interior solid panel such that no insulation can erode to the airstreams. Foil facing on insulation is not an acceptable alternate to double wall construction. Insulation shall have a minimum R-Value of 8 and shall be UL listed. Minimum insulation thickness shall be 2 inches. The installation shall comply with NFPA-90A and B requirements.

2.4 FANS

A. Provide fans of type and class as specified on the schedule. Fan shafts shall be solid, coated with a rust-inhibiting coating, and properly designed so that fan shaft does not pass through first critical speed as unit comes up to rated RPM. All fans shall be statically and dynamically tested by the manufacturer for vibration and alignment as an assembly at the operating RPM to meet design specifications. Fans controlled by variable frequency drives shall be statically and dynamically tested for vibration and alignment at speeds between 25% and 100% of design RPM. If fans are not factory-tested for vibration and alignment, the contractor shall be responsible for cost and labor associated with field balancing and certified vibration performance. Fan wheels shall be keyed to fan shafts to prevent slipping.

B. Provide grease lubricated ball bearings selected for L-50 200,000-hour average life per ANSI/AFBMA 9. Greasable bearings shall have lubrication lines extended to the drive side of the unit. Lubrication lines shall be a clear, high-pressure, polymer to aid in visual inspection. Extend both grease lubrication lines to drive side of unit and rigidly attach to drive side bearing support with zerk fittings. If extended lubrication lines are not provided, manufacturer shall provide permanently lubricated bearing with engineering calculations for proof of bearing life.

C. Fans shall be mounted on isolation bases. Internally-mounted motor shall be on the same isolation base. Fan and motor shall be internally isolated with spring isolators. Flexible canvas ducts shall be installed between fan and unit casing to ensure complete isolation. Flexible canvas ducts shall comply with NFPA 90A and UL 181 requirements. If fans and motors are not internally isolated, then the entire unit shall be externally isolated from the building, including supply and return duct work, piping, and electrical connections. External isolation shall be furnished by the contractor in order to avoid transmission of noise and vibration through the ductwork and building structure.

D. Fan modules shall have a minimum of one access door located on the drive side of the unit to allow inspection and maintenance of the fan, motor, and drive components. Construct door(s) per Section 2.03 paragraphs D, E, and F.

E. Belts shall be enclosed as required by OSHA standard 29 CFR 1910 to protect worker from accidental contact with the belts and sheaves.

2.5 MOTORS AND DRIVES

A. All motors and drives shall be factory-installed and run tested. All motors shall be installed on a slide base to permit adjustment of belt tension. Slide base shall be designed to accept all motor sizes offered by the air-handler manufacturer for that fan size to allow a motor

change in the future, should airflow requirements change. Fan sections without factory-installed motors shall have motors field installed by the contractor. The contractor shall be responsible for all costs associated with installation of motor and drive, alignment of sheaves and belts, run testing of the motor, and balancing of the assembly.

B. Fan Motors shall be heavy duty, open drip-proof (ODP) high efficiency, operable at specified voltage.

C. Motors shall be selected to operate continuously at 104 F (40 C) ambient without tripping of overloads. Motors shall have a +/- 10 percent voltage utilization range to protect against voltage variation. Motors shall be in compliance with EPACT when applicable.

D. V-Belt Drive shall be constant pitch rated at 1.5 times the motor nameplate.

E. Manufacturer shall provide for each fan a nameplate with the following information to assist air balance contractor in start up and service personnel in maintenance:
   1. Fan and motor sheave part number
   2. Fan and motor bushing part number
   3. Number of belts and belt part numbers
   4. Fan design RPM and motor HP
   5. Belt tension and deflection
   6. Center distance between shafts

2.6 COILS

A. Install coils such that headers and return bends are enclosed by unit casing to ensure that if condensate forms on the header or return bends, it is captured by the drainpan under the coil.

B. Coils shall be manufactured with plate fins to minimize water carryover and maximize airside thermal efficiency. Fin tube holes shall have drawn and belled collars to maintain consistent fin spacing to ensure performance and air pressure drop across the coil as scheduled. Tubes shall be mechanically expanded and bonded to fin collars for maximum thermal conductivity. Use of soldering or tinning during the fin-to-tube bonding process is not acceptable due to the inherent thermal stress and possible loss of bonding at that joint.

C. Construct coil casings of stainless steel. End supports and tube sheets shall have belled tube holes to minimize wear of the tube wall during thermal expansion and contraction of the tube.

D. All coils shall be completely cleaned prior to installation into the air handling unit. Complete fin bundle in direction of airflow shall be degreased and steam cleaned to remove any lubricants used in the manufacturing of the fins, or dirt that may have accumulated, in order to minimize the chance for water carryover.

E. On stacked cooling coils, intermediate drain pans shall be installed between the coils. Intermediate drain pans shall have drop tubes to guide condensate to the main drain pan, thus preventing flooding of lower coils that would result in moisture carryover.

F. Hydronic Coils
   1. Supply and return header connections shall be clearly labeled on outside of units such that direction of coil water-flow is counter to direction of unit air-flow.
   2. Coils shall be proof tested to 300 psig and leak tested to 200 psig air pressure under water.
   3. Headers shall be constructed of round copper pipe or cast iron.
   4. Tubes shall be 1/2 inch O.D. minimum 0.016 inch thick copper. Fins shall be aluminum. Construction and spaced at a maximum of 11 fins per inch.

5. Coated with herisite coating.

2.7 BASE-LEVEL DRAIN PANS

A. Drain pans shall be constructed of stainless steel. Insulation shall be encased between exterior and interior walls. Units with cooling coils shall have drain pans under complete cooling coil section that extend beyond the air-leaving side of the coil to ensure capture of all condensate in section. Cooling coil drain pans shall be sloped in 2 planes, pitched toward drain connections to ensure complete condensate drainage when unit is installed level and trapped per manufacturer's requirements. See section 2.05, paragraph E for specifications on intermediate drain pans between cooling coils.

B. Units with heating coils shall have a drain pan under complete heating coil section sloped in 2 planes and pitched toward drain connections to ensure proper drainage during cleaning and to capture water in the event of a coil failure.

C. All drain pan connections supplied by unit manufacturer including, piping, and piping connections extending from stainless steel drain pans shall be constructed of stainless steel. The contractor is responsible to ensure the unit is installed level, trapped in accordance with the manufacturer's requirements, and visually inspected to ensure proper drainage of condensate.

2.8 FILTERS

A. Provide factory-fabricated filter section of the same construction and finish as unit casings. Filter section shall have filter guides and access door(s) extending the full height of the casing to facilitate filter removal. Construct doors in accordance with Section 2.03, paragraphs D, E, and F. Provide filter block offs as required to prevent air bypass around filters.

B. Filter type, efficiency, and arrangement shall be provided as defined in project plans and schedule. Filters shall be removable from one side of filter section(s). Filters shall be 30% pleated media type.

C. Manufacturer shall provide one set of startup filters.

2.9 DAMPERS

A. All dampers, with the exception of external bypass and multi-zones (if scheduled), shall be internally mounted. Dampers shall be premium ultra low leak and located as scheduled. Dampers shall be Ruskin CD60 double-skin airfoil design or equivalent for minimal air leakage and pressure drop. Leakage rate shall not exceed 5 CFM/square foot at one inch water gauge and 9 CFM/square foot at 4 inches water gauge. All leakage testing and pressure ratings shall be based on AMCA Publication 500. Manufacturer shall submit brand and model of damper(s) being furnished.

END OF SECTION 23 70 00

SECTION 23 84 19 - POOL DEHUMIDIFICATION UNITS

PART 1 GENERAL

1.1 UNIT DESCRIPTION

A. Enclosure: The unit shall be fabricated per the following method: The base shall be U.S. 12 gauge Galvanneal steel; corner posts and side posts shall be formed U.S. 18 gauge Galvanneal steel; top panels and removable side panels shall be a minimum of U.S. 18 gauge Galvanneal steel. Removable panels shall be provided to allow easy access to all internal parts and components. The electrical control box and switch panel shall be enclosed in a separate compartment, complete with a hinged door.

B. Paint and Finish: Prior to painting, all metal parts shall be pretreated to remove oils and dirt and rinsed with an ionized solution. Painting shall be by a powder coat technique to assure positive adherence with a high impact finish. All sides of panels shall be painted after manufacturing. The paint shall be High Yield Polyester. The paint shall be rated to meet a minimum of 1,000-hour salt spray test (ASTM B117), have a minimum Direct Impact Resistance of 160 in-lbs (ASTM D2794), have a minimum flexibility of ¼" Mandrel (ASTM D522, Method B) and a minimum 1000-hour Humidity Resistance (ASTM D2247). The unit color shall be light gray.

1.2 REFRIGERATION SYSTEM:

A. Refrigerant: The system's operating refrigerant shall be R-454B.

B. Compressors: The compressor shall be a heavy-duty, scroll, hermetic compressor. The compressor shall be equipped with low and high pressure safety devices, with internal protection from overheating. The compressor shall be externally vibration isolated. Units 10-ton and above shall be equipped with suction line accumulators.

C. Receiver: The unit shall include a refrigerant receiver. The receiver shall assist the unit in operating at the highest efficiency over a wide range of load conditions.

D. The unit shall include hot gas bypass for each system compressor set.

1.3 EVAPORATOR DEHUMIDIFIER COILS:

A. Fins: Fins shall be die-formed, aluminum and shall be damage resistant. Extruded fin collars provide maximum heat transfer. Fin spacing shall be 12 FPI (fins per inch) maximum. The coil shall be a maximum of 30" in height to avoid water carryover to the reheat coil and re-evaporation into the air stream.

B. Tubes: Coils shall be fabricated from seamless drawn copper. The tubes shall be hydraulically expanded into the fins to form a permanent metal-to-metal bond for maximum heat transfer and stability.

C. Each coil shall have its own drain pan.

D. Testing: Coils shall be leak tested with nitrogen.

E. Evaporator Bypass: Provide a bypass damper to bypass a portion of the return air stream. After the evaporator has dehumidified its portion of the air stream, the mixing of the bypass and evaporator air shall result in a temperature above the space dew point temperature.

F. Refrigerant Condenser Coils:

G. Air-Cooled Condenser (Reheat Coil):

H. The reheat coil shall be positioned with a minimum of 5” clearance from the DX coil to help prevent water re-evaporation.

I. Fins: Fins shall be die–formed aluminum and shall be damage resistant. Fin spacing shall be 10 to12 FPI (fins per inch) maximum.

J. Tubes: Coils shall be fabricated from seamless drawn copper. The tubes shall be hydraulically expanded into the fins to form a permanent metal–to–metal bond for maximum heat transfer and stability.

K. Testing: Coils shall be leak tested with nitrogen.

1.4 COIL COATING

A. All air-side refrigerant heat exchangers (coils) shall be coated with a corrosion inhibitor (coating). The coating shall be applied after the coil is assembled and shall cover fins, exposed tubes, headers, and sheet metal casing. The application process shall achieve full penetration of the coil, so the fins are entirely coated, and shall be wear resistant and shall have negligible impact on heat transfer or airflow (no pooling or bridging). Using coated fin stock is not an acceptable alternative, because it leaves bare edges in the airstream, and does not coat tube or sheet metal parts. The following standards shall be met or exceeded:
   1. Dry film thickness of 0.6-1.2 mils per ASTM D7091, or heat transfer reduction less than 3%
   2. 5B rating for cross-hatch adhesion per ASTM B3359
   3. 15,000 hours of salt spray per ASTM B117, or 6,000 hours per ASTM G85 A3
   4. Temperature range –40°F to 250°F
   5. Warranted to be free of defects in materials and workmanship for five (5) years
   6. REACH and RoHS compliant.

1.5 REMOTE AIR-COOLED CONDENSER:

A. The size and capacity shall be in accordance with the unit schedule. The system shall be able to reject all the recovered heat (T.H.R.) from the unit to the outdoor condenser.

B. The RCD series units shall be provided with a weatherproof electrical panel. A field supplied and installed disconnect is required per the local code requirements.

C. The cabinet shall be constructed of powder coated galvannealed steel. The unit shall be provided with lifting brackets in each corner support.

D. The coil shall be constructed of copper tubing in a staggered design. Tubes shall be hydraulically expanded into full-collared, plate-type aluminum fins. Coils shall be factory leak-tested and sealed with caps.

E. The fan motors shall be Electronically Commutated (EC) design for maximum efficiency. All motors shall be factory-wired with leads terminating in the control panel.

F. The fan motor and fan shall be manufactured and supplied to the equipment manufacturer as a single unit.

G. For maximum system efficiency, the fan speed shall be modulated to maintain the internal pressure head to a preset, and adjustable, set point.

H. Fan guards shall be heavy-gauge, closed-mesh steel wire. Guards shall be contoured for maximum rigidity.

I. The condenser will produce a maximum of 69dbA @ 3 meters in accordance with AHRI standard 370-2001. On non-design condition days, the modulated fan will run slower and the

noise will be lower.

1.6 AUXILIARY HEATER

A. Electric Heater:
1. The capacity shall be in accordance with the schedule. The heater shall be integral to the unit and wired to the units as a single-point power connection or separate power for the electric heater. The option is configured at the factory at the time of manufacture. Refer to the model number for the submitted unit configuration.
2. The heater coils shall be constructed of High Grade Nickel-Chrome alloy and will be insulated by floating ceramic bushings from the galvanized steel frame. Coil terminal points shall be stainless steel insulated by means of non-rotating ceramic bushings.
3. The heater shall be equipped with fail-safe, automatic reset and manual reset disc-type thermal cut-outs.
4. The heater will include high limit cut-outs, magnetic contactors as required, a control transformer and an airflow switch.

1.7 UNIT LOCATION:

A. The unit shall be designed for indoor installation.

1.8 VENTILATION OUTDOOR AIR:

A. Evaporator Bypass: An automatic two-position evaporator bypass damper shall be provided. The bypass damper shall be located in fixed evaporator bypass opening. The damper shall be field-balanced to maintain constant evaporator airflow during unoccupied and occupied modes of operation.

1.9 OUTDOOR AIR ASSEMBLY:

A. The unit shall be supplied with an integral outdoor air intake assembly for the introduction of outdoor air. The outdoor air shall be introduced after the evaporator coil but before the reheat condensing coil. The complete assembly shall be field reversible (rotate 180°) to provide flexibility in the connection of the outside air ductwork. The outside air assembly shall include the following features:
1. A two-position, spring-return damper and actuator shall be provided to allow the system to bring in outdoor air during occupied time periods and to close during unoccupied times.
2. An outdoor air assembly box with duct connection shall be provided to house a 1" fiberglass disposable filter.

1.10 ELECTRICAL CONTROL PANEL:

A. The electrical control panel will be easily accessible on one side so that service can be performed from the side of the unit. It will be of adequate size so as to house all electrical controls and devices. The unit will be provided with single point power connection to serve controls, fans, electric auxiliary heater (if provided), and compressors, factory wired to the power connection lug set. The electrical controls will include low-voltage transformers to supply 24 VAC control power, clearly labeled high- and low-voltage terminal strips, high- and low-pressure control (with manual reset of the high-pressure cutout and automatic reset of low-pressure cutout), and an anti-short cycling timer to protect against compressor cycling.

B. Short Circuit Current Rating (SCCR): The complete unit shall be rated in compliance with NEC® 110.10 and UL 1995 at nameplate voltage maximum, when protected by Class J, Class T or Class RK1 fusing. Electrical markings on the unit shall include, but not limited to the MCA (Minimum Circuit Ampacity), the MOPD (Maximum Over-current Protection Device) and the SSCR.

1.11 CONTROL SYSTEM:

A. A digital control system using a modern microprocessor will be used to accurately and precisely control the DESERT AIRE dehumidification system and the space environment. The controller will include three (3) levels of password protection.

B. The controller will provide precise system control and feature an easy-to-read display which indicates actual operating and set-points. The display will be remote mountable up to 1,640 feet from the unit. The controller will have a built-in occupancy timer.
   1. Temperature & Humidity Sensor: The unit will include a temperature and humidity sensor either installed in the dehumidifier or shipped loose for wall mounting. See unit selection for details.
   2. BMS Compatibility: The unit's controller shall have the following BMS compatibility: BACnet MS/TP communication card
   3. The following Control Points will be available as read/write through the on board terminal or through the BMS system:
      Zone Air RH Setpoint
      Zone Air RH Deadband
      Zone Air Temperature Setpoint
      Zone Cooling Deadband
      Zone Cooling Stage Deadband
      Zone Heating Deadband
      Energy Recovery Deadband
      Pool 1 Temperature Setpoint (optional)
      Pool 1 Temperature Differential (optional)
      Pool 1 Stage Deadband (optional)
      Pool 2 Temperature Setpoint (optional)
      Pool 2 Temperature Differential (optional)
      Pool 2 Stage Deadband (optional)
      Network Occupancy Command (optional)
      Network Event Command (optional)
      Network Purge Command (optional)
      Network Off Command (optional)
      Remote Reset
   4. The controller will include the following alarms:
      Low Suction Pressure Circuit A
      Low Suction Pressure Circuit B
      High Discharge Pressure Circuit A
      High Discharge Pressure Circuit B
      Supply Air Sensor Failure
      Zone Air Sensor Failure
      Supply Fan Overload
      Compressor Circuit A Overload
      Compressor Circuit B Overload
      System Shutdown
      Low Supply Air Temperature
      Exhaust Fan Overload
      Low Voltage (optional)
      Low Air Flow
      Freeze Stat (optional)

C. Airflow Switch: The dehumidifier shall be equipped with an airflow switch to prevent the compressors from starting or operating on loss of airflow.

D. Condensate Drain Pan: The drain pan will be 20-gauge stainless steel, sloped, and positioned under the dehumidifier coil. The drain pan will be TIG welded and securely

attached to the evaporator endplates to avoid shifting. The drain pan will be fitted with a minimum 1" MPT non-corrosive plastic drain connection. The drain pan will meet all the requirements of ASHRAE Standard 62.

E. Insulation: The thermal and sound insulation shall be engineered polymer closed-cell foam insulation (EPFI). Indoor units shall have 3/8" thick insulation and outdoor units shall have 3/4" thick insulation. The insulation meets the following requirements:
NFPA 255 Flame Spread – 25
NFPA 255 Smoke Developed – 50
NFPA 255 Fuel Contributed – 0
NFPA 90A (2-2.4.2) and 90B
ASTM C5118 (Thermal Resistance)
ASTM C411 (Hot Surface Performance)
ASTM C423 (Sound Absorption)
ASTM C665 (Fungi Resistance)
ASTM E90 (Airborne Sound Trans. Loss)
ASTM E96 (Water Vapor Transmission)
UL 94HBF (Horizontal Burn)
UL 181 (Air Erosion, Mold Growth, and Humidity)
ASTM C1136 (Mold, Mildew, and Moisture Resistance)

1.12 SUPPLY FAN:

A. Supply fan will either be double inlet forward curve fan or double inlet air foil fan.
1. Double Inlet Forward Curve Fans: The fan housing shall be made of galvanized steel. The impeller is manufactured in galvanized steel with tab locked blades.
2. Double Inlet Air Foil Fans: The fan housing shall be made of galvanized steel. The high performance impeller is manufactured in corrosion resistant steel, with backward curved, true airfoil shaped blades, welded into position. All wheels are coated with an anticorrosive primer and a final layer of synthetic paint.

B. All bearings are selected for a minimum of a L50 Life time of 200,000 hours.

C. All fans shall be dynamically and statically balanced.

D. Blower Discharge: The unit's air discharge will be as shown on the drawing.

E. Blower Pulley Assembly: The driver pulley and the blower pulley will be made of cast iron. The motor sheave will be a variable pitch type to allow for field adjustment of CFM and external static

1.13 RETURN AIR FILTERS:

A. The system shall be provided with MERV 8 disposable filters consisting of 4" pleated filter.

1.14 APPROVALS/LISTINGS:

A. The unit shall be labeled and listed by ETL or UL.

1.15 UNIT MANUFACTURER:

A. The unit shall be manufactured by DESERT AIRE CORPORATION, Germantown, Wisconsin, U.S.A. The manufacture must be an active member of the ARI Dehumidification group.

PART 2 - EXECUTION

2.1 PREPARATION:

A. Installing contractor to provide all labor, refrigerant, and material required for a complete installation. Minimum of 3 feet clearance on all sides. Work to be performed shall be in accord with local codes, regulations, and OSHA standards.

2.2 DELIVERY, STORAGE, AND HANDLING:

A. Customer to provide a suitable space for the equipment with proper access and entries. Unit to be stored in a clean, dry place and protected from the outdoor environment. Handle with care to avoid damage.

2.3 INSTALLATION:

A. Unit shall be installed per plans and manufacturer's installation recommendations.

2.4 FIELD QUALITY CONTROL:

A. Installing contractor to clean, check, and perform all preliminary start-up procedures before final operation of the unit, per manufacturer's recommendations.

2.5 OPERATION/MAINTENANCE MANUALS (IN ENGLISH):

A. Manuals will include electrical and control drawings, and refrigeration piping drawings. Manufacturer's representative shall instruct owners/operators of the unit regarding its functions and sequence of operation.

END OF SECTION

DIVISION

ELECTRICAL

SECTION 26 00 00 - ELECTRICAL GENERAL PROVISIONS – COMMISSIONING

PART 1 – GENERAL

1.1 DESCRIPTION

A. Division 26 will be responsible to carry out the commissioning requirements specified in Section 01 91 13 and other sections referenced in 01 91 13.

END OF SECTION

SECTION 26 01 00 - BASIC ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 SCOPE

A. The scope of work is as indicated on electrical drawings and includes but is not limited to the following:

B. Site:

1. Coordination with the local utility company and provide primary conduits with pull boxes to utility tie-in point, per utility co. specifications. Provide secondary conduit, pull boxes, and service termination. Include all Utility Company fees for service connection in bid.
2. Coordinate communication services with the local telecommunication company and provide service conduit with pull rope to locations stipulated by Utility Company.
3. Provide a diesel emergency generator, automatic transfer switch, and associated emergency power feeders.
4. Provide temporary construction power; coordinate with the local Utility Company.
5. Provide in-ground pull boxes, manholes, and conduit as requires to serve any/all electrical equipment located throughout the site.
6. Provide concrete foundation for automatic transfer switch, docking stations, generator, and other floor mounted equipment.
7. Provide power and fire alarm connection to backflow preventer.
8. Provide site lighting poles and associated branch circuits.
9. Provide circuit to site monument signage.
10. Provide fiber IDF cabinet on site with fiber cable back to MDF. Provide CAT 6 to monument signage.
11. Provide panelboards and transformers throughout site to supply power to car chargers, site lighting, and fountains.
12. Provide connection to fountains located in pond.
13. Provide pedestrian site lights around walking track.
14. Provide emergency call boxes and locate throughout parking and near track as indicated on plan.
15. Provide electric vehicle charging stations, foundations, cat 6 cabling, etc as indicated on plan.
16. Throughout the site provide outdoor rated IDF racks with fiber cabling to MDF. Outdoor racks will house switches, patch panels, etc to serve marque signage, electric vehicle charging stations, etc.

D. Power:

1. Provide panel, safety disconnect switches and associated feeder(s).
2. Provide receptacles, special outlets, junction boxes, and their associated branch circuits.
3. Provide branch circuits associated with all kitchen equipment furnished Coordinate with Food Service Consultant drawings prior to bid and include all necessary connections for a complete and functional system.
4. Provide branch circuits to kitchen hood and interconnect associated supply and exhaust fan to hood control panel. Connect equipment below hood to hood

extinguishing system. Connect equipment beneath hood and supply fan to shunt trip breakers interconnected to the hood control panel.

5. Provide branch circuits associated with all medical equipment furnished. Coordinate with manufacturer specifications and drawings prior to bid and include all necessary connections for a complete and functional system.
6. Provide branch circuits associated with all mechanical and plumbing system equipment, including all accessories such as motorized dampers, valves, fan interlocks, ionization, etc.
7. Provide branch circuits associated with all pool & spa equipment furnished including but not limited to underwater lighting, scoreboard, timer system touch pads, and pumps. Coordinate with pool equipment drawings prior to bid and include all necessary connections for a complete and functional system.
8. Provide recessed concealed service floor boxes with GFCI receptacles for exercise equipment.
9. Provide feeders and branch circuitry for elevators. Include elevator shunt trips and interconnect to fire alarm system. Provide elevator disconnect switches, receptacles, lighting, etc per manufacturer specifications.
10. Provide bus bars in all electrical rooms. Interconnect bus bars per grounding riser diagram.
11. Provide surge suppression devices on all panelboards.
12. Provide a metering system as shown on one-line diagram. Metering system shall include webpage with custom one-line diagram to represent all devices and meter outputs.
13. All exterior disconnects and panelboards shall be NEMA-3R.
14. Provide all branch circuits required for A/V system located in Convention Room.

E. Lighting:

1. Lighting control shall adhere to all requirements of IECC 2021
2. Provide interior light fixtures, wall switches, wall dimmers, and occupancy sensors and associated branch circuits.
3. Provide all interior/exterior building mounted fixture and associated branch circuits.
4. Provide exit light fixtures and both interior and exterior emergency light fixtures.
5. All lighting shall be controllable via the Building Management Control System (BMCS). Provide connectivity from lighting control panels to BMCS.
6. For all site lighting fixtures provide pole foundations. Refer to pole detail on plans and structural plans for more information.

F. Telecommunications:

1. Provide junction boxes and conduit for phone and data outlets. Provide (2) CAT 6 cables to each data outlet shown unless otherwise indicated.
2. Provide 3/4” plywood lumber core backboard. Paint with two coats of fire retardant paint on both sides.
3. Provide floor mounted data racks in all MDF and IDF rooms. Provide single mode fiber cabling throughout to connect from MDF (located in central plant) to all IDF. Multi-mode fiber is prohibited on this project.
4. Provide ladder rack in telecommunications rooms.
5. Provide grounding bus bars in all telecommunications room and interconnect according to grounding riser diagram.
6. Provide two (2) CAT 6 cables to the fire alarm control panel

7. Provide two (2) CAT 6 cables to Building Management Control System Panels
8. Provide two (2) CAT 6 cables to lighting control panels.
9. Provide CAT 6 cables to all metering points illustrated on the one-line diagram.
10. Provide CAT 6 cables to all lighting control panels for connection to BMCS.

G. Fire Alarm:
1. Provide fire alarm control panel, voice evacuation panel and remote booster panels.
2. Provide manual pull stations at reception desk and where indicated on plan.
3. Provide visual and audio notification throughout including voice evacuation.
4. Provide smoke detectors at all control panels, voice evacuation panels and booster panels.
5. Provide duct mounted smoke detectors for all air units with greater than 2000 cfm air flow.
6. Provide a monitor module for all sprinkler system tamper and flow switches.
7. Provide a monitor module for sprinkler system hotbox heater power and tamper switches.
8. Provide a monitor module for kitchen hood suppression system.

H. Nurse Call
1. Nurse call system cabling & devices by others. Where nurse call dome lights and pull cords are illustrated on plan contractor shall provide back box and 1” C. with pull string to accessible location above ceiling.

I. Access Controls and Cameras
1. Provide a minimum of one (1) dedicated 120V circuits for access control and camera equipment in each telecommunications closet.
2. Provide junction box and 1” C. with pull string to accessible location above ceiling for all access and camera locations. All cabling by others.

J. Paging and Music Systems
1. Provide a minimum of one (1) dedicated 120V circuits for paging and music systems in each telecommunications closet.
2. Provide junction box and 1” C. with pull string to accessible location above ceiling for all speaker locations. All cabling by others.

K. Lightning Protection System
1. Provide a complete lightning protection system in accordance with specification 26 4113.

1.2 GENERAL CONDITIONS

A. The General Conditions and Supplementary General Conditions are a part of this section of these Specifications. The Contractor is cautioned to read and be thoroughly familiar with all provisions of the General Conditions. These conditions shall be complied with in every aspect.

1.3 DEFINITONS:

A. The word "shall" where used, is to be understood, as mandatory and the word "should" as advisory. "May" is used in the permissive sense.

B. Concealed: Concealed areas are those areas that cannot be seen by building occupants.

C. Exposed: Exposed areas are all areas that are exposed to view by building occupants, including areas below counter tops, inside cabinets and closets, inside all equipment rooms, and areas outside the building exterior envelope.

D. Feeder: Feeder consists of both conduit and wiring installed above or below grade

E. Provide: Provide shall including furnishing, installing, and connecting the item or items referenced unless specifically indicated otherwise.

1.4 QUALITY ASSURANCE

A. General:
1. Every effort has been made by the Engineer to clearly indicate all devices/equipment requiring an electrical/data connection. It is the intent of the Engineer that all light fixtures be powered and controlled, that all devices and equipment be circuited to a panelboard of appropriate voltage and breaker of MOCP not exceeding manufacturer’s specifications. That all communications, security, and fire alarm devices are installed, wiring, and functioning properly.
2. Where there is a conflict between the contract document and an applicable Code. The Code shall govern except where the requirements of the contract documents are more stringent. The most stringent requirement shall apply.
3. All work shall be concealed unless specifically noted to be exposed.
4. Coordinate the exact locations of electrical outlets and equipment with building features and equipment as indicated on architectural, structural, mechanical, plumbing, landscape, and food service drawings. Review any/all proposed changes in electrical device/equipment locations with Architect prior to rough-in. Architect may direct relocation of outlets before rough-in, up to ten (10) feet from the position indicated, without additional cost. Remove and relocate outlets placed in unsuitable locations when requested by the Architect, at no additional cost.
5. Resolve, in writing, any code violation discovered in contract documents with the Engineer prior to bidding. After award of the contract, Contactor shall make any correction or addition necessary for compliance with applicable codes at no additional cost.

B. An approved contractor for the work under this division shall be:
1. A licensed electrical contractor in the jurisdiction in which the work shall be performed.
2. Able to furnish evidence of having contracted for and installed not less than three (3) systems of similar size and scope.

C. All work, materials and equipment shall comply with the latest applicable codes, local ordinances, and UL requirements.

D. Provide new products of manufacturers regularly engaged in production of such

equipment. Provide the manufacturer's latest standard design for the type product specified. All new products shall be listed for the use shown on drawings.

E. Equipment shall be delivered with a factory-applied finish so that no additional field painting is required.

F. Equipment shall be selected to conform the building space limitations. Do not provide equipment that cannot meet the arrangement requirements shown on plans. Contractor shall submit room layouts with submitted items shown drawn to scale. Submittals will be rejected without floor plan Drawings showing submitted items.

G. All equipment included in the service and distribution specifications shall be provided by the same manufacturer.

H. Manufacturer names and model numbers are subject to change. Contractor shall verify them with manufacturer's representative prior to ordering any product or equipment.

1.5 GENERAL REQUIREMENTS

A. The Contractor is referred to all of the Drawings for building construction as well as the electrical Drawings.

B. The Contractor shall examine the site and shall verify to his own satisfaction the location of all utilities, and shall adequately inform himself as to their relation to his work before entering into a Contract and he shall base his bid on any conditions, which may be encountered during the progress of the work.

C. The Contractor shall furnish and install properly all materials, devices, equipment, supports, controls, appurtenances, etc., mentioned or required to make complete or satisfactory installations in working order whether shown or not. All electrical equipment shall be connected in accordance with manufacturer's instructions. All work shall be executed in a workmanlike manner and shall present a neat and mechanical appearance when completed.

D. The Contractor shall provide finished to match approved samples; all exposed finishes shall be approved by the Architect. Submit color samples as required.

1.6 APPLICABLE GENERAL CODES AND REGULATIONS

A. All electrical work and equipment, in whole or in part, shall conform to the applicable portions of the following specifications, codes and regulations in effect on that date of invitation for bids, and shall form a part of this specification.

B. The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition.

C. All reference amendments adopted prior to the effective date of this Contract shall be applicable to this Project.
   1. NFPA 70, National Electrical Code
   2. National Fire Codes:
      a. NFPA 70E, Electrical Safety Requirements for Employee Workplaces

b. NFPA 72, National Fire Alarm Code
c. NFPA 77, Static Electricity
d. NFPA 99, Health Care Facilities
e. NFPA 101, Life Safety Code
f. NFPA 110, Emergency and Standby Power Systems

3. Occupational Safety and Health Regulations (OSHA).
4. NFPA Standards in effect shall be as listed or adopted by the Louisiana authority having jurisdiction.
5. American National Standards Institute (ANSI)
6. Institute of Electrical and Electronics Engineers (IEEE)
7. Local, City and State Codes and Ordinances
8. Regulations and standards of the Electric Utility Company
9. National Electrical Safety Code (NESC)
10. National Electrical Manufacturers Association (NEMA)
11. Insulated Power Cable Engineers Association (IPCEA)
12. International Building Codes (IBC)
13. International Energy Conservation Codes (IECC)

B. Equipment that has been inspected and approved by the Underwriter's Laboratory shall bear its label or appear on its list of approved apparatus.

1.7 DRAWINGS

A. Plans and detail sketches are submitted to limit, explain, and define conditions, specified requirements, conduit sizes, and manner of erecting work. The Contractor is cautioned to field check and verify all existing conditions before bidding, as no extra compensation will be allowed for conditions found different than represented in the construction drawings and/or specifications. Written approval of the Architect shall be obtained prior to any alterations or additions to specified work.

B. Structural or other conditions may require certain modifications from the manner of installation shown, and such deviations are permissible and shall be made as required, but specified sizes and requirements necessary for satisfactory operations shall remain unchanged.

C. The drawings and these specifications are complementary to each other and what is called for by one shall be binding as if called for by both.

D. General arrangement of work is indicated on plans. Due to the small scale of the drawings, offsets, fittings, and boxes required are not all indicated; provide fittings, boxes, etc., as needed in accordance with codes and accepted practices.

1.8 SUPERVISION

A. The Contractor shall personally or through an authorized and competent representative, constantly supervise the work from beginning to completion and final acceptance. So far as possible, he shall keep the same foreman and workmen throughout the project duration.

B. During its progress, the work shall be subject to inspection by representatives of the Architect or Engineer, at which times the Contractor shall furnish required information.

C. It is not the Architect's or Engineer's duty to direct or guarantee the work of the Contractor, but to assist the Owner in obtaining a complete building in accordance with plans, specifications and addenda and to furnish engineering services in accordance with recognized practices.

1.9 PRIOR APPROVALS

A. The Contractor shall base his proposal on materials as specified herein. Any references to a specific manufacturer or trade name is made to establish a standard of quality and to define a type of product and in no way is intended to indicate a preference for a particular manufacturer. It is the intent of these specifications to allow all manufacturers of equipment, products, etc., judged by engineer equal to the specified product to bid on a competitive basis.

1.10 MEASUREMENTS

A. The Contractor shall verify all measurements and shall be responsible for the correctness of same, before ordering any materials or doing any work. No extra charge or compensation will be allowed for any differences between the actual measurements and those indicated on the drawings.

1.11 LAWS, PERMITS AND FEES

A. The entire electrical work shall comply with the rules and regulations of the City, Parish, and State, including the State Fire Marshal and State Board of Health, whether so shown on plans or not. The Contractor shall pay fees for permits, inspections, etc., and shall arrange with the inspecting authorities all required inspections.

1.12 SITE INSPECTION

A. The Contractor shall visit the site and familiarize himself with difficulties attendant to the successful execution of the work before bidding. Failure to visit the site shall not relieve the Contractor of the extent or conditions of the work required of him.

1.13 TEMPORARY FACILTIES

A. The Contractor shall provide all temporary power and lighting for construction purposes. Installation of temporary power shall be in accordance with NEC Article 527.

B. Temporary facilities, wire, lights, and devices are the property of the contractor and shall be removed by the Contractor at the completion of the Contract.

PART 2 - PRODUCTS

2.1 MATERIAL AND EQUIPMENT

A. All materials, equipment, and accessories installed under this Contract, whether approved or not, shall be new and shall conform to all rules, codes, etc., as recommended or adopted by the National Association(s) governing the manufacture, rating and testing of such materials, equipment, and accessories.

B. Product Substitutions
   1. If item of equipment or device offered as Substitution differs in dimension or configuration from that indicated in the Contract Documents, provide, as part of the substitution submittal, a drawing that shows that the equipment or devices proposed for Substitution can be installed in the space available without interfering with other trades or with access requirements for operations and maintenance in the completed project. Drawings shall be of appropriate scale but shall not be smaller than a scale of 1/4-inch equals one foot.
   2. Where substitute equipment or devices requires different arrangement or connections from that indicated in the Contract Documents, install the equipment or devices to operate properly and in accordance with the requirements of the Contract Documents. Make incidental changes necessary in piping, ductwork or wiring which results from the inclusion of the substitute equipment or device without any additional cost to the Owner. Pay all additional costs incurred by other trades in connection with changes required by the inclusion of the substituted equipment or device in the Work.

2.2 SHOP DRAWINGS & SUBMITTALS

A. Shop drawings shall be taken to mean detailed drawings with dimensions, schedules, weights, capacities installation details, and pertinent information that will be needed to describe the material or equipment in detail.
   1. Shop drawings shall be prepared using computerized digital software compatible with AutoDesk's AutoCAD
   2. Submit (3) hardcopy of Shop Drawings. Hardcopies of Shop Drawings shall have each sheet clearly labeled with a unique sheet identification number.
   3. In addition to hardcopies required by Division 01, submit one copy of Shop Drawings in electronic format on Flash Drive. Files contained shall be named to correspond with the sheet names contained in the hardcopy set. Files on shall include both AutoCAD compatible source files and files printed to Portable Document Format (.pdf).

B. Submittals shall be taken to mean catalog cuts, general descriptive information, catalog numbers, and manufacturer's name.

C. Review of submittals or shop drawings shall not remove the responsibility for furnishing materials or equipment of proper dimensions, quantity and quality; nor will such review remove the responsibility for error in the shop drawings or submittals.

D. Assume all costs and liabilities, which may result from the ordering of any material, or equipment prior to the review of the shop drawings or submittals, and no work shall be done until the shop drawings or submittals have been reviewed. In case of correction or rejection, resubmit until such time as they are accepted by the Owner's representative and such procedures will not be cause for delay. After the final review, 6 copies will be supplied if requested.

E. Shop drawings and submittals will be returned unchecked if the specific items proposed are not clearly marked, or if the general Contractor's approval stamp is omitted.

F. Shop drawings, unless mark-ups are very trivial, will not be returned, "No Exception Taken". They will be returned for re-submittal as many times as necessary, however, the Contractor shall be back charged for engineering review time beginning with the second resubmittal. Therefore, the Contractor should make every effort to comply with the requirements of this Project on the first submittal in order to avoid project delays.

G. The Contractor shall submit to the Architect complete descriptive and dimensional data on the following items for review and approval when specified or provided:
1. Cable Tray
2. Disconnect Switches
3. Electrical Contactors
4. Electrical Controls and Time Switches
5. Emergency/Standby generator set and transfer switches
6. Enclosed Circuit Breakers
7. Fire Alarm System Panels, Initiation Devices, and Annunciation Devices
8. Fire Rated Cables and Connectors
9. Lighting Controls and Occupancy Sensors
10. Lighting Fixtures
11. Lightning Protection System
12. Panelboards and enclosures
13. Site Lighting Poles and Fixtures
14. Surface Raceways
15. Surge Protection Devices
16. Switchboards
17. Transformers
18. Wiring Devices
19. Scada Systems
20. Emergency Call Boxes
21. Telecommunication Racks & Cabling
22. Electric Vehicle Charging Stations (EVCS)

PART 3 - METHODS OF INSTALLATIONS

3.1 CONTRACTOR COORDINATION

A. The Drawings are diagrammatic in nature. Cooperate with other trades so the interferences of facilities and equipment will be avoided.

B. Contractor to coordinate with door hardware provider, architect and owner prior to installation of any devices associated with doors to verify door operational requirement, placement of proximity readers, motion sensors, door switches, fire alarm control, magnetic locks, hold open devices, etc..

C. Contractor to coordinate with hospital equipment provider prior to installation of circuits, conduit and boxes for all hospital equipment. Contractor shall refer to hospital equipment shop drawings for installation and rough in requirements. Locations and circuit sizes indicated on the drawings shall be verified with final hospital equipment drawings.

D. Contractor to coordinate with architectural millwork shop drawings prior to rough-in for locations of under counter lighting to be installed in and around millwork. No receptacles shall be installed in an enclosed cabinet unless noted on the drawings. Outlets for refrigerators, microwaves, etc. shall be installed in the space identified on the millwork shop drawings.

E. Contractor shall not penetrate any stair wall assemble with conduit, boxes, cabling and the like, except for items that serve the stairwell.

F. Space allocations for materials, equipment and devices have been made on the basis of present and known future requirements and the dimensions of items of equipment or devices of a particular manufacturer. Verify that all materials, equipment and devices proposed for use on this Project are within the constraints of the allocated space.

G. Coordinate arrangement, mounting, and support of electrical equipment:
1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
2. To provide for ease of disconnecting the equipment with minimum interference to other installations.
3. To allow right of way for piping installed at required slope. So, connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.

H. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.

I. Coordination Drawings: Prepare BIM coordination models showing dimensioned layout for the following and clash detection:
1. Penetration and structural opening: Floor plans showing sleeves and formed structural penetrations. Shoe sleeve and formed penetration layout and relationships between structural components and their adjacent building elements, including but not limited to pre-tensioning and post-tensioning members where used.
2. Reflected Ceiling Plans: ceiling plans, sections, and other necessary details showing dimensioned layouts for equipment located in or on the ceiling plane. Base dimensions on exact dimensions layout for equipment located in or on the ceiling plane. Base dimension on exact dimensions data obtained from product submittals for products to be included in the work. Differentiated between field measurements and assumed dimensions. Include the following items coordinated with each other, based on input form installers the items involved:
    a. Suspended ceiling components
    b. Structural members to which suspension systems for luminaires will be attached.
    c. Perimeter moldings, decorative ceiling elements, and Architectural features.
    d. Luminaries
    e. Speakers
    f. Sprinklers
    g. Smoke detectors
    h. Fire alarm notification appliances
    i. Occupancy sensors
    j. Access panels.
    k. Security cameras
    l. Wireless Internet Access Points
    m. Nurse Call Zone and Dome Lights
3. Electrical Equipment Layouts: Floor plans, elevations, and other necessary details showing dimensioned layouts for spaces containing electrical equipment. Base electrical equipment dimensions on exact dimensioned data obtained from product submittals for products to be included in the Work. Differentiate between field measurements and assumed dimensions. Include the following items coordinated with each other, based on input from installers of the items involved:
    a. Electrical equipment layout and relationships between components and adjacent structural and mechanical elements.
    b. Indication of required working clearances and required area above and around electrical equipment where pipes and ducts are prohibited.
    c. Location of Conduit entry into electrical equipment.
    d. Location of luminaires, sprinkler piping and heads, ducts, and diffusers.

e. Electrical equipment support locations, type of support, and weight on each support.
f. Location of structural supports for structure-supported raceways.
g. For floor mounted equipment: concrete base dimension, outline of equipment, and required clearances.

3.2 OPENINGS, CUTTING AND PATCHING

A. Cut all openings as required for the electrical work. Patching will be done by the various crafts whose work is involved. Furnish and install all necessary sleeves, thimbles, hangers, inserts, etc., at such times and in such a manner as not to delay or interfere with the work of other Contractors. Caulk, flash or otherwise make weatherproof all penetrations through the roof and exterior walls.

B. Where conduit, cable or other items that are provided for under this contract penetrate fire rated walls or floors, the Contractor is to seal around the item to maintain the integrity of the rated system.

3.3 ACCESSIBILITY AND DEVICE MOUNTING HEIGHTS

A. All electrical devices shall be installed in compliance with the Americans with Disabilities Act (ADA) and local accessibility codes. Typical mounting heights shall be as follows unless noted otherwise on the drawings or required by authority having jurisdiction:

Device Type	Mounting Height (AFF to Center unless noted)
Duplex receptacles (general use)	18″
Data / communication outlets	18″
Above Counter	4” Above countertop
Wall switches / dimmers / occupancy sensors	48″
Thermostats / control panels	48″
Fire alarm pull stations	42″ (to operable part)
Wall mounted Fire alarm horn/strobes	80″ min. to bottom, 96″ max. to top
Exit signs	As required by Life Safety Code, typically above doors with bottom at 80″ min. AFF
Wall mounted Nurse call dome lights	80″ min.
Card readers / access controls	48″
Audio/visual devices (TV, monitors, etc.)	Coordinate with architect/owner

3.4 PAINTING

A. Painting shall be performed as described in the painting specifications. No painting will be required by the Contractor except for touch-up of factory finishes on equipment furnished under this contract.

3.5 INSTALLATION

A. Housekeeping Pads: All floor and ground mounted electrical equipment - panels, switchboards, motor control centers, transformers, etc. shall be installed with a reinforced concrete housekeeping pad, whether shown on the drawings or not. The pad shall extend 4” above either the finished floor or final grade (as applicable), have 45 degree chamfered edges, and be constructed of 3000psi concrete. The pad shall extend 3”

beyond the edge of the respective electrical equipment. Concrete shall have smooth steel trowel finish.

B. Equipment must be leveled and set plumb. Use corrosion resistant mounting hardware. For sheet metal enclosures mounted against a wall provide corrosion-resistant spaces to separate the wall by 1/4 inch or by 3 inches of air for freestanding units.

C. Unused knockouts on panels and boxes shall be covered with approved cover plates manufactured for the purpose.

3.6 TESTS AND INSPECTIONS

A. The Contractor shall assist in making periodic inspections or tests required by the Architect or Engineer. When requested, the Contractor shall provide the assistance of foremen and qualified craftsmen for reasonable duration of each test, etc.

B. The contract will not be declared to be substantially complete until all of the following conditions are satisfied.
   1. the functional operation of the subsystems have been demonstrated and verified and reports have been provided, reviewed and accepted.
   2. The “As-Built” drawings have been submitted, reviewed and accepted by the Architect / Owner / Owner’s Construction Representative.
   3. The various systems and building emergency lighting system have been commissioned and accepted.
      a. Building Lightning protection System
      b. Data / Voice Cabling System
      c. Emergency Lighting System
      d. Fire Alarm System
      e. Intercom / Telephone
      f. Lighting Occupancy Sensor Controls
      g. Surveillance and Security System

3.7 SAFETY PRECAUTIONS DURING CONSTRUCTION

A. It shall be the Contractor's responsibility to furnish and install proper guards and instruction signs for prevention of accidents and to provide and maintain for the duration of construction any installations needed for safety of life and property.

3.8 CONNECTIONS

A. This Contractor shall be responsible for providing electrical service to all devices of the heating and air conditioning system, and is referred to the mechanical plan for the exact location of the various devices.

B. Mechanical Controls: Provide 120VAC power connections as required to components of Mechanical Control system. Coordinated quantity of circuits, connection requirements and locations between trades and with provisions of Divisions 21, 22, and 23 sections.

C. Security and Access Control: Where the Drawings indicate a 120VAC circuit in a general area labeled for security or access control use, the intent is for this circuit to be extended and connected to the security or access control device in that general area in coordination with other trades. Coordinate connection requirements and locations between trades and with Owner’s Security vendor prior to installation.

D. Motors and Motor Connections: Motors for driven equipment are specified in Divisions 21, 22, and 23. Provide connections as follows, unless otherwise indicated:
   1. Equipment provided with factory installed disconnecting means: Upon installation of motor and associated equipment, Provide the electrical installation in accordance with approved wiring diagrams and manufacturer's written instructions.
   2. Equipment furnished with factory disconnecting means: Upon installation of motor and associated equipment, Install factory furnished disconnecting means and provide the electrical installation in accordance with approved wiring diagrams and manufacturer's written instructions.
   3. Equipment not furnished with factory installed disconnecting means: Provide disconnect switch required in accordance with NFPA 70 or as indicated on the Drawings. Provide the electrical installation in accordance with approved wiring diagrams and manufacturer's written instructions.

3.9 LOAD BALANCING

A. Balance load on all phases in each panel to within 10% of respective phase loads.

3.10 IDENTIFICATION OF EQUIPMENT

A. Identification of Equipment: Refer to specification 26 05 53 Identification for Electrical Equipment systems.

3.11 COMPLETION

A. The Contractor shall leave all electrical equipment with proper connections, and in proper working order. He shall test the entire electrical system to show that it is properly installed. Contractor shall leave all panels and switches completely fused or complete with circuit breakers.

3.12 RECORD DRAWINGS

A. The Contractor shall furnish one (1) complete set of drawings on which any changes in the work shall be shown. In addition to changes in work contractor shall clearly indicate routing of all feeders both above and below ground. All underground conduit shall be noted on drawings to show "as built" locations. These drawings must be turned over to the Architect prior to final acceptance of the work.

3.13 GUARANTEE

A. The Contractor shall guarantee to keep the entire electrical system as installed by him or his subcontractors in repair and free from defects in materials and workmanship for one (1) year from the date of the substantial completion, and shall furnish free of cost to the Owner, all material and labor necessary to comply with the above guarantee; said guarantee shall be based upon defective material and workmanship. In any case where equipment has a factory warranty exceeding this one-year limit, the full extent of the warranty shall apply.

B. Extended Warranty Options: for equipment such as generators, transfer switches, and switchgear. Extended warranty options shall be presented to the owner for consideration.

3.14 CLEANING

A. When all work has been finally tested, the Contractor shall clean all fixtures, equipment, conduits, ducts, and all exposed work. All cover plates and other finished products shall be thoroughly cleaned.

3.15 VANDAL RESISTANT DEVICES

A. Where vandal resistant screws or bolts are employed on the project, deliver to the Owner 2 suitable tools for use with each type of fastener used, and 25 percent spare fasteners.

B. Proof of delivery of these items to the Owner shall be included in the Operating and Maintenance Manuals.

3.16 INSTRUCTION MANUALS

A. The Contractor shall provide three (3) operating and maintenance instruction manuals on all systems and equipment installed in the electrical work.

B. The Contractor shall provide (3) copies of all warranties and guarantees for systems, equipment, devices, and materials.

C. Final Payment will be withheld until A & B are delivered.

3.17 CONTRACTOR SPECIAL NOTE

A. The Contractor is again cautioned to refer to all parts of these Specifications and all Drawings, not just electrical sections, and the individual cross references made to other standard specifications or details describing any electrical work, which may be required under these other sections. The Contractor is cautioned to note carefully any other sections which may reference electrical work in order for this Contractor to fully understand the wiring requirements and electrical work that is required. Any conflicts found between the electrical sections of these Specifications or Drawings shall be immediately directed to the General Contractor for clarification.

B. These Specifications and the electrical Drawings size equipment, wire, conduit, etc. based on the horsepower of motors and/or wattages of equipment as shown on the plans or specified herein. The Contractor shall install electrical raceways, conductors, fuses, safety switches, breakers, contactors, starters or any other electrical equipment with the capacities to suit the horsepower and/or wattages of the equipment actually furnished and installed. The Contractor shall not furnish or install any electrical raceways, conductors, safety switches, contactors or motor starters of sizes smaller than those shown on the Drawings or specified herein. The Contractor shall coordinate with the various sections of the Specifications and/or Drawings and with the various Sub-Contractors to provide the properly sized equipment without additional cost to the Owner.

END OF SECTION

SECTION 26 05 10 - UTILITY COORDINATION SERVICE ENTRANCE

PART 1 GENERAL

1.1 WORK INCLUDED

A. General: Electrical service shall be provided by local utility company. Provide infrastructure, conduit, ductbanks and pathways from public street right-of-way to building for telecommunications and cable service.

B. Power Company Data: Obtain from utility company information and installation standards for electrical, telecommunication, and cable service installation.

C. Responsibilities: Determine what equipment and labor is provided by utility company and what equipment and labor is required of this Contractor.

PART 2 PRODUCTS

2.1 PRIMARY SERVICE

A. General: Division 26 shall provide primary service conduit, manholes, and pull boxes as required and as specified for electrical service. Division 26 shall provide grounding rods, grounding conductors, sleeves, conduits, pull boxes and manholes as required by telecommunications and cable service providers.

B. Electric utility company shall provide transformer, primary cables, splices, terminations, and primary underground service conductors. Telecommunications and cable service utility companies shall provide cabling and connections to the Owner’s demarcation point of service.

2.2 SECONDARY SERVICE CABLE TAP BOXES

A. When required by local utility company contractor shall provide a NEMA-3R demarcation junction box per company standards.

2.3 SECONDARY SERVICE CONDUCTORS

A. General: Division 26 shall provide secondary service entrance conductors and conduit.

B. Where required by local utility standards provide in-grade pull boxes.

PART 3 EXECUTION

3.1 INSTALLATION

A. The installation of the service entrance provisions shall comply with the published standards and requirements of the utility company, the utility company’s specific construction requirements for this project, and with requirements of this Division.

B. Any failure to meet the standards and requirements shall be corrected to the satisfaction of the utility company and Owner without any additional cost to the Owner.

C. Contractor shall provide all construction materials and labor that the utility company determines to be the responsibility of the customer, at no additional cost to the Owner.

D. The materials and labor required by Contractor the for a complete installation shall be provided by the contractor and includes, but is not limited to permanent or removable /

lockable vehicular barriers, grounding rods, grounding conductors, sleeves, concrete pads, conduits, metering racks and metering enclosures.

E. Primary distribution poles and service entrance ductbank locations shall be staked and surveyed prior to pole installation by the Contractor to verify their proper placement is within the Owner's property and respective utility easements. Contractor shall verify by survey that the pole and service entrance ductbank location and easements do not interfere with existing easements, right-of-ways, or other restricted properties. Conflicts with existing easements and restrictions shall be brought to the attention of the Architect prior to construction.

F. Contractor shall initiate contact with the utility providers and Owner within 14 days of Notice to Proceed to ensure permanent power will be available to the site. Any delays resulting from lack of this coordination shall be the responsibility of the Contractor.

END OF SECTION 26 05 10

SECTION 26 05 19 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. building wires and cables rated 600V and less
   2. Connectors, splices and terminations rated 600 V and less
   3. Sleeves and sleeve seals for cables

1.3 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70- Latest edition as adopted by the LA state Fire Marshall or edition enforced by state and local code authority.

PART 2 PRODUCTS

2.1 CONDUCTORS AND CABLES

A. Refer to Part 3.1 "Conductor and Insulation Applications" Article for insulation type, cable construction, and ratings.

B. Conductor Material: Copper unless indicated otherwise on Drawings; stranded conductor or solid conductor for No. 10 AWG and smaller, stranded for No. 8 AWG and larger.

C. Conductor Insulation Types: Comply with NEMA WC 70 for Types THHN-THWN, and SO as indicated.

D. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

E. Conductor Temperature Rating: Provide conductors with 75 degree C rating. For high temperature applications, provide conductors with temperature ratings in accordance with NFPA 70 for ambient condition.

PART 3 EXECUTION

3.1 CONDUCTOR AND INSULATION APPLICATIONS

A. Service Entrance: Type THHN-THWN, single conductors in raceway.

B. Exposed Feeders: Type THHN-THWN, single conductors in raceway.

C. Feeders Concealed in Ceilings, Walls, and Partitions: Type THHN-THWN, single conductors in raceway.

D. Feeders Concealed in Concrete, below Slabs-on-Grade, and in Crawlspaces: Type THHN-

THWN, single conductors in raceway.

E. Exposed Branch Circuits, including in Crawlspaces: Type THHN-THWN, single conductors in raceway.

F. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN-THWN, single conductors in raceway .

G. Branch Circuits Concealed in Concrete and below Slabs-on-Grade: Type THHN-THWN, single conductors in raceway.

H. Branch Circuits Installed below Raised Flooring: Type THHN-THWN, single conductors in raceway.

I. Fire Alarm Cabling: Plenum rated. Secured per NFPA 70-760.

J. Contractor to provide metal raceway in Patient Care Areas per 517.13. Raceway shall be installed as a redundant ground.

K. Combining of more than three circuits in a conduit is not allowed. IE no more than three phase conductors.

L. Single Phase Circuits: Provide a dedicated neutral. Sharing of neutrals is not allowed.

M. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel,wire-mesh, strain relief device at terminations to suit application.

3.2 INSTALLATION

A. Conceal cables in finished walls, ceilings, and floors, unless otherwise indicated.

B. Run feeders in continuous lengths, without joints or splices. Where continuous runs are impractical; obtain Engineer’s approval for splice locations and application.

C. Make joints in branch circuits only where circuits divide.

D. Do not use gutters of panelboards as raceways, junction boxes, or pull boxes for conductors not terminating in said panelboards.

E. Run conduits for emergency power conductors separate from all other wiring.

F. Bundling Conductors: Bundle conductors in switchboards, panelboards, cabinets, and the like, using nylon ties made for the purpose. Bundle conductors larger than No. 10 in individual circuits. Smaller conductors may be bundled in larger groups.

G. Terminations of multiple branch circuit conductors on a single circuit breaker is not acceptable.

H. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours. Install all conductors in raceways, unless specifically noted otherwise.

I. Support cables according to Section 26 01 00 "Basic Electrical Requirements."

J. Identify and color-code conductors and cables according to Section “Identification for Electrical Equipment”

K. Sizes:

1. Provide conductors no smaller than No. 12 AWG, except for signal or control circuits.
2. Use #10 AWG conductors for 20 amperage 120V circuits when the circuit conductors are longer than 75 feet.
3. Use #10 AWG conductors for 20 amperage 277V circuits when the circuit conductors are longer than 200 feet.
4. Provide neutral conductors of the same size as the phase conductor(s) for individual branch circuit homeruns.

3.3 WIRE PULLING

A. Pull no conductors into conduits until all Work of a nature which may cause injury to conductors is completed.

B. Follow manufacturers' recommendations for regulating temperature conditions of conductors prior to installation.

C. Exercise care in handling and installing cables to avoid damage. Carefully form cables in equipment pull boxes. Form bends in cables larger than the minimum radii shown in the cable manufacturer's published data for minimum bends such that bends will not reduce the cable life.

D. Provide suitable installation equipment to prevent abrasion and cutting of conductors by raceways during the pulling of conductors. Use ropes of polyethylene, nylon or other suitable non-metallic material to pull in feeders. Metallic ropes are prohibited.

E. Before any wire is pulled into any conduit, thoroughly swab the conduit to remove all foreign material and to permit the wire itself to be pulled into a clean, dry conduit.

F. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

G. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

3.4 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B

B. Wiring at Outlets: Install conductor at each outlet, with at least 6 inches (150 mm) of slack.

C. Provide temperature ratings of connectors and splices to match wire rating.

END OF SECTION 26 05 19

SECTION 26 05 26 - GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.1 SUMMARY

A. NFPA 70 and IEEE C2 include basic grounding requirements for electrical safety. This Section supplements the minimum safety requirements of the Code with requirements for additional grounding and with optional grounding methods and materials for both power and electronic systems.

B. This Section includes methods and materials for grounding systems and equipment, plus the following special applications:
   1. Underground distribution grounding.
   2. Common ground bonding with lightning protection system.

C. Related Sections include the following:
   1. Division 26 Section 26 41 13 "Lightning Protection Devices " for common ground bonding with lightning protection system.

1.2 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with UL 467 for grounding and bonding materials and equipment.

C. Comply with NFPA 70

D. Comply with IEEE C2

E. Comply with ANSI/EIA/TIA-607

PART 2 PRODUCTS

2.1 CONDUCTORS

A. Insulated Conductors: Copper wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction.

B. Bare Copper Conductors:
   1. Solid Conductors: ASTM B 3.
   2. Stranded Conductors: ASTM B 8.
   3. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG conductor, 1/4 inch (6 mm) in diameter.
   4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.
   5. Bonding Jumper: Copper tape, braided conductors, terminated with copper ferrules; 1-5/8 inches (41 mm) wide and 1/16 inch (1.6 mm) thick.
   6. Tinned Bonding Jumper: Tinned-copper tape, braided conductors, terminated with copper ferrules; 1-5/8 inches (41 mm) wide and 1/16 inch (1.6 mm) thick.
   7. Main Bonding Jumper: stranded copper conductors sized as indicated on Drawings.
   8. Grounding Electrode Conductor: stranded copper conductors sized as indicated on Drawings.
   9. Common Grounding Electrode Conductor: stranded copper conductors sized as indicated on Drawings.

C. Grounding Bus: Rectangular bars of annealed copper, 1/4 by 4 inches (6 by 100 mm) in cross section, unless otherwise indicated; with insulators. Length as indicated on Drawings.

2.2 CONNECTORS

A. Listed and labeled by a nationally recognized testing laboratory acceptable to authorities having jurisdiction for applications in which used, and for specific types, sizes, and combinations of conductors and other items connected.

B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, bolted pressure-type, with at least two bolts.
   1. Pipe Connectors: Clamp type, sized for pipe.

C. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.3 GROUNDING ELECTRODES

A. Ground Rods: Copper-clad steel; 3/4 inch (19 mm) diameter by 120 inches (3000 mm) long, unless otherwise indicated.

PART 3 EXECUTION

3.1 APPLICATIONS

A. Conductors: Install insulated solid conductor for No. 10 AWG and smaller, and insulated stranded conductors for No. 8 AWG and larger, unless otherwise indicated.

B. Underground Grounding Conductors: Install bare copper conductor, No. 3/0 AWG minimum, unless otherwise indicated.
   1. Bury at least 30 inches (762 mm) below grade.
   2. Duct-Bank Grounding Conductor: Bury 12 inches above duct bank when indicated as part of duct bank installation.

C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.

D. Grounding Bus: Install in electrical and telephone/communications equipment rooms, in rooms housing service equipment, and elsewhere as indicated.
   1. Install bus on insulated spacers 1 inch (25 mm), minimum, from wall 6 inches (150 mm) above finished floor, unless otherwise indicated.
   2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, down to specified height above floor, and connect to horizontal bus.

E. Conductor Terminations and Connections: Use the following connectors styles, unless otherwise indicated.
   1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
   2. Underground Connections: Exothermic Welded connectors, except at test wells and as otherwise indicated.
   3. Connections to Ground Rods at Test Wells: Bolted connectors.
   4. Connections to Structural Steel: Exothermic Welded connectors.
   5. Connections to Ufer Ground: Exothermic Welded connectors.

F. Comply with ANSI-607 requirements for telephone/communications grounding riser
   1. Provide independent, fully-sized grounding pathway to each telecommunication branch

closets.

2. Interconnect vertical grounding risers horizontally at a minimum of every three floors, unless indicated otherwise.

3.2 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

A. Comply with IEEE C2 grounding requirements.

B. Grounding Handholes: Install a driven ground rod through handhole floor, close to wall, and set rod depth so 4 inches (100 mm) will extend above finished floor. If necessary, install ground rod before handhole/manhole is placed and provide No. 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches (50 mm) above to 6 inches (150 mm) below concrete. Seal floor opening with waterproof, nonshrink grout.

C. Pad-Mounted Transformers and Switches: The following is a minimum if the utility company

does not have requirements, otherwise meet the utility company requirements. Install two ground rods and a ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with transformer, switch, or substations by connecting them to underground cable and grounding electrodes. Install tinned-copper conductor not less than No. 2 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 6 inches (150 mm) from the edge of foundation.

D. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with No. 4 AWG minimum, stranded, hard-drawn copper bonding conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields as recommended by manufacturer of splicing and termination kits

3.3 EQUIPMENT GROUNDING

A. Install insulated equipment grounding conductors with all feeders and branch circuits.
   1. Bond to each device, box, or luminaire, unless otherwise indicated.
   2. Conductor insulation of the same rating as the phase conductors, for all feeders and branch circuits. Install the grounding conductors in the raceway with related phase and neutral conductors.
   3. Where parallel conductors in separate raceways occur, provide a grounding conductor in each raceway that meets requirements of NFPA 70.

B. Dry-Type Transformers: Install an insulated grounding conductor from the common point of connection of the transformer secondary neutral point and the transformer enclosure to the following:
   1. The nearest grounding electrode per NFPA 70, including but not limited to building steel where available.
   2. The grounding bus of the common electrode grounding system, located in the electrical equipment room.

C. Enclosures: Install an insulated grounding conductor from grounding bushings to the frame of the enclosure, ground bus, and equipment grounding strap where each occurs. Install grounding bushings on all raceways terminating within electrical enclosures constructed of separate enclosure panels, which are not integrally welded together.

D. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-

mounted electrical devices operating at 120 V and more, including but not limited to air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.

E. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

F. Signal and Communication Equipment: For telephone, alarm, voice and data, and other communication equipment, provide No. 4 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.
   1. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 1/4-by-4 (6-by-1000) grounding bus.
   2. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.

3.4 INSTALLATION

A. Provide permanent service neutral and equipment grounding in accordance with NFPA 70 and subject to the following additional requirements.

B. Grounding Conductors: Route along shortest and straightest paths possible, unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

C. Comply with mounting and support requirements specified in Division 26 Section "Hangers and Supports for Electrical Systems."

D. Connect the service neutral and equipment ground to a common point within the metallic enclosure containing the main service disconnecting means. Equipment grounds and the identified neutral of the wiring system shall not be interconnected beyond this point in the interior wiring system. From the common point of connection of the service neutral and the equipment ground, run in non-magnetic conduit a grounding electrode conductor without joint or splice to the grounding electrode system and connect it with an approved bolted pressure clamp.

E. Common Ground Bonding with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in conduit.

F. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance, except where routed through short lengths of conduit.
   1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
   2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install so vibration is not transmitted to rigidly mounted equipment.
   3. Use exothermic-welded connectors for outdoor locations, but if a disconnect-type connection is required, use a bolted clamp.
   4. Where expansion joints or telescoping joints occur, provide bonding jumpers.

G. Grounding and Bonding for Piping:
   1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes, using a bolted clamp connector or by bolting a lug-type connector to a pipe flange, using

one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.

2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

H. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install bonding jumper to bond across flexible duct connections to achieve continuity.

I. Ground Rods: Drive rods until tops are 12 inches (50 mm) below finished floor or final grade, unless otherwise indicated.
1. Interconnect ground rods with grounding electrode conductor a minimum of 30-inches below grade unless otherwise indicated. Make connections without exposing steel or damaging coating, if any.
2. For grounding electrode system, install at least three rods spaces at least two-rod lengths from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor. Refer to plans for details.

J. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes are specified in Division 26 Section "Underground Ducts and Raceways for Electrical Systems," and shall be at least 12 inches (300 mm) deep, with cover.
1. Test Wells: Install at least three test wells for each service, unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.

K. Grounding for Steel Building Structure: Install a driven ground rod at base of each corner column and at intermediate exterior columns at distances not more than 60 feet (18m) apart.

L. Ufer Ground (Concrete-Encased Grounding Electrode): Fabricate according to NFPA 70, using a minimum of 20 feet (6 m) of bare copper conductor not smaller than No. 4 AWG.
1. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building grounding grid or to grounding electrode external to concrete.

3.5 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components as specified in Division 26 Section "Identification for Electrical Systems."

3.6 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare certified test reports:
1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
2. Test completed grounding system at each location where a maximum at service disconnect enclosure grounding terminal, at ground test wells, at individual ground rods and locations where a ground-resistance level is specified,. Make tests at ground rods before any conductors are connected.
a. Measure ground resistance not less than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
b. Perform tests by fall-of-potential method according to IEEE 81.

3. Prepare dimensioned drawings locating each test well, ground rod and ground rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location, and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.
4. Tests for patient-care areas: In addition to the test listed above, perform additional field tests and inspections for patient care areas.
    a. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements. Perform the following tests:
        1) Impedance: Measurement shall be made between the reference point and the grounding contact of all receptacles in the patient care room. The maximum limit allowed is 0.1 ohms.
        2) Voltage: Measurement shall be made under no-fault conditions between a reference point and all exposed fixed electrical equipment with conductive surfaces in the patent care vicinity, including but not limited to: overbed wall- mounted fixtures, ceiling mounted exam lights, sensor faucets, etc. The maximum limit allowed is 20mV.
    b. Prepare certified test reports in compliance with NFPA 99 and submit reports in conjunction with field quality control reports required in Division 26 Section "Wiring Devices". Utilize the Patient Care Area Electrical Testing Form in the Appendix of this section for each patient care area.

B. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Architect promptly and include recommendations to reduce ground resistance.
1. Report measured ground resistances that exceed the following values:
    a. Building's Grounding Triad: 2 ohms or less.
    b. Power and Lighting Equipment or System with Capacity 500 kVA and Less: 10 ohms.
    c. Power and Lighting Equipment or System with Capacity 500 to 1000 kVA: 5 ohms.
    d. Power and Lighting Equipment or System with Capacity More Than 1000 kVA: 3 ohms.
    e. Power Distribution Units or Panelboards Serving Electronic Equipment: 1 ohm(s).
    f. Substations and Pad-Mounted Equipment: 5 ohms.
    g. Manhole/Handhole Grounds: 10 ohms.

C. Correct Deficiencies, Retest and Report:
1. Correct unsatisfactory conditions, and retest to demonstrate compliance; replace conductors, units, and rods as required to bring system into compliance.
2. Prepare a report, certified by testing agency, which identifies components checked and describes results. Include notation of deficiencies detected, remedial action taken, and observations and test results after remedial action.

END OF SECTION 26 05 26

SECTION 26 05 29 - HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Hangers and supports for electrical equipment and systems.
   2. Construction requirements for concrete bases.

B. Related Sections include the following:
   1. Division 26 Section 26 05 48 "Vibration and Seismic Controls For Electrical Systems" for products and installation requirements necessary for compliance with seismic criteria.

1.3 DEFINITIONS

A. EMT: Electrical metallic tubing.

B. FMC: Flexible metal conduit.

C. RMC: Rigid metal conduit.

D. RAC: Rigid aluminum conduit.

E. RNC: Rigid nonmetallic conduit.

F. RSC: Rigid Steel conduit.

1.4 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design supports for multiple raceways, raceways using NFPA 70 criteria and performance requirements and design criteria indicated.
   1. Design supports for multiple raceways capable of supporting combined weight of supported systems and its contents.
   2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

B. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of five times the applied force.

1.5 SUBMITTALS

A. Product Data: For the following:
   1. Steel slotted support systems.
   2. Nonmetallic slotted support systems.

B. Shop Drawings: Show fabrication and installation details and include calculations for the following:
   1. Trapeze hangers. Include Product Data for components.
   2. Steel slotted channel systems. Include Product Data for components.
   3. Nonmetallic slotted channel systems. Include Product Data for components.

4. Equipment supports.
5. Concrete Based for Equipment.

C. Welding certificates.

1.6 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Comply with NFPA 70.

1.7 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

PART 2 PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Allied Tube & Conduit.
b. Cooper B-Line, Inc.; a division of Cooper Industries.
c. ERICO International Corporation.
d. GS Metals Corp.
e. ABB Corporation
f. Unistrut; Tyco International, Ltd.
g. Wesanco, Inc.
2. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
3. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.
4. Channel Dimensions: Selected for applicable load criteria.

B. Nonmetallic Slotted Support Systems: Structural-grade, factory-formed, glass-fiber-resin channels and angles with 9/16-inch- (14-mm-) diameter holes at a maximum of 8 inches (200 mm) o.c., in at least 1 surface.
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Allied Tube & Conduit.
b. Cooper B-Line, Inc.; a division of Cooper Industries.
c. Fabco Plastics Wholesale Limited.
d. Seasafe, Inc.
2. Fittings and Accessories: Products of channel and angle manufacturer and designed for use with those items.
3. Fitting and Accessory Materials: Same as channels and angles, except metal items may be stainless steel.
4. Rated Strength: Selected to suit applicable load criteria.

C. Device Box Mounting Brackets and Stabilizer: Factory-fabricated sheet steel brackets for support of device boxes adjacent to or between studs.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

D. Through-Stud Cable and Raceway Support Clips: Factory-fabricated spring steel clip for cables or raceways where run horizontally through metal studs.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

E. Roof-mounted Raceway Support Blocking: Factory-fabricated support blocking for use under roof-mounted raceways. Wedge-shaped blocking constructed of 100% recycled UV-resistant Rubber with integral galvanized steel strut to accept raceway support clips.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

F. Tee Bar Grid Box Hanger: Factory-fabricated metal electrical box hanger for supporting boxes at locations between ceiling system t-grid components. Height adjustable for various electrical box depths. Attached to ceiling tee bar with screws or integral clamp for stability. Includes tab for independent support wire attachment.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

G. Raceway and Cable Supports: As described in NECA 1 and NECA 101.

H. Conduit and Cable Support Devices: Steel and malleable-iron hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

I. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

J. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
   1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
      a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
         1) Hilti Inc.
         2) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
         3) MKT Fastening, LLC.
         4) Simpson Strong-Tie Co., Inc.; Masterset Fastening Systems Unit.
   2. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel, for use in

hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1) Cooper B-Line, Inc.; a division of Cooper Industries.
   2) Empire Tool and Manufacturing Co., Inc.
   3) Hilti Inc.
   4) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
   5) MKT Fastening, LLC.

3. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
6. Toggle Bolts: All-steel springhead type.
7. Hanger Rods: Threaded steel.

2.2 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Division 05 Section 05 50 00 "Metal Fabrications" for steel shapes and plates.

PART 3 EXECUTION

3.1 APPLICATION

A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.

B. Maximum Horizontal and Vertical Support Spacing for Raceway(s): Space supports for EMT, IMC, and RMC as required by NFPA 70, but in no case less than listed below:
1. For raceways 1" diameter and larger, provide one hanger at 8'-0" on center.
2. For raceways less than 1" diameter, provide one hanger at 5'-0" on center.

C. Minimum Hanger Rod Size for Raceway Supports: Minimum rod size shall be 1/4 inch (6 mm) in diameter.

D. Single Raceways or Cables:
1. For Raceways 1-1/4-inch (32mm) and smaller: Install adjustable steel band hanger suspended on threaded rod.
2. For Raceways larger than 1-1/4-inch (30mm): Install trapeze-type supports fabricated with steel slotted support system suspended on threaded rods. Size trapeze members, including the suspension rods, based on the support required for the size, and loaded weight of the conduits.
   a. Secure raceway or cable to support with two-bolt conduit clamps or single-bolt conduit clamps using spring friction action for retention in support channel.

E. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted or other support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.
1. Secure raceways and cables to these supports with two-bolt conduit clamps or single-bolt conduit clamps using spring friction action for retention in support channel.

F. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

G. Corrosive Areas: Provide non-metallic slotted support systems for supports installed in corrosive areas. Corrosive areas include, but are not limited to the following:
   1. Pools and Pool Equipment Areas. (Rod shall be all threaded aluminum)
   2. Within 25-feet (7.62-m) of Cooling Towers and Air Cooled Chillers.

3.2 SUPPORT INSTALLATION

A. Comply with NFPA 70, NECA 1 and NECA 101 for installation requirements except as specified in this Article.

B. Raceway Support Methods: In addition to methods described in NECA 1, EMT RMC EMT, RAC, and RMC may be supported by openings through structure members, as permitted in NFPA 70.

C. Fasten junction, pull and devices boxes securely to the building construction, independent of raceway system.

D. Install Device Box Mounting Brackets supported between two studs. Do not attached Receptacle boxes directly to a single stud.

E. Install Through-Stud Cable and Raceway Support Clips where cables or raceways run horizontally through metal studs.

F. Support raceways at a distance above suspended ceilings to permit removal of ceiling panels and luminaires.

G. Locate raceways so as not to hinder access to mechanical equipment.

H. Do not secure conductors, raceways, or supports to suspended ceiling hanger rods or wires.

I. Install Tee Bar Grid Box Hanger supported between two ceiling grid tee bars where devices boxes are located flush in recessed suspended ceilings.
   1. Install at least one independent support rod from box hanger to structure.

J. Install Roof-mounted Raceway Support Blocking where raceways run on across roofing.
   1. Coordinate installation of roof supports with items specified in Division 07 Section "Roof Accessories." Provide products compatible with rooftop materials included in the Work.

K. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb.

L. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
   1. To Wood: Fasten with lag screws or through bolts.
   2. To New Concrete: Bolt to concrete inserts.
   3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
   4. To Existing Concrete: Expansion anchor fasteners.
   5. Instead of expansion anchors, powder-actuated driven threaded studs provided with

lock washers and nuts may be used in existing standard-weight concrete 4 inches thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches thick.

6. To Steel: Beam clamps (MSS Type 19, 21, 23, 25, or 27) complying with MSS SP-69 or Spring-tension clamps.
7. To Light Steel: Sheet metal screws.
8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate.

M. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Division 05 Section 05 50 00 "Metal Fabrications" for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.4 CONCRETE BASES

A. Construct concrete bases of dimensions indicated but not less than 4 inches larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

B. Use 3000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 Section "Cast-in-Place Concrete." Bagged ready mix is not acceptable.

C. Anchor equipment to concrete base.

1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
2. Install anchor bolts to elevations required for proper attachment to supported equipment.
3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.5 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Touchup: Comply with requirements in Division 09 painting Section 09 91 23 for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION 26 05 29

SECTION 26 05 33 - RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes raceways, fittings, boxes, enclosures, and cabinets for electrical wiring.

B. Related Sections include the following:
   1. Refer to architectural for firestopping materials and installation at penetrations through walls, ceilings, and other fire-rated elements.
   2. "Basic Electrical Materials and Methods" for supports, anchors, and identification products.
   3. "Wiring Devices" for devices installed in boxes and for floor-box service fittings.

1.3 DEFINITIONS

A. EMT: Electrical metallic tubing.

B. FMC: Flexible metal conduit.

C. LFMC: Liquidtight flexible metal conduit.

D. RNC: Rigid nonmetallic conduit, underground only.

1.4 SUBMITTALS

A. Product Data: For surface raceways, floor boxes, and cabinets.

B. Shop Drawings: For the following raceway components. Include plans, elevations, sections, details, and attachments to other work.
   1. Custom enclosures and cabinets.

C. Coordination Drawings: Submit Coordination Drawings in accordance with Division 26 Section “Basic Electrical Requirements”. Include the following:
   1. Raceway routing plans, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
      a. Proposed cable pull points.
      b. Structural members in the paths of conduit groups with common supports.
      c. HVAC, plumbing items, and architectural features in the paths of conduit groups.
      d. Proposed splice locations.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70-Latest edition or edition enforced by state and local code authority.

1.6 COORDINATION

A. Coordinate layout and installation of raceways, boxes, enclosures, cabinets, and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

PART 2 PRODUCTS

2.1 METAL WIREWAYS

A. Material and Construction: Sheet metal sized and shaped as indicated.
   1. Indoors: NEMA-1
   2. Indoors Pool Environment: NEMA-4X (Fiberglass)
   3. Outdoors: NEMA-3R Stainless Steel

B. Fittings and Accessories:

1. Include couplings, offsets, elbows, expansion joints, adapters, hold- down straps, end caps, and other fittings to match and mate with wireways as required for complete system.

2. Provide spring nuts or guards on all screws installed toward the inside to prevent wire insulation damage.

C. Select features, unless otherwise indicated, as required to complete wiring system and to comply with NFPA 70 and UL 870.

D. Wireway Covers:
   1. Hinged type unless access restrictions require screw-cover type.
   2. Flanged-and-gasketed as required for NEMA type

E. Finish: Manufacturer's standard enamel finish.

2.2 BOXES, ENCLOSURES, AND CABINETS

A. Floor Boxes: Cast metal, fully adjustable, rectangular with four separate wiring compartments for power outlets, phone and data outlets as indicated on the drawing. The minimum size shall allow for devices, refer to drawings and provide larger boxes where indicated.
   1. Provide products by the following manufactures or submit prior approval for equals.
      a. Legrand Evolution EFB45
   2. Covers shall be UL Listed to U.S. and Canadian safety standards for tile, carpet, wood, bare concrete and terrazzo floors.
   3. Covers shall be selected by the architect.

B. Poke Thru Floor Boxes: Two hour rated poke thru floor unit with capabilities of four power receptacles and four communication outlets. The minimum size shall allow for four devices, refer to drawings and provide larger boxes where indicated. Provide power , data and phone outlets indicated on drawing.
   1. Provide products by the following manufactures or submit prior approval for equals.
      a. Legrand Wiremold 6AT
      b. Hubbell SystemOne
   2. Covers shall be selected by the architect.
   3. Poke thru floor boxes are to be utilized on upper floors unless noted otherwise. There must be accessibility in the space below the poke thru box.

C. Sheet Metal Pull and Junction Boxes: NEMA OS 1.

D. Cast-Metal Pull and Junction Boxes: NEMA FB 1, cast aluminum, type FD with gasketed cover.

E. Hinged-Cover Enclosures: NEMA 250, Type 1, with continuous hinge cover and flush latch.
   1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
   2. Nonmetallic Enclosures: Plastic, finished inside with radio-frequency-resistant paint.

F. Cabinets:
   1. NEMA 250, Type 1, galvanized steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
   2. Hinged door in front cover with flush latch and concealed hinge.
   3. Key latch to match panelboards.
   4. metal barriers to separate wiring of different systems and voltage and
   5. Accessory feet where required for freestanding equipment.

G. In Grade Enclosures, Boxes And Covers:
   1. required to conform to all test provisions of the most current ANSI/SCTE 77 for Tier 22 applications.
   2. When multiple “Tiers” are specified the boxes must physically accommodate and structurally support compatible covers while possessing the highest Tier rating.
   3. All covers are required to have the Tier level rating embossed on the surface. In no assembly can the cover design load exceed the design load of the box.
   4. Cover to be labeled per use of box, ie “Electrical, Communications, etc”. Communications pull boxes shall be a minimum of 24"W X 36"L X 36 “D.

2.3 FACTORY FINISHES

A. Finish: For raceway, enclosure, or cabinet components, provide manufacturer's standard prime- coat finish ready for field painting.

2.4 METAL CONDUIT AND TUBING

A. Rigid Steel Conduit: Comply with ANSI C80.1 and UL 6; Galvanized rigid steel, each length with a coupling on one end and thread protector on opposite end.

B. Aluminum Rigid Conduit: Comply with ANSI C80.5 and UL 6A; Rigid aluminum, each length with a coupling on one end and thread protector on opposite end.

C. EMT and Fittings: ANSI C 80.3 and UL 797

D. FMC: Aluminum

E. LFMC: Comply with UL 360; Flexible steel conduit with neoprene jacket and copper grounding strand.

F. Fittings for RMC and RAC : Provide factory made threaded couplings of same material as the conduit.
   1. Molded thermoplastic insulating bushing at all boxes and cabinets, with locknuts inside and outside box or cabinet. In wet locations, provide watertight hubs for conduit entry into enclosures.
   2. Thermoplastic insulated grounding bushing on all conduits where grounding bushings are required, with locknuts inside and outside the enclosure. In wet locations provide watertight hubs for conduit entry into enclosures.

G. Fittings for EMT:
   1. Steel, set-screw or compression couplings.
   2. Steel, set-screw or compression insulated throat box connectors with molded thermoplastic insulating bushing at all boxes and cabinets, with locknuts inside box or cabinet.
   3. Steel, set-screw or compression insulated throat box connectors with thermoplastic

insulated grounding bushing on all tubing where grounding bushings are required.
4. Insulated throat material for fittings to be of a color that is easily distinguishable; clear thermoplastic throats are not acceptable.

H. Fittings for RMC and LFMC:
1. Adapters at connections between flexible and rigid conduit.
2. Thermoplastic insulated throat, steel connectors at box or cabinet terminations.
3. Insulated throat material for fittings to be of a color that is easily distinguishable; clear thermoplastic throats are not acceptable.

I. Fittings for Conduit (Including all Types and Flexible and Liquidtight), EMT, and Cable:NEMA FB 1; listed for type and size raceway with which used, and for application and environment in which installed.

J. Joint Compound for RMC: Listed for use in cable connector assemblies, and compounded for use to lubricate and protect threaded raceway joints from corrosion and enhance their conductivity.

PART 3 EXECUTION

3.1 RACEWAY APPLICATION

A. Outdoors:
1. Exposed: RAC,
2. Concealed: RMC.
3. Underground, Single Run: RNC.
4. Underground, Grouped: RNC.
5. Emergency Feeders: RAC
6. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.
7. Boxes and Enclosures: NEMA 250, Type 3R, unless otherwise indicated.

B. Indoors:
1. Exposed, Not Subject to Physical Damage: EMT.Concealed: EMT.
2. Exposed and Subject to Physical Damage: RMC. Includes, but is not limited to, raceways in the following locations:
a. Loading dock
b. Areas used for traffic of mechanized carts, forklifts, and pallet-handling units.
3. Concealed within Masonry Walls: RMC
4. Concealed under Raised Floors: EMT or LFMC.
5. Elevator Pits: RAC, RMC, or LFMC.
6. Emergency feeders and branch circuits: EMT
7. Conductors over 600 volts: RMC.
8. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC; except use LFMC in damp or wet locations.
9. Damp or Wet Locations above Ground: RAC,
10. Boxes and Enclosures: NEMA 250, Type 1, except as follows:
a. Damp or Wet Locations: NEMA 250, Type 4, stainless steel.

C. Minimum Raceway Size:
1. Branch Circuits:3/4-inch (21mm) trade size
2. Feeder Circuits: 3/4-inch (21mm)

D. Provide minimum 1/2-inch (16-mm) conduit for controls circuiting.

E. Raceway Fittings: Compatible with raceways and suitable for use and location.

1. RAC and RMC: Use threaded fittings, unless otherwise indicated.

F. Contractor to provide metal raceway in Patient Care Areas per 517.13. Raceway shall be installed as a redundant ground. Raceway shall be a considered a ground and an equipment grounding conductor shall be provided.

G. Magnetic Resonance Imaging (MRI) Environments: Provide aluminum raceways, boxes, supports and fittings within RF shielding. All fittings and supports in area shall be nonferrous.

H. Junction and Pull Boxes: Sheet steel boxes, unless noted or required otherwise.
1. Provide boxes no smaller than 4 inches square and 1-1/2 inches deep.
2. Size all junction and pull boxes in accordance with the NFPA 70, unless project conditions dictate use of larger boxes.

I. Outlet and Device Boxes: Sheet steel boxes, unless noted or required otherwise.
1. For Lighting Fixture Outlets: 4 inch square with raised fixture ring.
2. For Wall Switches, Receptacles, and Communication Use: 4 inch square, one-piece. Use boxes with plaster rings in all plastered walls where wall thickness permits. Use boxes less than 1-1/2 inch deep only in locations where deep boxes cannot be accommodated by construction.
3. Boxes Used Outdoors or in Damp/Wet Locations: Cast metal boxes with gasketed covers and threaded hubs.

3.2 INSTALLATION

A. Install raceways a minimum of 6-inches (150 mm) away from parallel runs of flues, steam pipes,hot-water pipes, and other objects operating at high temperatures

B. Install horizontal raceway runs above water and steam piping. Install raceways a minimum of 2-inch (50.8-mm) from pipe insulation.

C. Complete raceway installation before starting conductor installation.

D. Support raceways as specified in "Basic Electrical Requirements."

E. Install temporary closures to prevent foreign matter from entering raceways.

F. Recessed Boxes in Fire-Rated Partitions: For boxes located on opposite sides of same partition do not install boxes back-to-back; separate boxes with a minimum of 24 inch separation

G. Recessed Boxes in partitions around Acoustically-Sensitive Spaces: For boxes located on opposite sides of same partition do not install boxes back-to-back; separate boxes with a minimum of 24 inch separation. Acoustically-Sensitive Spaces include, but are not limited to,the following:
1. Conference Rooms, Meeting rooms and similar spaces.
2. Classrooms, Training Rooms and similar spaces.
3. Interview Rooms, Consultation Rooms and similar spaces.
4. Auditoriums, Lecture Rooms, and similar spaces.
5. Ballrooms, Private Dining, and similar spaces.
6. Exam rooms, MRI rooms, and similar spaces.

H. Do not install aluminum conduits in contact with concrete.

I. Make bends and offsets so ID is not reduced. Keep legs of bends in the same plane and keep straight legs of offsets parallel, unless otherwise indicated.

J. Conceal conduit:
   1. EMT shall be installed within finished walls, ceilings, and floors, unless otherwise indicated.
   2. Install concealed raceways with a minimum of bends in the shortest practical distance, considering type of building construction and obstructions, unless otherwise indicated.
   3. On concealed conduit systems where boxes are not otherwise accessible, set boxes flush with finished surfaces for access, and provide overlapping covers.

K. Raceways Embedded in Slabs: Install in middle 1/3 of slab thickness where practical and leave at least 2 inches (50 mm) of concrete cover.
   1. Secure raceways to reinforcing rods to prevent sagging or shifting during concrete placement.
   2. Space raceways laterally to prevent voids in concrete.
   3. Run conduit larger than 1-inch trade size (DN 27) parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support.

L. Install exposed raceways parallel or at right angles to nearby surfaces or structural members and follow surface contours as much as possible.
   1. Run parallel or banked raceways together on common supports.
   2. Make parallel bends in parallel or banked runs. Use factory elbows only where elbows can be installed parallel; otherwise, provide field bends for parallel raceways.

M. Join raceways with fittings designed and approved for that purpose and make joints tight.
   1. Use insulating bushings to protect conductors.

N. Terminations:
   1. Where raceways are terminated with locknuts and bushings, align raceways to enter squarely and install locknuts with dished part against box. Use two locknuts, one inside and one outside box.
   2. Where raceways are terminated with threaded hubs, screw raceways or fittings tightly into hub so end bears against wire protection shoulder. Where chase nipples are used, align raceways so coupling is square to box; tighten chase nipple so no threads are exposed.

O. Stub-up Connections:
   1. Extend conduits through concrete floor for connection to freestanding equipment. Install with an adjustable top or coupling threaded inside for plugs set flush with finished floor.
   2. Extend conductors to equipment with rigid steel conduit; FMC may be used 6 inches (150 mm) above the floor. Install screwdriver-operated, threaded plugs flush with floor for future equipment connections.
   3. Protect stub-ups from damage where conduits rise through floor slabs. Arrange so curved portions of bends are not visible above the finished slab.

P. Flexible Conduit Connections:
   1. Use minimum of 72 inches at final connections to equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
   2. Use LFMC in damp or wet locations subject to severe physical damage including mechanical equipment rooms, at motor or equipment locations at or near pumps, and when installed outdoors. Use LFMC in damp or wet locations not subject to severe physical damage.

Q. Install covers on junction boxes and conduit bodies after wiring and connections are completed.

R. Run conductors over 48 Volts in raceway, unless otherwise indicated.

S. Surface Raceways: Install a separate, green, ground conductor in raceways from junction box supplying raceways to receptacle or fixture ground terminals.

T. Pull Boxes:
   1. Install no more than the equivalent of three 90-degree bends and a maximum of 150 feet between pull points in any conduit run except for communications conduits, for which fewer bends are allowed.
   2. Provide boxes where shown and where necessary for the installation and pulling of cables and wires.

U. Pull Wires:
   1. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb (90-kg) tensile strength.
   2. Leave at least 12 inches (300 mm) of slack at each end of pull wire.

V. Install hinged-cover enclosures and cabinets plumb. Support at each corner.

3.3 PROTECTION

A. Provide final protection and maintain conditions that ensure coatings, finishes, and cabinets are without damage or deterioration at time of Substantial Completion.
   1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
   2. Repair damage to PVC by removing and replacing damaged portion of PVC with new.

3.4 CLEANING

A. After completing installation of exposed, factory-finished raceways and boxes, inspect exposed finishes and repair damaged finishes.

END OF SECTION 26 05 33

SECTION 26 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following:
   1. Conduit, ducts, and duct accessories for direct-buried and concrete-encased duct banks, and in single duct runs.
   2. Handholes and boxes.
   3. Manholes.

B. Related Sections include the following:
   1. Division 26 Section "Raceways and Boxes for Electrical Systems" for raceways, fittings, boxes, enclosures, and cabinets for electrical wiring.

1.2 DEFINITION

A. Duct: an underground raceway. This term may be used interchangeably with the term raceway.

B. Duct Bank: two or more raceways grouped together, irrespective of duct material or encasement material.

C. RMC: Rigid metal conduit.

D. RNC: Rigid nonmetallic conduit.

E. RSC: Rigid Steel conduit.

1.3 SUBMITTALS

A. Product Data: For the following:
   1. Duct-bank materials, including separators and miscellaneous components.
   2. Ducts and conduits and their accessories, including elbows, end bells, bends, fittings, and solvent cement.
   3. Accessories for manholes, handholes, boxes, and other utility structures.
   4. Warning tape.
   5. Warning planks.

B. Shop Drawings for Precast or Factory-Fabricated Underground Utility Structures: Include plans and elevations with dimensions and weights. Include sections, details, attachments to other work, and accessories, including the following:
   1. Duct entry provisions, including locations and duct sizes.
   2. Reinforcement details.
   3. Frame and cover design and manhole frame support rings.
   4. Ladder details.
   5. Grounding details.
   6. Dimensioned locations of cable rack inserts, pulling-in and lifting irons, and sumps.
   7. Joint details.

C. Shop Drawings for Factory-Fabricated Handholes and Boxes Other Than Precast Concrete: Include dimensioned plans, sections, and elevations, and fabrication and installation details, including the following:
   1. Duct entry provisions, including locations and duct sizes.
   2. Cover design.

3. Grounding details.
4. Dimensioned locations of cable rack inserts, and pulling-in and lifting irons.

D. Coordination Drawings: Submit Coordination Drawings including:
1. Duct-Bank, Manhole, and Handhole plans, sections and elevation profiles; on which the following items are shown and coordinated with each other, based on input from installers of the items invlolved:
a. Duct banks included in the Work. Denote duct routing including bends and locations of expansion fittings. Include system profiles and elevations.
b. Other utilities, underground structures, architectural features, and topographic elements in the paths of duct banks. Denote system profiles and elevations.
c. Precast or Factory-Fabricated Underground Utility Structures.
d. Factory-Fabricated Handholes and Boxes.

E. Product Certificates: For concrete and steel used in precast concrete manholes and handholes, as required by ASTM C 858.

1.4 QUALITY ASSURANCE

A. Comply with ANSI C2.

B. Comply with NFPA 70.

1.5 COORDINATION

A. Coordinate layout and installation of ducts, manholes, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field. Verify field measurements, routing and termination locations of duct bank prior to excavation for rough-in. Coordinate duct bank installation with underground Work and site Work and other site improvement Work specified in other Divisions.

B. Coordinate elevations of ducts and duct-bank entrances into manholes, handholes, and boxes with final locations and profiles of ducts and duct banks as determined by coordination with other utilities, underground obstructions, and surface features. Duct bank routing as indicated on the Drawings is the approximate location. Revise locations and elevations from those indicated as required to suit field conditions and to ensure that duct runs drain to manholes and handholes, and as approved by Engineer.

C. Accurately record actual routing of duct bank on Project record documents, and submit in accordance with Division 01.

PART 2 PRODUCTS

2.1 METAL CONDUIT AND DUCTS

A. RMC: Comply with ANSI C80.1 and UL 6; Galvanized rigid steel, each length with a coupling on one end and thread protector on opposite end.

B. Fittings for RMC: Provide factory made threaded couplings of same material as the conduit.
1. Molded thermoplastic insulating bushing at all boxes and cabinets, with locknuts inside and outside box or cabinet. In wet locations, provide watertight hubs for conduit entry into enclosures.
2. Thermoplastic insulated grounding bushing on all conduits where grounding bushings are required, with locknuts inside and outside the enclosure. In wet locations provide watertight hubs for conduit entry into enclosures.

2.2 NONMETALLIC CONDUIT AND DUCTS

A. RNC: Comply with NEMA TC 2 and UL 651, type EPC-40-PVC or type EPC-80-PVC as indicated.

B. Fittings for RNC: Comply with NEMA TC 3 and UL 514B.; match to conduit or tubing type and material.

2.3 DUCT ACCESSORIES

A. Duct Separators: Factory-fabricated rigid PVC interlocking spacers, sized for type and sizes of ducts with which used, and selected to provide minimum duct spacings indicated while supporting ducts during concreting or backfilling.

B. Corrosion Resistance Tape for RSC: 20 mil polyvinyl chloride (PVC) tape with a high-tack adhesive and pipe primer to provide a corrosion- and impact-resistant seal.

C. Warning Tape: Underground-line warning tape specified in Division 26 Section "Identification for Electrical Systems."

2.4 PRECAST CONCRETE HANDHOLES AND BOXES

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Christy Concrete Products.
2. Oldcastle Precast Group.
3. Riverton Concrete Products; a division of Cretex Companies, Inc.
4. Utility Concrete Products, LLC.
5. Hubbel

B. Comply with ASTM C 858 for design and manufacturing processes.

C. Description: Factory-fabricated, reinforced-concrete, monolithically poured walls and bottom unless open-bottom enclosures are indicated. Frame and cover shall form top of enclosure and shall have load rating consistent with that of handhole or box.
1. Frame and Cover: Weatherproof steel frame, with steel cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.
2. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
3. Cover Legend: Molded lettering, selected to suit system or as otherwise required.
   a. "ELECTRIC-LV" for duct systems with power wires and cables operating at 600 V and less.
   b. "ELECTRIC-HV" for duct systems with power wires and cables operating over 600 V.
   c. "SIGNAL" for communications, data, and telephone duct systems.
4. Configuration: Units shall be designed for flush burial and have integral closed bottom, unless otherwise indicated.
5. Extensions and Slabs: Designed to mate with bottom of enclosure. Same material as enclosure.
   a. Extension shall provide increased depth as required.
   b. Slab: Same dimensions as bottom of enclosure, and arranged to provide closure.
6. Handholes 12 inches wide by 24 inches long (300 mm wide by 600 mm long) and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

2.5 HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE

A. Description: Comply with SCTE 77.
1. Color: Gray for paved areas and Green for landscaped areas, unless otherwise

indicated.

2. Configuration: Units shall be designed for flush burial and have integral closed bottom, unless otherwise indicated.
3. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
4. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
5. Cover Legend: Molded lettering, selected to suit system or as otherwise required.
   a. Legend: "ELECTRIC-LV" for duct systems with power wires and cables operating at 600 V and less.
   b. Legend: "ELECTRIC-HV" for duct systems with power wires and cables operating over 600 V.
   c. Legend: "SIGNAL" for communications, data, and telephone duct systems.
6. Handholes 12 inches wide by 24 inches long (300 mm wide by 600 mm long) and larger shall have factory-installed inserts for cable racks and pulling-in irons.

B. Polymer Concrete Handholes and Boxes with Polymer Concrete Cover: Molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two.
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Armorcast Products Company.
   b. Carson Industries LLC.
   c. CDR Systems Corporation.
   d. NewBasis.

2.6 UTILITY STRUCTURE ACCESSORIES

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Bilco Company (The).
2. Campbell Foundry Company.
3. Christy Concrete Products.
4. East Jordan Iron Works, Inc.
5. Neenah Foundry Company.
6. NewBasis.
7. Oldcastle Precast Group.
8. Osburn Associates, Inc.
9. Pennsylvania Insert Corporation.
10. Riverton Concrete Products; a division of Cretex Companies, Inc..
11. Strongwell Corporation; Lenoir City Division.
12. Underground Devices, Inc.
13. Utility Concrete Products, LLC.

B. Manhole Frames, Covers, and Chimney Components: Comply with structural design loading specified for manhole.
1. Frame and Cover: Weatherproof, gray cast iron complying with ASTM A 48/A 48M, Class 30B or cast aluminum with milled cover-to-frame bearing surfaces; diameter, 29 inches (737 mm).
   a. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
   b. Special Covers: Recess in face of cover designed to accept finish material in paved areas.
2. Cover Legend: Cast in. Selected to suit system.
   a. Legend: "ELECTRIC-LV" for duct systems with power wires and cables for systems operating at 600 V and less.
   b. Legend: "ELECTRIC-HV" for duct systems with medium-voltage cables.

c. Legend: "SIGNAL" for communications, data, and telephone duct systems.

3. Manhole Chimney Components: Precast concrete rings with dimensions matched to those of roof opening.
   a. Mortar for Chimney Ring and Frame and Cover Joints: Comply with ASTM C 270, Type M, except for quantities less than 2.0 cu. ft. (60 L) where packaged mix complying with ASTM C 387, Type M, may be used.

C. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2-inch- (50-mm-) diameter eye, and 1-by-4-inch (25-by-100-mm) bolt.
   1. Working Load Embedded in 6-Inch (150-mm), 4000-psi (27.6-MPa) Concrete: 13,000-lbf (58-kN) minimum tension.

D. Pulling Eyes in Nonconcrete Walls: Eyebolt with reinforced fastening, 1-1/4-inch- (32-mm-) diameter eye, rated 2500-lbf (11-kN) minimum tension.

E. Pulling-In and Lifting Irons in Concrete Floors: 7/8-inch- (22-mm-) diameter, hot-dip galvanized, bent steel rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.
   1. Ultimate Yield Strength: 40,000-lbf (180-kN) shear and 60,000-lbf (270-kN) tension.

F. Bolting Inserts for Concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts of noncorrosive, chemical-resistant, nonconductive thermoplastic material; 1/2-
inch (13-mm) ID by 2-3/4 inches (69 mm) deep, flared to 1-1/4 inches (32 mm) minimum at base.
   1. Tested Ultimate Pullout Strength: 12,000 lbf (53 kN) minimum.

G. Expansion Anchors for Installation after Concrete Is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip with 1/2-inch (13-mm) bolt, 5300-lbf (24-kN) rated pullout strength, and minimum 6800-lbf (30-kN) rated shear strength.

H. Cable Rack Assembly: Steel, hot-dip galvanized, except insulators.
   1. Stanchions: T-section or channel; 2-1/4-inch (57-mm) nominal size; punched with 14 holes on 1-1/2-inch (38-mm) centers for cable-arm attachment.
   2. Arms: 1-1/2 inches (38 mm) wide, lengths ranging from 3 inches (75 mm) with 450-lb (204-kg) minimum capacity to 18 inches (460 mm) with 250-lb (114-kg) minimum capacity. Arms shall have slots along full length for cable ties and be arranged for secure mounting in horizontal position at any vertical location on stanchions.
   3. Insulators: High-glaze, wet-process porcelain arranged for mounting on cable arms.

I. Duct-Sealing Compound: Nonhardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 35 deg F (2 deg C). Capable of withstanding temperature of 300 deg F (150 deg C) without slump and adhering to clean surfaces of plastic ducts, metallic conduits, conduit coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals. Capable of withstanding maximum hydrostatic pressures at the installation location with the ground-water level at grade.

PART 3 EXECUTION

3.1 UNDERGROUND DUCT APPLICATION

System / Service	Voltage	Location	Duct Type & Standard	Encasement / Notes
Normal Power – Utility Service	>600 V	Outside building footprint	RNC, NEMA EPC-40 PVC	Direct-buried, with warning tape. Coordinate with utility (SLECA).
Normal Power – Services & Feeders	≤600 V	Outside building footprint	RNC, NEMA EB-20 PVC	Concrete-encased, with warning tape.
		Under building slab / structures	RNC, NEMA DB-20 PVC	Direct-buried with warning tape.
Normal Power – Branch Circuits	≤600 V	Outside building footprint	RNC, NEMA EPC-40 PVC	Direct-buried with warning tape.
		Under building slab (where permitted)		Direct-buried, 6” minimum below slab for floor boxes. NEC 300.5 restrictions apply.
Emergency / Essential Systems	≤600 V	Outside building footprint	RNC, NEMA EPC-40 PVC	Concrete-encased, with warning tape.
		Under building slab / structures	RNC, NEMA EPC-80 PVC	Direct-buried, with warning tape.
Emergency Branch Circuits	≤600 V	Outside building footprint	RNC, NEMA EPC-80 PVC	Direct-buried, with warning tape.
		Under building slab / structures		Direct-buried, with warning tape.
Communications / Signal	Low-voltage (≤600 V, telecom /data)	Outside building footprint	RNC, NEMA EPC-40 PVC	Direct-buried, with warning tape.
		Under building slab / structures		Direct-buried, with warning tape.

3.2 UNDERGROUND ENCLOSURE APPLICATION

A. Handholes and Boxes for 600 V and Less, Including Telephone, Communications, and Data Wiring:
   1. Units in Roadways and Other Deliberate Traffic Paths: Precast concrete. AASHTO HB 17, H-20 structural load rating.
   2. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Precast concrete, AASHTO HB 17, H-20 structural load rating.
   3. Units in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: Polymer concrete units, SCTE 77, Tier 8 structural load rating.
   4. Units Subject to Light-Duty Pedestrian Traffic Only: Fiberglass-reinforced polyester resin, structurally tested according to SCTE 77 with 3000-lbf (13 345-N) vertical loading.

3.3 EARTHWORK

A. Excavation and Backfill: Comply with Division 31 Section 31 00 01 "Earth Moving", but do not use heavy- duty, hydraulic-operated, compaction equipment.

B. Restore surface features at areas disturbed by excavation and reestablish original grades, unless otherwise indicated. Replace removed sod immediately after backfilling is completed.

C. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching.

D. Prepare excavation, base material installation, and compaction necessary for the specific ductbank arrangement.

E. Verify that excavation, base material installation, and compaction is completed.

3.4 DUCT INSTALLATION

A. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes to drain in both directions.

B. Curves and Bends:
   1. Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 48 inches (1220 mm), both horizontally and vertically, at other locations, unless otherwise indicated.

C. Install conduits to locate top of ductbank at depths as indicated or as required to coordinate with other portions of the Work.

D. Apply corrosion resistance tape and primer to direct-buried or concrete-encased RSC.

E. Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in same plane.

F. Duct Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 10 inches (250 mm) o.c. for 5-inch (125-mm) ducts, and vary proportionately for other duct sizes.
   1. Begin change from regular spacing to end-bell spacing 10 feet (3 m) from the end bell

without reducing duct line slope and without forming a trap in the line.

2. Direct-Buried Duct Banks: Install an expansion and deflection fitting in each conduit in the area of disturbed earth adjacent to manhole or handhole.
3. Grout end bells into structure walls from both sides to provide watertight entrances.

G. Stub-Ups: Use manufactured rigid steel conduit elbows and rigid steel conduit extensions for stub-ups at poles, equipment, and at building entrances through the floor. Install insulated bushings on terminations.
1. Extend conduit extensions installed in floors a minimum of 4 inches (102 mm) above finished floor level.
2. Extend conduit extensions installed in equipment bases a minimum of 4 inches (102 mm) above finished base level.
3. Stub-Ups to Outdoor Equipment: For equipment mounted on outdoor concrete bases, Install insulated grounding bushings on terminations at equipment.

H. Sealing: Provide temporary caps to protect installed conduit against entrance of dirt and moisture prior to cable installation. Provide temporary closure at terminations of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig (1.03-MPa) hydrostatic pressure.

I. Pulling Cord: Install 100-lbf- (445-N-) test nylon cord in ducts, including spares.

J. Concrete-Encased Duct(s) and Duct Banks:
1. Support duct(s) on duct separators.
2. Separator Installation: Space separators close enough to prevent sagging and deforming of ducts, with not less than 5 spacers per 20 feet (6 m) of duct. Secure separators to earth and to ducts to prevent floating during concreting. Stagger separators approximately 6 inches (150 mm) between tiers. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
3. Minimum Space between Ducts: 3 inches (75 mm) between ducts and exterior envelope wall, 2 inches (50 mm) between ducts for like services, and 4 inches (100 mm) between power and signal ducts.
4. Depth: Install top of duct bank at least 30 inches below finished grade in areas not subject to deliberate traffic, and at least 36 inches below finished grade in deliberate traffic paths for vehicles, unless otherwise indicated.
5. Stub-ups: Provide SCH 80 PVC conduit stub-ups.
6. Concrete Color: Dye added to concrete during batching or powder dye applied to top prior to curing.
   a. ELECTRIC: Red for duct systems with power wires and cables.
   b. SIGNAL: Orange for communications, data, and telephone duct systems.
7. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
   a. Start at one end and finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written recommendations, or use other specific measures to prevent expansion-contraction damage.
   b. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch (19-mm) reinforcing rod dowels extending 18 inches (450 mm) into concrete on both sides of joint near corners of envelope.
   c. For Cast-In-Place manholes: Connect to manhole wall using dowels.
8. Pouring Concrete: Spade concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Use a plank to direct concrete down sides of bank assembly to trench bottom. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment

unless specifically designed for duct-bank application.

9. Reinforcement: Reinforce concrete-encased duct banks where they cross disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.
10. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
11. Label top of encased duct bank with stenciled lettering 2-inch- (50-mm-) high letters at not less than 10-foot intervals, after curing. Label selected to suit system or as otherwise required.
    a. Legend: "ELECTRIC-LV" for duct systems with power wires and cables operating at 600 V and less.
    b. Legend: "ELECTRIC-HV" for duct systems with power wires and cables operating over 600 V.
    c. Legend: "SIGNAL" for communications, data, and telephone duct systems.

K. Direct-Buried Duct(s) and Duct Banks:
1. Support duct(s) on duct separators coordinated with duct size, duct spacing, and outdoor temperature.
2. Space separators close enough to prevent sagging and deforming of ducts, with not less than 5 spacers per 20 feet (6 m) of duct. Secure separators to earth and to ducts to prevent displacement during backfill and yet permit linear duct movement due to expansion and contraction as temperature changes. Stagger spacers approximately 6 inches (150 mm) between tiers.
3. Excavate trench bottom to provide firm and uniform support for duct bank. Prepare trench bottoms as specified in Division 31 Section 31 00 01 "Earth Moving" for pipes less than 6 inches (150 mm) in nominal diameter.
4. After installing first tier of ducts, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand-place backfill to 4 inches (100 mm) over ducts and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction as specified in Division 31 Section "Earth Moving".
5. Install ducts with a minimum of 3 inches (75 mm) between ducts for like services and 6 inches (150 mm) between power and signal ducts.
6. Depth: Install top of duct bank at least 36 inches (900 mm) below finished grade, unless otherwise indicated.
7. Set elevation of bottom of duct bank below the frost line.
8. Install manufactured PVC SCH 80 conduit elbows for stub-ups at poles and equipment and at building entrances through the floor.

L. Warning Tape: Bury Warning Tape Caps approximately 12 inches (300 mm) above ducts and duct banks, where indicated.
1. Align tape parallel to and within 3 inches (75 mm) of the centerline of duct bank.
2. Provide an additional warning tape for each 12-inch (300-mm) increment of duct-bank width over a nominal 18 inches (450 mm). Space additional tapes 12 inches (300 mm) apart, horizontally.

3.5 INSTALLATION OF CONCRETE HANDHOLES, AND BOXES

A. Precast Concrete Handhole and Manhole Installation:
1. Comply with ASTM C 891, unless otherwise indicated.
2. Install units level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances.

3. Unless otherwise indicated, support units on a minimum 6-inch (150-mm) level bed of crushed stone or gravel, graded from 1-inch (25-mm) sieve to No. 4 (4.75-mm) sieve and compacted to same density as adjacent undisturbed earth.

B. Elevations:
1. Manhole Roof: Install with rooftop at least 15 inches (380 mm) below finished grade or as required to prevent floating of manhole.
2. Manhole Frame: In paved areas and trafficways, set frames flush with finished grade. Set other manhole frames 1 inch (25 mm) above finished grade.
3. Install handholes with bottom below the frost line.
4. Handhole Covers: In paved areas and trafficways, set surface flush with finished grade. Set covers of other handholes 1 inch (25 mm) above finished grade.
5. Where indicated, cast handhole cover frame integrally with handhole structure.

C. Dampproofing: Apply dampproofing to exterior surfaces of manholes and handholes after concrete has cured at least three days. After ducts have been connected and grouted, and before backfilling, dampproof joints and connections and touch up abrasions and scars. Dampproof exterior of manhole chimneys after mortar has cured at least three days.

D. Hardware: Install removable hardware, including pulling eyes, cable stanchions, and cable arms, and insulators, as required for installation and support of cables and conductors and as indicated.

E. Field-Installed Bolting Anchors in Manholes and Concrete Handholes: Do not drill deeper than 3-7/8 inches (98 mm) for manholes and 2 inches (50 mm) for handholes, for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.

F. Warning Sign: Install "Confined Space Hazard" warning sign on the inside surface of each manhole cover.

3.6 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE

A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of ducts, and seal joint between box and extension as recommended by the manufacturer.

B. Unless otherwise indicated, support units on a minimum 4-inch (100-mm) level bed of crushed stone or gravel, graded from 1/2-inch (12.7-mm) sieve to No. 4 (4.75-mm) sieve and compacted to same density as adjacent undisturbed earth.

C. Elevation: In paved areas and trafficways, set so cover surface will be flush with finished grade. Set covers of other handholes 1 inch (25 mm) above finished grade.

D. Install handholes and boxes with bottom below the frost line.

E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in the enclosure.

F. Field-cut openings for ducts and conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

G. For enclosures installed in asphalt paving and other non-concrete surfaces and subject to occasional, nondeliberate, heavy-vehicle loading, form and pour a concrete ring encircling,

and in contact with, enclosure and with top surface screeded to top of box cover frame. Bottom of ring shall rest on compacted earth.

1. Concrete: 3000 psi (20 kPa), 28-day strength, complying with Division 03 Section 03 30 00"Cast- in-Place Concrete," with a troweled finish.
2. Dimensions: 10 inches wide by 12 inches deep (250 mm wide by 300 mm deep).

3.7 GROUNDING

A. Ground underground ducts and utility structures according to Division 26 Section "Grounding and Bonding for Electrical Systems."

3.8 SLEEVE AND SLEEVE SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Apply Sleeve and Sleeve Seal where raceways, cables, wireways, cable trays, or busways penetrate concrete slabs, concrete or masonry walls, exterior walls, sub-grade walls or fire-rated floor and wall assemblies. Sleeve and Sleeve Seal materials and installation requirements are specified in Division 26 Section "Common Work Results for Electrical."

3.9 FIELD QUALITY CONTROL

A. Perform the following tests and inspections and prepare test reports:
   1. Pull aluminum or wood test mandrel through duct to prove joint integrity and test for out- of-round duct. Provide mandrel equal to 80 percent fill of duct. If obstructions are indicated, remove obstructions and retest.
   2. Test manhole and handhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Division 26 Section "Grounding and Bonding for Electrical Systems."

B. Correct deficiencies and retest as specified above to demonstrate compliance.

3.10 CLEANING

A. On completion of installation but before any equipment or cable is installed, inspect interior and exterior surfaces and perform the following:
   1. Clean ducts prior to cleaning manhole or pull box.
   2. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.
   3. Remove all dirt and debris and pump out the manhole or pull box so that it is free of standing water. Manholes and pull boxes shall be dry prior to equipment or cable is installed.
   4. Clean internal surfaces of manholes, including sump and remove foreign material.
   5. Repair of damages resulting from construction after initial installation.
   6. Install ductile pipe plugs on each end of the raceways to prevent future debris from entering the raceways in the ducts.

END OF SECTION 26 05 43

SECTION 26 05 53 - IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Furnish and install items for identification of electrical products installed under Division 26.

1.2 SUBMITTALS

A. Product Data: For each electrical identification product indicated.

B. Identification Schedule: An index of nomenclature of electrical equipment and system components used in identification signs and labels.

C. Samples: For each type of label and sign to illustrate size, colors, lettering style, mounting provisions, and graphic features of identification products.

1.3 COORDINATION

A. Coordinate identification names, abbreviations, colors, and other features with requirements in the Contract Documents, Shop Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual, and with those required by codes and standards. Use consistent designations throughout Project.

B. Coordinate installation of identifying devices with completion of covering surfaces where devices are to be applied.

C. Coordinate installation of identifying devices with location of access panels and doors.

D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 PRODUCTS

2.1 RACEWAY AND METAL-CLAD CABLE IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.

B. Color for Printed Legend:
1. Power Circuits: Black letters on an orange field.
2. Legend: Indicate system or service and voltage, if applicable.
   a. Typical:
      1) Type: Example – AC 60 Hertz
      2) Load: Example – Lighting and Power
      3) Voltage: Example – 120VA / 1 Phase
   b. As Required
      1) If more than one type of power is available in a conduit, then it shall be marked with the title “Electrical” on orange background.
      2) If used for control of HVAC conduit shall be marked with the title “Control” on an orange background
   c. Conduit that contains communication systems shall have the exact content and title on blue background.

C. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

D. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; 2 inches (50 mm)wide; compounded for outdoor use.

2.2 CONDUCTOR IDENTIFICATION MATERIALS

A. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils (0.08 mm)thick by 1 to 2 inches (25 to 50 mm) wide.

B. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.

C. Permanent Marker: Use of permanent marker in-lieu of the above is strictly prohibited.

2.3 UNDERGROUND-LINE WARNING TAPE

A. Description: Permanent, bright-colored, continuous-printed, polyethylene tape.
1. Not less than 6 inches (150 mm) wide by 4 mils (0.102 mm) thick.
2. Compounded for permanent direct-burial service.
3. Embedded continuous metallic strip or core.
4. Printed legend shall indicate type of underground line.

2.4 WARNING LABELS AND SIGNS

A. Comply with NFPA 70 and 29 CFR 1910.145

B. Self-Adhesive Warning Labels: Factory printed, multicolor, pressure-sensitive adhesive labels, configured for display on front cover, door, or other access to equipment, unless otherwise indicated.

C. Baked-Enamel Warning Signs: Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application. 1/4-inch grommets in corners for mounting. Nominal size, 7 by 10 inches.

D. Warning label and sign shall include, but are not limited to, the following legends:
1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENTHAS MULTIPLE POWER SOURCES."
2. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR ## INCHES." Verify work space required for specific project conditions with NFPA 70 and replace “##” in previous sentence with appropriate distance.
    i. Where panels are located in dedicated electrical rooms the floor shall be painted to indicated the clearance area.
3. Arc Flash Warning and Instructions: “WARNING – ARC FLASH AND SHOCK HAZARD. WEAR APPROPRIATE PPE. Determine appropriate protective clothing and personal protective equipment (PPE) for the task from NFPA 70E.

2.5 INSTRUCTION SIGNS

A. Engraved, laminated acrylic or melamine plastic, minimum 1/16 inch thick for signs up to 20 sq. in. and 1/8 inch thick for larger sizes.

B. Engraved legend with black letters on white face.

C. Punched or drilled for mechanical fasteners.

D. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.6 ONE-LINE DIAGRAM NAMEPLATE

A. Preprinted engraved, laminated acrylic or melamine plastics sign. Nominal size, 12 by 12 inches (305 by 305 mm) by 1/8 inch (3.2 mm) thick. Engraved legend with black letters on white face. Image on sign depicting equipment components in single-line diagram format, using symbols and letter designations consistent with final one-line bus diagram. Produce a concise visual presentation of principal equipment components and connections.

2.7 EQUIPMENT IDENTIFICATION LABELS

A. Engraved, Laminated Acrylic or Melamine Label: Punched or drilled for screw mounting. White letters on a dark-gray background. Minimum letter height shall be 3/8 inch. Lettering and Background colors as indicated below:

System / Circuit Type	Label Letter Color	Background Color	Notes
Normal Power Circuits	White	Black	Applies to all normal distribution equipment and receptacles.
Emergency / Optional Standby Power	White	Purple	Distinct from life safety branch.
Life Safety Branch	White	Red	Applies to Panels and receptacles fed from Life Safety.
Fire Alarm System	Black	Red	Applies to FACP, annunciators, initiating and notification circuits.
Fire Suppression Supervisory & Control	Yellow	Red	Sprinkler, clean agent, or suppression monitoring.
Combined Fire Alarm & Security	Blue	Red	Only if systems are combined in panels or circuits.
Security System	Blue	Yellow	Access control, intrusion detection, cameras.
Mechanical / Electrical Supervisory (BAS)	Green	White	Building automation and monitoring systems.
Telecommunications	Blue	White	Structured cabling, data, voice. (Coordinate with Division 27).
Control Wiring	Green	White	HVAC and other control circuits.
Nurse Call	White	Blue	Applies to head-end equipment and devices.
Public Address / Intercom	White	Black	Paging/intercom amplifiers and speakers.
CATV / MATV	White	Black	Television distribution systems.
Clock System	White	Black	Central or master clock controls.

2.8 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Cable Ties : Fungus-inert, self-extinguishing, 1-piece, self-locking, Type 6/6 nylon cable ties.
   1. Minimum Width: 3/16 inch (5 mm)
   2. Tensile Strength: 50 lb (22.6 kg), minimum
   3. Temperature Range: Minus 40 to plus 185 deg F (Minus 40 to plus 85 deg C).
   4. Color: Black, except where used for color-coding.

B. Paint: Paint materials and application requirements are specified in Division 09 painting Section 09 91 23.

C. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 EXECUTION

3.1 APPLICATION

A. Branch-Circuit Conductor Identification: Where there are conductors for more than three branch circuits in same junction or pull box, use color-coding conductor tape. Identify each ungrounded conductor according to source and circuit number.

B. Conductors to Be Extended in the Future: Attach write-on tags to conductors and list source and circuit number.

C. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, signal, sound, intercommunications, voice, and data connections.
   1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
   2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
   3. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and Operation and Maintenance Manual.

D. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable. Install underground-line warning tape for both direct-buried cables and cables in raceway.

E. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Comply with 29 CFR 1910.145 and apply self-adhesive warning labels. Identify system voltage with black letters on an orange background. Apply to exterior of door, cover, or other access.
   1. Equipment with Multiple Power or Control Sources: Apply to door or cover of equipment including, but not limited to, the following:
      a. Power transfer switches.
      b. Main-Tie-Main Switchboards
      c. Controls with external control power connections.
   2. Equipment Requiring Workspace Clearance According to NFPA 70: Unless otherwise indicated, apply to door or cover of equipment but not on flush panelboards and similar equipment in finished spaces.
   3. Arc Flash Warning Labels: Apply label to door or cover at all access point of equipment including, but not limited to, the following:
      a. Disconnect switches
      b. Electrical switchgear and switchboards
      c. Enclosed circuit breakers
      d. Motor starters
      e. Panelboards
      f. Power transfer equipment (ATS/MTS)
      g. Transformers

F. Junction Boxes and Pull Boxes: Identify voltage, source, and circuit number(s) on cover of pull and junction boxes with hand-written legible block lettering using black permanent marking pen.

G. Instruction Signs:
1. Operating Instructions: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation.
2. Emergency Operating Instructions: Install instruction signs with minimum 3/8-inch- (10-mm-) high letters for emergency instructions at equipment used for power transfer load shedding, Kirk Key Controlled Breakers.

H. Equipment Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and Operation and Maintenance Manual. This applies to existing equipment that is modified during this project. Apply labels to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.
1. Labeling Instructions:
   a. Indoor Equipment: Engraved, laminated acrylic label. Unless otherwise indicated, provide a single line of text with 1/2-inch- high letters on 1-1/2-inch- high label; where 2 lines of text are required, use labels 2 inches high.
   b. Outdoor Equipment: Engraved, laminated acrylic label.
   c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.
2. Equipment to Be Labeled Shall Include But Not Be Limited To:
   a. Panelboards, electrical cabinets, and enclosures.
   b. Access doors and panels for concealed electrical items.
   c. Electrical switchgear and switchboards.
   d. Transformers.
   e. Emergency system boxes and enclosures.
   f. Disconnect switches.
   g. Enclosed circuit breakers.
   h. Power transfer equipment. (ATS/MTS)
   i. Contactors.
   j. Motor Starters
   k. Fire-alarm control panel and annunciators
   l. Power-generating units.
   m. All junction boxes. Label to include circuit numbers (panel and number).
   n. All receptacle device plates shall be etched with circuit numbers. (panel and number).
   o. All lighting switch plates shall have circuit numbers on the back of the plate. (panel and number).

Examples:

NORMAL 'HA' 480Y/277V FED FROM 'MDP'	EMERGENCY SYSTEM 'ATS-LS' 480Y/277V FED FROM 'MDP' NORMAL FED FROM 'EMSB' EMERGENCY	NORMAL 'T-LA' 75KVA, 480V to 208Y/120V FED FROM 'HA' FEEDS 'LA'

	FEEDS 'LS-HA'	

3. Provide for each feeder overcurrent protective device in each switchgear, switchboard, distribution panelboard, motor control center, and any other similar equipment furnished under this Division, identification as to the specific load that it serves.

3.2 INSTALLATION

A. Verify identity of each item before installing identification products.

B. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.

C. Apply identification devices to surfaces that require finish after completing finish work.

D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.

E. Attach non-adhesive signs and plastic labels with screws and auxiliary hardware appropriate to the location and substrate.

F. System Identification Color Banding for Raceways and Cables: Each color band shall completely encircle cable or conduit. Place adjacent bands of two-color markings in contact, side by side. Locate bands at changes in direction, at penetrations of walls and floors, at 50-foot (15-m) maximum intervals in straight runs, and at 25-foot (7.6-m) maximum intervals in congested areas.

G. Color-Coding for Identification, 600 V and Less: Use the colors listed below for ungrounded service, feeder, and branch-circuit conductors.
   1. Color shall be factory applied or for sizes larger than No. 1 AWG, if authorities having jurisdiction permit, field applied.
   2. Colors for Grounding Conductors:
      a. Equipment Grounding Conductor: Green.
      b. Isolated Equipment Grounding Conductor: Green with Yellow Stripe.
   3. Colors for 208/120-V Wye Systems:
      a. Phase A: Black.
      b. Phase B: Red.
      c. Phase C: Blue.
      d. Grounded Conductor (Neutral): White
   4. Colors for 480/277-V Wye Systems:
      a. Phase A: Brown.
      b. Phase B: Purple.
      c. Phase C: Yellow.
      d. Grounded Conductor (Neutral): white
   5. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6 inches (150 mm) from terminal points and in boxes where splices or taps are made. Apply last two turns of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings.

H. Aluminum Wraparound Marker Labels and Metal Tags: Secure tight to surface of conductor or cable at a location with high visibility and accessibility.

I. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6 to 8 inches (150 to 200 mm) below finished grade. Use multiple tapes where width of multiple lines installed in a common

trench or concrete envelope exceeds 16 inches (400 mm) overall.

J. Painted Identification: Prepare surface and apply paint according to Division 09 painting Section 09 91 23.

END OF SECTION 26 05 53

SECTION 26 25 60 – DUAL PURPOSE TRANSFER SWITCH DOCKING STATION

PART 1 GENERAL

1.1 GENERAL

A. Dual Purpose Quick Connect Power panels shall provide a convenient, reliable, and economical way to connect temporary emergency power from portable generators to a facility in conjunction with a transfer switch or shall provide a convenient way to connect load banks to a facility.

B. Dual Purpose Quick Connect power panels shall include two sets of 16 Series Camlocks (Male and Female).
   1. Female camlocks shall be enclosed behind a pad-lockable door.
   2. Male camlocks shall be enclosed behind a trap key interlocked door.

C. Quick Connect Power Panels shall be TRYSTAR or ASCO 300 Series. Any alternate shall be submitted for approval to the consulting engineer at least 10 days prior to bid. Alternate bids must list any deviations from this specification.

D. Dual Purpose Quick Connect Panels are not designed for the simultaneous operation of both Input and Output Connections.
   1. Castell™ or Kirk Key™ locks must be installed on outer door housing male quick connects and permanent generator breaker which serves as an interlock between the permanent generator and portable generator.

1.2 ENCLOSURE

A. The dual-purpose quick-connect power panel shall be a pad mount enclosure manufactured of aluminum and painted ANSI 61 gray.

B. All dual purpose quick-connect power panels shall be Type 3R compliant. The Type 3R rating shall be maintained with the temporary cables installed.

C. Cables shall enter and exit the wiring chamber via access holes specifically designed for conductors and shall be provided with a bushing or shall be formed so that there are no sharp edges with which conductor insulation may come in contact.

D. Connections shall be arranged so that cables drape downward when connected.

E. The dual-purpose quick connect panel shall be able to accommodate side, and bottom cable entry.

F. Multiple Chamber style designed to isolate permanent connections and camlock connections.

G. The quick-connect panel shall be divided into an upper termination chamber and a lower wiring chamber.
   1. The upper termination chamber shall consist of:
      a. Female 16 series single pole connectors with flip covers.
      b. Load Dump Receptacle
      c. Pad-lockable door preventing access to hot temporary load bank connections while the unit is in use.
   2. The lower chamber shall have:
      a. 45 degree recessed male 16 series single pole connectors for hassle-free connection eliminating stress on cables during operation
      b. Pad-lockable tamper-resistant door with trap door preventing access to temporary connections while the unit is in use.

c. Trap door for cable egress.
d. Castell ™ Lock and key (kirk key compatible) mounted on the exterior trap door. Restricts access to Portable generator connection unless the key is captive Permanent Generator Breaker is open.
e. Slotted fingers to restrict cable access reducing theft.
f. Phase Rotation Relay
g. 2- Wire Auto Start Terminals
h. Auto Start Destination Switch

3. The quick-connect panel shall have two outer hinged access doors restricting access to both chambers for safety and security.
4. The outer access doors shall have a padlock hasp preventing unauthorized entry.

1.3 ELECTRICAL

A. The dual-purpose quick connect panel shall have input and output connections rated up to 600 VAC.

B. Input and Output connectors share a common 100 kA Plated Copper Smart T-Slotted Buss.

C. All electrical connectors shall be cam-type single pole connectors compatible with Marinco or Leviton 16 Series CAM Locks™ and available color-coded as per industry standard practice:
1. 240V and below: phase 1 = black, phase 2 = red, phase 3 = blue (if required).
2. 440 to 480V: phase 1 = brown, phase 2 = orange, phase 3 = yellow.
3. Ground shall always be green.
4. Neutral shall always be white.
5. A minimum of 25% ground shall be provided.
6. Lug size and quantity as indicated on outline drawings.
7. Input and Output connections share a common bus, Castell Lock provided, or Kirk Key compatible Lock must be used as a mechanical interlock with the Permanent Generator breaker.

D. The upper termination chamber shall be provided with lug terminals for the permanently installed conductors.

E. The front of the panel shall have the cam-type single pole connectors as specified above:
1. For 1200A, there shall be three rows of up to 4 female single-pole connections (no neutral) for Load Bank connections and three rows of up to 5 female single-pole connections for portable generator connections.

F. Withstand Current Rating (WCR) shall be no less than 100kA verified by testing supervised by a Nationally Recognized Testing Laboratory, not by calculation.

1.4 STANDARD ACCESSORIES

A. Schneider Electric Phase Rotation Monitor with fuses

B. Auto start Banana Terminal Post

C. Auto Start Destination Toggle Switch

D. Load Dump Receptacle (L1-15R 15A 125V Twist Lock receptacle)

1.5 COMPLIANCE

A. Dual Purpose Quick Connect Panels shall bare UL 891 markings.

B. The 800 - 4000 Amp Dual Purpose Quick Connect Panel must be listed to UL 891 for Panelboards.

C. “Built to the standard” shall not be allowed: the quick connect panels shall be tested in accordance with and listed to UL 1008 & UL 891 standards.

D. UL 50 Listed enclosures may be used but only listed to UL 50 shall not be acceptable.

E. Comply with NFPA 70.

1.6 WARRANTY AND SERVICE

A. The Dual Purpose Quick Connect Panel shall come with a warranty of no less than 24 months from the date of shipment.

B. The service center's personnel must be factory trained and must be on call 24 hours a day, 365 days a year.

END OF SECTION 26 25 60

SECTION 260572 - OVERCURRENT PROTECTIVE DEVICE SHORT-CIRCUIT STUDY

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes a computer-based, fault-current study to determine the minimum interrupting capacity of circuit protective devices.

1.3 DEFINITIONS

A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

B. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.

D. SCCR: Short-circuit current rating.

E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

1.4 ACTION SUBMITTALS

A. Product Data: For computer software program to be used for studies.

B. Other Action Submittals: Submit the following after the approval of system protective devices submittals. Submittals shall be in digital form.
   1. Short-circuit study input data, including completed computer program input data sheets.
   2. Short-circuit study and equipment evaluation report; signed, dated, and sealed by a qualified professional engineer.
      a. Submit study report for action prior to receiving final approval of the distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that the selection of devices and associated characteristics is satisfactory.
      b. Revised single-line diagram, reflecting field investigation results and results of short-circuit study.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Short-Circuit Study Specialist and Field Adjusting Agency.

B. Product Certificates: For short-circuit study software, certifying compliance with IEEE 399.

1.6 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are unacceptable.

B. Short-Circuit Study Software Developer Qualifications: An entity that owns and markets computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.

C. Short-Circuit Study Specialist Qualifications: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.

D. Field Adjusting Agency Qualifications: An independent agency, with the experience and capability to adjust overcurrent devices and to conduct the testing indicated, that is a member company of the International Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

PART 2 PRODUCTS

2.1 COMPUTER SOFTWARE

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. SKM Systems Analysis, Inc.
   2. ETAP
   3. Easy Power

B. Comply with IEEE 399 and IEEE 551.

C. Analytical features of fault-current-study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

D. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output.

2.2 SHORT-CIRCUIT STUDY REPORT CONTENTS

A. Executive summary.

B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of the computer printout.

C. One-line diagram, showing the following:
   1. Protective device designations and ampere ratings.
   2. Cable size and lengths.
   3. Transformer kilovolt ampere (kVA) and voltage ratings/ and impedance
   4. Motor and generator designations and kVA ratings.
   5. Switchgear, switchboard, motor-control center, and panelboard designations.

D. Comments and recommendations for system improvements, where needed.

E. Protective Device Evaluation:
   1. Evaluate equipment and protective devices and compare to short-circuit ratings.
   2. Tabulations of circuit breaker, fuse, and other protective device ratings versus calculated short-circuit duties.
   3. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

4. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in the standards to 1/2-cycle symmetrical fault current.
5. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

F. Short-Circuit Study Input Data: As described in "Power System Data" Article in the Evaluations.

G. Short-Circuit Study Output:
1. Low-Voltage Fault Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
   a. Voltage.
   b. Calculated fault-current magnitude and angle.
   c. Fault-point X/R ratio.
   d. Equivalent impedance.
2. Momentary Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
   a. Voltage.
   b. Calculated symmetrical fault-current magnitude and angle.
   c. Fault-point X/R ratio.
   d. Calculated asymmetrical fault currents:
      1) Based on fault-point X/R ratio.
      2) Based on calculated symmetrical value multiplied by 1.6.
      3) Based on calculated symmetrical value multiplied by 2.7.
3. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
   a. Voltage.
   b. Calculated symmetrical fault-current magnitude and angle.
   c. Fault-point X/R ratio.
   d. No AC Decrement (NACD) ratio.
   e. Equivalent impedance.
   f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
   g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

PART 3 EXECUTION

3.1 EXAMINATION

A. Obtain all data necessary for the conduct of the study.
1. Verify completeness of data supplied on the one-line diagram. Call any discrepancies to the attention of Engineer.
2. For equipment provided that is Work of this Project, use characteristics submitted under the provisions of action submittals and information submittals for this Project.
3. For relocated equipment and that which is existing to remain, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers. The qualifications of technicians and engineers shall be qualified as defined by NFPA 70E.
4. Obtain all arc flash information from the local utility in a timely manner. No extension of the contract time shall be permitted due to coordination with the local utility.

B. Gather and tabulate the following input data to support the short-circuit study. Comply with recommendations in IEEE 551 as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the

engineer in charge of performing the study, and shall be by the engineer or its representative who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.

1. Product Data for Project's overcurrent protective devices involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
2. Obtain electrical power utility impedance at the service.
3. Power sources and ties.
4. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
5. For reactors, provide manufacturer and model designation, voltage rating, and impedance.
6. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip, SCCR, current rating, and breaker settings.
7. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
8. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
9. Motor horsepower and NEMA MG 1 code letter designation.
10. Cable sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).

3.2 SHORT-CIRCUIT STUDY

A. Perform study following the general study procedures contained in IEEE 399.

B. Calculate short-circuit currents according to IEEE 551.

C. Base study on the device characteristics supplied by device manufacturer.

D. The extent of the electrical power system to be studied is indicated on Drawings.

E. Begin short-circuit current analysis at the service, extending down to the system overcurrent protective devices as follows:
   1. To normal system low-voltage load buses where fault current is 10 kA or less.
   2. Exclude equipment rated 240-V ac or less when supplied by a single transformer rated less than 125 kVA.

F. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

G. The calculations shall include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and shall apply to low- and medium-voltage, three-phase ac systems. The calculations shall also account for the fault-current dc decrement, to address the asymmetrical requirements of the interrupting equipment.
   1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.

H. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault at each of the following:
   1. Electric utility's supply termination point.
   2. Incoming switchgear.
   3. Unit substation primary and secondary terminals.
   4. Low-voltage switchgear.
   5. Motor-control centers.

6. Control panels.
7. Standby generators and automatic transfer switches.
8. Branch circuit panelboards.
9. Disconnect switches.

3.3 ADJUSTING

A. Make minor modifications to equipment as required to accomplish compliance with short-circuit study.

3.4 DEMONSTRATION

A. Train Owner's operating and maintenance personnel in the use of study results.

END OF SECTION 26 05 72

SECTION 26 05 73 - OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes computer-based, overcurrent protective device coordination studies to determine overcurrent protective devices and to determine overcurrent protective device settings for selective tripping.

1.3 DEFINITIONS

A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

B. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.

D. SCCR: Short-circuit current rating.

E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

1.4 ACTION SUBMITTALS

A. Product Data: For computer software program to be used for studies.

B. Other Action Submittals: Submit the following after the approval of system protective devices submittals. Submittals shall be in digital form.
   1. Coordination-study input data, including completed computer program input data sheets.
   2. Study and equipment evaluation reports.
   3. Overcurrent protective device coordination study report; signed, dated, and sealed by a qualified professional engineer.
      a. Submit study report for action prior to receiving final approval of the distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that the selection of devices and associated characteristics is satisfactory.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Coordination Study Specialist and Field Adjusting Agency.

B. Product Certificates: For overcurrent protective device coordination study software, certifying compliance with IEEE 399.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For the overcurrent protective devices to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
      a. The following parts from the Protective Device Coordination Study Report:
         1) One-line diagram.
         2) Protective device coordination study.
         3) Time-current coordination curves.
      b. Power system data.

1.7 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are unacceptable.

B. Coordination Study Software Developer Qualifications: An entity that owns and markets computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.

C. Coordination Study Specialist Qualifications: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.

D. Field Adjusting Agency Qualifications: An independent agency, with the experience and capability to adjust overcurrent devices and to conduct the testing indicated, that is a member company of the International Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

PART 2 PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

A. Software Developers:
   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. SKM Systems Analysis, Inc.
      b. ETAP

B. Comply with IEEE 242 and IEEE 399.

C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

D. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.
   1. Optional Features:
      a. Arcing faults.
      b. Simultaneous faults.
      c. Explicit negative sequence.
      d. Mutual coupling in zero sequence.

2.2 PROTECTIVE DEVICE COORDINATION STUDY REPORT CONTENTS

A. Executive summary.

B. Study descriptions, purpose, basis and scope. Include case descriptions, definition of terms and guide for interpretation of the computer printout.

C. One-line diagram, showing the following:
   1. Protective device designations and ampere ratings.
   2. Cable size and lengths.
   3. Transformer kilovolt ampere (kVA) and voltage ratings.
   4. Motor and generator designations and kVA ratings.
   5. Switchgear, switchboard, motor-control center, and panelboard designations.

D. Short-Circuit Study Output: As specified in "Short-Circuit Study Output" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260572 "Overcurrent Protective Device Short-Circuit Study."

E. Protective Device Coordination Study:
   1. Report recommended settings of protective devices, ready to be applied in the field. Use manufacturer's data sheets for recording the recommended setting of overcurrent protective devices when available.
      a. Phase and Ground Relays:
         1) Device tag.
         2) Relay current transformer ratio and tap, time dial, and instantaneous pickup value
         3) Recommendations on improved relaying systems, if applicable.
      b. Circuit Breakers:
         1) Adjustable pickups and time delays (long time, short time, ground).
         2) Adjustable time-current characteristic.
         3) Adjustable instantaneous pickup.
         4) Recommendations on improved trip systems, if applicable.
      c. Fuses: Show current rating, voltage, and class.

F. Time-Current Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:
   1. Device tag and title, one-line diagram with legend identifying the portion of the system covered.
   2. Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which the device is exposed.
   3. Identify the device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.
   4. Plot the following listed characteristic curves, as applicable:
      a. Power utility's overcurrent protective device.
      b. Medium-voltage equipment overcurrent relays.
      c. Medium- and low-voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands.
      d. Low-voltage equipment circuit-breaker trip devices, including manufacturer's tolerance bands.
      e. Transformer full-load current, magnetizing inrush current, and ANSI through-fault protection curves.
      f. Cables and conductors damage curves.
      g. Ground-fault protective devices.
      h. Motor-starting characteristics and motor damage points.

i. Generator short-circuit decrement curve and generator damage point.
j. The largest feeder circuit breaker in each motor-control center and panelboard.

5. Series rating on equipment allows the application of two series interrupting devices for a condition where the available fault current is greater than the interrupting rating of the downstream equipment. Both devices share in the interruption of the fault and selectivity is sacrificed at high fault levels. Maintain selectivity for tripping currents caused by overloads.
6. Provide adequate time margins between device characteristics such that selective operation is achieved.
7. Comments and recommendations for system improvements.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are indicated on Drawings.
1. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

3.2 PROTECTIVE DEVICE COORDINATION STUDY

A. Comply with IEEE 242 for calculating short-circuit currents and determining coordination time intervals.

B. Comply with IEEE 399 for general study procedures.

C. The study shall be based on the device characteristics supplied by device manufacturer.

D. The extent of the electrical power system to be studied is indicated on Drawings.

E. Begin analysis at the service, extending down to the system overcurrent protective devices as follows:
1. To normal system low-voltage load buses where fault current is 10 kA or less.
2. Exclude equipment rated 240-V ac or less when supplied by a single transformer rated less than 125 kVA.

F. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

G. Transformer Primary Overcurrent Protective Devices:
1. Device shall not operate in response to the following:
a. Inrush current when first energized.
b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
2. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.

H. Motor Protection:
1. Select protection for low-voltage motors according to IEEE 242 and NFPA 70.
2. Select protection for motors served at voltages more than 600 V according to IEEE 620.

I. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and protection recommendations in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.

J. Generator Protection: Select protection according to manufacturer's written recommendations and to IEEE 242.

K. The calculations shall include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and shall apply to low- and medium-voltage, three-phase ac systems. The calculations shall also account for the fault-current dc decrement, to address the asymmetrical requirements of the interrupting equipment.
   1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.

L. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault and single line-to-ground fault at each of the following:
   1. Electric utility's supply termination point.
   2. Switchgear.
   3. Unit substation primary and secondary terminals.
   4. Low-voltage switchgear.
   5. Motor-control centers.
   6. Standby generators and automatic transfer switches.
   7. Branch circuit panelboards.

M. Protective Device Evaluation:
   1. Evaluate equipment and protective devices and compare to short-circuit ratings.
   2. Adequacy of switchgear, motor-control centers, and panelboard bus bars to withstand short-circuit stresses.

3.3 LOAD-FLOW AND VOLTAGE-DROP STUDY

A. Perform a load-flow and voltage-drop study to determine the steady-state loading profile of the system. Analyze power system performance two times as follows:
   1. Determine load-flow and voltage drop based on full-load currents obtained in "Power System Data" Article.
   2. Determine load-flow and voltage drop based on 80 percent of the design capacity of the load buses.
   3. Prepare the load-flow and voltage-drop analysis and report to show power system components that are overloaded, or might become overloaded; show bus voltages that are less than as prescribed by NFPA 70.

3.4 MOTOR-STARTING STUDY

A. Perform a motor-starting study to analyze the transient effect of the system's voltage profile during motor starting. Calculate significant motor-starting voltage profiles and analyze the effects of the motor starting on the power system stability.

B. Prepare the motor-starting study report, noting light flicker for limits proposed by IEEE 141 and voltage sags so as not to affect the operation of other utilization equipment on the system supplying the motor.

3.5 POWER SYSTEM DATA

A. Obtain all data necessary for the conduct of the overcurrent protective device study.

1. Verify completeness of data supplied in the one-line diagram on Drawings. Call discrepancies to the attention of Engineer.
2. For new equipment, use characteristics submitted under the provisions of action submittals and information submittals for this Project.
3. For existing equipment, whether or not relocated obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers. The qualifications of technicians and engineers shall be qualified as defined by NFPA 70E.

B. Gather and tabulate the following input data to support coordination study. The list below is a guide. Comply with recommendations in IEEE 551 for the amount of detail required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study, and shall be by the engineer or its representative who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
   1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
   2. Electrical power utility impedance at the service.
   3. Power sources and ties.
   4. Short-circuit current at each system bus, three phase and line-to-ground.
   5. Full-load current of all loads.
   6. Voltage level at each bus.
   7. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
   8. For reactors, provide manufacturer and model designation, voltage rating, and impedance.
   9. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
   10. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
   11. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
   12. Maximum demands from service meters.
   13. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
   14. Motor horsepower and NEMA MG 1 code letter designation.
   15. Low-voltage cable sizes, lengths, number, conductor material, and conduit material (magnetic or nonmagnetic).
   16. Medium-voltage cable sizes, lengths, conductor material, and cable construction and metallic shield performance parameters.
   17. Data sheets to supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram, showing the following:
      a. Special load considerations, including starting inrush currents and frequent starting and stopping.
      b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
      c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
      d. Generator thermal-damage curve.
      e. Ratings, types, and settings of utility company's overcurrent protective devices.
      f. Special overcurrent protective device settings or types stipulated by utility company.

g. Time-current-characteristic curves of devices indicated to be coordinated.
h. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
j. Panelboards, switchboards, motor-control center ampacity, and SCCR in amperes rms symmetrical.
k. Identify series-rated interrupting devices for a condition where the available fault current is greater than the interrupting rating of the downstream equipment. Obtain device data details to allow verification that series application of these devices complies with NFPA 70 and UL 489 requirements.

3.6 FIELD ADJUSTING

A. Adjust relay and protective device settings according to the recommended settings provided by the coordination study. Field adjustments shall be completed by the engineering service division of the equipment manufacturer under the Startup and Acceptance Testing contract portion.

B. Make minor modifications to equipment as required to accomplish compliance with short-circuit and protective device coordination studies.

C. Testing and adjusting shall be by a full-time employee of the Field Adjusting Agency, who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters. Perform NETA tests and inspections for all adjustable overcurrent protective devices.

3.7 DEMONSTRATION

A. Engage the Coordination Study Specialist to train Owner's maintenance personnel in the following:
1. Acquaint personnel in the fundamentals of operating the power system in normal and emergency modes.
2. Hand-out and explain the objectives of the coordination study, study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpreting the time-current coordination curves.
3. Adjust, operate, and maintain overcurrent protective device settings.

END OF SECTION 26 05 73

SECTION 26 05 74 - OVERCURRENT PROTECTIVE DEVICE ARC-FLASH STUDY

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes a computer-based, arc-flash study to determine the arc-flash hazard distance and the incident energy to which personnel could be exposed during work on or near electrical equipment.

1.3 DEFINITIONS

A. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

B. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.

C. SCCR: Short-circuit current rating.

D. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

1.4 ACTION SUBMITTALS

A. Product Data: For computer software program to be used for studies.

B. Other Action Submittals: Submit the following submittals after the approval of system protective devices submittals. Submittals shall be in digital form.
   1. Arc-flash study input data, including completed computer program input data sheets.
   2. Arc-flash study report; signed, dated, and sealed by a qualified professional engineer.
      a. Submit study report for action prior to receiving final approval of the distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that the selection of devices and associated characteristics is satisfactory.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Arc-Flash Study Specialist and Field Adjusting Agency.

B. Product Certificates: For arc-flash hazard analysis software, certifying compliance with IEEE 1584 and NFPA 70E.

1.6 CLOSEOUT SUBMITTALS

A. Maintenance procedures according to requirements in NFPA 70E shall be provided in the equipment manuals.

B. Operation and Maintenance Procedures: In addition to items specified in Section 01 78 23 "Operation and Maintenance Data," provide maintenance procedures for use by Owner's personnel that comply with requirements in NFPA 70E.

1.7 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are unacceptable.

B. Arc-Flash Study Software Developer Qualifications: An entity that owns and markets computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.
   1. The computer program shall be developed under the charge of a licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.

C. Arc-Flash Study Specialist Qualifications: Professional engineer in charge of performing the study, analyzing the arc flash, and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.

D. Field Adjusting Agency Qualifications: An independent agency, with the experience and capability to adjust overcurrent devices and to conduct the testing indicated, that is a member company of the International Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

PART 2 PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

A. Software Developers:
   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. SKM Systems Analysis, Inc.
      b. ETAP
      c. Easy power

B. Comply with IEEE 1584 and NFPA 70E.

C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

2.2 ARC-FLASH STUDY REPORT CONTENT

A. Executive summary.

B. Study descriptions, purpose, basis and scope.

C. One-line diagram, showing the following:
   1. Protective device designations and ampere ratings.
   2. Cable size and lengths.
   3. Transformer kilovolt ampere (kVA) and voltage ratings.
   4. Motor and generator designations and kVA ratings.
   5. Switchgear, switchboard, motor-control center and panelboard designations.

D. Short-Circuit Study Output: As specified in "Short-Circuit Study Report Contents" Article in Section 260572 "Overcurrent Protective Device Short-Circuit Study."

E. Protective Device Coordination Study Report Contents: As specified in "Protective Device Coordination Study Report Contents" Article in Section 260573 "Overcurrent Protective Device Coordination Study."

F. Arc-Flash Study Output:
   1. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
      a. Voltage.
      b. Calculated symmetrical fault-current magnitude and angle.
      c. Fault-point X/R ratio.
      d. No AC Decrement (NACD) ratio.
      e. Equivalent impedance.
      f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
      g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis

G. Incident Energy and Flash Protection Boundary Calculations:
   1. Arcing fault magnitude with and without required Arc Energy Reduction methods.
   2. Protective device clearing time.
   3. Duration of arc.
   4. Arc-flash boundary.
   5. Working distance.
   6. Incident energy.
   7. Hazard risk category.
   8. Recommendations for arc-flash energy reduction.

H. Fault study input data, case descriptions, and fault-current calculations including a definition of terms and guide for interpretation of the computer printout.

2.3 ARC-FLASH WARNING LABELS

A. Comply with requirements in Section 260553 "Identification for Electrical Systems." Produce a 3.5-by-5-inch thermal transfer label of high-adhesion polyester for each work location included in the analysis.

B. The label shall have an orange header with the wording, "WARNING, ARC-FLASH HAZARD," and shall include the following information taken directly from the arc-flash hazard analysis:
   1. Location designation.
   2. Nominal voltage.
   3. Flash protection boundary.
   4. Hazard risk category.
   5. Incident energy.
   6. Working distance.
   7. Engineering report number, revision number, and issue date.

C. Labels shall be machine printed, with no field-applied markings.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine Project overcurrent protective device submittals. Proceed with arc-flash study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to arc-flash study may not be used in study.

3.2 ARC-FLASH HAZARD ANALYSIS

A. Comply with NFPA 70E and its Annex D for hazard analysis study.

B. Preparatory Studies:
1. Protective Device Coordination Study Report Contents: As specified in "Protective Device Coordination Study Report Contents" Article in Section 26 05 73 "Overcurrent Protective Device Coordination Study."

C. Calculate maximum and minimum contributions of fault-current size.
1. The minimum calculation shall assume that the utility contribution is at a minimum and shall assume no motor load.
2. The maximum calculation shall assume a maximum contribution from the utility and shall assume motors to be operating under full-load conditions.

D. Calculate the arc-flash protection boundary and incident energy at locations in the electrical distribution system where personnel could perform work on energized parts.

E. Include medium- and low-voltage equipment locations, except equipment rated 240-V ac or less fed from transformers less than 125 kVA.

F. Safe working distances shall be specified for calculated fault locations based on the calculated arc-flash boundary, considering incident energy of 1.2 cal/sq.cm.

G. Incident energy calculations shall consider the accumulation of energy over time when performing arc-flash calculations on buses with multiple sources. Iterative calculations shall take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators shall be decremented as follows:
1. Fault contribution from induction motors should not be considered beyond three to five cycles.
2. Fault contribution from synchronous motors and generators should be decayed to match the actual decrement of each as closely as possible (e.g., contributions from permanent magnet generators will typically decay from 10 per unit to three per unit after 10 cycles).

H. Arc-flash computation shall include both line and load side of a circuit breaker as follows:
1. When the circuit breaker is in a separate enclosure.
2. When the line terminals of the circuit breaker are separate from the work location.

I. Base arc-flash calculations on actual overcurrent protective device clearing time. Cap maximum clearing time at two seconds based on IEEE 1584, Section B.1.2.

3.3 POWER SYSTEM DATA

A. Obtain all data necessary for the conduct of the arc-flash hazard analysis.
1. Verify completeness of data supplied on the one-line diagram on. Call discrepancies to the attention of Engineer.
2. For new equipment, use characteristics submitted under the provisions of action submittals and information submittals for this Project.

3. For existing equipment, whether or not relocated, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers.

B. Electrical Survey Data: Gather and tabulate the following input data to support study. Comply with recommendations in IEEE 1584 and NFPA 70E as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study, and shall be by the engineer or its representative who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
2. Obtain electrical power utility impedance at the service.
3. Power sources and ties.
4. Short-circuit current at each system bus, three phase and line-to-ground.
5. Full-load current of all loads.
6. Voltage level at each bus.
7. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in per cent, and phase shift.
8. For reactors, provide manufacturer and model designation, voltage rating and impedance.
9. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
10. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
11. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
12. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
13. Motor horsepower and NEMA MG 1 code letter designation.
14. Low-voltage cable sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).
15. Medium-voltage cable sizes, lengths, conductor material, and cable construction and metallic shield performance parameters.

3.4 LABELING

A. Apply one arc-flash label for 600-V ac, 480-V ac, and applicable 208-V ac panelboards and disconnects and for each of the following locations:
1. Motor-control center.
2. Low-voltage switchboard.
3. Switchgear.
4. Medium-voltage switch.
5. Control panel.

3.5 APPLICATION OF WARNING LABELS

A. Install the arc-fault warning labels under the direct supervision and control of the Arc-Flash Study Specialist.

3.6 DEMONSTRATION

A. Engage the Arc-Flash Study Specialist to train Owner's maintenance personnel in the potential arc-flash hazards associated with working on energized equipment and the significance of the arc-flash warning labels.

END OF SECTION 26 05 74

SECTION 26 08 10 - ELECTRICAL SYSTEMS COMMISSIONING

PART 1 - GENERAL

1.1 DESCRIPTION

A. The purpose of this section is to specify Division 26 responsibilities in the commissioning process which are being directed by the CxA. Other electrical system testing is required under the direction of the GC.

B. The list of commissioned equipment and systems is found in Section 01 91 13.1.7.

C. Commissioning requires the participation of Division 26 to ensure that all systems are operating in a manner consistent with the Contract Documents. The general commissioning requirements and coordination are detailed in Division 01 91 13. Division 26 shall be familiar with all parts of Division 01 91 13 and the commissioning plan issued by the CxA and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

1.2 RESPONSIBILITIES

A. Electrical Contractors. The commissioning responsibilities applicable to the electrical contractor are as follows *(all references apply to commissioned equipment only)*:

Construction and Acceptance Phases

1. Include the cost of commissioning in the contract price.

2. In each purchase order or subcontract written, include requirements for submittal data, O&M data and training.

3. Attend a commissioning scoping meeting and other necessary meetings scheduled by the CxA to facilitate the Cx process.

4. Contractors shall provide normal cut sheets and shop drawing submittals to the CxA of commissioned equipment.

5. Provide additional requested documentation, prior to normal O&M manual submittals, to the CxA for development of start-up and functional testing procedures.

   a. Typically this will include detailed manufacturer installation and start-up, operating, troubleshooting and maintenance procedures, full details of any owner-contracted tests, full factory testing reports, if any, and full warranty information, including all responsibilities of the Owner to keep the warranty in force clearly identified. In addition, the installation and checkout materials that are actually shipped inside the equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the Commissioning Agent.

   b. The Commissioning Agent may request further documentation necessary for the commissioning process.

   c. This data request may be made prior to normal submittals.

6. Provide a copy of the O&M manuals submittals of commissioned equipment, through normal channels, to the CxA for review and approval.

7. Contractors shall assist (along with the design engineers) in clarifying the operation and control of commissioned equipment in areas where the specifications, control drawings or equipment documentation is not sufficient for writing detailed testing procedures.

8. Provide assistance to the CxA in preparation of the specific functional performance test procedures specified in Section 260811. Subs shall review test procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests.

9. Develop a full start-up and initial checkout plan using manufacturer's start-up procedures and the pre-functional checklists from the CxA. Submit manufacturer's detailed start-up procedures and the full start-up plan and procedures and other requested equipment documentation to CxA for review.

10. During the startup and initial checkout process, execute and document the electrical-related portions of the pre-functional checklists provided by the CxA for all commissioned equipment.

11. Perform and clearly document all completed startup and system operational checkout procedures, providing a copy to the CxA.

12. Address current A/E punch list items before functional testing. Air and water TAB shall be completed with discrepancies and problems remedied before functional testing of the respective air- or water-related systems.

13. Provide skilled technicians to execute starting of equipment and to execute the functional performance tests. Ensure that they are available and present during the agreed upon schedules and for sufficient duration to complete the necessary tests, adjustments and problem-solving.

14. Perform functional performance testing under the direction of the CxA for specified equipment in Section 260811 and 01 91 13. Assist the CxA in interpreting the monitoring data, as necessary.

15. Correct deficiencies (differences between specified and observed performance) as interpreted by the CxA, PM and A/E and retest the equipment.

16. Prepare O&M manuals according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built conditions.

17. During construction, maintain as-built red-line drawings for all drawings and final CAD as-builts for contractor-generated coordination drawings. Update after completion of commissioning (excluding deferred testing). Prepare red-line as-built drawings for all drawings and final as-builts for contractor-generated coordination drawings.

18. Provide training of the Owner's operating personnel as specified.

19. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

Warranty Period

1. Execute seasonal or deferred functional performance testing, witnessed by the CxA, according to the specifications.

2. Correct deficiencies and make necessary adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

B. Electrical Designer/Engineer

1. Refer to Section 01 91 13 for the responsibilities of the Electrical Designer/Engineer.

1.3 RELATED WORK

A. Refer to Section 01 91 13, Part 1.4 for a listing of all sections where commissioning requirements are found.

B. Refer to Section 01 91 13 Part 1.7 for systems to be commissioned and section 01 91 13 Part 1.6 and 260811 for functional testing requirements.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. Division 26 shall provide all test equipment necessary to fulfill the testing requirements of this Division.

B. Refer to Section 01 91 13 Part 2.1 for additional Division 16 requirements.

PART 3 - EXECUTION

3.1 SUBMITTALS

A. Division 26 shall provide submittal documentation relative to commissioning to the CxA as requested by the CxA. Refer to Section 01 91 13 Part 3.3 for additional Division 26 requirements.

3.2 STARTUP

A. The electrical contractors shall follow the start-up and initial checkout procedures listed in the Responsibilities list in this section and in 01 91 13 Part 3.4. Division 16 has start-up responsibility and is required to complete systems and sub-systems so they are fully functional, meeting the design objectives of the Contract Documents. The commissioning procedures and functional testing do not relieve or lessen this responsibility or shift that responsibility partially to the commissioning agent or Owner.

B. Functional testing is intended to begin upon completion of a system. Functional testing may proceed prior to the completion of systems, or sub-systems at the discretion of the CxA and CM. Beginning system testing before full completion, does not relieve the Contractor from fully completing the system, including all pre-functional checklists as soon as possible.

3.3 FUNCTIONAL PERFORMANCE TESTS

A. Refer to Section 01 91 13 Part 1.7 for a list of systems to be commissioned and to Part 3.6 for a description of the process and to Section 260811 for specific details on the required functional performance tests.

3.4 TESTING DOCUMENTATION, NON-CONFORMANCE AND APPROVALS

A. Refer to Section 01 91 13 Part 3.4 for specific details on non-conformance issues relating to pre-functional checklists and tests.

B. Refer to Section 01 91 13 Part 3.6 for issues relating to functional performance tests.

3.5 OPERATIONS AND MAINTENANCE (O&M) MANUALS

A. Division 26 shall compile and prepare documentation for all equipment and systems covered in Division 26 and deliver to the GC for inclusion in the O&M manuals, according to Section 01 78 24.

B. The CA shall receive a copy of the O&M manuals for review.

3.6 TRAINING OF OWNER PERSONNEL

A. The GC shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed. Refer to Section 01 91 13 for additional details.

B. The CxA shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment. Refer to Section 01 91 13 for additional details.

C. Electrical Contractor. The electrical contractor shall have the following training responsibilities:

1. Provide the CxA with a training plan two weeks before the planned training according to the outline described in Section 01 91 13, Part 3.9.

2. Provide designated Owner personnel with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned electrical equipment or system.

3. Training shall start with classroom sessions, if necessary, followed by hands on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, power failure, etc.

4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer’s representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.

6. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

7. Training shall include:

a. Use the printed installation, operation and maintenance instruction material included in the O&M manuals.

b. Include a review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.

c. Discuss relevant health and safety issues and concerns.

d. Discuss warranties and guarantees.

e. Cover common troubleshooting problems and solutions.

f. Explain information included in the O&M manuals and the location of all plans and manuals in the facility.

g. Discuss any peculiarities of equipment installation or operation.

h. The format and training agenda in *Guidelines for Commissioning HVAC Systems*, ASHRAE, 1989R, 1996 is recommended.

i. Classroom sessions shall include the use of overhead projections, slides, video and audio taped material as might be appropriate.

8. Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and maintenance of all pieces of equipment.

9. The electrical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not *controlled* by the central control system.

10. Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.

11. Duration of Training. The electrical contractor shall provide training on each piece of equipment according to the following schedule.

__1___ Lighting Controls

3.7 DEFERRED TESTING

A. Refer to Section 01 91 13, Part 3.10 for requirements of deferred testing.

3.8 WRITTEN WORK PRODUCTS

A. Written work products of Contractors will consist of the startup and initial checkout plan described in Section 01 91 13 and the filled out startup, initial checkout and pre-functional checklists.

END OF SECTION

SECTION 26 08 11 - ELECTRICAL TESTING REQUIREMENTS

PART 1 - GENERAL

1.1 INCLUDED SYSTEMS AND EQUIPMENT

A. The following is a list of the equipment and system test requirements included in this section:

1. Electrical System Power Quality
2. Lighting Controls and Lighting
3. Emergency Power Systems
4. Fire Alarm System

1.2 DESCRIPTION

A. This section specifies the functional testing requirements for Division 26 systems and equipment. From these requirements, the Commissioning Authority (CxA) shall develop step-by-step procedures to be executed by the Subs. The general functional testing process, requirements and testing methods definitions are described in Section 01 91 13. The test requirements for each piece of equipment or system contain the following:

1. The contractors responsible to execute the tests, under the direction of the CxA.
2. A list of the integral components being tested.
3. Pre-functional checklists associated with the components.
4. Functions and modes to be tested.
5. Required conditions of the test for each mode.
6. Special procedures.
7. Required methods of testing.
8. Required monitoring.
9. Acceptance criteria.
10. Sampling strategies allowed.

1.3 PREREQUISITES

The following applicable generic prerequisite checklist items are required to be listed on each written functional test form and be completed and checked off by CxA prior to functional testing.

__ All related equipment has been started up and start-up reports and pre-functional checklists submitted and approved ready for functional testing:

__ All control system functions for this and all interlocking systems are programmed and operable per contract documents, including final setpoints and schedules with debugging, loop tuning and sensor calibrations completed.

_____ _____

Controls Contractor Signature or Verbal Date

__ All A/E punchlist items for this equipment corrected.

__ These functional test procedures reviewed and approved by installing contractor.

__ Safeties and operating ranges reviewed by the CxA.

__ Test requirements and sequences of operation attached.

__ Schedules and setpoints attached.

__ Sufficient clearance around equipment for servicing.

__ Record of all values for pre-test setpoints changed to accommodate testing has been made and a check box provided to verify return to original values (control parameters, limits, delays, lockouts, schedules, etc.).

__ Other miscellaneous checks of the pre-functional checklist and start-up reports completed successfully.

1.4 MONITORING

A. Monitoring is a method of testing as a stand-alone method or to augment manual testing.

B. All points listed in the required monitoring section of the test requirements which are control system monitored points shall be trended by the controls contractor. Other points shall be monitored by the CA using dataloggers. At the option of the CxA, some control system monitoring may be replaced with datalogger monitoring. At the CxA's request, the controls contractor shall trend up to 20% more points than listed at no extra charge.

C. Hard copies of monitored data must be in columnar format with time down the left column and at least 4 columns of point values on the same page. Graphical output is a desirable option, if the system can produce it.

PART 2 - PRODUCTS

-- NOT APPLICABLE --

PART 3 - EXECUTION

1. ELECTRICAL POWER SYSTEM

A. Parties Responsible to Execute Functional Test
1. Electrical contractor: assist in testing sequences
2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
1. Switchgear
2. Transformers
3. Panelboards

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 26 08 11 shall be listed on each functional test form and checked off prior to functional testing.

D. Functions / Modes Required To Be Tested and Test Methods
The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	**Test Method Manual (demonstration), Monitoring, Either or Both**
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, debugged and fully operable.	Verbal discussion of features
2. Test Meter Readings	Demonstration

E. Special Procedures (other equipment to test with, etc.; reference to function ID)
None

F. Required Monitoring
1. None required, though monitoring can substitute for manual testing for all functions. See section 1.4 above.

G. Acceptance Criteria (referenced by function or mode ID)
1-2 For the conditions, sequences and modes tested, related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

H. Sampling Strategy for Identical Units
1. All will be tested.

END OF REQUIREMENTS FOR ELECTRICAL POWER QUALITY TEST

2. LIGHTING CONTROLS AND LIGHTING

A. Parties Responsible to Execute Functional Test
1. Electrical contractor: assist in testing sequences
2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
1. Lighting

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 26 08 11 shall be listed on each functional test form and checked off prior to functional testing.

D. Functions / Modes Required To Be Tested and Test Methods
The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	**Test Method Manual (demonstration), Monitoring, Either or Both**
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, debugged and fully operable.	Verbal discussion of features
2. Test Meter Readings	Demonstration

E. Special Procedures (other equipment to test with, etc.; reference to function ID)
None

F. Required Monitoring
1. None required, though monitoring can substitute for manual testing for all functions. See section 1.4 above.

G. Acceptance Criteria (referenced by function or mode ID)
1-2 For the conditions, sequences and modes tested, related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

H. Sampling Strategy for Identical Units
1. All will be tested.

END OF REQUIREMENTS FOR LIGHTING CONTROLS

3. EMERGENCY GENERATOR & ATS

A. Parties Responsible to Execute Functional Test
1. Electrical contractor: assist in testing sequences
2. CxA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested
1. ATS

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 16997 shall be listed on each functional test form and checked off prior to functional testing.

D. Functions / Modes Required To Be Tested and Test Methods
The following testing requirements are an addition to and do not replace any testing requirements elsewhere in this Division.

Function / Mode	**Test Method Manual (demonstration), Monitoring, Either or Both**
MISCELLANEOUS FUNCTIONS	
1. All specified functions and features are set up, debugged and fully operable.	Verbal discussion of features
2. Full load test.	Demonstration
3. Remote Monitoring	Demonstration
4. Override Mode	Demonstration
5. Weekly Exercise	Demonstration

E. Special Procedures (other equipment to test with, etc.; reference to function ID)
None

F. Required Monitoring
1. None required, though monitoring can substitute for manual testing for all functions. See section 1.4 above.

G. Acceptance Criteria (referenced by function or mode ID)
1-3 For the conditions, sequences and modes tested, related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

H. Sampling Strategy for Identical Units
1. All will be tested.

END OF REQUIREMENTS FOR EMERGENCY GENERATOR

4. FIRE ALARM

This is a performance test to verify that the fire alarm system can perform as specified.

A. Parties Responsible to Execute Functional Test
   1. Electrical contractor: provide all testing instruments and test sequences and debugging
   2. Fire alarm system contractor, local and remote monitoring site
   3. CxA to witness, direct and document testing

B. Integral Components or Related Equipment Being Tested
   Fire Suppression

C. Prerequisites: The applicable prerequisite checklist items listed in the beginning of Section 26 08 11 shall be listed on each functional test form and checked off prior to functional testing.

D. Required Monitoring
   None

E. Acceptance Criteria
   As required by Fire Marshall.

F. Sampling Strategy
   As required by Fire Marshall.

END OF REQUIREMENTS FOR FIRE ALARM SYSTEM TEST

END OF SECTION

SECTION 26 08 12 - ELECTRICAL PRE-FUNCTIONAL CHECKLISTS

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section contains representative Pre-functional Checklists in a form format (PC).

1. The checklists contain items for both Division 26 contractors to perform. On each checklist, a column is provided that should be filled out by the Contractor assigning responsibility for that line item to a trade.

2. Those executing the checklists are only responsible to perform items that apply to the specific application at hand. These checklists do not take the place of the manufacturer's recommended checkout and start-up procedures or report. Some checklist procedures may be redundant of some checkout procedures that will be documented on typical factory field checkout sheets. Double documenting is required in those cases.

3. Refer to Section 01 91 13 for additional requirements regarding pre-functional checklists, startup and initial checkout. Items that do not apply should be noted along with the reasons on the form. If this form is not used for documenting, one of similar rigor and clarity shall be used. Contractors assigned responsibility for sections of the checklist shall be responsible to see that checklist items by their subcontractors are completed and checked off. "Contr." column or abbreviations in brackets to the right of an item refer to the contractor responsible to verify completion of this item. A/E = architect/engineer, All = all contractors, CxA = commissioning agent, CC = controls contractor, EC = electrical contractor, GC = general contractor, MC = mechanical contractor, SC = sheet metal contractor, TAB = test and balance contractor.

Pre-functional Electrical Checklist

Project : SAMPLE

PF-01 ELECTRICAL POWER SYSTEM

Components included: PANELBOARDS, SWITCHBOARD

1. Submittal / Approvals

Submittal. The above equipment and systems integral to them are complete and ready for functional testing. The checklist items are complete and have been checked off only by parties having direct knowledge of the event, as marked below, respective to each responsible contractor. This pre-functional checklist is submitted for approval, subject to an attached list of outstanding items yet to be completed. A Statement of Correction will be submitted upon completion of any outstanding areas. None of the outstanding items preclude safe and reliable functional tests being performed. ___ List attached.

_____	_____	_____	_____
Electrical Contractor	Date	General Contractor	Date

Pre-functional checklist items are to be completed as part of startup & initial checkout, preparatory to functional testing.

- This checklist does not take the place of the manufacturer's recommended checkout and startup procedures or report.
- Items that do not apply shall be noted with the reasons on this form (N/A = not applicable, BO = by others).
- If this form is not used for documenting, one of similar rigor shall be used.
- Contractors assigned responsibility for sections of the checklist shall be responsible to see that checklist items by their subcontractors are completed and checked off.
- "Contr." column or abbreviations in brackets to the right of an item refer to the contractor responsible to verify completion of this item. A/E = architect/engineer, All = all contractors, CA = commissioning agent, CC = controls contractor, EC = electrical contractor, GC = general contractor, MC = mechanical contractor, SC = sheet metal contractor, TAB = test and balance contractor.

2. Installation Checks

Check if Okay. Enter comment or note number if deficient.

Check **Equip Tag->**						**Contr.**
Permanent labels affixed						
Compare equipment nameplate and data with drawings and specs.						
Operate circuit breaker to insure smooth operation.						
Maintenance access acceptable for NEC compliance						
Perform a contact/pole resistance test.						
Determine ground fault pickup and time delay by primary current injection.						
Inspect main and branches for cracks or defects						
Verify any adjustable settings are in accordance with coordination survey						
Verify that proper bushings are installed						
Verify wire sizes, panel clean and circuit directory accurate						
Torque all lugs to factory settings						

- *The checklist items of Part 4 are all successfully completed for given trade.....___ YES ___ NO*

Approvals. This filled-out checklist has been reviewed. Its completion is approved with the exceptions noted below.

SECTION 26 08 13 - ELECTRICAL FUNCTIONAL TEST PROCEDURES

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section contains sample Functional performance Test procedures in a form format (FT).

1. The sample FT procedures displayed in a form format here are intended to provide the Subs and CA with an example of a format and an indication of the rigor of the required testing and documentation for various equipment types. They were not developed for this project. Other forms and formats are acceptable if they comply with the rigor, clarity and intent of all the commissioning specifications. The CA will use the functional testing requirements in Sections 26 08 11 and the testing protocols specified in Section 01 91 13 for developing site-specific functional test procedures and forms for this project. For illustrative purposes, sequences of operation associated with a few pieces of the equipment for which tests are included are also provided.

Functional Test

Project: Sample

EFT-01 INTERIOR LIGHTING CONTROLS – OCCUPANCY SENSORS

1. Participants

Party		Participation
Thompson Building Energy Solutions		

Party filling out this form and witnessing testing _____
Date of test _____

2. Prerequisite Checklist

a. _X_ All control system functions for this and all interlocking systems are programmed and operable per contract documents, including final setpoints, schedules, debugging and fine tuning of occupancy sensor parameters.
b. _X_ All A/E punchlist items for this equipment corrected.
c. _X_ Safeties and operating ranges reviewed.
d. _X_ Test requirements and sequences of operation attached.
e. _X_ Schedules and setpoints attached.
f. _X_ Schedule of fixtures on each control type has been reviewed.
g. _X_ Record of All Values for Current Setpoints (SP), Control Parameters, Limits, Delays, Lockouts, Schedules, Etc. Changed to Accommodate Testing:

3. Sensor Calibration Checks. Check the sensors listed below for calibration and adequate location.

4. Device Calibration Checks.

5. Verification of Misc. Pre-functional Checks.

Misc. site checks of the pre-functional checklist and startup reports completed successfully. Pass? Y / N

_____

_X_ Occupancy sensor in the correct location.

_X_ Occupancy sensor mounted securely.

Functional Testing Record – Interior Occupancy Sensors

Proced. No.	Rm No.	Test Procedure (including special conditions)	Expected and Actual Response [Write ACTUAL response in brackets or circle]	Pass Y/N & Note #
1		Walk into room with lights off. Note: All occupancy sensor timing should be set for 15minutes.	Lights should turn on.	
2		Exit the room	Lights should stay on.	
3		Wait 15 minutes	Lighting should turn off after 15 minutes.	

Approvals. This filled-out checklist has been reviewed. Its completion is approved with the exceptions noted below.

END OF SECTION

SECTION 26 09 13 - ELECTRICAL POWER MANAGEMENT SYSTEM

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Electrical power management system (EPMS) and associated hardware, software, and services.

1.2 ABBREVIATIONS AND ACRONYMS

A. PQ: Power quality.

B. PTP: Precision time protocol.

1.3 DEFINITIONS

A. Electrical power management system may also be identified as EPMS, EMS, PEMS, energy management system, electrical power monitoring system, power and energy monitoring system, or energy and power management system.

B. Precision Time Protocol: Protocol for accurate and precise network synchronization of clocks, complying with IEEE 1588.

C. Smart Mobile Device: Smart phone or tablet compatible with iOS or Android OS capable of running apps used for specified functionality.

1.4 REFERENCE STANDARDS

A. BS EN 50160 - Voltage Characteristics of Electricity Supplied by Public Electricity Networks; 2010, with Amendments (2019).

B. ISO 9001 - Quality Management Systems — Requirements; 2015, with Amendment (2024).

C. ISO 50001 - Energy Management Systems – Requirements with Guidance for Use; 2018.

D. ISO 50002 - Energy Audits – Requirements with Guidance for Use; 2014.

E. ISO 50006 - Energy Management Systems – Measuring Energy Performance Using Energy Baselines (EnB) and Energy Performance Indicators (EnPI) – General Principles and Guidance; 2014.

F. NECA 1 - Standard for Good Workmanship in Electrical Construction; 2023.

G. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

H. NFPA 99 - Health Care Facilities Code; 2024, with Errata.

I. NFPA 110 - Standard for Emergency and Standby Power Systems; 2025.

1.5 ADMINISTRATIVE REQUIREMENTS

A. Coordination: Coordinate work to provide EPMS-compatible equipment and systems with sensors, interfaces, and other appurtenances required for specified functionality.

B. Software Configuration Review Meetings:
1. Review proposed screens and report formats with Owner and Engineer throughout configuration process.

2. Convene minimum of two meetings at Owner's facilities, one for initial review and one at approximately 50 percent completion. EPMS supplier's programming personnel to attend initial review meeting.

C. Preinstallation Meeting: Review material selections and installation procedures with manufacturer's representative and affected installers.

D. Scheduling: Where source interruptions are required for testing and commissioning, arrange scheduling with Owner; allow minimum of one day for pretesting and one day for acceptance testing, with accommodations for testing outside of normal business hours where applicable.

1.6 SUBMITTALS

A. Provide sufficient information to determine compliance with contract documents. Identify submittal data with specific equipment tags and/or service descriptions to which they pertain. Identify specific model numbers, options, and features of equipment proposed.

B. Indicate deviations from contract documents with reference to corresponding drawing or specification number and written justification for deviation.

C. Software Configuration Standards and Conventions:
1. EPMS supplier to document decisions made during first EPMS software configuration review meeting.
2. Provide color documents for accuracy, using accurately depicted colors and shapes proposed for use in final system; black and white documents are not acceptable.
3. Include the following for review and approval before software configuration commences:
   a. Intelligent Building Management System (iBMS) Integration:
      1) Energy metering points list with associated metadata tags indicating location and load type.
      2) Electrical quantities for each metering point, including but not limited to, energy per phase, real power per phase, apparent power per phase, reactive power per phase, current per phase, voltage, power factor.
   b. High Accuracy and Resolution Event Recording: Implementation details, including critical status points and time synchronization mechanism.
   c. Capacity Management: Circuits for reporting, report formats, and dashboard layouts.
   d. Backup Power Testing: Mechanisms of integration with generator system, report formats, and dashboard layouts.
   e. Asset Performance: Circuits for LV breaker aging monitoring, report formats, and dashboard layouts.
   f. Utility Bill Verification: Billing determinants and billing report formats.
   g. Cost Allocation: Energy cost determinants, report formats, and dashboard layouts.
   h. Energy Usage and Benchmarking:
      1) Energy usage determinants.
      2) Report formats and dashboard layouts.
      3) Data import mechanisms to integrate normalization data from external systems, such as building management systems and production systems.
      4) Data import mechanisms to integrate operating state information from external systems, such as HVAC and production systems.
   i. Energy Performance Analysis and Verification (Modeling):
      1) Energy usage determinants.
      2) Report formats and dashboard layouts.
      3) Data import mechanisms to integrate relevant energy driver information, such as temperature and occupancy.

D. Product Data: Provide manufacturer's standard catalog pages and data sheets, including physical data, electrical performance, electrical characteristics, and connection requirements.

E. Shop Drawings:
1. Provide elementary and interconnection diagrams for field-monitoring devices and networking components, including power, signal, control, and communications wiring with network addresses.
2. Identify network connections, protocols, device room locations, and recommended installation notations.
3. EPMS-Connected LV Switchgear: Provide project-specific drawings for each switchgear/breaker.

F. Commissioning Report: Provide detailed scope of work checklist document with delivered functionality listed and checked.

G. Manufacturer's qualification statement.

H. Installer's qualification statement.

I. EPMS services contract.

J. Operation and Maintenance Data: Include sequence of operation (for control applications such as automatic transfer schemes and load control), layout drawings, bill of material, spare parts list, and component catalog information.

K. Project Record Documents:
1. Construction, installation, schematic, and wiring diagrams updated to as-installed and commissioned state.
2. Configured settings/parameters for adjustable components updated to as-installed and commissioned state, noted if different from factory default.

L. Software: Copy of software required in this section, associated licensing documentation, and support contact information. Indicate licensing in Owner's name.

M. Maintenance Materials: Furnish the following for Owner's use in maintenance of project:
1. Tools: Manufacturer-specific special tools required to install, remove, test, and maintain EPMS components.
a. Equipment Configuration Software: PC-based or smart mobile device application; provide one of each different communication interface cable required to connect computer/device for configuration and programming.
b. Electronic Configuration Files: For future upload into replaced/repaired components, in media format acceptable by Owner.

1.7 QUALITY ASSURANCE

A. Comply with the following:
1. NFPA 70.
2. Requirements of local authorities having jurisdiction.
3. Applicable local codes.

B. Manufacturer Qualifications:
1. Firm engaged in manufacture of specified products of types and sizes required, and whose products have been in satisfactory use in similar service for minimum of 10 years.
2. Certified in accordance with ISO 9001 with applicable quality assurance system regularly reviewed and audited by third-party registrar. Develop and control manufacturing, inspection, and testing procedures under guidelines of quality assurance system.
3. Service, repair, and technical support services available 24 hours per day, 7 days per week from manufacturer or their representative.

C. Installer Qualifications: Firm with minimum 10 years experience with EPMS of similar type and scope.

D. Product Listing Organization Qualifications: Organization recognized by OSHA as Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

E. Design Tests:
1. Test EPMS in test-bed environment with hardware devices representative of large-scale functional power distribution system, including both physical and simulated devices, such as advanced power quality meters, low-voltage main meters, low-voltage feeder meters, circuit breaker trip units, transformer monitoring units, protective relays, and branch circuit power meters.
2. Publish documented test results, including system response times, network performance, and recommended network architectures, available upon request.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Prior to delivery to project site, verify suitable storage space is available to store materials in well-ventilated area protected from weather, moisture, soiling, extreme temperatures, humidity, and corrosive atmospheres.

B. Protect materials during delivery and storage and maintain within manufacturer's written storage requirements. At minimum, store indoors in clean, dry space with uniform temperature to prevent condensation and protect electronics from potential damage from electrical and magnetic energy.

C. Deliver materials to project site in supplier's or manufacturer's original wrappings and containers, labeled with supplier's or manufacturer's name, material or product brand name, and equipment tag number or service name as identified in Contract Documents.

D. Inspect products and report concealed damage or violation of delivery, storage, and handling requirements to Engineer.

1.9 FIELD CONDITIONS

A. Maintain field conditions within manufacturer's required service conditions during and after installation.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Schneider Electric; Square D EcoStruxure Power

B. Source Limitations: Furnish products produced by same manufacturer as electrical distribution equipment for project and obtained from single supplier.

2.2 ELECTRICAL POWER MANAGEMENT SYSTEM (EPMS) - GENERAL REQUIREMENTS

A. Basis of Design: Schneider Electric; Square D EcoStruxure Power

B. Provide data and analytics functionality for energy performance optimization, power reliability/availability, and sustainability metrics. Provide features, including but not limited to, real-time monitoring, alarming/event management, energy, power, and sustainability data analytics/visualization to facilitate the following functions:
1. Analyze energy usage and uncover savings opportunities.
2. Meet and exceed energy efficiency and sustainability standards and certifications.
3. Measure return on investment of energy capital projects.
4. Decrease frequency and duration of unplanned outages.
5. Improve workplace safety by minimizing exposure to electrical hazards.
6. Provide accurate and automated documentation for regulatory compliance.

7. Improve effectiveness of equipment maintenance activities.
8. Manage multiple power generation sources effectively.
9. Increase return on electrical distribution assets.

C. Data and analytics for EPMS operations, including but not limited to, centralized display, analysis, logging, alarming, and event recording to be accessible from computer workstation with supported operating system and interface software.

D. Software Licenses:
1. License software programs provided with EPMS to Owner for use on specified system.
2. Do not restrict Owner from using software on system provided or its replacement.
3. Grant Owner right to make copies of software for use on system provided.
4. Subject to review and approval by Owner and Engineer.

E. Computer Hardware:
1. Provided by Owner, meeting EPMS supplier's minimum requirements, and supplied to EPMS supplier for configuration.
2. Use current-generation, PC-based architectures with Microsoft operating systems.
3. Provide 50 percent additional capacity for system expansion.
4. Type, Quantity, and Location: As indicated on drawings.

F. Connected Equipment and Devices:
1. Provide EPMS network-connected devices as required to support specified EPMS functionality.
2. For equipment containing connected devices, provide internal wired communications network to provide single point of connection to EPMS network.
3. Meters:
   a. Applications:
      1) Utility Revenue: Utility revenue power quality meter; for grid revenue, substation automation, network management, energy cost allocation, power quality analysis, asset management, operational efficiency, and compliance reporting.
      2) Transfer Switches: Power quality meter; for automated generator test documentation.
      3) Generators: Advanced power quality meter; for automated generator test documentation.
      4) Low-Voltage Mains: Power quality meter; for network management, energy cost allocation, power quality analysis, asset management, operational efficiency, and compliance reporting.
      5) Low-Voltage Feeders: Power meter; for network management, energy cost allocation, asset management, operational efficiency, and compliance reporting.
      6) Low-Voltage Sub-Metering for Individual Circuits: Power meter; for network management, energy cost allocation, and operational efficiency.
      7) Low-Voltage Sub-Metering for Multiple Circuits: Multi-circuit meter; for network management, energy cost allocation, and compliance reporting.
   b. Power Quality Meters: See Section 262713.16.
   c. Advanced Power Quality Meters: See Section 262713.16.

G. Communications and Interfaces:
1. EPMS Network: Provide EPMS network using Ethernet, except where specifically indicated otherwise, for communication between EPMS system and connected equipment/devices, including but not limited to the following:
   a. Ethernet network as indicated. Provide dedicated VPN for EPMS network where physical media is shared with other networks.
   b. Serial communication connections as indicated to gateway devices for Ethernet EPMS network interface.
   c. Connection to direct digital control (DDC) system for HVAC network.

d. Connection to intelligent building management system (iBMS) network.
e. Connection to process control and instrumentation system or SCADA system network.

2. Integration with Intelligent Building Management System (iBMS):
   a. Provide iBMS access to, via web service, Modbus, BACnet or other supported open standard communication protocols, metered energy data for utilities, including water, air, gas, electricity, and steam (WAGES), from the following sub-systems:
      1) Electrical circuit breakers, power/energy meters, and power quality meters monitored by EPMS.
   b. Provide categorization for integration of metered energy data with iBMS, including but not limited to, the following load types monitored by EPMS:
      1) Lighting loads.
      2) HVAC loads.
      3) Plug loads.
      4) IT equipment loads.
      5) Special purpose loads, such as manufacturing equipment and medical equipment.
      6) Ancillary electrical loads.
   c. Provide categorization for integration of metered energy data with iBMS by associated logical entity, such as building, facility, floor, and zone, using appropriate data tags.
   d. Provide iBMS access to the following EPMS applications:
      1) Energy usage and benchmarking.
      2) Energy cost allocation.
      3) Utility bill verification.
      4) Power quality monitoring.
      5) Power events recording and analysis.
3. Cybersecurity: Comply with best practices and provide technical features to reduce risk to people, assets, and processes, including:
   a. Secure network architecture.
   b. User privilege/authentication policy.
   c. 2-factor authentication.
   d. Comply with IEC 62443 standards series, including but not limited to IEC TS 62443-1-1, IEC 62443-2-1, IEC TR 62443-2-3, IEC 62443-2-4, IEC TR 62443-3-1, IEC 62443-3-3, IEC 62443-4-1, and IEC 62443-4-2.
   e. Comply with Owner's cybersecurity program/practices.
4. Equipment Interfaces:
   a. Equipment Connected to EPMS: Provide interface compatible with EPMS network/software and required appurtenances, including gateways, transceivers, and converters, integral to equipment.
   b. Unless otherwise indicated, use Modbus TCP/IP Ethernet protocol. Use Modbus serial only where specifically indicated.

2.3 ELECTRICAL DISTRIBUTION MONITORING AND ALARMING

A. Provide screens displaying real-time data from electrical infrastructure, such as incoming utility feeds, and low-voltage distribution.

B. Display relevant real-time data from energy meters and other facility metadata, such as WAGES, industrial process data, weather, and occupancy, from connected, compatible devices, equipment, and systems.

C. Organize and display real-time data of EPMS software to provide logical views for system health and support EPMS applications.

D. Provide set of screens for electrical single-line diagram of facility, including:
   1. Links to navigate between various levels of single-line diagram.
   2. Electrical parameters for equipment components on single-line diagram, such as MV switchgear, MV transformers, generators, unit substations, LV switchboards, UPS, and isolated panel system.

3. Link to power equipment details screens.

E. Equipment Details:
1. Provide screens to display details pertaining to each piece of equipment, including equipment picture (if available), local single-line diagram (if applicable), information for each electrical section (e.g., breaker and disconnect switch), and alarm points.
2. Measured peak demand and loading of equipment (e.g., breakers, UPSs, transformers, and generators).
3. Navigation link to default diagrams of each applicable meter/protection device.

F. Floor Plans:
1. Provide set of screens displaying floor plans overlaid with relevant real-time data.
2. Digital image files provided to EPMS supplier by Owner or Engineer.
3. Provide navigation links to summary screens and equipment details screens.

G. Provide summary status screen for alarm indication for major power equipment components of electrical distribution system.

H. Alarms:
1. Organize abnormal electrical conditions, events, and group-related incidents using alarm management practices for situational awareness and actionable intelligence.
2. Notify appropriate staff members of alarms through email or SMS text messages.

2.4 POWER QUALITY (PQ) MONITORING AND COMPLIANCE

A. Monitor electrical disturbances, such as harmonics, unbalance, flicker, and over/under voltage conditions, to assist in reporting, analysis of conditions, and diagnoses of events.

B. Provide screens and reports specific to PQ, including:
1. Device Level PQ Summary Screen: Data collected by compliant PQ-capable metering device summarized to display:
a. Voltage Disturbances: Date/time of last disturbance, count of transient events, and count of sag/swell events.
b. Harmonic Measurements: Include navigation link to harmonics log for device.
c. Real-Time Harmonic Distortion Measurements: Total harmonic distortion (THD) content and maximum THD.
d. Flicker measurements.
e. Logged Events: Include navigation link to event log for device.
f. Waveform Logs: Include navigation link for waveforms captured during transients and sag/swell events.
g. Detailed waveform analysis tools.
2. System Level PQ Summary Screen: Provide PQ report displaying PQ events collected for one or more metered points within given time period.
a. Provide summary table of events within given time period and navigation link to event details (power quality details report).
b. Provide plot of Information Technology Industry Council (ITIC) curve that displays worst disturbance from each event listed in summary table, with the following for each event:
1) Event identifier.
2) Source.
3) Event timestamp.
4) Phase identifier for worst disturbance (e.g., "V1").
5) Voltage magnitude for worst disturbance in percentage of nominal (e.g., "68.8 percent").
6) Voltage magnitude maximum and minimum on phases V1, V2, and V3 for worst disturbance in percentage of nominal.
7) Duration for worst disturbance in seconds (e.g., "0.084 seconds").
8) Disturbance type for worst disturbance (e.g., "sag").

9) ITIC tolerance curve violations (e.g., "outside tolerance").
10) Link to details report.
11) Link to waveform report for worst disturbance.

c. Provide link in each summary table entry to additional details for event, including:
1) Disturbance event timestamp.
2) Phase identifier.
3) Voltage magnitude in percentage of nominal (e.g., "68.8 percent").
4) Voltage magnitude maximum and minimum on phase V1, V2, and V3 in percentage of nominal.
5) Duration in seconds.
6) Disturbance type.
7) ITIC tolerance curve violations (e.g., "outside tolerance").
8) Link to waveform report.

d. Provide navigation link in each summary table entry for waveforms of events, if available. Display waveforms for voltage and current readings of measuring point.

3. Disturbance Direction Detection:
a. For PQ-compliant devices, indicate direction of disturbance within electrical distribution system in event logs, with associated confidence/certainty rating, such as 'Upstream: Confidence Rating - High", or "Downstream: Confidence Rating – Medium".
b. Provide navigation link to detailed information for given measuring point/period.

C. PQ Analytics:
1. PQ Analytics Key Performance Indicators (KPIs):
a. PQ Downtime Impact: Display current count and trend over time for grid and facility PQ events and electrical system downtime in hours with associated cost.
b. Power Factor Impact: Display current value and trend over time for average power factor and estimated penalties/surcharges incurred.
c. PQ Index: Display overall health indicator and trend over time representing baseline for overall PQ of facility, based on analysis of PQ events and limits/thresholds defined by established PQ standards. Calculate index over various time periods and assign value on scale of "A" to "F", with "A" representing optimal and "F" representing poor.
d. PQ Event Categorization: Display event type, likely origin, and potential impact to operations in accordance with thresholds recommended by recognized PQ standards. Support flexible time periods and trending over time periods.
2. PQ Disturbance Indicator Analytics:
a. Calculate and display summary screen with high-level health indicators (red, yellow, green) for each type of PQ event/disturbance.
b. Evaluated PQ Events/Disturbances:
1) PQ Events: Voltage sags/dips, voltage swells, voltage transients, voltage interruptions, and over/under voltages.
2) PQ Disturbances: Harmonic distortion, voltage/current unbalance, frequency variation, and flicker.
c. Provide aggregate count or maximum/average values, depending on event/disturbance type.
d. For each PQ event/disturbance type, provide access to detailed information as applicable to event type, including source of event (device), timestamp, potential impact, duration, and magnitude.

2.5 POWER EVENTS RECORDING AND ANALYSIS

A. Provide event aggregation and analysis tools to gather timestamped events from compatible connected devices to provide consolidated system event view, showing date/time ordered list of events, event priority, and reporting device name.

B. Automatically acquire onboard event data and associated waveforms from power quality monitoring devices without additional software configuration or data upload scheduling.

C. Retrieve onboard, high-resolution timestamps of one-millisecond accuracy without degradation or modification, including devices supporting clock synchronization via GPS, IRIG-B, NTP, or precision time protocol (PTP).

D. High Accuracy and Resolution Event Recording: System-wide events associated with critical status points timestamped to accuracy of one millisecond.
   1. Critical status points include but are not limited to:
      a. Utility Distribution Switchgear: Multifunction electronic relays, power quality meters, and breaker open/closed/tripped position.
      b. Generator Paralleling Switchgear: Multifunction electronic relays, power quality meters, and breaker open/closed/tripped position.
      c. Substations and Low Voltage Switchgear/Switchboards: Power quality meters and breaker open/closed/tripped position.
      d. UPS, Distribution Panels, and PDUs: Power quality meters and breaker open/closed/tripped position.
   2. Mechanism of Time Synchronization: External GPS time signal or PTP over Ethernet within 100 microseconds.
   3. Sequence of Events Recording (SER) Hardware:
      a. Capable of providing synchronized timestamp signals and recording events with accuracy of one millisecond.
      b. Compatible with and natively supported by EPMS software.
      c. Include necessary components to record system events for critical status points, including but not limited to:
         1) PTP master clock.
         2) GPS antenna, cable, and lightning arrestor; provided by EPMS vendor.
         3) Clock signal distribution hardware and cabling for legacy protocols.
         4) Event recorders.
         5) Power quality meters.
         6) Multifunction electronic relays.
         7) Data network components.
         8) Enclosures.
         9) Computer equipment.
   4. Implement time stamping and event recording at local, field-device level where event occurs (e.g., event recorders, meter I/O, or relays), not at EPMS computer server. Use of software to scan, poll, and timestamp events through PLC or on server, which introduces scan time and network communication delays, is not acceptable.
   5. Dedicated Sequence of Events Recorder (SER) Hardware: Include the following for one-millisecond event recording of discrete inputs (e.g., breaker open/close/trip status):
      a. Onboard clocks time-synchronized to one-millisecond accuracy.
      b. Precision time synchronization input compatible with standard formats, including PTP, IRIG B, and DCF77.
      c. 32 high-speed digital inputs, each with configurable filter, debounce, and chatter functions.
      d. Onboard Data Logs for Storing Events: Event log capacity to store 8,000 events accessible from multiple masters. Record descriptive information for root-cause analysis, including time/date stamp, input number, event type, input status, time quality, and unique sequence number.
      e. Discrete output capable of triggering waveform capture in power quality meter, wired to designated power quality meters and prewired within connected equipment by manufacturer.
      f. Modbus RTU or Modbus/TCP interface.
      g. GPS time synchronization input compatible with IRIG B.
      h. Ethernet network interface supporting Modbus TCP/IP and embedded web server for setup and monitoring.

i. Capability to customize embedded web pages.
j. Nonvolatile memory to store setup and event data.
k. Integral SD flash memory card to store user setup values and other user files.
l. Capability to export event data in .CSV format directly from device without need for additional software.
m. Capability to serve as time distribution hub for other devices, accepting PTP precision time sync input over Ethernet and outputting required legacy protocol, such as IRIG B, DCF77, and ASCII/RS-485.

6. Multifunction Electronic Relays with Time Synchronization Capability: Provide accessible ANSI function codes of events with one-millisecond timestamp for software integration, using Modbus RTU or Modbus/TCP interface.
7. Power Quality Meters with Time Synchronization and Waveform Capability: Match one-millisecond timestamps of waveform with events that initiated waveform capture.

2.6 CAPACITY MANAGEMENT

A. Provide service and circuit load management with capacity planning compliant with NFPA 70. Provide sufficient information for operations and management decision making for site expansion and modification planning using dashboards, trending, and reporting.

B. Configured Project-Specific Requirements:
1. Monitor/aggregate measurements for source capacity to indicate degree of source loading.
2. For each circuit measured, monitor maximum load and compare to equipment capacity to indicate degree of equipment loading.
3. Identify when user-configurable threshold (e.g., 80 percent) is exceeded.
4. Provide historical trending and reporting for loading on power sources and power distribution equipment, such as automatic transfer switches, medium- and low-voltage switchgear, transformers, power distribution panels, and uninterruptible power supplies.
5. Display peak load provided by transfer switch or other equipment over given time period and compare to equipment capacity.
6. Provide summary of transfer switches or equipment in groups or daily information for each piece of equipment in group.

2.7 BACKUP POWER TESTING

A. Provide emergency power supply system (EPSS) test automation mechanism to document backup generator system testing for written record of generator system inspection, performance, testing, and repairs in accordance with applicable codes and standards, including but not limited to:
1. NFPA 110.

B. Configured Project-Specific Requirements:
1. Generator test and generator activity reports, scheduled at user-defined intervals.

C. Provide screens to display information relating to generator system testing, including:
1. General Information: Generator name, nameplate ratings, and description.
2. Testing Evaluation Data: Test load and duration.
3. Generator Status: Starting, running, and stopped.
4. Engine Data: Oil pressure, coolant temperature, and other available user-defined measurements.
5. Exhaust Gas Data: Left/right exhaust gas temperature.
6. Electrical Data: Voltage, current, active power, reactive power, apparent power, power factor, load percentage, and frequency.

D. Generator /EPSS Test Report:
1. Devices Summary Section: ATS/generator descriptions; indicate if device was excluded from report.

2. ATS Summary Section: Lead ATS, required transfer time in seconds, transfer time in seconds. Detail with priority level and transfer time for each ATS tested.
3. Generator Summary Section: Test pass/fail result and test evaluation method used.
4. Generator Load Summary Section:
   a. Load Graph:
      1) Load Evaluation Method: Compare recorded test data to required load threshold.
      2) Exhaust Gas Temperature Evaluation Method: Compare recorded test data to minimum required exhaust gas temperature.
      3) Load Bank Testing Method: Compare applicable acceptable power load thresholds with respective test data.
   b. Minimum, Maximum, and Average Table:
      1) Load Evaluation Method: Corresponding values for active power, apparent power, current per phase, and L-N/L-L voltages.
      2) Load Bank Testing Method: Corresponding values for applicable stages.
5. Generator Exhaust Temperature Summary Section:
   a. Display beginning and end timestamp for longest continuous temperature (LCT) at or above manufacturer-recommended minimum exhaust gas temperature.
   b. Display manufacturer-recommended minimum exhaust gas temperature, required run duration in minutes, and pass/fail status based on LCT.
   c. Exhaust Temperature Graph: Display required manufacturer-recommended minimum exhaust gas temperature and actual recorded exhaust gas temperature data.
   d. Exhaust Temperature Table: Display minimum, average, and maximum exhaust temperature readings for LCT at or above minimum acceptable exhaust temperature.
   e. Report Behavior: If test solution has not been configured to collect exhaust temperature data, do not include generator exhaust temperature summary section or show warning message.

E. Generator/EPSS Test Configuration:
1. Device Grouping:
   a. Provide mechanism to group generators and ATS functionally or logically for subsequent report generation.
2. Evaluation Methods Supported:
   a. Load.
   b. Exhaust gas temperature.
   c. Load bank.
   d. Load or exhaust gas temperature.
   e. Load and exhaust gas temperature.
3. Pass/Fail Criteria Settings: Based on exhaust gas temperature and/or electrical load, or load bank criteria.
4. User-Configurable Parameters:
   a. Exhaust Gas Mode: Minimum manufacturer-recommended exhaust gas temperature in degrees C or degrees F.
   b. Load Test Mode: Minimum required load as percentage of generator nameplate rating.
   c. Load Bank Mode: Load percentage and run duration for each applicable stage.
5. For each generator, support user assignment of monitoring device/transducer measurement and active value (logical 0 or 1) to logical device parameters, including but not limited to, engine start, engine running, engine stopped, oil pressure, battery voltage, and tank level.
   a. ATS Device Configuration:
      1) For each ATS, support user configuration of individual priority level, permissible transfer time, and text description.

2) Support mapping of logical ATSs to device/transducer-based parameters.
3) Support assignment of monitoring device measurement and logical 0/1 active value to test, emergency, and normal parameters.
4) Support capturing and mapping of "utility power available" status.

b. Generator/EPSS Test Report User Configuration:
1) Add EPSS report group to include in test report.
2) Exclude subset of devices from report group.
3) Choose 'reason for running report" to differentiate reporting on test versus real power outage.
4) Change report layout to selectively enable/disable displaying parameters, such as exhaust gas temperature graph and minimum/maximum/average voltage, current, power, frequency, and exhaust gas temperature data.

c. Support data quality checks with warnings for issues (e.g., missing data).

F. Generator Capacity Planning Report: Customizable to accommodate site redundancy.
1. Report available capacity before designed redundancy is compromised, or show if system is oversubscribed, and by how much.
2. Graphically display level of redundancy of generator equipment during user-selected time period.
3. Display redundancy design limit.
4. Display peak system load.
5. Display calculated difference between redundancy design limit and peak system load.

G. Generator Fuel Monitoring: When integrated with generator testing system, provide capability to display facility fuel data, including:
1. Volume of fuel left in tank.
2. Available run time, based on fuel levels and tank temperature.
3. Alarms for leaks, low fuel levels, and water presence.

H. Generator Activity Report:
1. List each instance generator was run, categorize reason (e.g., test or emergency), and provide cumulative total of emergency/nonemergency run time.
2. Compare number of nonemergency hours with allowable threshold (e.g., 100 hours) for reporting period.

I. Generator Load Summary: Show electrical data captured during run of generator, including load graph with kW and kVA and summary table with minimum/maximum/average, with option to include table with electrical details.

2.8 ASSET PERFORMANCE

A. Circuit Breaker Aging: Provide low-voltage (LV) circuit breaker aging monitoring to provide estimate of electrical and environmental aging data of supported breakers for preventive maintenance planning for LV switchgear.
1. Provide circuit breaker aging report, including:
a. Electrical aging, in percent.
b. Environmental aging, in percent.
c. Classification of breakers by group and aging status.
2. Aging Algorithm: Estimate aging percentages for supported devices using electrical and environmental parameters, including:
a. Overload tripping.
b. Short-circuit tripping.
c. Operation.
d. Commissioning date.
e. Ambient temperature.
f. Vibration.
g. Humidity.

B. Generator Battery Health: Monitor generator battery health by capturing battery voltage signatures during generator starts. Compare signatures to provide predictive maintenance insight into when batteries need replacement or related equipment needs servicing.

2.9 LOW-VOLTAGE (LV) CIRCUIT BREAKER SETTINGS MONITORING

A. Capabilities:
1. View protection settings for LV circuit breakers in real-time.
2. Generate report, for audit purposes, summarizing protection settings of LV circuit breakers.
3. Trigger alarm upon changes to breaker settings as compared to previously recorded baseline.

B. Provide breaker settings report, including:
1. Breaker name, protection settings/modes, and maintenance status.
2. Current recorded value with timestamp.
3. Previously recorded baseline value with timestamp.
4. Highlight changes between baseline and changed values.

2.10 EPMS ADVISORY SERVICES

A. Provide separate contract to Owner, as proposal in addition to base bid, for EPMS advisory services for two years from date of Substantial Completion. Include proposal for yearly renewals.

B. Provide ongoing technical support services to advise on, optimize, and tune performance of EPMS.
1. Use EPMS via internet connection for read-only data access for functionality; do not modify data; devices not capable of being controlled.
2. Analyze data on electrical power distribution equipment, identify problems through expert analysis, and provide recommended actions for system improvement.
3. Provide expert analysis through review of data and reports by qualified electrical power distribution and power quality professionals.

C. Services:
1. Periodic monitoring of EPMS server(s) and software to alert for system problems, including but not limited to, areas of communications infrastructure and software diagnostics.
2. Specialized EPMS diagnostic and analytics tools with capabilities for detection, diagnosis, and mitigation recommendations, including:
a. Communications issues (e.g., loss of communications and intermittent problems).
b. Electrical and load issues (e.g., CT shorting blocks left closed, voltage disconnects left open, miswired or disconnected phases, and incorrectly sized CTs).
c. Sensor issues (e.g., CT polarity errors, malfunctioning pulse counters, and incorrect phase wiring).
d. Configuration issues (e.g., incorrectly configured logging triggers, measurement unit mismatches, and incorrect PT/CT ratios).
e. Measurement issues (e.g., energy balance mismatches).
f. Overall system health issues (e.g., data corruption, missing data, operating system errors, excessive CPU usage, disk usage, and low-memory errors).
g. Electrical systemic power quality issues (e.g., over/undervoltage, voltage imbalances, excessive lagging power factor, and excessive harmonic distortion).
h. Alarm diagnostics to detect nuisance alarm behaviors (e.g., chattering, intermittent, stale, and flooding).
i. Provide recommendations engine for:
1) Harmonic mitigation equipment, to correct detected excessive harmonic conditions.

2) Mitigation equipment, to correct detected excessive power factor conditions.

3. Software verification, including provision of service packs and license upgrades for installed EPMS software. Software upgrades installed and verified at additional cost in accordance with advisory service rates and fees.
4. Minimum of one yearly visit for on-site maintenance, including system repairs, database maintenance, firmware upgrades, and software installations. Training on system operation provided during on-site maintenance visit by application engineer.
5. Basic support via telephone and email during regular business hours to provide technical guidance, incident diagnosis, basic troubleshooting, and instructions to operate installed software and hardware.
6. Emergency after-hours support with guaranteed response within four hours.
7. Reserved support engineer as single point of contact for customer support.
8. Direct access to advanced-level support, with priority case escalation to expert-level support. Provide quarterly proactive system maintenance.
9. Periodic reports with system optimization recommendations and actionable work orders.
10. System benchmark of site with system score indicating percentage of load potentially impacted or affected. Include Owner and/or Engineer in setup of metering hierarchy in EPMS advisory services to ensure relevancy of benchmark.
11. Periodic executive/detailed report to promote power reliability; prioritize identified electrical network issues based on severity.
12. Quarterly recommendations for system optimization to improve data quality and system performance.
13. On-demand, self-paced training with energy management, metering infrastructure, and power quality content modules.

D. Products:
1. Schneider Electric; EcoStruxure Power Advisor.

2.11 ENERGY USAGE AND BENCHMARKING

A. Provide energy analysis and benchmarking features to isolate factors contributing to energy usage, analyze energy usage patterns, and implement energy conservation measures.

B. Capabilities:
1. Categorize energy usage by load types to identify where to focus energy conservation initiatives.
2. Compare energy usage across various entities, such as buildings, departments, plants, and processes.
3. Analyze factors contributing to energy usage/patterns and isolate energy waste.
4. Compare energy usage by normalizing consumption with respect to area, production volume, or other energy drivers.

C. Configured Project-Specific Requirements:
1. Energy analysis reports, scheduled at user-defined intervals.
2. Dashboard screens displaying relevant energy analysis parameters, model, and other performance parameters.

D. Provide report templates to support benchmarking initiatives for improved energy efficiency, including:
1. Energy Comparison Report: Display and compare normalized energy consumption.
2. Energy Dashboards: Compare normalized energy consumption between sites or other organizational entities, such as buildings, plants, and processes.
3. Calendar Trend: Display energy data in interactive monthly/weekly calendar views monthly/weekly, with overlaid target lines.
4. Duration Curve: Display data organized by order of magnitude, rather than chronological, with overlaid target lines.

E. Support importing and logging parameters for normalization calculations, including:
   1. Area (square feet/square meters).
   2. Outdoor temperature.
   3. Humidity.
   4. Building occupancy.
   5. Manufacturing productivity (number of devices produced).

F. Operating States: Support energy usage analysis for operating states to facilitate energy efficiency initiatives for operational systems, such as HVAC and industrial processes, including:
   1. For each operating state, such as off, normal, and high, calculate and display equipment energy and power consumption, including percentages for water, air, gas, electricity, and steam (WAGES).
   2. Calculate and display operational equipment statistics, including hours of operation in each state/mode, percentage hours in each state/mode, activations for each state/mode, and average duration operating in each state/mode.
   3. Provide report templates that support:
      a. Configurable reporting/aggregation time periods and state annotation.
      b. Flexible output formats, such as pie, stacked column, and data table.

2.12 CONTINUOUS THERMAL MONITORING

A. Provide real-time thermal monitoring functionality through data and analytics to detect abnormal thermal conditions within electrical distribution equipment. Periodic infrared thermal scanning is not acceptable.

B. Capabilities:
   1. Screens displaying real-time temperature and humidity conditions for compatible medium- and low-voltage switchgear, and low-voltage busway systems, including:
      a. Maximum per-phase and discrepancy temperatures for measured connection points.
      b. Ambient temperature and relative humidity within equipment.
   2. Store, analyze, and report historical data for thermal parameters.
   3. Plot real-time temperature readings through trend plots that can support display of target threshold lines and aggregate values (minimum, maximum, and average).
   4. Display thermal alarms and events with pre-alarm and threshold values.
   5. Display sensor communication status alarms.
   6. Configure email/text notifications upon triggering of thermal alarms.

2.13 ARC-FLASH PROTECTION

A. Provide visualization, event logging, and root-cause analysis of arc-flash events.

B. Capabilities:
   1. Graphically indicate occurrence of arc-flash event on real-time display.
   2. Aggregate arc-flash alarms within EPMS integrated electrical distribution monitoring/alarm management system and root-cause analysis tools.
   3. Configure email/text notifications upon triggering of arc-flash alarms.

C. Support native integration of compatible protective relays with integral arc-flash sensor inputs.

2.14 EPMS SOFTWARE

A. Basis of Design: Schneider Electric; Square D EcoStruxure Power Monitoring Expert

B. Provide dedicated, edge control, software platform designed as operational interface for EPMS to manage safe, reliable, and efficient power within buildings/facilities.

C. Provide specialized data acquisition, visualization, analysis, and reporting tools designed for power management applications.

D. Support minimum of 100 devices designed for power distribution and power quality (PQ) monitoring, including programmable power analyzers, power meters, branch/multi-circuit meters, smart panels with communicating circuit breakers, protective relays, uninterruptible power supplies, active harmonic filters, capacitor bank controllers, and electrical distribution thermal sensors.

E. Provide native device support, without requiring additional installation or configuration, including:
   1. Registers premapped to standard measurement names.
   2. Set of factory device graphical screens.
   3. Factory-tested support.

F. Cybersecurity: Comply with IEC 62443-4-1 and IIEC 62443-4-2 at component level.

G. Certify for use in energy data management system in accordance with the following:
   1. ISO 50001:
      a. Energy review.
      b. Energy baseline.
      c. Energy performance indicators.
      d. Monitoring, measurement, and analysis.
      e. Input to management review.
   2. ISO 50002:
      a. Data collection.
      b. Measurement plan.
      c. Analysis.
      d. Energy audit reporting.
   3. ISO 50006:
      a. Obtain relevant energy performance information from energy review.
      b. Identify energy performance indicators.

H. Natively support continuous electrical thermal monitoring system with capability to detect abnormal bus bar or cable temperatures due to loose/faulty connections in order to prevent equipment damage and fire.

I. Natively support active arc flash protection system with capability to detect/display arc flash alarm.

J. Real Time Monitoring:
   1. Support creation of diagrams representing power monitoring system, including electrical one-line diagrams, facility maps, plan views, floor layouts, equipment representations, and mimic displays. Provide graphic library with standard electrical one-line symbols.
   2. Support graphical trending of real-time measurements supported by metered connected electrical equipment.
   3. Support creation of interactive, side-by-side visualizations of real-time measurements, including:
      a. Display tabular and trend line views to compare readings from multiple devices.
      b. Create, modify, view, and share table views directly, without additional software.
      c. Support both physical and virtual devices defined in system.
      d. Support exporting of real-time data into Excel formats, without additional software.
   4. Provide automatic network diagram creation feature to support automatic creation of linked hierarchical graphical diagrams for connected devices.
   5. Support advanced power quality meters with integral high-speed power analysis and disturbance direction detection (DDD); include set of real-time graphical objects for use in electrical diagrams to indicate:
      a. Type of power quality disturbance (sag, swell, transient).
      b. Direction of PQ disturbance relative to reporting DDD device (upstream, downstream).

6. Provide real-time indication of aggregated demand measured by one or more devices in predefined zone, including:
    a. Zone demand expressed using kW or normalized kW/area.
    b. Visual indication of present zone demand comparison with four configurable limits/ targets, using color scale.
    c. Different values for configurable limits during on-peak and off-peak periods.

K. Alarm/Event Analysis and Notification:
1. Support acquisition of specialized high-speed power disturbance data from advanced PQ meters for power events analysis, including:
    a. Timestamped power events with disturbance direction detection (DDD).
    b. Timestamped high-speed (1/2-cycle sample rate) pre/post event RMS data.
    c. Pre/post event waveform captures (voltage and current, for all phases).
2. Provide alarm annunciator to display number of unacknowledged alarms with categorization into high, medium, and low priority, with navigation to alarm viewer.
3. Support analysis of cascading power events, including:
    a. Automatic, intelligent clustering of events into grouped alarms, and multiple alarms from multiple devices into incidents.
    b. Automatic categorization of alarms and incidents into predefined categories, including power quality, power availability, and diagnostics.
    c. Predefined views for events, alarms, and incidents with navigation and configurable filters based on priority, status, source, and categories.
    d. Creation of private or shared views with custom filters.
    e. Access to details on location, time, and nature of alarm or incident, with associated information including power disturbance and power quality data.
    f. Graphical indication of power disturbance direction for alarms and incidents captured by DDD-capable devices.
4. Provide graphical timeline view of alarms and events constituting incidents in electrical distribution network, including:
    a. Display alarms/events stacked by order of time for sequence of events analysis.
    b. Display start and end of alarms/events.
    c. Indicate direction of incident with associated captured waveforms.
    d. Display pre- and post-event high speed RMS data from supported PQ meters.
5. Support sending of email notifications based on changes to system, including:
    a. Communication Loss: Sent on loss of communication with selected devices.
    b. Alarm Summary: Sent regularly to indicate changes in average amount of high-, medium-, and low-priority alarms.
    c. Real-Time Analog and Digital Setpoints: Include options for time delays and custom alarm labels.
    d. Dynamic Setpoints: Designed for WAGES energy and power alarms based on historical average, standard deviation, or maximum, with options for time ranges, aggregation periods, multipliers, and comparison of time periods.
    e. Power Quality Event: Sent regularly to indicate change in average amount, duration, and magnitude of sag, swell, and transient power disturbances.
    f. Energy Usage: Sent when energy exceeds normal range for current day and time.

L. Data Analytics and Visualization:
1. Provide interactive, web-based dashboard application for water, air, gas, electric, steam (WAGES) data, historical data trends, power quality, images, and external content from URL addresses.
2. Provide capability to create, modify, view, and share dashboards, including graphics, labels, scaling, measurements, and date ranges, without additional software.

3. Support creation and configuration of kiosk slideshow displays to run independently on computer with browser in unattended mode, scrolling through designated dashboards at configurable time interval.
4. Provide library of graphical objects (gadgets):
   a. Standard: Include bar, pie, trend, real time, and web portal.
   b. Specialized Energy Usage: Include period over period comparison, pareto charts, heat map/carpet plot, and sankey diagrams.
5. Provide interactive, web-enabled interactive reports application with capability to generate, modify, save, and manage reports based on pre-engineered report templates for:
   a. Energy billing, verification, and allocation.
   b. Energy management and performance.
   c. Power quality performance and compliance.
   d. System average RMS variation frequency index (SARFI).
   e. Operation and performance for electrical equipment, such as breakers, UPSs, and generators.
6. Support automatic distribution of reports via email or shared folder on scheduled basis, based on event, or manual export including .csv, .xlsx, .pdf, .tiff, .html, and .xml formats.

M. Technical Infrastructure:
1. Support installation on physical computer or virtual machine, on Server and non-Server class Windows operating systems.
2. Support SQL Server, including Enterprise, Standard, and Express editions.
3. Only require SQL Server Database Engine Services and Basic Management Tools; do not require additional SQL components, such as Analysis Services or Reporting Services.
4. Cybersecurity:
   a. Support encrypted transmission of data between software platform server and web clients using transport layer security (TLS) version 1.2.
   b. Support secure authentication between software platform server and web clients using certification authority (CA) certificates.
   c. Support encryption and hashing of system credentials using AES256 and SHA-512, respectively.
   d. Support installation in environment complying with Federal Information Processing Standards (FIPS).
5. Support integration of Windows Active Directory across multiple domains, including:
   a. Login using Windows credentials.
   b. Enforcement of password complexity and expiration policies via Windows.
   c. Role-based access control (RBAC).
6. Automatically acquire onboard data, including events, trends, and waveforms, from natively supported device types without additional software configuration or data upload scheduling.
7. Retrieve onboard, high-resolution (1 ms) timestamps of one-millisecond accuracy without degradation or modification, including devices supporting clock synchronization via GPS, IRIG-B, NTP, or precision time protocol (PTP).
8. Support logical device definitions based on inputs/outputs or channels on devices representing downstream circuits, including:
   a. User interface for device and measurement mapping.
   b. Bulk-import capability to create large numbers of logical devices without manual single-device configuration.
9. Support real-time and historical data aggregation within defined hierarchy views (e.g., tenants/racks/circuits, PDUs/RPPs/panels, or buildings/floors/rooms), or user-defined hierarchy view, including:
   a. Web-based, end-user interface.
   b. Automatic, intelligent data aggregation across hierarchy nodes for data visualization in dashboards, trends, and reports.
   c. Creation of virtual devices to enable net metering, common area allocation, and apportionment.

d. Updating of hierarchy node names and associated time ranges to accurately represent and report facility changes (e.g., tenant move-in/out).
e. Bulk-import capability to create and edit large hierarchies without manual per-device setup.

10. Device-Level Modbus Integration:
    a. Modbus master to read/write registers in Modbus devices for monitoring and control applications.
    b. User interface to create and manage Modbus device definitions/drivers and association of device graphic template screens.
11. OPC Data Access Server 2.01 Support:
    a. Provide default OPC server tag mappings for natively supported device types without requiring manual mapping of device registers to OPC tags.
    b. Add or change OPC mappings or add custom measurements.
12. OPC Data Access Client 2.01 Support:
    a. User interface to create and manage OPC device definitions/drivers and association of device graphic template screens.
    b. Built-in OPC Test Client.
13. Web Services Interoperability:
    a. Web services server to share real-time, historical (i.e., timestamped trend data), and alarm (i.e., timestamped event strings) data to other web services client applications.
    b. User interface for web services configuration and mapping.
    c. Ability to acknowledge alarms by authenticated and authorized clients.
14. Provide extract, transform, and load (ETL) engine to exchange data between files, databases, and systems, including:
    a. User interface to specify connection information, data formats, measurement mappings, and schedules.
    b. Support for importing data from .csv and .xml data files, AVEVA Historian databases, and third-party databases via OleDB connections.
15. Support system-wide programming extensibility, using graphical, object-oriented application engine capable of logic and arithmetic functions, database queries, XML data import, complex logic-based alarming and data logging, and email/text notifications.
16. Remain online during system administration functions, including communications, logging, and alarming; do not require operator to take system offline.
17. Support internationalization and regional settings, with factory support for simplified Chinese, traditional Chinese, English, French, German, Italian, Russian, Spanish, Polish, Czech, and Swedish languages. Support capability to change default language without additional installation or advanced software configuration.
18. Support offline software configuration management for efficient system deployments and upgrades with dedicated user interface for creating, copying, and deploying software configuration projects.

N. Products:
    1. Schneider Electric; Square D EcoStruxure Power Monitoring Expert

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine equipment exterior and interior for damage, including but not limited to, structure, moisture, and mildew.

B. Examine for conditions detrimental to completion of work.

3.2 INSTALLATION

A. Install equipment in accordance with manufacturer’s written instructions.

B. Install equipment in accordance with NECA 1.

3.3 FIELD QUALITY CONTROL

A. Manufacturer Services: Provide services of manufacturer's field representative to perform functional testing, commissioning, and first parameter adjusting.
   1. Include necessary material, equipment, labor, and technical supervision.
   2. On-site commissioning to be performed by factory-trained personnel using automated commissioning tools.
   3. System to be prepared for startup by EPMS supplier's central engineering resources in conjunction with on-site factory-trained personnel.
   4. EPMS manufacturer to provide trained and certified project manager during project installation and commissioning.
   5. For control applications, such as automatic transfer, include verification of approved sequence of operation in both manual and automatic modes. Include testing of source outage and breaker exercising.
   6. Replace damaged or malfunctioning equipment and report discrepancies or installation issues.
   7. Identify EPMS equipment with label indicating inspection/testing agency and date of service.

3.4 CLOSEOUT ACTIVITIES

A. Training:
   1. On-Site Training: Train Owner's personnel on operation and maintenance of system.
      a. Accommodate minimum of ten attendees.
      b. Provide not less than one session with four hours of hands-on training.
      c. For each student, provide compact power monitoring system demonstration unit, direct Ethernet communication, and laptop running applicable metering software.
      d. Training Reference: Provide training manuals for each student; include agenda, defined objectives for each lesson, detailed description of subject matter , and descriptive labs to complete hands-on exercises.
      e. Instructor: Factory-trained manufacturer's representative with direct experience with EPMS.
   2. Provide sufficient time and detail in each session to cover the following at minimum:
      a. Operation theory.
      b. Major equipment components.
      c. System and software function and operation.
      d. Definition and use of various system data, such as energy, demand, power factor, load profile, time of use, and KYZ.
      e. System architecture and communications methods.
      f. System optimization.
      g. Electric meter function and operation.
   3. Additional Training Sessions:
      a. Self-paced on-demand training on energy management, metering infrastructure, and power quality.
      b. At project site, hands-on training using power monitoring equipment involving hardware and software to train Owner to implement, operate, and maintain power monitoring system.
         1) Video recording services to coincide with custom client on-site training with professional postproduction services.
      c. Instructor-led, remote web-based training providing real-time interaction with trainer using virtual servers to perform labs and exercises.

3.5 PROTECTION

A. Protect installed EPMS equipment from subsequent construction operations.

3.6 MAINTENANCE

A. Provide to Owner, as alternate to base bid, separate contract for switchgear service plan for two years from date of Substantial Completion including, but not limited to, dedicated customer success management team, priority remote and on- expert support, discounted service rates, continuous monitoring and alarming, online training.

END OF SECTION 26 09 13

SECTION 26 09 13 - ELECTRICAL POWER MONITORING AND CONTROL

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following for monitoring of electrical power system:
   1. PC-based workstation(s) and software.
   2. Communication network and interface modules for RS-232, RS-485, Modbus TCP/IP and IEEE 802.3 data transmission protocols.

1.2 DEFINITIONS

A. Ethernet: Local area network based on IEEE 802.3 standards.

B. Firmware: Software (programs or data) that has been written onto read-only memory (ROM). Firmware is a combination of software and hardware. Storage media with ROMs that have data or programs recorded on them are firmware.

C. HTML: Hypertext markup language.

D. I/O: Input/output.

E. KB: Short for kilobyte. When used to describe data storage, "KB" represents 1024 bytes.

F. KY Pulse: A term used by the metering industry to describe a method of measuring consumption of electricity that is based on a relay changing status in response to the rotation of the disk in the meter.

G. LAN: Local area network; sometimes plural as "LANs."

H. LCD: Liquid crystal display.

I. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less that 50 V or remote-control, signaling and power-limited circuits.

J. Modbus TCP/IP: An open protocol for exchange of process data.

K. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.

L. PC: Personal computer; sometimes plural as "PCs."

M. RMS: Root-mean-square value of alternating voltage, which is the square root of the mean value of the square of the voltage values during a complete cycle.

N. RS-232: A TIA standard for asynchronous serial data communications between terminal devices.

O. RS-485: A TIA standard for multipoint communications using two twisted-pairs.

P. TCP/IP: Transport control protocol/Internet protocol incorporated into Microsoft Windows.

Q. THD: Total harmonic distortion.

R. UPS: Uninterruptible power supply; used both in singular and plural context.

S. WAN: Wide area network.

1.3 SUBMITTALS

A. Submit product data and shop drawings in accordance with Division 01 for products specified under PART 2 - PRODUCTS.

B. Product Data: For each type of product indicated.
1. Attach copies of approved Product Data submittals for products that include power monitoring (such as switchboards and switchgear) that describe power monitoring and control features to illustrate coordination among related equipment and power monitoring and control.

C. Shop Drawings: For power monitoring and control equipment. Include plans, elevations, sections, details, and attachments to other work.
1. Outline Drawings: Indicate arrangement of components and clearance and access requirements.
2. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components. Indicate data communication paths and identify networks, data buses, data gateways, concentrators, and other devices to be used. Describe characteristics of network and other data communication lines.
3. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
4. Wiring Diagrams: Power, signal, and control wiring. Coordinate nomenclature and presentation with a block diagram.
5. UPS sizing calculations for workstation.

D. Software and Firmware Operational Documentation:
1. Self-study guide describing the process for setting equipment's network address; setting Owner's options; procedures to ensure data access from any PC on the network, using a standard Web browser; and recommended firewall setup.
2. Software operating and upgrade manuals.
3. Software Backup: On a magnetic media or compact disc, complete with Owner-selected options.
4. Device address list and the set point of each device and operator option, as set in applications software.
5. Graphic file and printout of graphic screens and related icons, with legend.

E. Software Upgrade Kit: For Owner to use in modifying software to suit future power system revisions or power monitoring and control revisions.

F. Software licenses and upgrades required by and installed for operating and programming digital and analog devices.

G. Qualification Data: For Installer and manufacturer.

H. Field quality-control test reports.

I. Operation and Maintenance Data: For power monitoring and control units, to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:
1. Operating and applications software documentation.
2. Software licenses.
3. Software service agreement.
4. PC installation and operating documentation, manuals, and software for the PC and all

installed peripherals. Software shall include system restore, emergency boot diskettes, and drivers for all installed hardware. Provide separately for each PC.

5. Hard copies of manufacturer's specification sheets, operating specifications, design guides, user's guides for software and hardware, and PDF files on CD-ROM of the hard- copy submittal.

J. Other Informational Submittals:

1. System installation and setup guides, with data forms to plan and record options and setup decisions.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Manufacturer Qualifications: A firm experienced in manufacturing power monitoring and control equipment similar to that indicated for this Project and with a record of successful in-service performance.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.5 COORDINATION

A. Coordinate features of distribution equipment and power monitoring and control components to form an integrated interconnection of compatible components.

1. Match components and interconnections for optimum performance of specified functions.

B. Coordinate Work of this Section with those in Sections specifying distribution components that are monitored or controlled by power monitoring and control equipment.

1.6 SOFTWARE SERVICE AGREEMENT

A. Technical Support: Beginning with Substantial Completion.

B. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include the operating systems. Upgrade shall include new or revised licenses for use of software.

1. Provide 30-day notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Addressable Relays: One for every ten installed. Furnish at least one of each type.
2. Data Line Surge Suppressors: One for every ten of each type installed. Furnish at least one of each type.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Schneider Electric product.

2.2 FUNCTIONAL DESCRIPTION

A. Instrumentation and Recording Devices: Monitor and record load profiles and chart energy consumption patterns.
   1. Calculate and Record the Following:
      a. Load factor.
      b. Peak demand periods.
      c. Consumption correlated with facility activities.
   2. Measure and Record Metering Data for the Following:
      a. Electricity.

B. Power Quality Monitoring: Identify power system anomalies and measure, display, and record trends and alarms for all quality power parameters as described in other sections of this division including but not limited to the following:
   1. Voltage regulation and unbalance.
   2. Continuous three-phase RMS voltage.
   3. Periodic max./min./avg. samples.
   4. Harmonics.
   5. Voltage excursions.

C. Emergency Load Shedding. Preserve critical loads or avoid total shutdown due to unforeseen loss of power sources according to the following logic:
   1. Determine system topology.
   2. Evaluate remaining loads and sources.
   3. Shed loads in less than 100 ms.

D. Demand Management:
   1. Load interlocking.
   2. Load shedding.

E. System: Report equipment status and power system control.

2.3 SYSTEM REQUIREMENTS

A. Monitoring and Control System: Include multiple PC-based workstations with graphics capability and Web access, with its operating system and application software, connected to data transmission network.

B. Surge Protection: For external wiring of each conductor entry connection to components to protect components from voltage surges originating external to equipment housing and entering through power, communication, signal, control, or sensing leads.
   1. Minimum Protection for Power Lines 120 V and More: Auxiliary panel suppressors complying with requirements in Division 26 Section 26 43 13 "TVSS for Low-Voltage Electrical Power Circuits."
   2. Minimum Protection for Communication, Signal, Control, and Low-Voltage Power Lines: Comply with requirements as recommended by manufacturer for type of line being protected.

C. Addressable Devices: All transmitters and receivers shall communicate unique device identification and status reports to monitoring and control clients.

2.4 OPERATING SYSTEM

A. Software: Configured for a server and multiple client PCs, each with capability for accessing multiple devices simultaneously. Software shall include interactive graphics client and shall be Web enabled. Workstations and portable computers shall not require any software except for an Internet browser to provide connectivity and full functionality. Include a firewall

recommended by manufacturer. 100 Base-T Ethernet, Modbus TCP/IP RS-232, and RS-485 digital communications.

B. Coordinate with IT to put on the network building.

C. Operating System Software: Based on industry standard bit Microsoft Windows workstation operating system. Software shall have the following features:
   1. Multiuser and multitasking to allow independent activities and monitoring to occur simultaneously at different workstations.
   2. Graphical user interface to show pull-down menus and a menu tree format.
   3. Capability for future additions within the indicated system size limits.

D. Peer Computer Control Software: Shall detect a failure of workstation and associated server, and shall cause other workstation and associated server to assume control of all system functions without interruption of operation. Drivers shall be provided in both central computers to support this mode of operation.

2.5 APPLICATIONS SOFTWARE

A. Basic Requirements:
   1. Fully compatible with and based on the approved operating system.
   2. Password-protected operator login and access; three levels, minimum.
   3. Password-protected setup functions.
   4. Context sensitive on-line help.
   5. Capability of creating, deleting, and copying files; and automatically maintaining a directory of all files, including size and location of each sequential and random-ordered record.
   6. Capability for importing custom icons into graphic views to represent alarms and I/O devices.
   7. Automatic and encrypted backups for database and history; automatically stored at central control PC and encrypted with a nine-character alphanumeric password, which must be used to restore or read data contained in backup.
   8. Operator audit trail for recording and reporting all changes made to user-defined system options.

B. Workstation Server Functions:
   1. Support other client PCs on the LAN and WAN.
   2. Maintain recorded data in databases accessible from other PCs on the LAN and WAN.

C. Data Formats:
   1. User-programmable export and import of data to and from commonly used Microsoft Windows spreadsheet, database, billing, and other applications; using dynamic data exchange technology.
   2. Option to convert reports and graphics to HTML format.
   3. Interactive graphics.
   4. Option to send preprogrammed or operator designed e-mail reports.

D. Metered Data: Display metered values in real time.

E. Equipment Documentation: Database for recording of equipment ratings and characteristics; with capability for graphic display on monitors.

F. Graphics: Interactive color-graphics platform with pull-down menus and mouse-driven generation of power system graphics, in formats widely used for such drafting; to include the following:
   1. Site plan.
   2. Floor plans.

3. Equipment elevations.
4. Single-line diagrams.

G. User-Defined Monitoring and Control Events: Display and record with date and time stamps accurate to 0.1 second, and including the following:
1. Operator log on/off.
2. Attempted operator log on/off.
3. All alarms.
4. Equipment operation counters.
5. Out-of-limit, pickup, trip, and no-response events.

H. Trending Reports: Display data acquired in real-time from different meters or devices, in historical format over user-defined time; unlimited as to interval, duration, or quantity of trends.
1. Spreadsheet functions of sum, delta, percent, average, mean, standard deviation, and related functions applied to recorded data.
2. Charting, statistical, and display functions of standard Windows-based spreadsheet.

I. Alarms: Display and record alarm messages from discrete input and controls outputs, according to user programmable protocol.
1. Functions requiring user acknowledgment shall run in background during computer use for other applications and override other presentations when they occur.

J. Waveform Data: Display and record waveforms on demand or automatically on an alarm or programmed event; include the graphic displays of the following, based on user-specified criteria:
1. Phase voltages, phase currents, and residual current.
2. Overlay of three-phase currents, and overlay each phase voltage and current.
3. Waveforms ranging in length from 2 cycles to 5 minutes.
4. Disturbance and steady-state waveforms up to 512 points per cycle.
5. Transient waveforms up to 83,333 points per cycle on 60-Hz base.
6. Calculated waveform on a minimum of four cycles of data of the following:
a. THD.
b. RMS magnitudes.
c. Peak values.
d. Crest factors.
e. Magnitude of individual harmonics.

K. Data Sharing: Allow export of recorded displays and tabular data to third-party applications software.

L. Reporting: User commands initiate the reporting of a list of current alarm, supervisory, and trouble conditions in system or a log of past events.
1. Print a record of user-defined alarm, supervisory, and trouble events on workstation printer.
2. Sort and report by device name and by function.
3. Report type of signal (alarm, supervisory, or trouble), description, date, and time of occurrence.
4. Differentiate alarm signals from other indications.
5. When system is reset, report reset event with same information concerning device, location, date, and time.

2.6 COMMUNICATION COMPONENTS AND NETWORKS

A. Transient Voltage Surge Suppression and Electromagnetic-Interference Immunity: Include in solid-state equipment. Comply with IEEE C37.90.

B. Network Configuration: High-speed, multi-access, open nonproprietary, industry standard communication protocol; LANs complying with EIA 485, 100 Base-T Ethernet, and Modbus TCP/IP.

2.7 POWER MONITORS

A. Separately mounted, permanently installed instrument for power monitoring and control.
   1. Enclosure: NEMA 250, Type 1.

B. Environmental Conditions: System components shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
   1. Indoor installation in non-air-conditioned spaces that have environmental controls to maintain ambient conditions of 0 to 122 deg F (minus 18 to plus 50 deg C) Insert temperature range dry bulb and 20 to 90 percent relative humidity, noncondensing.

C. RMS Real-Time Measurements:
   1. Current: Each phase, neutral, average of three phases, percent unbalance.
   2. Voltage: Line-to-line each phase, line-to-line average of three phases, line-to-neutral each phase, line-to-neutral average of three phases, line-to-neutral percent unbalance.
   3. Power: Per phase and three-phase total.
   4. Reactive Power: Per phase and three-phase total.
   5. Apparent Power: Per phase and three-phase total.
   6. Power Factor: Per phase and three-phase total.
   7. Displacement Power Factor: Per phase and three-phase total.
   8. Frequency.
   9. THD: Current and voltage.
   10. Accumulated Energy: Real kWh, reactive kVARh, apparent kVAh (signed/absolute).
   11. Incremental Energy: Real kWh, reactive kVARh, apparent kVAh (signed/absolute).
   12. Conditional Energy: Real kWh, reactive kVARh, apparent kVAh (signed/absolute).

D. Demand Current Calculations, per Phase, Three-Phase Average and Neutral:
   1. Present.
   2. Running average.
   3. Last completed interval.
   4. Peak.

E. Demand Real Power Calculations, Three-Phase Total:
   1. Present.
   2. Running average.
   3. Last completed interval.
   4. Predicted.
   5. Peak.
   6. Coincident with peak kVA demand.
   7. Coincident with kVAR demand.

F. Demand Reactive Power Calculations, Three-Phase Total:
   1. Present.
   2. Running average.
   3. Last completed interval.
   4. Predicted.
   5. Peak.
   6. Coincident with peak kVA demand.
   7. Coincident with kVAR demand.

G. Demand Apparent Power Calculations, Three-Phase Total:
   1. Present.
   2. Running average.
   3. Last completed interval.
   4. Predicted.
   5. Peak.
   6. Coincident with peak kVA demand.
   7. Coincident with kVAR demand.

H. Average Power Factor Calculations, Demand Coincident, Three-Phase Total:
   1. Last completed interval.
   2. Coincident with kW peak.
   3. Coincident with kVAR peak.
   4. Coincident with kVA peak.

I. Power Analysis Values:
   1. THD, Voltage and Current: Per phase, three phase, and neutral.
   2. Displacement Power Factor: Per phase, three phase.
   3. Fundamental Voltage, Magnitude and Angle: Per phase.
   4. Fundamental Currents, Magnitude and Angle: Per phase.
   5. Fundamental Real Power: Per phase, three phase.
   6. Fundamental Reactive Power: Per phase.
   7. Harmonic Power: Per phase, three phase.
   8. Phase rotation.
   9. Unbalance: Current and voltage.
   10. Harmonic Magnitudes and Angles for Current and Voltages: Per phase, up to 63rd harmonic.

J. Power Demand Calculations: According to one of the following calculation methods, selectable by the user:
   1. Thermal Demand: Sliding window updated every second for the present demand and at end of the interval for the last interval. Adjustable window that can be set in 1-minute intervals, from 1 to 60 minutes.
   2. Block Interval with Optional Subintervals: Adjustable for 1-minute intervals, from 1 to 60 minutes. User-defined parameters for the following block intervals:
      a. Sliding block that calculates demand every second, with intervals less than 15 minutes, and every 15 seconds with an interval between 15 and 60 minutes.
      b. Fixed block that calculates demand at end of the interval.
      c. Rolling block subinterval that calculates demand at end of each subinterval and displays it at end of the interval.
   3. Demand Calculation Initiated by a Synchronization Signal:
      a. Signal is a communication signal. Calculation shall be configurable as either a block or rolling block calculation.
      b. Demand can be synchronized with clock in the power meter.

K. Sampling:
   1. Current and voltage shall be digitally sampled at a rate high enough to provide accuracy to 63rd harmonic of 60-Hz fundamental.
   2. Power monitor shall provide continuous sampling at a rate of 128 samples per cycle on all voltage and current channels in the meter.

L. Minimum and Maximum Values: Record monthly minimum and maximum values, including date and time of record. For three-phase measurements, identify phase of recorded value. Record the following parameters:
   1. Line-to-line voltage.
   2. Line-to-neutral voltage.

3. Current per phase.
4. Line-to-line voltage unbalance.
5. Line-to-neutral voltage unbalance.
6. Power factor.
7. Displacement power factor.
8. Total power.
9. Total reactive power.
10. Total apparent power.
11. THD voltage L-L.
12. THD voltage L-N.
13. THD current.
14. Frequency.

M. Harmonic Calculation: Display and record the following:
1. Harmonic magnitudes and angles for each phase voltage and current through 63rd Insert number harmonic. Calculate for all three phases, current and voltage, and residual current. Current and voltage information for all phases shall be obtained simultaneously from same cycle.
2. Harmonic magnitude reported as a percentage of the fundamental or as a percentage of RMS values, as selected by user.

N. Current and Voltage Ratings:
1. Designed for use with current inputs from standard instrument current transformers with 5-A secondary and shall have a metering range of 0-10 A.
2. Withstand ratings shall be not less than 15 A, continuous; 50 A, lasting over 10 seconds, no more frequently than once per hour; 500 A, lasting 1 second, no more frequently than once per hour.
3. Designed for use with voltage inputs from standard instrument potential transformers with a 120-V secondary.

O. Accuracy:
1. Comply with ANSI C12.20, Class 0.5; and IEC 60687, Class 0.5 for revenue meters.
2. Accuracy from Light to Full Rating:
   a. Power: Accurate to 0.25 percent of reading, plus 0.025 percent of full scale.
   b. Voltage and Current: Accurate to 0.075 percent of reading, plus 0.025 percent of full scale.
   c. Power Factor: Plus or minus 0.002, from 0.5 leading to 0.5 lagging.
   d. Frequency: Plus or minus 0.01 Hz at 45 to 67 Hz.

P. Waveform Capture:
1. Capture and store steady-state waveforms of voltage and current channels; initiated manually. Each capture shall be for 3 cycles, 128 data points for each cycle, allowing resolution of harmonics to 31st harmonic of basic 60 Hz.
2. Store captured waveforms in internal nonvolatile memory; available for PC display, archiving, and analysis.

Q. Input: One digital input signal(s).
1. Normal mode for on/off signal.
2. Demand interval synchronization pulse, accepting a demand synchronization pulse from a utility demand meter.
3. Conditional energy signal to control conditional energy accumulation.

R. Outputs:
1. Operated either by user command sent via communication link, or set to operate in response to user-defined alarm or event.
2. Closed in either a momentary or latched mode as defined by user.

3. Each output relay used in a momentary contact mode shall have an independent timer that can be set by user.
4. One digital KY pulse to a user-definable increment of energy measurement. Output ratings shall be up to 120-V ac, 300-V dc, 50 mA, and provide 3500-V RMS isolation.
5. One relay output module(s), providing a load voltage range from 20- to 240-V ac or from 20- to 30-V dc, supporting a load current of 2 A.
6. Output Relay Control:
    a. Relay outputs shall operate either by user command sent via communication link or in response to user-defined alarm or event.
    b. Normally open and normally closed contacts, field configured to operate as follows:
        1) Normal contact closure where contacts change state for as long as signal exists.
        2) Latched mode when contacts change state on receipts of a pickup signal; changed state is held until a dropout signal is received.
        3) Timed mode when contacts change state on receipt of a pickup signal; changed state is held for a preprogrammed duration.
        4) End of power demand interval when relay operates as synchronization pulse for other devices.
        5) Energy Pulse Output: Relay pulses quantities used for absolute kWh, absolute kVARh, kVAh, kWh In, kVARh In, kWh Out, and kVARh Out.
        6) Output controlled by multiple alarms using Boolean-type logic.

S. Onboard Data Logging:
1. Store logged data, alarms, events, and waveforms in 800 KB of onboard nonvolatile memory.
2. Stored Data:
    a. Billing Log: User configurable; data shall be recorded every 15 minutes, identified by month, day, and 15-minute interval. Accumulate 24 months of monthly data, 32 days of daily data, and between 2 to 52 days of 15-minute interval data, depending on number of quantities selected.
    b. Custom Data Logs: Three user-defined log(s) holding up to 96 parameters. Date and time stamp each entry to the second and include the following user definitions:
        1) Schedule interval.
        2) Event definition.
        3) Configured as "fill-and-hold" or "circular, first-in first-out."
    c. Alarm Log: Include time, date, event information, and coincident information for each defined alarm or event.
    d. Waveform Log: Store captured waveforms configured as "fill-and-hold" or "circular, first-in first-out."
3. Default values for all logs shall be initially set at factory, with logging to begin on device power up.

T. Alarms.
1. User Options:
    a. Define pickup, dropout, and delay.
    b. Assign one of four severity levels to make it easier for user to respond to the most important events first.
    c. Allow for combining up to four alarms using Boolean-type logic statements for outputting a single alarm.
2. Alarm Events:
    a. Over/undercurrent.
    b. Over/undervoltage.
    c. Current imbalance.
    d. Phase loss, current.

e. Phase loss, voltage.
f. Voltage imbalance.
g. Over kW demand.
h. Phase reversal.
i. Digital input off/on.
j. End of incremental energy interval.
k. End of demand interval.
U. Control Power: 90- to 457-V ac or 100- to 300-V dc.
V. Communications:

1. Power monitor shall be permanently connected to communicate via Modbus TCP via a 100 Base-T Ethernet.
2. Local plug-in connections shall be for RS-232 and 100 Base-T Ethernet.

W. Display Monitor:

1. Backlighted LCD to display metered data with touch-screen selecting device.
2. Touch-screen display shall be a minimum 12-inch diagonal, resolution of 800 by 600 RGB pixels, 256 colors; NEMA 250, Type 1 display enclosure.
3. Display four values on one screen at same time.
   a. Current, per phase RMS, three-phase average and neutral.
   b. Voltage, phase to phase, phase to neutral, and three-phase averages of phase to phase and phase to neutral.
   c. Real power, per phase and three-phase total.
   d. Reactive power, per phase and three-phase total.
   e. Apparent power, per phase and three-phase total.
   f. Power factor, per phase and three-phase total.
   g. Frequency.
   h. Demand current, per phase and three-phase average.
   i. Demand real power, three-phase total.
   j. Demand apparent power, three-phase total.
   k. Accumulated energy (MWh and MVARh).
   l. THD, current and voltage, per phase.
4. Reset: Allow reset of the following parameters at the display:
   a. Peak demand current.
   b. Peak demand power (kW) and peak demand apparent power (kVA).
   c. Energy (MWh) and reactive energy (MVARh).

2.8 STANDALONE, WEB-ENABLED MONITORING AND CONTROL INSTRUMENT

A. Separately mounted, permanently installed instrument for power monitoring and control.
   1. Enclosure: NEMA 250, Type 1.

B. Environmental Conditions: System components shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability.
   1. Indoor installation in non-air-conditioned spaces that have environmental controls to maintain ambient conditions of 0 to 122 deg F (minus 18 to plus 50 deg C) dry bulb and 20 to 90 percent relative humidity, noncondensing.

C. Power-Distribution Equipment Monitor: Web enabled, with integral network port and embedded Web server with factory-configured firmware and HTML-formatted Web pages for viewing of power monitoring and equipment status information from connected devices equipped with digital communication ports.

D. LAN Connectivity: Multipoint, RS-485 Modbus serial communication network,

interconnecting all breaker trip units, protective relays, drives, and metering devices equipped with communications. Serial communication network connected to Ethernet server that functions as a gateway and server, providing data access via 100 Base-T LAN.

E. Communication Devices within the Equipment: Addressed at factory and tested to verify reliable communication with network server.

F. Server Configuration:
   1. Initial network parameters set using a standard Web browser. Connect via a local operator interface, or an RJ-45 port accessible from front of equipment.
   2. Network server shall be factory programmed with embedded HTML-formatted Web pages that are user configurable and that provide detailed communication diagnostic information for serial and Ethernet ports as status of RS-485 network; with internal memory management information pages for viewing using a standard Web browser.
   3. Login: Password protected; password administration accessible from the LAN using a standard Web browser.
   4. Operating Software: Suitable for local access; firewall protected.

G. Data Access:
   1. Network server shall include embedded HTML pages providing real-time information from devices connected to RS-485 network ports via a standard Web browser.

H. Equipment Monitoring Options: Login shall be followed by a main menu for selecting summary Web pages that follow.

I. Summary Web pages shall be factory configured to display the following information for each communicating device within the power equipment lineup:
   1. User-Configurable Custom Home Page: Provide for the lineup, showing status-at-a-glance of key operating values.
   2. Circuit Summary Page: Circuit name, three-phase average RMS current, power (kW), power factor, and breaker status.
   3. Load Current Summary Page: Circuit name, Phase A, B, and C RMS current values.
   4. Demand Current Summary Page: Circuit name, Phase A, B, and C average demand current values.
   5. Power Summary Page: Circuit name, present demand power (kW), peak demand power (kW), and recorded time and date.
   6. Energy Summary Page: Circuit name, energy (kWh), reactive energy (kVARh), and time/date of last reset.
   7. Transformer Status Page: Transformer tag, coil temperatures, and cooling fan status.
   8. Specific Device Pages: Each individual communicating device shall display detailed, real- time information, as appropriate for device type.
      a. Display historical energy data that shall be logged automatically for each device, as appropriate for device type.
      b. Display historical data logged from each device in graphical time-trend plots. Value to be displayed on time-trend plot shall be user selectable. Time interval to be displayed on scale shall be for previous day or week.
   9. Export historical energy data to a PC or workstation through network using FTP (File Transfer Protocol). Format exported data in a CSV (Comma Separated Variable) file format for importing into spreadsheet applications.

J. Communications:
   1. Power monitor: Permanently connected to communicate via Modbus TCP via an 100 Base-T Ethernet.
   2. Local Plug-in Connections: RS-232 and 100 Base-T Ethernet.
   3. Monitor Display: Backlighted LCD to display metered data with touch-screen selecting device.

2.9 WORKSTATION HARDWARE

A. Environmental Conditions: System components shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
   1. Indoor installation in spaces that have environmental controls to maintain ambient conditions of 36 to 122 deg F (2 to 50 deg C) dry bulb and 20 to 90 percent relative humidity, noncondensing.

B. Computer: Standard unmodified PC of modular design. CPU word size shall be 32 bytes or larger; CPU operating speed shall be at least 2.4 GHz.
   1. Memory: 2 GB of usable installed memory, expandable to a minimum of 4 GB without additional chassis or power supplies.
   2. Real-Time Clock:
      a. Accuracy: Plus or minus 1 minute per month.
      b. Time Keeping Format: 24-hour time format including seconds, minutes, hours, date, day, and month; automatic reset by software.
      c. Clock shall function for one year without power.
      d. Provide automatic time correction once every 24 hours by synchronizing clock with the Time Service Department of the U.S. Naval Observatory.
   3. Serial Ports: Two RS-232-F serial ports for general use, with additional ports as required. Data transmission rates shall be selectable under program control.
   4. Parallel Port: Enhanced.
   5. LAN Adapter Card: 10/100-Mbps PCI bus, internal network interface card.
   6. Sound Card: For playback and recording of digital WAV sound files associated with audible warning and alarm functions.
   7. Color Monitor: PC compatible, not less than 21 inches (455 mm) widescreen, LCD type, with a minimum resolution of 1280 by 1024 pixels, non-interlaced.
   8. Keyboard: Minimum of 64 characters, standard ASCII character set based on ANSI INCITS 154.
   9. Mouse: Standard, compatible with installed software.
   10. Disk Storage: Include the following, each with appropriate controller:
      a. Minimum 120-GB hard disk, maximum average access time of 10 ms.
      b. PCMCIA slot with removable 500-MB media.
   11. Modem: 56,600 bps, full duplex for asynchronous communications. With error detection, auto answer/autodial, and call-in-progress detection. Modem shall comply with requirements in ITU-T v.34, ITU-T v.42, ITU-T v.42 Appendix VI for error correction, and ITU-T v.42 BIS for data compression standards; and shall be suitable for operating on unconditioned voice-grade telephone lines complying with 47 CFR 68.
   12. Audible Alarm: Manufacturer's standard.
   13. DVD/CD-ROM Drive:
      a. Nominal Storage Capacity: 650 MB.
      b. Data Transfer Rate: 1.2 Mbps.
      c. Average Access Time: 150 ms.
      d. Cache Memory: 256 KB.
      e. Data Throughput: 1 MB/second, minimum.
   14. Report Printer: Minimum resolution 600 dpi laser printer.
      a. Connected to central station and designated workstations.
      b. RAM: 2 MB, minimum.
      c. Printing Speed: Minimum 12 pages per minute.
      d. Paper Handling: Automatic sheet feeder with 250-sheet paper cassette and with automatic feed.
   15. Interface: Bidirectional parallel and universal serial bus.
   16. LAN Adapter Card: 10/100-Mbps internal network interface card.

C. UPS: Self-contained; Static Uninterruptible Power Supply for workstation computer, display monitor and printer.
   1. Size: Provide a minimum of 2 hours of operation of workstation station equipment, including 2 hours of alarm printer operation.
   2. Batteries: Sealed, valve regulated, recombinant, lead calcium.
   3. Accessories:
      a. Transient voltage suppression.
      b. Input-harmonics reduction.
      c. Rectifier/charger.
      d. Battery disconnect device.
      e. Static bypass transfer switch.

2.10 NETWOFK ALARM AND REMOTE NOTIFICATION INTERFACE

A. General: Replace legacy RS-232 ASCII alarm interfaces with Ethernet-based communication methods to ensure compatibility with modern IT infrastructure and long-term maintainability.

B. Alarm Communication Protocols:

1. System shall provide alarm/event notification via secure Ethernet-based protocols including:

   i. SNMP v3 traps for integration with facility IT network monitoring tools.

   ii. SMTP (secure email notifications) with TLS encryption.

   iii. SMS or push notifications via secure email-to-text gateway or approved cellular notification service.

2. Each alarm shall include a customizable message with device identification, alarm type, date, and time stamp.

C. Cybersecurity:

1. Alarm and notification features shall comply with NIST 800-82 and/or ISA/IEC 62443 guidelines for securing industrial control systems.

2. All communication shall be encrypted (TLS/SSL minimum).

D. Configuration:

1. System shall allow assignment of priority levels (critical, warning, informational) to alarms.

2. Alarms shall be user-configurable to initiate multiple notification methods simultaneously (e.g., SNMP trap and email).

E. Redundancy:

1. The system shall support redundant communication paths (dual Ethernet network connections or failover server architecture) to ensure delivery of alarm notifications.

2.11 LAN CABLES

A. Comply with Division 27 Section "Communications Horizontal Cabling."

B. RS-485 Cable:
1. Plenum-Type, RS-485 Cable: Paired, 2 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and fluorinated-ethylene-propylene jacket, and NFPA 70, Type CMP.

C. Unshielded Twisted Pair Cables: Category 6 as specified for horizontal cable for data service in Division 27 Section "Communications Horizontal Cabling."

2.12 LOW-VOLTAGE WIRING

A. Low-Voltage Control Cable: Multiple conductor, color-coded, No. 20 AWG copper, minimum.
1. Sheath: PVC; except in plenum-type spaces, use sheath listed for plenums.
2. Ordinary Switching Circuits: Three conductors, unless otherwise indicated.
3. Switching Circuits with Pilot Lights or Locator Feature: Five conductors, unless otherwise indicated.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.
1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CABLING

A. Comply with NECA 1.

B. Wiring Method for wiring penetrating floor slabs: Install wiring in metal raceway according to Division 26 Section "Raceways and Boxes for Electrical Systems."

C. Wiring Method for wiring concealed in Walls, Partitions, and Inaccessible Ceilings: Install wiring in metal raceway according to Division 26 Section "Raceways and Boxes for Electrical Systems."

D. Wiring Method for surface mounted and other exposed circuits, including in Crawlspaces: Install wiring in metal raceway according to Division 26 Section "Raceways and Boxes for Electrical Systems."

E. Wiring Method for wiring concealed in accessible ceilings, install NRTL-listed plenum-rated cables supported on j-hooks.
1. For wall mounted devices: Install recessed device back boxes with conduit extended to above accessible ceiling according to Division 26 Section "Raceways and Boxes for Electrical Systems."

F. Install LAN cables using techniques, practices, and methods that are consistent with specified category rating of components and that ensure specified category performance of completed and linked signal paths, end to end.

G. Install cables without damaging conductors, shield, or jacket.

3.3 IDENTIFICATION

A. Identify components and power and control wiring according to Division 26 Section "Identification for Electrical Systems."

B. Label each power monitoring and control module with a unique designation.

3.4 GROUNDING

A. Comply with IEEE 1100, "Power and Grounding Sensitive Electronic Equipment."

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Assist factory-authorized service representative during testing and correct deficiencies as required. Report results in writing.
   1. Electrical Tests: Use caution when testing devices containing solid-state components.
   2. Continuity tests of circuits.
   3. Operational Tests: Set and operate controls at workstation and at monitored and controlled devices to demonstrate their functions and capabilities. Use a methodical sequence that cues and reproduces actual operating functions as recommended by manufacturer. Submit sequences for approval. Note response to each test command and operation. Note time intervals between initiation of alarm conditions and registration of alarms at central-processing workstation.
      a. Coordinate testing required by this Section with that required by Sections specifying equipment being monitored and controlled.
      b. System components with battery backup shall be operated on battery power for a period of not less than 10 percent of calculated battery operating time.
      c. Verify accuracy of graphic screens and icons.
      d. Metering Test: Load feeders, measure loads on feeder conductor with an RMS reading clamp-on ammeter, and simultaneously read indicated current on the same phase at central-processing workstation. Record and compare values measured at the two locations. Resolve discrepancies greater than 5 percent and record resolution method and results.
      e. Record metered values, control settings, operations, cues, time intervals, and functional observations and submit test reports printed by workstation printer.

B. Correct Deficiencies, Retest and Report:
   1. Correct unsatisfactory conditions, and retest to demonstrate compliance; replace conductors, units, and devices as required to bring system into compliance.
   2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   3. Prepare a report that identifies panelboards, units, conductors and devices checked and describes results. Include notation of deficiencies detected, remedial action taken, and observations and test results after remedial action.

C. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's personnel to adjust, operate, and maintain system. Refer to Division 01 Section 01 79 00 "Demonstration and Training."
   1. Train Owner's personnel in interpreting and using monitoring displays and in configuring and using software and reports. Include troubleshooting, servicing, adjusting, and maintaining equipment.
   2. Training Aid: Use approved final versions of software and maintenance manuals as

training aids.

3.7 ON-SITE ASSISTANCE

A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to three visits to Project during other-than-normal occupancy hours for this purpose.

END OF SECTION 26 09 13

SECTION 26 09 21 - DIGITAL LIGHTING CONTROL SYSTEM

PART 1 – GENERAL

1.1 SUMMARY

A. The intent of this set of specifications is to provide a complete, functional, intelligent, low-voltage lighting control system for the control of incandescent, low-voltage, LED, neon, cold cathode, fluorescent and HID lighting sources.

B. Where shown in the drawings, the contractor shall furnish and install a complete low-voltage lighting control system consisting of, but not limited to, relays, controllers, switch stations, and miscellaneous components as required for a complete, operational lighting control system.

C. Where applicable standards have been established, all items of equipment, individual components, and installation methods shall meet the requirements of these standards, including, but not limited to, Underwriter Laboratories, National Electrical Code, Federal Communications Commission, and any local or state codes that may be applicable.

D. Low voltage lighting control systems manufactured by the following manufacturers shall be considered providing they meet the requirements of these specifications and provide the quality and performance specified herein.

1. Intelligent Lighting Controls

E. Listing a manufacturer as acceptable does not in relieve the contractor from the responsibility for providing a lighting control system that meets all the requirements of these specifications.

F. All manufacturers shall submit to the specifying engineer a line-by-line compliance comparison between each specification requirement and the system being proposed.

G. Any ambiguities in the drawing or specification shall be brought to the attention of the specifying engineer for clarification.

1.2 QUALITY ASSURANCE

A. Factory Assembly: All relays, contactors, controllers, enclosures, switch stations and miscellaneous components shall be factory assembled and tested. All system components shall arrive at the job site completely pre-wired and ready for installation, requiring only the connection of lighting circuits and low-voltage control stations and/or network terminations. All connections shall be made to clearly and permanently labeled termination points. Systems that require field assembly shall not be acceptable.

B. Manufacturer: A minimum of 30 years of experience in the design and manufacture of lighting control equipment.

C. Component Testing: All system components and assemblies shall be individually tested before assembly. Once assembled, all finished products shall be tested for proper operation of all control functions per specifications before shipment.

D. NEC Compliance**:** All system components shall comply with all applicable sections of the National Electrical Code (NEC) as required.

E. NEMA Compliance: All system components shall comply with all applicable portions of NEMA standards pertaining to types of electrical equipment and enclosures.

F. UL/CUL Approval: All applicable equipment shall be UL/CUL listed under section 916 and shall bear labels indicating compliance.

G. FCC Emissions**:** All applicable equipment shall comply with FCC emissions standards specified in Part 15 and Part 68 where applicable for commercial applications and shall bear labels indicating compliance testing. Equipment not meeting these standards shall not be acceptable.

1.3 SUBMITTALS

A. The manufacturer shall provide an electronic copy of submittal drawings and data for approval before beginning the manufacture of equipment.

B. Hard copy submittal package shall be provided upon request.

C. Submittal package shall include, but not be limited to, the following. Submittals that do not contain all the information listed below will not be considered for approval.

1. Specifications Compliance: Submit a line-by-line comparison that describes the differences between each specification requirement and the equipment/systems being proposed. The comparison shall include a complete listing of how the proposed equipment/systems differ from those specified in size, quantity, quality, method of control, features and functions, control software functions, and installation requirements.

2. System Description: Supply as part of the submittal package a brief description of the lighting control system's major features and functions.

3. Bill of Materials: Provide as part of the submittal package a detailed itemized listing of all proposed equipment, including quantities and capacities for all major system components.

4. Product Data Sheets: Provide as part of the submittal package detailed product data sheets for all major system components.

5. Riser Drawing: Provide as part of the submittal package a system riser drawing of sufficient detail to indicate the relative placement of major system components and the required connections between each. Drawings shall be project specific. Generic or typical riser diagrams shall not be acceptable.

6. Control Schedules: Provide as part of the submittal package a complete control schedule spreadsheet for relay panels, Timers, Inputs, Groups, and Presets.

7. Switch Details: Provide as part of the submittal package complete switch details including color, gangs, buttons, plate style, plate colors, and engraving.

8. Warranty: Provide as part of the submittal package a complete written warranty.

1.4 WARRANTY

A. **Manufacturer's Warranty:** The manufacturer shall provide a written warranty that shall cover all lighting control equipment. The manufacturer shall agree to repair or replace any equipment that fails due to material or workmanship for a period of 5 years.

B. Relay Warranty: The manufacturer shall provide a separate written warranty that shall cover all lighting control relays within the lighting control system. The manufacturer shall agree to replace any relay that fails due to material or workmanship for a period of 5 years.

C. **Warranty Period:** The warranty period shall begin after the completion of the installation and the systems field start-up and training. Systems not provided with a field start-up begin upon receiving the product.

PART 2 – PRODUCTS

2.1 PROGRAMMABLE **LIGHTING CONTROL** PANELS

A. **Hardware** Features**:**

1. **Controller Back-Box:** Each programmable lighting controller shall be provided with a factory furnished; UL listed NEMA 1 enclosure designed for wall mounting. The backbox must be capable of being shipped ahead of the controller chassis insert to allow for rough-in of all electrical connections prior to receipt of the controller chassis insert.

2. Controller Chassis Insert: Each programmable lighting controller shall be provided with a factory or field-installable controller chassis insert. The Controller chassis insert shall contain all controller electronics, power supplies, relays, contactors, and other required components. Controller chassis inserts shall arrive at the project site completely pre-wired and require only the connection of lighting circuits and control devices.

3. Line Voltage / Control Voltage Separation: Each controller shall be provided with a mechanical barrier that separates all line voltage components and wiring from all control voltage components and wiring. An additional barrier may be installed that provides isolation between normal and emergency circuits where required.

4. Controller Covers: Each programmable lighting controller shall be provided with a dead front screw-held or hinged locking cover that is designed for either surface or flush mounting. Flush mount doors shall be provided with a trim ring. If a hinge-locking door is provided, it shall be provided with a slam-latch with 2 keys and door hooks to assist in mounting.

5. Controller Capacity**/Configurations:** Controllers shall be available in sizes to accommodate 4, 8, 16, 24, 32, 40, 48, 56, and 64 relay outputs. Controllers shall be available with the electronics in the center and voltage dividers with the lighting relays on the right/left sides.

B. Electrical**:**

1. **Controller Power Supply:** Each programmable lighting controller shall be provided with a dual-rated, UL-listed Class 2 transformer capable of either 120/277 VAC or 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.

2. Connections**:** All connections shall have clearly and permanently labeled termination points.

C. Controller **Electronics:**

1. **Controller CPU:** Each programmable controller shall have a CPU (Central Processing Unit) that shall provide all the programming and control functions for the entire controller.
2. Real-Time Clock: Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.
3. Relay Driver Module: Relay output cards shall be provided to expand the controller capability from 8 to 64 relay outputs in increments of 8. Electronics shall feature surge protection and optic isolation. It shall also provide an interface for mounting input boards.

4. Relay Control Switches**:** Controller shall contain push-button switches to turn all relays ON or OFF without the presence of any programming.

5. **Backup and Restore:** The controller shall be equipped with an internal memory backup and restore capability. It shall have the ability to back up all internal programming into additional onboard memory, verify present programming with backup, and restore programming.

6. Runtime Logging: The controller shall be equipped with memory to log the runtime of each relay. It shall be capable of storing up to 30 days or 1092 hours of data and be able to be exported in a delimitative format.
7. Non-Volatile Memory: Controller shall have a minimum of 4MB of nonvolatile EEPROM memory with data retention of >200 years and electrostatic discharge protection of >4000V.
8. Power Input Surge Suppression: The controller's 24VAC power input shall be equipped with double surge suppression to protect the electronics from transient over-voltages. Protection shall clamp over-voltages up to 123 volts.
9. Data Line Surge Suppression: The controller data line communications shall be equipped with transient voltage suppression protection that will protect the electronics from electrostatic discharge and other transient over-voltages. Protection shall clamp transients up to 8kV direct discharges and 15kV air discharges.
10. Data Line Communications: The controller shall be equipped with serial communications through RJ45 connectors for communicating on CAT-5 cable with other panels. It shall also be equipped with a separate local port for communicating with devices. The communications shall consist of 2-RS485 data lines.
11. USB Serial Communications: A USB port shall be provided for programming and interfacing the system with the use of a personal computer.
12. TCP/IP Communications: A TCP/IP port shall be provided for programming and interfacing the system with a computer over a network (LAN) or the internet (WAN).
13. Optional Module **Interface:** The controller shall contain 4 ports for interfacing optional modules which include communications and power. Optional modules shall be able to be mixed on each controller.

D. Switching and Control **Devices:**

1. Device Capacity: Each controller shall have an RJ45 data line port with power for up to 8 data line devices and shall be able to support up to 64 data line devices when using Power Supply Repeaters. A network of 254 panels would be able to support up to 16,510 devices. Each device shall have a unique address and shall be capable of being programmed to the applicable functions described in the Switched Input Types heading in this specification.

2. Data Line Media: The data line shall consist of RS485 communications protocol transmitted over CAT-5, CAT-5E, or CAT-6 Cable. The cable shall have male RJ45 connectors installed on each end for interfacing controllers and devices. Both daisy-chain and "T" (3-direction branching) of cable runs shall be permitted. "T" branching shall be accomplished by the addition of power supply repeaters.

3. Switch Stations: Data line switch stations shall be available in momentary push button (1-7 switches and pilots) and each switch shall have an associated pilot light. It shall be provided with optional dimming Raise and Lower buttons. Switches can be provided as Scene Multi-zone, Scene Stations, Multi-zone Stations, or Non-Dim Stations. Each button shall control any or all the relays in the lighting controllers or the dimmer outputs on the network. There shall be an option to program each pilot LED to indicate the state of any Relay, Group, Preset, Scene, and static ON or OFF. It shall also have the capability to reverse the status: LED is ON if the relay is OFF etc.

4. Digital Ceiling **Occupancy Sensor:** The Digital Ceiling Sensor shall be a low-profile ceiling mount sensor and provide dual-tech detection with passive infrared and overlapping passive acoustic sensing.

- **a.** Shall have two RJ45 ports for connection to a data line and shall be powered via the data line with no external power pack required.
- **b.** Shall have an auxiliary relay for connection to BAS system or power pack.
- **c.** Shall have a built-in daylight harvesting photosensor that can be enabled for full-range continuous daylight dimming control with 0-255 step resolution in the 0 to 1,800 fc range. The photosensor can be configured for open loop or closed loop daylight dimming and supports all standard ILC photocell sensor options.
- **d.** Shall support occupancy and vacancy modes, have an adjustable time-delay,

and be configurable over the digital bus for easy set-up and adjustment.

e. Sensitivity adjustments for passive infrared and acoustic can be independently adjusted to three different levels, including PIR-only mode, and shall have separate LED indicators for PIR and acoustic detection which can be independently disabled.

f. Automatic Gain Control filters background noise to fine tune acoustic sensitivity, filtering out non-occupant noises.

g. An initial PIR event shall be required to enable acoustic functionality, which will overlap and enhance overall detection once enabled, and will extend sensor time delay upon occupant sound detection. To prevent sounds alone from keeping lights on indefinitely, periodic PIR detection shall be needed to keep lights on for an extended period, otherwise lighting shall automatically shut-off after 5 minutes of acoustic only detection.

h. Acoustic detection shall remain enabled for a brief period after the sensor times out, to allow for voice reactivation of the lights.

5. **Digital Wall** Sensor **Switch:** The Digital Wall Sensor Switch station shall provide dual-tech occupancy sensing via passive infrared (PIR) and overlapping passive acoustic sensor, along with the programmable functionality of a digital switch station.

a. shall match the family of digital switches and be available in the same 6 colors and 12 button configurations supporting: 1-3 non-dim zones, 1-3 dimming zones, 1-3 scene capture and control, and 3 combinations of Scene/Multi-Zone functionality.

b. shall have field replaceable faceplates with color change kits and the option for individually replaceable buttons that can be custom engraved. The sensor switch shall also be field reconfigurable to change between different switch types.

c. Shall have two RJ45 ports for connection to a data line and shall be powered via the data line with no external power pack required.

d. Shall support occupancy and vacancy modes, have an adjustable time-delay, and be configurable over the digital bus for easy set-up and adjustment.

e. Sensitivity adjustments for passive infrared and acoustic can be independently adjusted to three different levels, including PIR-only mode, and the sensor switch shall have separate LED indicators for PIR and acoustic detection which can be independently disabled.

f. Automatic Threshold Control filters background noise to fine tune acoustic sensitivity, filtering out non-occupant noises.

g. An initial PIR event shall be required to enable acoustic functionality, which will overlap and enhance overall detection once enabled, and will extend sensor time delay upon occupant sound detection. To prevent sounds alone from keeping lights on indefinitely, periodic PIR detection shall be needed to keep lights on for an extended period, otherwise lighting shall automatically shut-off after 5 minutes of acoustic only detection.

h. Acoustic detection shall remain enabled for a brief period after the sensor times out, to allow for voice reactivation of the lights.

6. **Photocell Controllers:** The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs on the network.

7. Input Modules: The input module shall provide 4 inputs that accept momentary, momentary PB, and maintained switch closures. Each input shall be optically isolated and can accept dry contact closures or 12-24VDC signals. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs on the network. It shall provide four pilot outputs that provide the true status of relays, groups, and presets. It shall be installed in the control panel or remotely mounted.

8. Disable Key Switch: The disable switch shall provide an RJ45 connector that shall disable all devices down line with the closure of a key switch. It shall also provide two

RJ45 connectors to pass data through. It shall indicate with an LED when the disable switch is active.

9. Occupancy Sensor Module: The Occupancy Sensor Module shall provide 800mA of power for 24VDC hardwired motion sensors. It shall have 8 independent inputs that shall be able to interface multiple sensors. Each input shall control any or all of the relays in the lighting controllers or the dimmer outputs on the network. It shall have the ability to set AND/OR conditional logic. It shall be installed in the control panel or remotely mounted.

10. 0-10V Dimmer Output Module: The 0-10VDC dimmer output module shall be designed to control dimmable ballasts or other 0-10VDC devices. Each module shall have 4 independent output channels that can control up to 200 devices per output at .5mA per device. It shall have the capability to vary its level 256 steps between 0 and 10VDC. It shall be able to respond to photo controllers, switch inputs, DMX512 signals, and timers. Each output shall be galvanically isolated up to 1500V to protect electronics. It shall be installed in the control panel or remotely mounted.

11. **Graphical Touch Screen Control Station:** The Touch screen control station shall display the status and control the lighting control panel relay outputs via pre-programmed control objects on standard or custom bitmap screens.

E. Special **Purpose Modules:** The following special-purpose controller nodes shall be available. Four modules shall be permitted per controller.

1. **BACnet Control:** This module shall communicate directly to the lighting controller through serial communications from the BAS system using BACnet MSTP or BACnet IP protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.
2. DMX Control: This module shall support the control of relays using the standard USITT DMX512 protocol used by theatrical lighting systems. Each relay in the lighting panel shall be configured to be controlled by any DMX channel. It shall contain a frame filter that can be set from 1 – 16 frames. It shall have a priority setting for switch inputs or DMX signals. It shall have the capability to control any 0 – 10V dimming output throughout the network. It shall display current DMX levels from the keypad.
3. DMX Driver: This module shall send DMX signals from the lighting control panels using the standard USITT DMX512 protocol used by theatrical lighting systems. Each module added to the panel shall control up to 64 channels. Each dimming output channel shall be able to be mapped to 1-512 DMX channels. It shall be 1 to 1 mapped or programmed with free software. It shall be installed in the control panel or remotely mounted.

4. Modbus Control: This module shall communicate directly to the lighting controller through RS485, RS232, or TCP serial communications from the BAS system using Modicon Modbus RTU or ASCII protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.

5. **N2 Control:** This module shall communicate directly to the lighting controller through serial communications from the BAS system using the Metasys-N2 protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.

6. Protocol Input Control: This module shall allow serial communications from a Modbus, N2, or BACnet network. It shall be capable of emulating switches or photocells for direct control and status of relays, dimmers, or motor controls.

F. **Programming:** Programmable controllers shall be capable of being programmed, monitored, backed up, or controlled through any of the below methods. All programming changes shall take effect immediately as they are programmed and shall not suspend or disable switches or other system functions. The same functions shall be available for any of

the connection types.

1. **Local Keypad and Display:** The system user shall be able to program, monitor, and control any of the controller features and functions through the use of a simple menu-driven self-prompting user interface consisting of a 4-line 20-character backlit LCD display and 8 selection keys that change function based on the current operating mode.
2. USB Serial Direct Connect: The system user shall be able to program, monitor, or control any of the controller features and functions utilizing Windows-based graphical user interface software using a USB port from a PC.
3. TCP/IP Connect: The system user shall be able to remotely program, monitor, or control any of the controller features and functions utilizing Windows-based graphical user interface software using a PC with TCP/IP on a LAN or WAN.

G. Diagnostics**:** Programmable controllers shall have the ability to do the following diagnostics.

1. **Power Status:** Each programmable lighting controller shall be provided with an LED on the controller and each output board shall indicate that power is present.
2. Keypad: System users shall be able to view thru the keypad the status of any relay, input, group, or preset and force any ON or OFF.
3. Software: System users shall be able to view thru the software the status of any relay, input, group, or preset and force any ON or OFF. It shall also be able to scan the network for devices and controllers and then poll them to verify network quality.
4. Relay Cycle Test: The controller shall have a cycle test for relays to turn them off/on/off and then return them to the original state to verify proper operation. It shall display the results for each relay for turning the relay ON and OFF.
5. Device Finder: It shall have the capability through the keypad to find devices, dimmer devices, and motor devices on the network.
6. Switch Test Mode: Shall be able to enter switch test mode, where normal control is disabled, and switch input activation will only control input status LEDs.
7. Demo Clock: It shall have the ability to speed the clock's time by 10, 30, or 60 times for testing timer functions.

H. Power Failure and Power-Up: Each controller shall be provided with circuitry that shall automatically shut down the controller when the incoming power fails to be delivered to the within the required limits. When power is returned to the controller, one of the following power-up modes will be implemented for each controlled relay output in the system.

1. **No Action:** Upon restoration of incoming control power, the controller electronics shall be restarted and resume normal operation and all circuits will be maintained in the condition they were last in.
2. Turn ON: Controller shall turn the selected relay output to the ON state after power-up.
3. Turn ON if **Input Closed:** Controller shall turn the selected relay output to the ON state after power-up if the local input selected is closed. It shall be able to monitor any input.
4. **Turn OFF:** Controller shall turn the selected relay output to the OFF state after power-up.
5. **Turn** OFF if Input Closed: Controller shall turn the selected relay output to the OFF state after power-up if the local input selected is closed. It shall be able to monitor any input.
6. On if Open Time, OFF if Closed Time: Controller shall turn the selected relay output to the ON state during Open hours and shall turn selected relay outputs to the OFF state during Closed hours. This shall be used in conjunction with OPEN/CLOSED timers.
7. OFF if Open Time, ON if Closed Time: Controller shall turn the selected relay output to the OFF state during Open hours and shall turn selected relay outputs to the ON state during Closed hours. This shall be used in conjunction with OPEN/CLOSED timers.
8. Time of Day: Controller shall turn the selected relay output to the ON or OFF state based on the time of day in 30-minute increments for every day of the week.

I. **True Relay Status Feedback:** Each controller shall be provided with circuitry that shall monitor the actual status of each relay via pilot contacts mechanically linked to the relay main contacts.

J. Switch **Input Details:** All switch inputs shall have the following options:

1. **Input Flexibility:** Each switch input shall accept a 2 or 3-wire maintained or momentary switch. It shall be capable of accepting a dry contact, open collector closure, or a 12-24VDC signal. Each switch shall be able to have 2 switch types associated with it in an A/B form.
2. Input to Output Programmability: Any switch input shall be programmed to control any or all the controller's relay outputs without limitations in the network.
3. Input Logic Conditionals: All switch inputs shall have 2 conditionals that add a logic "AND" or "OR" dependent on a relay on, a relay off, an "on" input opened or closed, and an "off" input opened or closed. It shall also have a priority level setting.
4. Input Active Times: All switch inputs shall have a time-of-day or open/close time of action that can change the switch type on the time of day every 30 minutes or per open/closed times.
5. Input Types**:**
   a) **Momentary ON/OFF:** When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON. When momentary contact is made between OFF and COM, relay outputs controlled by this input shall be turned OFF.
   b) Momentary ON/OFF w/Blink: When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON. When momentary contact is made between OFF and COM, relay outputs controlled by this input shall blink and postpone being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning it OFF. If an ON command is received during the blink alert time, relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
   c) Momentary Push-Button ON/OFF: When momentary contact is made between the ON and COM, relay outputs controlled by this input are turned ON and OFF alternately, based on the current state, each time contact is made.
   d) Momentary Push-Button ON: When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON.
   e) Momentary Push-Button OFF: When momentary contact is made between ON and COM, relay outputs controlled by this input shall be turned OFF.
   f) Momentary Push-Button Toggle: When momentary contact is made between ON and COM, relay outputs controlled by this input shall toggle from the present state.
   g) Maintained ON/OFF: When contact is made between the ON and COM, relay outputs controlled by this input are turned ON. When contact is broken between ON and COM, relay outputs controlled by this input are turned OFF.
   h) Maintained Multi-way: When contact is either made or broken between the ON and COM, relay outputs controlled by this input will be toggled between ON and OFF conditions. This function shall be similar to that of standard 3 and 4-way switches.
   i) **Maintained ON/OFF w/Blink:** When contact is made between the ON and COM, relay outputs controlled by this input are turned ON. When contact is broken between ON and COM, relay outputs controlled by this input shall blink and postpone being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning OFF. If an ON command is received during the blink alert time, relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
   j) **Timed ON:** The timed-ON input shall operate either from the input closure or

open. If programmed to operate from the closure, the relays turn ON when the input closes and turn OFF after the time duration. The relays do nothing when the input opens. If programmed to operate from the open, the relays turn ON when the input closes and remain ON. When the input opens, the relays turn OFF after the timed-ON duration.

k) HID Bi-Level: This feature requires the configuration of ON/OFF relay outputs and HI/LOW relay outputs. The first momentary contact between ON and COM sets the ON relay outputs to ON and the HI/LOW outputs to HI (for at least 15 Minutes). The second contact switches the HI/LOW outputs to LOW. Additional contact closures will toggle the HI/LOW relay outputs. The cycle then repeats until momentary contact is made between the switch input OFF and COM. then the ON/OFF outputs and HI/LOW outputs are turned OFF.

l) Two-Step Alternating Sequence: The first time the switch is activated, relay outputs programmed as “Group A” are turned ON, and relay outputs programmed as “Group B” are turned OFF. The second time the switch is activated, “Group A” relay outputs are turned OFF, and “Group B” relay outputs are turned ON. The third time the switch is activated, the pattern begins again at step one.

m) Four-Step Alternating Sequence: The first time the switch is activated, relay outputs programmed as “Group A” are turned ON, and relay outputs programmed as “Group B” are turned OFF. The second time the switch is activated, “Group A” relay outputs are turned OFF, and “Group B” relay outputs are turned ON. The third time the switch is activated; both “Group A” and “Group B” relay outputs are turned ON. The fourth time the switch is activated; both “Group A” and “Group B” relays are turned OFF. The fifth time the switch is activated, the process begins again at step one.

n) Set Preset: When momentary contact is made between the ON and COM, the selected preset scene will be activated.

o) Set Scene: When momentary contact is made between the ON and COM, the selected scene will be activated.

p) Force Timer: When momentary contact is made between the ON and COM, the selected timer will be activated.

K. Timer Functions: Each of the programmable lighting controllers shall have the described timer options listed below for the relay outputs.

1. Time-of-Day Timers: Each programmable lighting controller shall be provided with a minimum of 128 available timers (scheduled events) for use in developing time-of-day automated schedules. Each timer shall have the ability to turn any or all relay outputs ON or OFF at any time in 1-minute increments. Timers shall be day-of-week selectable and may be programmed to activate on any combination of days of the week. Each shall be capable of being programmed to be enabled or disabled for any day of the calendar year.

2. Astronomical Scheduling: Each controller shall contain an astronomical time clock that shall calculate sunrise and sunset times based on the geographical latitude and longitude positioning. Sunrise and sunset times may be used as activation times for any system timer. In addition to sunrise and sunset time activation, the control shall be capable of programming activation time before and after these times based on an offset of 1-999 minutes.

3. Open/Closed Time Control: The user shall also have the option of controlling relay outputs in relation to the Open/Closed times of the facility. The Open/Closed times may vary for different days of the week and may be programmed for each day of the year. In addition to Open/Closed time activation, the control shall be capable of programming activation time before and after these Open/Closed times based on an offset of 1-999.

4. Off-Hour Sweeps: The system shall also support after-hours OFF sweeps of selected relays or groups of relays at user-defined one, two, or three-hour intervals.

5. Automated **Circadian Rhythm Control:** The system shall be capable of providing Automated Circadian Rhythm color shifting via a 0-10VDC dimming output.
   - **a.** Each dimming channel shall support up to a 100mA dimming load and be galvanically isolated up to 1500V to protect electronics.
   - **b.** The Automated Circadian Rhythm dimming curve shall be able to vary its level 256 steps between 0 and 10VDC and smoothly change colors between setpoints with no abrupt color changes. The system shall be able to automatically turn fixtures on to color temperature specified by the Automated Circadian Rhythm color shifting program.
   - **c.** The system shall have a default Automated Circadian Rhythm dimming curve that automatically adjusts start/stop times via astronomical time clock. Additionally, the system shall have the option for a user-defined dimming curve with static start/stop times.
   - **d.** The system shall provide the option for local controls to be capable of temporarily overriding the current circadian rhythm color. The manual override duration shall not be reliant upon nor limited by the time-of-day setpoints in the Automated Circadian Rhythm color shifting program. The system shall be capable of instantly flipping back and forth between manual override mode and Automated Circadian Rhythm mode without being reliant upon nor limited by the time-of-day setpoints in the Automated Circadian Rhythm color shifting program.
   - **e.** The system shall be capable of flipping between manual override mode and Automated Circadian Rhythm mode via inputs from 3rd party systems such as BAS, Fire, Security, AV etc.
   - **f.** The system shall be capable of providing multiple programming options for how/when to revert back to the Automatic Circadian Rhythm mode including the ability to revert back to the Automated Circadian Rhythm mode once a load is turned off and then back on.

L. **Relay Output OFF Options:** Each relay shall have the option to control the relay OFF in a certain way other than the default OFF.

1. **Single Blink Alert:** Each relay output within the programmable lighting controller shall be individually programmable to blink and postponed prior to being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning OFF with a timer OFF sweep to warn occupants of the upcoming OFF event. If an ON command is received during the blink alert time, the relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
2. **Double Blink Alert:** Each relay output within the programmable lighting controller shall be individually programmable to blink and postponed prior to being turned OFF and then blinked 1 minute before turning OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice for each alert to warn occupants of the upcoming OFF event. If an ON command is received during the blink alert time, the relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
3. **HID Delay:** Each relay output within the programmable lighting controller shall have the ability to be controlled like a Single Blink Alert as described above but without the blink, alert to prevent damage to HID lamps.
4. **Alarm ON:** Relays shall be capable of performing a momentary ON function. The ON function shall be programmable from 1 to 99 seconds.
5. Alarm OFF: Relays shall be capable of performing a momentary OFF function. The OFF function shall be programmable from 1 to 99 seconds.
6. Alarm Pulsed ON: Relays shall be capable of being cycled ON and OFF at 1-second intervals and returning to the OFF state. It shall be programmable from 1 to 90 seconds.
7. Alarm Pulsed OFF: Relays shall be capable of being cycled OFF and ON at 1-second intervals and returning to the ON state. It shall be programmable from 1 to 90

seconds.

8. Automatic Control Switch-OFF: Relays shall be capable of being cycled OFF for 5 seconds and then returned to the ON state for controlling Sentry or AS110 switches.
9. Automatic Con**trol Switch-Blink:** Relays shall be capable of being cycled OFF for 1.5 seconds and then returned to the ON state for controlling Delay-OFF mode on AS110 switches.

M. **Presets:** The lighting controller shall support up to 256 user-defined presets of ON/OFF relay patterns. The presets shall be invoked by a switch or timer actuation.

N. **Descriptive Names:** The system shall support the optional assignment of descriptive names (up to 10 characters) to the lighting controller, relay outputs, relay groups, inputs, timers, and presets. These names shall be able to switch from custom names to default names.

O. Password **Protection:** Each Programmable controller shall have user-definable 6-digit alphanumeric passwords with 2 levels of access. Level 1 is control & edit. Level 2 is control only.

P. Networking**:**

1. **Network Capacities:** In addition to the data line devices mentioned in Section D, Controllers shall be linked together on the data line to form a Local Area Network (LAN) of up to 254 controller nodes.
2. Network Features: The network manager shall allow the connection of up to 254 controllers and 254 data line devices (on top of the 64 devices per panel) and provide USB communications. It shall have a high-speed scanner, 4 gateway device ports, power for devices, and TCP/IP.
3. Network Universe: The network of panels shall be capable to connect to other networks over a network (LAN) or over the internet (WAN) to interconnect multiple systems.
4. Network Gateway**:** The following special-purpose gateways shall be available and provides network-wide control from a single point for its specialized function:
   a) **Modbus** Control: The Modbus gateway shall support communications from the BAS system using Modicon Modbus protocol from a single-point connection. All network input status, relay status, and control shall be supported.
   b) N2 Control: The N2 gateway shall support communications from the BAS system using a Metasys-N2 protocol from a single-point connection. Network-wide group status and control shall be supported.
   c) BACnet Control: The BACnet gateway shall support communications from the BAS system using BACnet MSTP or BACnet IP protocol from a single point connection. It shall allow up to 500 single relays, 100 multiple relays, 48 groups, and 48 presets.
   d) Advanced BACnet **Control:** The Advanced BACnet gateway shall support communications from the BAS system using BACnet IP protocol from a single-point connection. It shall allow up to per panel; 20 Relays, 20 Dimmers, 16 devices (128 maintained inputs), 64 Groups/Presets, and 48 Scenes.
5. **BAS System / Lighting Control System:** Programmable lighting controllers interfaced with other building systems must remain functional and continue to process all programmed commands, including time schedules and local switching.

Q. **Runtime Logging and Trending:** Each lighting control panel shall be capable of logging Runtime and Trending data for each relay. This data shall be able to be harvested and exported from the entire system.

1. **Runtime Logging:** The controller shall be able to internally log the runtime of each relay for up to 30 days. This data shall be able to be harvested with a personal computer at 1-minute intervals.
2. Logging and Trending Software: Runtime Logging and Trending software shall be available for harvesting data from the lighting control panels. It shall have a dedicated

personal computer connected to the system through a LAN or USB cable to the panel or network controller.

- **a)** **Load Configuration:** Each relay in the system shall be able to have a wattage load assigned to it to represent the actual load on the relay. Loads shall be able to be named, or names shall be exported directly from the system programming software.
- **b)** Combined Loads: Up to 254 combined relay loads from any panel in the network shall be allowed, for total wattage recording of areas in the facility. Combined loads shall be able to be named for identification in reports and graphs.
- **c)** Daily or Monthly Usage Report: The software shall be able to generate spreadsheet reports in a daily or monthly format for each relay or combined relays in the system.
- **d)** Export Data: The compiled reports shall be able to be exported to a .csv file. These files when exported shall be coded for the year, month, and date.
- **e)** Daily or Monthly Usage Graphs: The software shall be capable of generating usage graphs in a daily or monthly format for each relay or combined relays in the system.
- **f)** Printing: Daily or monthly usage graphs shall have the capability to be directly printed from the software.
- **g)** Live Usage Graphs: The software shall have 1 to 9 live usage meter dials to display the present wattage of combined loads.
- **h)** Calendar **View:** It shall provide a full-year calendar that shall display the number of calendar events.

R. **Graphical Control Interface:** The software shall be a Windows-based graphical interface that allows monitoring and control of panels using icons on custom or standard graphical screens.

1. Graphical **Background Screens:** Graphical background screen shall consist of any bitmap image with any resolution or number of colors. There shall be virtually limitless numbers of screens with a limit to the capacity of the computer.
2. Multiple **Interfaces:** It shall support an unlimited number of satellite computers controlling the same system. (1 Main computer, multiple remote computers).
3. **Virtual PC:** It shall support web access via a virtual computer.
4. **Fault** Log**:** It shall log and notify of any relay or network faults.
   - **a)** The software shall monitor itself and restart if there is a system communication issue.
   - **b)** It shall automatically send an e-mail to the user(s) notifying them of the problem.
   - **c)** An alarm shall report if a relay doesn't turn on/off correctly with real-time status updates.
   - **d)** It shall log the loss of communications of each network and every node per network. It shall log when it goes offline and when it goes back online.
5. **Control Icons:** Control icons shall be unlimited per screen and shall be chosen from an extensive library. It shall be able to use custom control icons that can be created and saved as BMP, JPEG, or GIF images. Control icons shall be able to be placed anywhere on the screen and edited at any time. Control icons shall control relays, LL Groups, LL Presets, LL Scenes, LL Timers, or dimmer scenes.
6. **Control** Options**:** It shall have the following capabilities for control and setup.
   - **a)** **Flood:** It shall have the capability to flood areas or change the color of a defined section of the screen (floor plan) for depicting On/Off states.
   - **b)** Sounds**:** It shall be able to trigger custom sound WAV files for on/off triggers.
   - **c)** **Verify:** There should be settings to verify control action and relay sweep commands.
   - **d)** **Toggle:** This shall be a selectable action for relays which shall include always, never, or selective relays.
   - **e)** **Sweep** Enable: There shall be an option for a sweep command.
   - **f)** Grid: A grid shall be available for the design and placement of icons on the

screens. This shall be adjustable for size and color, plus it shall be able to allow a snap-to-grid feature.

g) Tool Tips: It shall have a Tool Tips option that displays text when hovered over an icon.

h) Extra Loads: It shall have the capability to add extra loads to a single relay control icon.

i) Import: It shall have the capability to import settings and objects.

j) Synchronize Screens: Remote computers shall have the capability to synchronize screens with a single button push.

k) Text Icons: Text icons can be added to any screen and shall be able to be placed anywhere on the screen and edited at any time. They should be adjustable for size, color, font, and transparency.

l) UDP Command**:** It shall support UDP command strings for special functions in the system.

7. **Navigation Icons:** These shall have navigation buttons for going from one screen to another. These icons shall have the capability to be Global and be visible on all screens. Icons shall have standard sizes that shall be editable for color, size, and font. It shall be able to use custom control icons that can be created and saved as BMP, JPEG, or GIF images. Navigation icons shall be able to be placed anywhere on the screen and edited at any time.

8. **Sequence Control:** It shall be able to sequences with up to 16 transitions over a 12-hour period for events. It shall be able to turn on/off single relays, LL Groups, set a Preset, or LL Scenes in a sequence.

9. **Dimmer** Control**:**

a) **Single Slider:** Slide dimmers shall be available for single control and/or status of a 0-10V output or an sACN slot.

b) **Pop-up Multi-Sliders:** It shall have up to 16 pop-up control sliders. Each shall be able to be linked to any dimmer(s) in the system. It shall have the capability to have a slider to control all dimmers, direct or proportional.

10. **Security** and **User Access:**

a) It shall have an Administrator lock-out for specific screens and for specific users during an event in the facility.

b) It shall support up to 5 levels of user security.

c) There shall be advanced managed user access for up to 32 users.

d) A settable administrator timeout shall be settable from 15 minutes to 4 hours.

e) The Administrator shall be able to assign users' access and passwords.

11. **Multi Network:** It shall be able to link together up to 32 networks with up to 254 nodes per network to operate as one system.

12. **Schedules:** It shall have programmable schedules that send commands to each network and each node in the system.

a) It shall have up to 4000 programmable schedules.

b) It shall automatically control relays, groups, scenes, presets, or trigger a sequence.

c) Schedules shall be based on a fixed time, shared time, or before-at-after sunrise-sunset.

d) Latitude/Longitude and time-zone settings shall be settable with adjustable DST settings.

e) It shall have a search option for all schedules that include relays, LL Groups, LL Presets, and Sequences.

13. **Runtime Monitoring:** It shall incorporate the "Runtime Logging and Trending" software as specified in section "Q".

14. Diagnostics **Dashboard:** It shall have a tool to monitor all the relays/devices in the system.

15. **Serial** Interfaces**:**

a) **sACN Interface:** It shall have the capability to view sACN via (no interface needed for viewing) and control sACN through an Interactive Technologies

CueServer Interface optional add-on.

b) DMX Control: It shall have an optional DMX output for lighting fixtures and ILC dimmer outputs

c) BACnet IP: It shall have an optional serial input for status and control. It shall have up to 750 control points and status for Groups, Presets, or Sequence. It shall have an export to .csv file for documentation.

S. Emergency **UL924 Lighting Controller Option:** Each lighting controller shall have the option to provide an emergency lighting bypass without the use of external devices. It shall be UL924 listed and clearly marked.

1. **Bypass Control:** If normal power is lost, if selected, the panel shall force the EM relays to the ON position. It shall also force any 0-10V dimming to 100%.

2. **Control Type:** It shall have the option to select the EM relay control for Force On, Force Off, and No change.

3. **Phase Monitoring:** It shall be able to monitor up to three phases of normal power. Upon loss of any phase, the panel will go into an emergency state. It shall be selectable for each phase monitored. It shall be able to monitor 120/277 VAC circuits.

4. Isolation: It shall have barriers to separate Normal and Emergency circuits.

5. Remote Testing**:** It shall be provided with input for remote testing. It shall also be provided an output for driving a remote status LED.

2.2 LIGHTING ROOM CONTROLLERS:

A. **Room** Controller**:** Each controller shall be designed to be remotely installed and provide control of 4 remote load control relays. This controller shall have the same programmable features as the Programmable Lighting Control Panels.

1. **Enclosure:** Each controller shall be provided with a NEMA 1 galvanized steel enclosure with removable screw cover, 1/2" nipple, and pre-drilled mounting holes.

2. Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.

3. Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.

4. Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC or optional 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.

5. High Voltage Connections: Each controller shall be provided with 6” wire leads for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.

6. Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data line and relay connections, and push-to-connect connectors for occupancy and photo sensor inputs. All connections shall have clearly and permanently labeled termination points.

7. **Occupancy Sensor Inputs:** It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controller or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:

- 200mA w/4 devices connected to the controller
- 160mA w/5 devices connected to the controller
- 120mA w/6 devices connected to the controller
- 90mA w/7 devices connected to the controller
- 60mA w/8 devices connected to the controller

8. **Photocell Inputs:** It shall have 2 inputs for ILC photocell heads and shall be programmable for a 2 or 30-second delay. The controller shall be provided with 256 light-to-dark levels (0-1800fc). It shall include a selectable dead-band range and allow the selection of 8 individual setpoints for OFF and ON that can control any or all

relays/dimmers in the lighting controller.

9. Local Data Line Port: It shall provide an RJ45 data line port with power for up to 8 data line devices. It shall be able to support up to 61 data line devices when using Power Supply Repeaters.
10. Real-Time Clock: Each controller shall be provided with its own Real-Time Clock used to perform all time-related functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second. Time clock functions shall include the time of day, day of the week, date, and automatic DST and leap year adjustments. DST shall be adjustable with an enable/disable feature. It shall be protected against loss of time for a period of up to 45 days without power. Systems relying on a single clock device shall not be acceptable.
11. **Pre-Configured Programs:** Each controller shall have up to 16 selectable pre-configured lighting application programs and 1 default contractor program.

B. **Room Controller:** Each controller shall be designed to be remotely installed and provide control of 4 load control relays. This controller shall have the same features as the Programmable Lighting Control Panels excluding add-ons and naming.

1. **Enclosure:** Each controller shall be provided with a NEMA 1 galvanized steel enclosure with removable screw cover, 1/2" nipple, and pre-drilled mounting holes.
2. Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
3. Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
4. Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC or optional 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.
5. High Voltage Connections: Each controller shall be provided with 6” wire leads for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
6. Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, and the relay connections. It shall also be provided push-to-connect connectors for occupancy sensors, and photo sensor inputs. All connections shall be made to clearly and permanently labeled termination points.
7. Occupancy **Sensor Inputs:** It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 200mA w/4 devices connected to the controller
8. **Photocell Inputs:** It shall have 2 inputs for ILC photocell heads and shall be programmable for a 2 or 30-second delay. The controller shall be provided with 256 light-to-dark levels (0-1800fc). It shall include a selectable dead-band range and allow the selection of 8 individual setpoints for OFF and ON that can control any or all relays/dimmers in the lighting controller.
9. Local Data Line Port: It shall provide an RJ45 data line port with power for up to 4 data line devices.

C. **Integrated -4 -8 Relay Controller:** Each controller shall be designed to be remotely installed and provide control of 4 or 8 integrated load control relays. This controller shall have the same features as the Programmable Lighting Control Panels.

1. **Enclosure:** Each controller shall be provided with a NEMA 1 galvanized steel enclosure with removable screw cover, 1/2" knockouts, and pre-drilled mounting holes.
2. Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers

without this rating shall be unacceptable.

3. Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
4. Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
5. Relay Ratings**:** It shall be provided with 4- or 8- 50A load relays that shall be de-rated for 16 amps for durability. It shall control 16A for each set of 4 outputs:
   - 16A, 120/277VAC Electronic Ballast (LED)
   - 16A 120/277VAC Tungsten
   - 1/4 HP @ 120 VAC Motor Load
6. **High Voltage Connections:** Each controller shall be provided with terminal blocks for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
7. Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, and photo sensor connections. It shall also be provided push-to-connect and screw connectors for occupancy sensors, dimming, and low-voltage inputs. All connections shall be made to clearly and permanently labeled termination points.
8. Occupancy Sensor Inputs: It shall have 4 independent inputs able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 60mA w/4 devices connected to the controller
   - 50mA w/5 devices connected to the controller
   - 40mA w/6 devices connected to the controller
   - 20mA w/7 devices connected to the controller
   - 0mA w/8 devices connected to the controller
9. **Photocell Inputs:** It shall have 1 input for ILC photocell heads and shall be programmable for a 2 or 30-second delay. The controller shall be provided with 256 light-to-dark levels (0-1800fc). It shall include a selectable dead-band range and allow the selection of 8 individual setpoints for OFF and ON that can control any or all relays/dimmers in the lighting controller.
10. **Local Data Line Port:** It shall provide an RJ45 data line port with power for up to 8 data line devices. It shall be able to support up to 61 data line devices when using Power Supply Repeaters.
11. Dimming: It shall be provided with 4 or 8 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
12. Real-Time Clock: Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.
13. **Pre-Configured Programs:** Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.

D. Integrated **2 Relay Controller:** Each controller shall be designed to be remotely installed and shall provide 2 integrated load control relays with dimming.

1. **Enclosure:** Each controller shall be provided with a polycarbonate plastic enclosure provided with a ½" nipple and mounting tab.

2. Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
3. Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
4. **Controller Power Supply:** Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
5. Relay Rati**ngs:** It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
   - 16A, 120/277VAC Electronic Ballast (LED)
   - 20A 120/277VAC General
   - 1/4 HP @ 120 VAC Motor Load
6. **High** Voltage Connections: Each controller shall be provided with color-coded wire leads. All connections shall be made to clearly and permanently labeled terminations.
7. Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, occupancy sensor, and photo sensor connections. Dimming shall be provided with color-coded wire leads. All connections shall be permanently labeled terminations.
8. Occupancy **Sensor Inputs:** It shall have 1 input with power provided for the occupancy sensors. The input shall control any or all the relays in the lighting controller or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 70mA w/1 device connected to the controller
   - 60mA w/2 devices connected to the controller
   - 50mA w/3 devices connected to the controller
   - 40mA w/4 devices connected to the controller
9. Photocell Inputs: It shall have 1 input for ILC photocell heads and shall be programmable for a 2 or 30-second delay. The controller shall be provided with 256 light-to-dark levels (0-1800fc). It shall include a selectable dead-band range and allow the selection of 8 individual setpoints for OFF and ON that can control any or all relays/dimmers in the lighting controller.
10. Local Data Line Port: It shall have an RJ45 data line port with power for up to 8 data line devices. It shall be able to support up to 61 data line devices when using Power Supply Repeaters.
11. Dimming: It shall be provided with 2 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
12. Pre-Configured **Program:** It shall have a pre-configured default plug-n-play program, with the option for a customizable job-specific program.

E. **Integrated 2 Room Controller:** Each controller shall be designed to be remotely installed and shall provide 2 integrated load control relays with dimming.
   1. **Enclosure:** Each controller shall be provided with a polycarbonate plastic enclosure provided with a ½" nipple and mounting tab.
   2. Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
   3. Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
   4. Controller **Power Supply:** Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
   5. **Relay Ratings:** It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
      - 16A, 120/277VAC Electronic Ballast (LED)

- 20A 120/277VAC General
- 1/4 HP @ 120 VAC Motor Load

6. **High Voltage Connections:** Each controller shall be provided with color-coded wire leads. All connections shall be made to clearly and permanently labeled terminations.
7. Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, occupancy sensor, and photo sensor connections. Dimming shall be provided with color-coded wire leads. All connections shall be permanently labeled terminations.
8. Occupancy Sensor **Inputs:** It shall have 1 input with power provided. The input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 70mA w/1 device connected to the controller
   - 60mA w/2 devices connected to the controller
   - 50mA w/3 devices connected to the controller
9. **Photocell Inputs:** It shall have 1 input for ILC photocell heads and shall be programmable for a 2 or 30-second delay. The controller shall be provided with 256 light-to-dark levels (0-1800fc). It shall include a selectable dead-band range and allow the selection of 8 individual setpoints for OFF and ON that can control any or all relays/dimmers in the lighting controller.
10. Local Data Line Port: It shall provide an RJ45 data line port with power for up to 3 data line devices.
11. Dimming: It shall be provided with 2 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.

    Pre-Configured Programs: Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.

2.3 LIGHTING **CONTROL RELAYS:**

A. **Single Pole Relay:** It shall be designed for controlling high-inrush single pole lighting circuits. It shall employ 4 latching nickel-silver contacts.

1. **Listing:** Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
2. Labeling: Lighting control relays shall bear labels for relay current and SCCR ratings.
3. Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
4. SCCR: Lighting relays shall have an SCCR rating of 18,000 amps up to 347 VAC.
5. Relay Ratings: It shall be rated for the following:
   - 16A, 120/277/347 VAC Electronic Ballast (LED)
   - 40A 120/277/347 VAC Ballast
   - 40A 120/277/347 VAC Tungsten
   - 1/5 HP @ 120 VAC Motor Load
   - It shall be suitable for plug-loads
6. **Latching:** Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
7. Auxiliary Contacts: Each Lighting control relay shall contain an auxiliary set of contacts rated at 1 AMP 30 VAC/VDC electrically isolated but mechanically linked to the main contacts for the purpose of true status monitoring and pilot light activation.
8. Mounting: Relays shall be capable of panel mounting.
9. Lock-Out: Relays shall be equipped with an Enable/Disable switch to lock out On/Off control from the controller.
10. Actuator: Relays shall be equipped with a manual actuator switch for turning the relay

ON or OFF along with status indication.

B. **2 and 3 Pole Relay:** It shall be designed for controlling high-inrush 2-, 3-pole lighting circuits. Each pole shall employ 4 latching nickel-silver contacts.

1. Listing: Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.

2. Labeling: Lighting control relays shall bear labels for relay current and SCCR ratings.

3. Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.

4. SCCR: Lighting relays shall have an SCCR rating of 18,000 amps up to 347 VAC.

5. Relay **Ratings:** Each relay shall be designed for the control of 208, 240, and 480 VAC lighting loads at the following per pole.

- 16A, 120/277/347 VAC Electronic Ballast (LED)
- 40A 120/277/347 VAC Ballast
- 40A 120/277/347 VAC Tungsten
- 1/5 HP @ 120 VAC Motor Load
- It shall be suitable for plug-loads

6. **Latching:** Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.

7. Auxiliary Contacts: Each Lighting control relay shall contain an auxiliary set of contacts rated at 1 AMP 30 VAC/VDC electrically isolated but mechanically linked to the main contacts for the purpose of true status monitoring and pilot light activation.

8. Mounting: Relays shall be capable of panel mounting.

9. Lock-Out: Relays shall be equipped with an Enable/Disable switch to lock out On/Off control from the controller.

10. Actuator: Relays shall be equipped with a manual actuator switch for turning the relay ON or OFF along with status indication

11. Mechanical **Link:** Poles within the relay shall be electrically isolated but mechanically linked so as to open and close together without the possibility of one pole being closed while the other remains open. Systems that utilize two single-pole relays to accomplish this function are not acceptable.

C. Single **Pole Relay w/Dimming:** The remote relay shall be designed to be mounted to a junction box or fixture and shall control 1 load up to 16 Amp circuit and 0-10V dimming.

1. **Listing:** Lighting control relays shall be individually UL and CUL listed and shall bear labels indicating compliance.

2. Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.

3. **Labeling:** Lighting control relays shall bear labels for relay current ratings.

4. **Endurance:** Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.

5. SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 277 VAC.

6. **Relay Ratings:** It shall be rated for the following:

- 16A, 120/277/347 VAC Electronic Ballast (LED)
- 16A 120/277/347 VAC Ballast
- 16A 120/277/347 VAC Tungsten
- 16A 120/277/347 VAC Resistive
- 1/5 HP @ 120 VAC Motor Load
- It shall be suitable for plug-load

7. **Dimming:** Shall be able to control 0-10V dimming ballast and be able to sink up to 100 mA.

8. Latching: Lighting control relays shall be designed with a latching mechanism that

shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.

9. Mounting: It shall have a ½" nipple for mounting to an enclosure or fixture

D. EM Dimming Relay with Emergency Bypass: The EM relay shall be able to control 1 normal and 1 emergency 0-10V dimmable load together, providing UL924 bypass operation of the emergency load during a loss of normal power It shall be designed to be mounted to a junction box or fixture.

1. Listing: Lighting control relays shall be individually UL/CUL/UL924 listed and shall bear labels indicating compliance.

2. Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.

3. Labeling: Lighting control relays shall bear labels for relay current ratings.

4. Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.

5. SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 347 VAC.

6. EM Function: It shall have one normal power relay and one EM relay. Both shall be controlled by a controller. Upon loss of power, the EM relay shall be forced to the ON state. During the EM state, 0-10 V dimming shall be forced to 100%.

7. Relay Ratings: It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:

- 16A, 120/277VAC Electronic Ballast (LED)
- 20A 120/277VAC General
- 1/4 HP @ 120 VAC Motor Load
- It shall be suitable for plug-load

8. Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.

9. Mounting: It shall have a ½" nipple for mounting to an enclosure or fixture.

10. Test Button: It shall have a test button for testing the EM function.

11. Test Input: It shall have an input for testing the EM function from a remote location.

2.4 STANDALONE **CONTROL DEVICES:**

A. Power Pack: Each Power Pack shall provide standalone on/off and 0-10V dimming control of a single 20A (16A LED) load and provide 350mA of power for connected low voltage devices.

1. Enclosure: Each Power Pack shall have a molded plastic enclosure with a ½" molded electrical nipple and mounting bracket.

2. Plenum Rated: Each Power Pack shall have a molded plastic enclosure with a 5VA flammability rating suitable for plenum mounting. Controllers without this rating shall be unacceptable.

3. Listing: Lighting controls shall be UL/CUL listed and be compliant with the following:

a. FCC Part 15

b. BAA and BABA

c. Title 24, ASHRAE, IECC

4. Controller Power Supply: Each Power Pack shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC (50 to 60 Hz).

5. High Voltage Connections: Each Power Pack shall be provided with 6" wire leads for terminating the high voltage connections.

6. Low Voltage Connections: Each Power Pack shall be provided with x2 RJ45 connectors for connecting devices with CAT5/5e/6 cable and have x3 20 AWG wire leads as an alternate connection method for occupancy sensors.

7. Configuration Options**:** Each Power Pack shall have selectable configuration options to adjust the operation of the power pack.

B. **Switch:** The Switches shall be available in 1 or 2 zone, dimming or non-dimming configurations with 6 color options; White, Ivory, Light Almond, Gray, Black, and Red. Each switch shall have an associated pilot light.

1. **Listing:** Lighting controls shall be UL/CUL listed and be compliant with the following:
   - **a.** FCC Part 15
   - **b.** BAA and BABA
   - **c.** Title 24, ASHRAE, IECC
2. **Low Voltage** Connections: Each switch shall be provided with x2 RJ45 connectors for connecting to other devices with CAT5/5e/6 cable
3. Power: Powered from Power Pack via CAT5/5e/6 cable.
4. Button Labelling: Each Switch shall have field replaceable faceplates with color change kits and the option for individually replaceable buttons that can be custom engraved. It shall also be field reconfigurable to change between different switch types.

C. **Wall Sensor Switch:** The Sensor Switches shall provide dual-tech occupancy sensing via passive infrared (PIR) and overlapping passive acoustic sensing, and be available in 1 or 2 zone, dimming or non-dimming configurations with 6 color options; White, Ivory, Light Almond, Gray, Black, and Red. Each switch shall have an associated pilot light.

1. **Listing:** Lighting controls shall be UL/CUL listed and be compliant with the following:
   - **a.** FCC Part 15
   - **b.** BAA and BABA
   - **c.** Title 24, ASHRAE, IECC
2. **Low Voltage Connections:** Each Sensor Switch shall be provided with x2 RJ45 connectors for connecting to other devices with CAT5/5e/6 cable.
3. **Power:** Powered from Power Pack via CAT5/5e/6 cable.
4. **Button** Labelling**:** Each Sensor Switch shall have field replaceable faceplates with color change kits and the option for individually replaceable buttons that can be custom engraved. It shall also be field reconfigurable to change between switch types.
5. **Sensor Functionality and Adjustments:** The Sensor Switch shall support occupancy and vacancy modes and require an initial PIR event to enable acoustic functionality, which will overlap and enhance overall detection once enabled, and will extend sensor time delay upon occupant sound detection. To prevent sounds alone from keeping lights on indefinitely, periodic PIR detection shall be needed to keep lights on for an extended period, otherwise lighting shall automatically shut off after 5 minutes of acoustic detection only. Acoustic detection shall remain enabled for a brief period after the sensor times out, to allow for voice reactivation of the lights. Automatic Threshold Control filters background noise to fine tune acoustic sensitivity, filtering out non-occupant noises. Additionally, the sensor switch shall allow for the following manual adjustments:
   - **a.** Sensitivity adjustments for passive infrared and acoustic which can be independently adjusted to three different levels, including PIR-only mode
   - **b.** Vacancy time-delay adjustments
   - **c.** Enable/Disable LED indicators.

D. **Ceiling Sensor:** The Ceiling Sensor shall provide dual-tech occupancy sensing via passive infrared (PIR) and overlapping passive acoustic sensing and include a full range photosensor to support open loop daylight harvesting.

1. **Listing:** Lighting controls shall be UL/CUL listed and be compliant with the following:
   - **a.** FCC Part 15
   - **b.** BAA and BABA
   - **c.** Title 24, ASHRAE, IECC
2. **Low Voltage Connections:** Each Ceiling Sensor shall be provided with x2 RJ45 connectors for connecting to other devices with CAT5/5e/6 cable. Additionally, each Ceiling Sensor shall have the following:
   - **a.** x3 22 AWG wire leads as an alternate connection method to Power Packs or

other 24VDC power supplies.

b. x3 22 AWG wire leads to provide N.O./N.C. auxiliary contacts for connection to HVAC or BAS systems.

c. x2 22 AWG wire leads for direct 0-10VDC control of fixtures by the full range photosensor.

3. Power: Powered from Power Pack via CAT5/5e/6 cable or via x3 22 AWG wire leads as an alternate connection method.

4. Sensor Functionality and Adjustments: The Ceiling Sensor shall support occupancy and vacancy modes and require an initial PIR event to enable acoustic functionality, which will overlap and enhance overall detection once enabled, and will extend sensor time delay upon occupant sound detection. To prevent sounds alone from keeping lights on indefinitely, periodic PIR detection shall be needed to keep lights on for an extended period, otherwise lighting shall automatically shut off after 5 minutes of acoustic detection only. Acoustic detection shall remain enabled for a brief period after the sensor times out, to allow for voice reactivation of the lights. Automatic Threshold Control filters background noise to fine tune acoustic sensitivity, filtering out non-occupant noises. Additionally, it shall allow for the following manual adjustments:

a. Sensitivity adjustments for passive infrared and acoustic which can be independently adjusted to three different levels, including PIR-only mode

b. Vacancy time-delay adjustments

c. Enable/Disable LED indicators.

d. Photocell 0-10V Scale and Relay cutout adjustments.

2.5 SWITCH STATIONS AND COVER PLATES

A. Hardwired Switches and Cover Plates: Electrical contractor shall provide and install switch plates and switches of the quantities and types shown on the drawings and specified herein.

1. Key Switch

a) Key Switch: Key switch shall consist of a single-pole double-throw momentary or maintained switch. They shall be available to allow the key to being removed in the ON position or the OFF position.

b) Cover p**lates:** Plates shall be available in stainless steel.

2. Wet Location **Touch Switch:**

a) Switch: Touch activated switches shall be momentary push-buttons with an IP65 rating.

b) Cover plates: Single-gang plates available in stainless steel with 1-3 buttons per gang.

c) Gasket: Cover plate neoprene gaskets shall be available for weatherproof applications.

d) Status: LED status indicators rings shall be optional for each switch provided.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Installation: Where shown in the drawings, the contractor shall furnish and install programmable lighting controllers of the quantities, sizes, and types shown on the drawings or specified herein.

B. Requirements**:** All equipment shall be installed in accordance with manufacturer requirements and in compliance with all applicable local and national codes and requirements.

3.2 MANUFACTURES **SERVICES**

A. Factory Programming: All controllers shall be factory programmed upon request in accordance with the project specifications prior to shipment.

B. Installation Assistance: During the installation process, the manufacturer shall provide, at no cost, technical support via a toll-free telephone line to the installing contractor or owner's representative to answer questions and supply additional information when required.

C. System Start**-Up:** The system manufacturer shall provide a factory authorized field technician to the project site after installation has been completed and prior to the system being energized for the purpose of testing and adjustment of the system. Factory field technician shall test and verify all system functions and ensure proper operation of the system components in accordance with the specifications and on-site conditions. The installing contractor shall notify the system manufacturer in writing that the system is completely wired and ready to be energized and tested 4 weeks prior to scheduling a field technician for the start-up of the system. Should the field technician arrive on the job site and find the installation incomplete, the installing contractor shall pay the cost of any future visits by the field technician required to complete the system start-up.

D. **On-Site Programming:** During the start-up procedure, the factory field technician shall provide programming assistance and guidance to the building operating personnel to program the systems for initial operation.

E. Instruction: During the start-up procedure, the factory field technician shall provide training to the building operating personnel in the operation, programming, and maintenance of the lighting control system.

F. As-Built Drawings: After completion of the system installation and testing, the manufacturer shall provide 3 sets of "as-built" drawings.

G. Operation and Maintenance Manuals: After completion of the system installation and testing, the manufacturer shall provide 3 sets of Operations and Maintenance Manuals.

H. Lifetime Telephone **Support:** The system manufacturer shall provide a direct telephone number to the system user and shall allow access to free telephone support for the life of the system.

END OF SECTION

SECTION 26 09 22 - ANALOG LIGHTING CONTROL DEVICES

PART 1: GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Line Voltage Sensors Include:
1. Wall Box Occupancy Sensors (Line Voltage)
2. Wall Box Occupancy Sensors with 0-10V Dimming (Line Voltage)
3. Ceiling Occupancy Sensors (Line Voltage)
4. Wide View / Hallway Occupancy Sensors (Line Voltage)
5. Fixture Mount Sensors (Line Voltage)
6. Daylight Sensors (Line Voltage)
7. Wall Box Phase Dimmer (Line Voltage)
8. Wall Box Timer Switch (Line Voltage)
9. Wall Box 0-10V Dimmer (Line Voltage)
10. Wall Box 3-Way Switch (Line Voltage)

B. Low Voltage Sensors, Wall Stations,& Power Packs Include:
1. Power Packs (Load Control Relays)
2. Wall Stations (Low voltage)
3. Wall Box Occupancy Sensors (Low Voltage)
4. Wall Box Occupancy Sensors with 0-10V Dimming (Low Voltage)
5. Ceiling Occupancy Sensors (Low Voltage)
6. Wide View / Hallway Occupancy Sensors (Low Voltage)
7. Daylight Sensors (Low Voltage)

1.3 SUBMITTALS

A. Submit under provisions of Section 01 30 00 – Administrative Requirements

B. Submittals shall include the following:
1. Bill of Materials: Complete list of parts required to provide a complete and functioning Lighting Control System
2. Manufacturer’s Data Sheets: Data Sheets are to provide information on item function, features, and dimensions
3. Shop and Wiring Drawings:
a. Typical wiring diagrams for all components including, but not limited to, wall box occupancy sensors, ceiling mounted occupancy sensors, daylight sensors, load control relays, and low-voltage wall stations
b. Site Specific Diagrams: Depicting site specific interactions with other systems
c. Installation locations and details for occupancy sensors, daylight sensors, load control relays, and low-voltage wall stations
4. Warranty: Provide copy of applicable device warranty

C. Coordination: Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including luminaires, HVAC equipment, smoke detectors, fire-suppression system, and partition assemblies.

1.4 WARRANTIES

A. Manufacturer’s Warranty: Manufacturer and Installer agree to repair or replace lighting control devices that fail(s) in material or workmanship within specified warranty period.

B. Failures include any faulty operation of lighting control device(s).

C. Warranty Period: Five (5) years from date of Substantial Completion.

PART 2: PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Manufacturer Qualifications: Manufacturer of Lighting Control System listed in this Section must be comparable to Basis of Design and equal system must meet operational requirements.
1. SENSORWORX (Basis of Design)
2. X
3. X

B. Quality Assurance: All control devices shall be visually inspected by an individual to be free of defects and tested for proper device functionality.

2.2 WALL BOX OCCUPANCY SENSORS (LINE VOLTAGE)

A. Provide wall box occupancy sensor for stand-alone control of lighting load in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Sensor unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Sensor shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
3. Sensor shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Sensor shall have a vandal resistant lens.
5. Sensor shall have a single toggle button to manually control the load
6. Sensor unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.

D. Line Voltage Requirements
1. Sensor unit is rated for 800 Watts @ 120VAC and 1200 Watts @ 277VAC.
2. Sensor unit accommodates both neutral (3-wire) and no neutral (2-wire) installation and shall not require a minimum load. Unit meets NEC 404.2(c) & 404.22 guidelines regarding powering over ground & current leakage.
3. Sensor unit shall have interchangeable line and load wires.
4. Sensor unit shall be available with the ability to control additional line-voltage loads via companion “sidecar” switches located in a common multi-gang wall box. All sidecars shall receive detection signal from the primary sensor unit. Sidecar units can operate with the same or different operational modes, time delays, and detection types as the primary sensor unit.

E. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

F. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

G. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
1. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present

upon initial occupancy).
2. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

H. Sensor unit settings shall be adjustable without removing wall plate cover or unit from wall box.

I. Sensor unit shall have several programable modes of operation:
1. Vacancy Mode
2. Occupancy w/ Predictive (Lock Down) Mode
3. Occupancy w/ Exit Time Mode
4. Override Off Mode
5. Disabled Switch Mode
6. Occupancy Mode (Presentation Operation)
7. Disable Sensor (Toggle Switch Mode)

J. Sensor unit shall have multiple colors of LED indicator light for the following:
1. Detection of occupancy, either passive infrared or acoustic detection
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

K. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

L. Sensor unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

M. Sensor shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

N. Full electronic and mechanical assembly of sensors shall be in the USA.

O. Part Numbers:
1. SWX-100 Series

2.3 WALL BOX OCCUPANCY SENSORS WITH 0-10V DIMMING (LINE VOLTAGE)

A. Provide wall box occupancy sensor for stand-alone control of lighting load in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Sensor unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Sensor shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
3. Sensor shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Sensor shall have a vandal resistant lens.
5. Sensor shall have a toggle, raise, and lower button to manually control the load
6. Sensor unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.
7. Dimming output, 0-10V signal, sinking up to 50 mA

D. Line Voltage Requirements
1. Sensor unit is rated for 800 Watts @ 120VAC and 1200 Watts @ 277VAC.
2. Sensor unit accommodates both neutral (3-wire) and no neutral (2-wire) installation and shall

not require a minimum load. Unit meets NEC 404.2(c) & 404.22 guidelines regarding powering over ground & current leakage.

3. Sensor unit shall have interchangeable line and load wires.

E. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

F. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

G. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
1. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
2. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

H. Sensor unit settings shall be adjustable without removing wall plate cover or unit from wall box.

I. Sensor unit shall have several programable modes of operation:
1. Vacancy Mode
2. Occupancy w/ Predictive (Lock Down) Mode
3. Occupancy w/ Exit Time Mode
4. Override Off Mode
5. Disabled Switch Mode
6. Occupancy Mode (Presentation Operation)
7. Partial On
8. Partial Off

J. Dimming Output feature include:
1. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
2. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
3. Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
4. Sensor shall have selectable Dimming Curves, which define how the dimmer unit adjusts its voltage output in response to button commands:
   a. Linear (default)
   b. Square Log

K. Sensor unit shall have multiple colors of LED indicator light for the following:
1. Detection of occupancy, either passive infrared or acoustic detection
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

L. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

M. Sensor unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

N. Sensor shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

O. Full electronic and mechanical assembly of sensors shall be in the USA.

P. Part Numbers:
1. SWX-100-D Series

2.4 CEILING OCCUPANCY SENSORS (LINE VOLTAGE)

A. Provide a complete and operable occupancy sensor lighting control system in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Sensor housing shall be impact resistant plastic, available in White or Black.
2. Ceiling-Mounted lenses can be swapped in field, if necessary, without need for any tools
3. Sensor unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.
4. Optional Dimming output, 0-10V signal, sinking up to 50 mA

D. Sensors shall be available with the following lens options:
1. 360° field of view for small motion (8 to 12 feet above finished floor, ~500 ft2)
2. 360° field of view for large motion (8 to 15 feet above finished floor, ~2000 ft2)
3. 360° field of view for high bay application (15 to 40 feet above finished floor)

E. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

F. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

G. Optional dimming capabilities via 0-10V Dimming adds the following:
1. Daylight Harvesting to Off
2. Daylight Harvesting to Low trim
3. Partial Off (High/Low)
4. Partial Off plus Delay Off (High/Low/Off)

H. Dimming Output feature include:
1. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
2. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
3. Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.

I. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
1. Daylight Harvesting (0-10V Dimming to maintain the target light level). Daylight Harvesting restricts the manual dimming range by a wall dimmer station to a maximum level that equals the setpoint down to the low-trim and/or off position. Sensor will ignore any attempt to raise the lighting above the setpoint with any wall dimmer station.
2. ON/OFF Photocell Control (Lights switched OFF if ambient level surpasses the threshold and back ON if level drops).
3. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
4. Auto-setpoint method which shall automatically determine setpoint in a given area based on

the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

J. Sensors have been designed to fail to the ON condition for predictable internal failure conditions.

K. Sensor unit shall have multiple colors of LED indicator light for the following:
1. Detection of occupancy, either passive infrared or acoustic detection
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

L. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

M. Sensors shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

N. Sensor shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

O. Full electronic and mechanical assembly of sensors shall be in the USA.

P. Part Numbers:
1. SWX-200-2 Series

2.5 WIDE VIEW / HALLWAY OCCUPANCY SENSORS (LINE VOLTAGE)

A. Provide a complete and operable occupancy sensor lighting control system in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Sensor housing shall be impact resistant plastic, available in White or Black.
2. Sensor unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.
3. Mounting options, include corner, wall, and ceiling. It must not require additional mount brackets.

D. Sensors shall be available with the following lens options:
1. 120° field of view for corner mount application.
2. 45° field of view for hallway application.

E. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

F. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

G. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
1. ON/OFF Photocell Control (Lights switched OFF if ambient level surpasses the threshold and then back ON if level drops).
2. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
3. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

H. Sensors have been designed to fail to the ON condition for predictable internal failure conditions.

I. Sensor unit shall have multiple colors of LED indicator light for the following:
   1. Detection of occupancy, either passive infrared or acoustic detection
   2. Response to programming push button
   3. Indication of function current setting when queried
   4. Error code sequence

J. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

K. Sensors shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

L. Sensor shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

M. Full electronic and mechanical assembly of sensors shall be in the USA.

N. Part Numbers:
   1. SWX-400-2 Series

2.6 Fixture Mount Sensors (Line Voltage)

A. Provide a complete and operable occupancy sensor lighting control system in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
   1. Sensor housing shall be impact resistant plastic, available in White.
   2. The lens provided must be a universal lens for High Bay, Low Bay, and Aisle Way applications.
   3. Sensor unit shall be powered by line voltage, 120VAC, 208VAC (2-Phase) or 277VAC, supplied by utility through a local circuit.
   4. Optional Dimming output, 0-10V signal, sinking up to 50 mA

D. Sensor unit shall contain a passive infrared detector. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection.

E. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

F. Optional dimming capabilities via 0-10V Dimming adds the following:
   1. Daylight Harvesting to Off
   2. Daylight Harvesting to Low trim
   3. Partial Off (High/Low)
   4. Partial Off plus Delay Off (High/Low/Off)
   5. Nightlight Operations

G. Dimming Output feature include:
   1. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
   2. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
   3. Fade On and Fade Off Times;
      a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.

b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.

H. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
1. Daylight Harvesting (0-10V Dimming to maintain the target light level). Daylight Harvesting restricts the manual dimming range by a wall dimmer station to a maximum level that equals the setpoint down to the low-trim and/or off position. Sensor will ignore any attempt to raise the lighting above the setpoint with any wall dimmer station.
2. ON/OFF Photocell Control (Lights switched OFF if ambient level surpasses the threshold and then back ON if level drops).
3. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
4. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

I. Sensors have been designed to fail to the ON condition for predictable internal failure conditions.

J. Sensor unit shall have multiple colors of LED indicator light for the following:
1. Detection of occupancy
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

K. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

L. Sensors shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

M. Sensor shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

N. Full electronic and mechanical assembly of sensors shall be in the USA.

O. Part Numbers:
1. SWX-500 Series

2.7 DAYLIGHT SENSORS (LINE VOLTAGE)

A. Provide a complete and operable daylight sensor system in areas shown on Drawings.

B. Daylight sensor lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Sensors shall be self-contained, photo-electric detectors which shall provide detection of ambient light level in a given area.
2. Sensor unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.
3. Sensor housing shall be impact resistant plastic.

D. Setpoint: The minimum overall light level that shall be maintained in a space by the sensor is referred to as the Setpoint.

E. Sensor shall have a photocell for closed-loop ambient light sensing with the following functions:
1. ON/OFF Photocell Control (Lights switched OFF if ambient level surpasses the threshold and then back ON if level drops).
2. Auto-setpoint method which shall automatically determine setpoint in a given area based on

the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

F. Dimming Output feature include:
1. Daylight Harvesting (0-10V Dimming to maintain the target light level). Daylight Harvesting restricts the manual dimming range by a wall dimmer station to a maximum level that equals the setpoint down to the low-trim and/or off position. Sensor will ignore any attempt to raise the lighting above the setpoint with any wall dimmer station.
2. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
3. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
4. Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.

G. Sensor shall have multiple colors of LED indicator light for the following:
1. Notification of upcoming transition to On or Off
2. Indication of ambient level of lighting being sufficient
3. Response to programming push button
4. Indication of function current setting when queried

H. Sensor shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

I. Sensor shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

J. Full electronic and mechanical assembly of sensors shall be in the USA.

K. Part Numbers:
1. SWX-250-2 Series

2.8 WALL BOX PHASE DIMMER (LINE VOLTAGE)

A. Provide wall box dimmer switch for stand-alone control of lighting load in areas shown on Drawings.

B. Wall box dimmer switch control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Switch unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Switch shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
3. Switch shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Switch unit shall be powered by line voltage, 120VAC, supplied by utility through a local circuit.

D. Line Voltage Requirements
1. Dims LED, CFL, ELV, and Incandescent Lighting Loads
2. No minimum Load Rating. Dimmers that require a minimum load to operate at the low end are not acceptable.
3. Dimmer Switch is rated for 375 Watts @ 120VAC for Reverse Phase Mode and 150 Watts @ 120VAC for Forward Phase Mode. Devices that cannot accommodate both Reverse and Forward Phase Modes are not acceptable.

E. Dimming Output feature include:
1. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
2. Low-End Trim settings, enabling minimum user level of dimmer to be customized.

3. Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.

F. Switch unit settings shall be adjustable without removing wall plate cover or unit from wall box.

G. Switch unit shall have multiple colors of LED indicator light for the following:
1. Blue locator LED when lights are off.
2. White LED with variable intensity indicating light level
3. Response to programming push button
4. Indication of function current setting when queried
5. Error code sequence

H. Switch unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

I. Switch shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

J. Full electronic and mechanical assembly of sensors shall be in the USA.

K. Part Numbers:
1. SWX-864-ELV Series

2.9 WALL BOX TIMER SWITCH (LINE VOLTAGE)

A. Provide wall box occupancy sensor for stand-alone control of lighting load in areas shown on Drawings.

B. Wall Box Timer Switch lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Switch shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
2. Switch shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
3. Switch shall have a single toggle button to manually control the load
4. Switch unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.

D. Line Voltage Requirements
1. Switch unit is rated for 800 Watts @ 120VAC and 1200 Watts @ 277VAC.
2. Switch unit accommodates both neutral (3-wire) and no neutral (2-wire) installation and shall not require a minimum load. Unit meets NEC 404.2(c) & 404.22 guidelines regarding powering over ground & current leakage.

E. Switch shall be available with adjustable time delay increment settings from 5-to-60 minutes or 1-to-12 hours.

F. Switch unit settings shall be adjustable without removing wall plate cover or unit from wall box.

G. Switch unit shall have multiple colors of LED indicator light for the following:
1. The remaining time indicator.
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

H. The timer switch shall have the option to blink warn the lights before turning on.

I. Sensor unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

J. Sensor shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

K. Full electronic and mechanical assembly of sensors shall be in the USA.

L. Part Numbers:
1. SWX-843 Series

2.10 WALL BOX 0-10V DIMMER (LINE VOLTAGE)

A. Provide wall box dimmer switch for stand-alone control of lighting load in areas shown on Drawings.

B. Wall box dimmer switch control shall include, but not be limited to, all required devices, low and line-voltage wiring.

C. Physical Requirements:
1. Switch unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Switch shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
3. Switch shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Switch unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.
5. Dimming output, 0-10V signal, sinking up to 50 mA

D. Line Voltage Requirements
1. Switch unit is rated for 800 Watts @ 120VAC and 1200 Watts @ 277VAC.
2. Switch unit accommodates both neutral (3-wire) and no neutral (2-wire) installation and shall not require a minimum load. Unit meets NEC 404.2(c) & 404.22 guidelines regarding powering over ground & current leakage.
3. Wall box dimmer shall be capable of being wired in 3-Way configuration with a 3-Way Switch.

E. Dimming Output feature include:
1. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
2. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
3. Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
4. Dimming Curve Type; Linear or Square Log

F. Switch unit settings shall be adjustable without removing wall plate cover or unit from wall box.

G. Switch unit shall have multiple colors of LED indicator light for the following:
1. Blue locator LED when lights are off.
2. White LED scale with indicating light level
3. Response to programming push button
4. Indication of function current setting when queried
5. Error code sequence

H. Switch unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

I. Switch shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

J. Full electronic and mechanical assembly of sensors shall be in the USA.

K. Part Numbers:
1. SWX-823 Series

2.11 WALL BOX 3-WAY SWITCH (LINE VOLTAGE)

A. Provide wall box switch for stand-alone control of lighting load in areas shown on Drawings.

B. Wall box switch control shall include, but not be limited to, all required devices, low and line-voltage wiring.

C. Wall box switch shall be capable of being wired in a 2-Way or 3-Way configuration.

D. Physical Requirements:
1. Switch unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Switch shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
3. Switch shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Switch unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.

E. Line Voltage Requirements
1. Switch unit is rated for 800 Watts @ 120VAC and 1200 Watts @ 277VAC.
2. Switch unit accommodates both neutral (3-wire) and no neutral (2-wire) installation and shall not require a minimum load. Unit meets NEC 404.2(c) & 404.22 guidelines regarding powering over ground & current leakage.

F. Switch unit settings shall be adjustable without removing wall plate cover or unit from wall box.

G. Switch unit shall have multiple colors of LED indicator light for the following:
1. Blue locator LED when lights are off.
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

H. Switch unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

I. Switch shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

J. Full electronic and mechanical assembly of sensors shall be in the USA.

K. Part Numbers:
1. SWX-821 Series

2.12 POWER PACKS (LOAD CONTROL RELAYS)

A. Provide a complete and operable load control relay system to be used in conjunction with low voltage occupancy sensors, daylight sensors, and wall stations in areas shown on Drawings.

B. Power Packs shall include, but not be limited to, all required sensors, wall stations, power supplies, low-voltage, and line-voltage wiring.

C. Physical Requirements:
1. Power Packs shall have an operating voltage of 120VAC or 277VAC.
2. Power Packs housing shall be impact-resistant, and plenum rated plastic.
3. Power Packs shall have an on-board button for programming and testing, which toggles the

load for test purposes.
4. Power Packs shall have snaps integrated into the chase nipple to enable quick mounting to a junction box via a standard knockout.
5. Power Packs shall have an optional snap-on low voltage wiring chamber for concealing low voltage wire connections.

D. Power Packs shall have a Class 2 18VDC power supply. Output Rating of at least 18VDC @ 150mA with 80mA dedicated to powering connected devices. Voltage will be higher when a reduced low voltage load is connected.

E. Power Pack switching relay shall be rated to switch the following loads:
1. 20A @ 120VAC – General Purpose Plug Load
2. 20A @120/277 VAC – General Purpose, Tungsten, Magnetic Ballast
3. 16A @ 120/277 VAC – Electronic Ballast, LED Driver

F. Power Packs shall integrate electronically timed switching (i.e. zero crossing) to ensures long relay life.

G. Power Packs shall have multiple colors of LED indicator light for the following:
1. Indication of normal or other-than-normal operation
2. Response to programming push button
3. Indication of programming function current setting when queried
4. Indication of successful or unsuccessful push button programming

H. Power Packs shall have the following operational modes:
1. Occupancy Mode (Auto On / Auto Off) – (default)
2. Vacancy Mode (Manual On / Auto Off) – requires Low Voltage Wall Station(s)
3. Partial On – requires 0-10V dimming
4. Partial Off – requires 0-10V dimming

I. Optional Features:
1. Power Packs may include 0-10 Volt Stepped Dimming for Partial Off or Partial On Operation.
2. Power Packs may include Auxiliary Switch Input wires for Manual On, Hold On, or Hold Off Operation. It shall include a relay status output signal to keep all connected wall station indicator LEDs operating in unison.

J. Power Packs shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

K. Power Packs shall be UL Listed, Plenum Rated (UL2043), RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

L. Full electronic and mechanical assembly of load control relay shall be in the USA.

M. Part Numbers:
1. SWX-900 Series

2.13 WALL STATIONS (LOW VOLTAGE)

A. Provide low voltage wall stations as required in areas shown on Drawings. These devices are to function seamlessly with other control devices.

B. Low Voltage Wall Station shall include, but not be limited to, all required sensors, relays, power supplies, and low-voltage wiring.

C. Physical Requirements:
1. Wall Station unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Wall Station unit shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.

3. Wall Station unit shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Wall Station unit shall be powered by low voltage, 12-24VDC, supplied by power supply or power pack.

D. Station shall be capable of switching and/or dimming the lighting load with a momentary pulse length of 250msec.

E. Station shall have multiple colors of LED indicator light for the following:
1. Location of switch when lighting load is Off
2. Relay status
3. Response to programming push button
4. Indication of function current setting when queried
5. Current dimming level with five (5) stacked LEDs displayed to the user (3-button dimming station only)

F. Dimming Station:
1. Station shall have High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
2. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
3. Station shall have Turn On/Turn Off Dimming Operation (when used with a load controller and an occupancy sensor):
4. Allow Turns On lighting to last user level or can be programmed to a pre-set level (100%, 50%, or custom).
5. Lighting can also be held at low-end trim level during unoccupied/off state.
6. Lighting can turn Off lighting by switching Off power (by opening relay) or dimming below electronic Off Level.
7. Station shall have adjustable Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
8. Station shall have selectable Dimming Curves, which define how the dimmer unit adjusts its voltage output in response to button commands:
   a. Linear (default)
   b. Square Log

G. Station shall be capable of Multiway Switching with all connected stations indicating the same state. Manual dimming control shall be available at one (1) location.

H. Station shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

I. Station shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

J. Full electronic and mechanical assembly of sensors shall be in the USA.

K. Part Numbers
1. SWX-801, SWX-803, SWX-804

2.14 WALL BOX OCCUPANCY SENSORS (LOW VOLTAGE)

A. Provide wall box occupancy sensor for stand-alone control of lighting load in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required sensors, wall stations, power supplies, low-voltage, and line-voltage wiring.

C. Physical Requirements:

1. Sensor unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Sensor shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
3. Sensor shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Sensor shall have a vandal resistant lens.
5. Sensor shall have a single toggle button to manually control the load output
6. Sensor unit shall be powered by low voltage, 12-24VDC, supplied by power supply or power pack.

D. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

E. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

F. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
1. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
2. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

G. Sensor unit settings shall be adjustable without removing wall plate cover or unit from wall box.

H. Sensor unit shall enable several programable modes of operation:
1. Vacancy Mode
2. Occupancy w/ Predictive (Lock Down) Mode
3. Occupancy w/ Exit Time Mode
4. Override Off Mode
5. Occupancy Mode (Presentation Operation)
6. Disabled Switch Mode

I. Sensor unit shall have multiple colors of LED indicator light for the following:
1. Detection of occupancy, either passive infrared or acoustic detection
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

J. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

K. Sensor unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

L. Sensor shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

M. Full electronic and mechanical assembly of sensors shall be in the USA.

N. Part Numbers:
1. SWX-100-1 Series

2.15 WALL BOX OCCUPANCY SENSORS WITH 0-10V DIMMING (LOW VOLTAGE)

A. Provide wall box occupancy sensor for stand-alone control of lighting load in areas shown on

Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required sensors, wall stations, power supplies, low-voltage, and line-voltage wiring.

C. Physical Requirements:
1. Sensor unit to be self-contained in impact resistant plastic, suitable for mounting in a standard switch box.
2. Sensor shall be less than one (1) inch deep into the switch box in order to provide maximum space for wire connections.
3. Sensor shall have interchangeable face colors that can be field changed without removing the unit from wall box or rewiring. (Available in White, Ivory, Light Almond, Gray, Black, and Red)
4. Sensor shall have a vandal resistant lens.
5. Sensor shall have a toggle, raise, and lower button to manually control the load
6. Sensor unit shall be powered by low voltage, 12-24VDC, supplied by power supply or power pack.
7. Dimming output, 0-10V signal, sinking up to 50 mA

D. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

E. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

F. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
1. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
2. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

G. Sensor unit settings shall be adjustable without removing wall plate cover or unit from wall box.

H. Sensor unit shall enable several programable modes of operation:
1. Vacancy Mode
2. Occupancy w/ Predictive (Lock Down) Mode
3. Occupancy w/ Exit Time Mode
4. Override Off Mode
5. Occupancy Mode (Presentation Operation)
6. Disabled Switch Mode
7. Partial On
8. Partial Off

I. Sensor unit shall have multiple colors of LED indicator light for the following:
1. Detection of occupancy, either passive infrared or acoustic detection
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

J. Dimming Output feature include:
1. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
2. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
3. Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or

15 sec.

4. Sensor shall have selectable Dimming Curves, which define how the dimmer unit adjusts its voltage output in response to button commands:
   a. Linear (default)
   b. Square Log

K. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

L. Sensor unit shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

M. Sensor shall be UL Listed, RoHS Compliant, BA, BAA/TAA and BABA Compliant.

N. Full electronic and mechanical assembly of sensors shall be in the USA.

O. Part Numbers:
   1. SWX-100-1-D Series

2.16 CEILING OCCUPANCY SENSORS (LOW VOLTAGE)

A. Provide a complete and operable occupancy sensor lighting control system in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required sensors, wall stations, power supplies, low-voltage, and line-voltage wiring.

C. Physical Requirements:
   1. Sensor housing shall be impact resistant plastic, available in White or Black.
   2. Ceiling-Mounted (lenses can be swapped in field, if necessary, without need for any tools)
   3. Sensor unit shall be powered by low voltage, 12-24VDC, supplied by power supply or power pack.
   4. Optional Dimming output, 0-10V signal, sinking up to 50 mA for Daylight Harvesting.

D. Sensors shall have the ability to be wired in parallel to provide detection coverage of large areas beyond the range of a single unit. All joined sensors must time out (i.e. register unoccupied) before the lights will turn OFF.

E. Sensors shall be available with the following lens options:
   1. 360° field of view for small motion (8 to 12 feet above finished floor, ~500 ft2)
   2. 360° field of view for large motion (8 to 15 feet above finished floor, ~2000 ft2)
   3. 360° field of view for high bay application (15 to 40 feet above finished floor)

F. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

G. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

H. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
   1. Daylight Harvesting (0-10V Dimming to maintain the target light level). Daylight Harvesting restricts the manual dimming range by a wall dimmer station to a maximum level that equals the setpoint down to the low-trim and/or off position. Sensor will ignore any attempt to raise the lighting above the setpoint with any wall dimmer station.
   2. ON/OFF Photocell Control (Lights switched OFF if ambient level surpasses the threshold and

then back ON if level drops).
3. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
4. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

I. Sensor unit shall enable several programmable modes of operation:
1. Occupancy Mode (Auto On / Auto Off)
2. Vacancy Mode (Manual On / Auto Off)
3. Partial On
4. Partial Off (High/Low)

J. Optional dimming capabilities (-D option) via 0-10V Dimming output adds the following:
1. Daylight Harvesting to Off
2. Daylight Harvesting to Low Trim
3. Partial On
4. Partial Off (High/Low)
5. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
6. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
7. Fade On and Fade Off Times;
   a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
   b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.

K. Optional auxiliary contact (-AR option) outputs shall be programmable to:
1. Disabled
2. Relay closed when occupied (state follows white wire). (default)
3. Relay closed when occupied and insufficient ambient light (state follows blue wire). Available for SWX-21x-1-AR and SWX-23x-1-AR models.
4. Relay open when occupied (state opposite white wire)
5. Relay open when occupied and insufficient ambient light (state opposite blue wire). Available for SWX-21x-1-AR and SWX-23x-1-AR models.

L. Sensors have been designed to fail to the ON condition for predictable internal failure conditions.

M. Sensor unit shall have multiple colors of LED indicator light for the following:
1. Detection of occupancy, either passive infrared or acoustic detection
2. Response to programming push button
3. Indication of function current setting when queried
4. Error code sequence

N. A test mode is required to ensure that sensor has proper coverage by allowing the installer to efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

O. Sensors shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

P. Sensor shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

Q. Full electronic and mechanical assembly of sensors shall be in the USA.

R. Part Numbers:
1. SWX-200-1 Series

2.17 WIDE VIEW / HALLWAY OCCUPANCY SENSORS (LOW VOLTAGE)

A. Provide a complete and operable occupancy sensor lighting control system in areas shown on Drawings.

B. Occupancy sensor lighting control shall include, but not be limited to, all required sensors, wall stations, power supplies, low-voltage, and line-voltage wiring.

C. Physical Requirements:
   1. Sensor housing shall be impact resistant plastic, available in White or Black.
   2. Sensor unit shall be powered by low voltage, 12-24VDC, supplied by power supply or power pack.
   3. Mounting options, include corner, wall, and ceiling. It must not require additional mount brackets.

D. Sensors shall have the ability to be wired in parallel to provide detection coverage of large areas beyond the range of a single unit. All joined sensors must time out (i.e. register unoccupied) before the lights will turn OFF.

E. Sensors shall be available with the following lens options:
   1. 120° field of view for corner mount application.
   2. 45° field of view for hallway application.

F. Sensor unit shall contain a passive infrared detector and an optional on-board microphone in dual technology models for passive audio detection. Sensor unit requires a passive infrared detection event to activate lights and will maintain occupied state dependant on continued passive infrared detection or, when dual technology is utilized, acoustic detection of occupants by the microphone.

G. Sensors shall have adjustable time delay increment settings from 30 seconds to 30 minutes (default 10 minutes), that is easily adjustable via push button without the use of dip switches, POTS or dials.

H. Sensor shall have an optional integrated photocell for closed-loop ambient light sensing with the following functions:
   1. ON/OFF Photocell Control (Lights switched OFF if ambient level surpasses the threshold and then back ON if level drops).
   2. Inhibit Only Photocell Control (Lighting is held OFF if sufficient ambient light level is present upon initial occupancy).
   3. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

I. Sensor unit shall enable several programable modes of operation:
   1. Occupancy Mode (Auto On / Auto Off)
   2. Vacancy Mode (Manual On / Auto Off)

J. Optional auxiliary contact (-AR option) outputs shall be programmable to:
   1. Disabled
   2. Relay closed when occupied (state follows white wire). (default)
   3. Relay closed when occupied and insufficient ambient light (state follows blue wire). Available for SWX-41x-1-AR and SWX-43x-1-AR models.
   4. Relay open when occupied (state opposite white wire)
   5. Relay open when occupied and insufficient ambient light (state opposite blue wire). Available for SWX-41x-1-AR and SWX-43x-1-AR models.

K. Sensors have been designed to fail to the ON condition for predictable internal failure conditions.

L. Sensor unit shall have multiple colors of LED indicator light for the following:
   1. Detection of occupancy, either passive infrared or acoustic detection
   2. Response to programming push button
   3. Indication of function current setting when queried
   4. Error code sequence

M. A test mode is required to ensure that sensor has proper coverage by allowing the installer to

efficiently perform a walk test. The sensor will blink white on any detected PIR event and blue on any detected acoustic event, although its time delay will only be reset by a PIR event. While in test mode, the blue locator LED also will not be lit when the lights are off (i.e. relay open).

N. Sensors shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

O. Sensor shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

P. Full electronic and mechanical assembly of sensors shall be in the USA.

Q. Part Numbers:
1. SWX-400-1 Series

2.18 DAYLIGHT SENSORS (LOW VOLTAGE)

A. Provide a complete and operable daylight sensor system in areas shown on Drawings.

B. Daylight sensor lighting control shall include, but not be limited to, all required devices and line-voltage wiring.

C. Physical Requirements:
1. Sensors shall be self-contained, photo-electric detectors which shall provide detection of ambient light level in a given area.
2. Sensor unit shall be powered by line voltage, 120VAC or 277VAC, supplied by utility through a local circuit.
3. Sensor housing shall be impact resistant plastic.

D. Setpoint: The minimum overall light level that shall be maintained in a space by the sensor is referred to as the Setpoint.

E. Sensor shall have a photocell for closed-loop ambient light sensing with the following functions:
1. ON/OFF Photocell Control (Lights switched OFF if ambient level surpasses the threshold and then back ON if level drops).
2. Auto-setpoint method which shall automatically determine setpoint in a given area based on the controlled and uncontrolled light sources or a manual setpoint from 2.5fc to 99fc.

F. Dimming Output feature include:
1. Daylight Harvesting (0-10V Dimming to maintain the target light level). Daylight Harvesting restricts the manual dimming range by a wall dimmer station to a maximum level that equals the setpoint down to the low-trim and/or off position. Sensor will ignore any attempt to raise the lighting above the setpoint with any wall dimmer station.
2. High-End Trim settings, enabling energy saving task tuning by setting a maximum level (100%-50%) to which users are allowed to raise lights.
3. Low-End Trim settings, enabling minimum user level of dimmer to be customized.
4. Fade On and Fade Off Times;
    a. Adjustable time interval for level to ramp up to Turn On Level is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.
    b. Adjustable time interval for level to ramp down to Off is 0.75 sec, 1.5 sec, 3 sec, 5 sec, or 15 sec.

G. Sensor shall have multiple colors of LED indicator light for the following:
1. Notification of upcoming transition to On or Off
2. Indication of ambient level of lighting being sufficient
3. Response to programming push button
4. Indication of function current setting when queried

H. Sensor shall have an operating temperature from 32°F to 122°F (0°C to 50°C) standard, and down to -40°F/C with an optional conformal coating.

I. Sensor shall be UL Listed, RoHS Compliant, and BA, BAA/TAA and BABA Compliant.

J. Full electronic and mechanical assembly of sensors shall be in the USA.

K. Part Numbers:
1. SWX-250-1 Series

PART 3: EXECUTION

3.1 INSTALLATION

A. Coordinate layout and installation of ceiling-mounted devices with other constructions that is supported by and/or penetrates the ceiling, including luminaires, smoke detectors, HVAC equipment, and fire-suppression systems.

B. Install and aim sensors to achieve not less than 90 percent coverage of indicated areas. Do not exceed coverage dimensions as specified by the manufacturer. Allow six (6) feet of cable slack for sensor location adjustment.

3.2 IDENTIFICATION

A. Identification: Refer to Section 26 05 53, “Identification of Electrical Systems”, for specific identification requirements, including, but not limited to, identification of circuits and luminaires, labelling, nameplates, and applicable painting.

3.3 WIRING

A. Wiring Method: Comply with Section 26 05 19 “Low-Voltage Electrical Power Conductors and Cables”.

B. Size conductors according to lighting control device manufacturer’s written instructions, unless otherwise indicated.

3.4 FIELD QUALITY CONTROL

A. Field Testing: Perform the following field tests and inspections and prepare test reports:

B. After installing all sensors, load controllers, and wall stations, and after electrical circuity has been energized, adjust and test for compliance with requirements.

C. Operational Test: Verify operation of each lighting control device and confirm the time delay duration.

D. Demonstration: Upon completion of testing and adjustment, the Contractor shall demonstrate operation of the system to representatives of the Owner and Engineer.

E. Training: The Contractors shall instruct the Owner's personnel in proper maintenance, adjustment, and operation of the occupancy sensor lighting controls.

END OF SECTION 26 09 23

SECTION 26 09 23 - LIGHTING CONTROL SYSTEM

PART 1 GENERAL

1.1 SUMMARY

A. The intent of this set of specifications is to provide a complete, functional, intelligent, low-voltage lighting control system for the control of incandescent, low-voltage, LED, neon, cold cathode, fluorescent and HID lighting sources.

B. Where shown in the drawings, the contractor shall furnish and install a complete low-voltage lighting control system consisting of, but not limited to, relays, contactors, controllers, enclosures, switch stations, and miscellaneous components as required for a complete, operational lighting control system.

C. Where applicable standards have been established, all items of equipment, individual components, and installation methods shall meet the requirements of these standards, including, but not limited to, Underwriter Laboratories, the National Electrical Code, Federal Communications Commission, and any local or state codes that may be applicable.

D. The products specified herein are based on those of Intelligent Lighting Controls, Inc. Low voltage lighting control systems manufactured by the following manufacturers shall be considered providing they meet the requirements of these specifications and provide the quality and performance specified herein.
1. Intelligent Lighting Controls, Inc.
2. Cooper Controls LKT
3. Leviton Greenmax

E. Listing a manufacturer as acceptable does not in any way relieve the contractor from the responsibility for providing a lighting control system that meets all the requirements of these specifications.

F. All manufacturers shall submit to the specifying engineer a line-by-line compliance comparison between each specification requirement and the system being proposed.

G. Any ambiguities in the drawing or specification shall be brought to the attention of the specifying engineer for clarification.

1.2 QUALITY ASSURANCE

A. **Factory Assembly:** All relays, contactors, controllers, enclosures, switch stations and miscellaneous components shall be factory assembled and tested. All system components shall arrive at the job site completely pre-wired and ready for installation, requiring only the connection of lighting circuits and low-voltage control stations and/or network terminations. All connections shall be made to clearly and permanently labeled termination points. Systems that require field assembly shall not be acceptable.

B. **Manufacturer:** A minimum of 30 years of experience in the design and manufacture of lighting control equipment.

C. **Component Testing:** All system components and assemblies shall be individually tested before assembly. Once assembled, all finished products shall be tested for proper operation of all control functions per specifications before shipment.

D. **NEC Compliance:** All system components shall comply with all applicable sections of the National Electrical Code (NEC) as required.

E. **NEMA Compliance:** All system components shall comply with all applicable portions of NEMA standards pertaining to types of electrical equipment and enclosures.

F. **UL/CUL Approval:** All applicable equipment shall be UL/CUL listed under section 916 and shall bear labels indicating compliance.

G. **FCC Emissions:** All applicable equipment shall comply with FCC emissions standards specified in Part 15 and Part 68 where applicable, for commercial applications and shall bear labels indicating compliance testing. Equipment that does not meet these standards shall not be acceptable.

H. **Made in USA:** All products shall be made in the USA. Products manufactured other than in the USA are unacceptable.

1.3 SUBMITTALS

A. The manufacturer shall provide an electronic copy of submittal drawings and data for approval before beginning the manufacture of equipment.

B. Hard copy submittal package shall be provided upon request.

C. Submittal package shall include, but not be limited to, the following. Submittals that do not contain all the information listed below will not be considered for approval.

1. **Specifications Compliance:** Submit a line-by-line comparison that describes the differences between each specification requirement and the equipment/systems being proposed. The comparison shall include a complete listing of how the proposed equipment/systems differ from those specified in size, quantity, quality, method of control, features and functions, control software functions, and installation requirements.
2. **System Description:** Supply as part of the submittal package a brief description of the lighting control system's major features and functions.
3. **Bill of Materials:** Provide as part of the submittal package a detailed itemized listing of all proposed equipment, including quantities and capacities for all major system components.
4. **Product Data Sheets:** Provide as part of the submittal package detailed product data sheets for all major system components.
5. **Riser Drawing:** Provide as part of the submittal package a system riser drawing of sufficient detail to indicate the relative placement of major system components and the required connections between each. Drawings shall be project specific. Generic or typical riser diagrams shall not be acceptable.
6. **Control Schedules:** Provide as part of the submittal package a complete control schedule spreadsheet for relay panels, Timers, Inputs, Groups, and Presets.
7. **Switch Details:** Provide as part of the submittal package complete switch details including color, gangs, buttons, plate style, plate colors, and engraving.
8. **Warranty:** Provide as part of the submittal package a complete written warranty.

1.4 WARRANTY

A. **Manufacturer's Warranty:** The manufacturer shall provide a written warranty that shall cover all lighting control equipment. The manufacturer shall agree to repair or replace any equipment that fails due to material or workmanship for a period of 6 years.

B. **Relay Warranty:** The manufacturer shall provide a separate written warranty that shall cover all lighting control relays within the lighting control system. The manufacturer shall agree to replace any relay that fails due to material or workmanship for a period of 6 years.

C. **Warranty Period:** The warranty period shall begin after the completion of the installation and the systems field start-up and training. Systems not provided with a field start-up begin upon receiving the product.

PART 2 PRODUCTS

2.1 PROGRAMMABLE LIGHTING CONTROL PANELS

A. **Hardware Features:**
1. **Controller Back-Box:** Each programmable lighting controller shall be provided with a factory furnished; UL listed NEMA 1 enclosure designed for wall mounting. The backbox must be capable of being shipped ahead of the controller chassis insert to allow for rough-in of all electrical connections prior to receipt of the controller chassis insert.
2. **Controller Chassis Insert:** Each programmable lighting controller shall be provided with a factory or field-installable controller chassis insert. The Controller chassis insert shall contain all controller electronics, power supplies, relays, contactors, and other required components. Controller chassis inserts shall arrive at the project site completely pre-wired and require only the connection of lighting circuits and control devices.
3. **Line Voltage / Control Voltage Separation:** Each programmable lighting controller shall be provided with a mechanical barrier that separates all line voltage components and wiring from all control voltage components and wiring. An additional barrier may be installed within the line voltage section that shall provide isolation between normal and emergency circuits where required.
4. **Controller Covers:** Each programmable lighting controller shall be provided with a dead front screw-held or hinged locking cover that is designed for either surface or flush mounting. Flush mount doors shall be provided with a trim ring. If a hinge-locking door is provided, it shall be provided with a slam-latch with 2 keys and door hooks to assist in mounting.
5. **Controller Capacity/Configurations:** Controllers shall be available in sizes to accommodate 4, 8, 16, 24, 32, 40, 48, 56, and 64 relay outputs. Controllers shall be available with the electronics in the center and voltage dividers with the lighting relays on the right and left sides.

B. **Electrical:**
1. **Controller Power Supply:** Each programmable lighting controller shall be provided with a dual-rated, UL-listed Class 2 transformer capable of either 120/277 VAC or 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.
2. **Connections:** All connections shall be made to clearly and permanently labeled termination points.

C. **Controller Electronics:**
1. **Controller CPU:** Each programmable controller shall be provided with a CPU (Central Processing Unit) that shall provide all the programming and control functions for the entire controller.
2. **Real-Time Clock:** Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.
3. **Relay Driver Module:** Relay output cards shall be provided to expand the controller capability from 8 to 64 relay outputs in increments of 8. Electronics shall feature surge

protection and optic isolation. It shall also provide an interface for mounting input boards.

4. **Relay Control Switches:** Controller shall contain push-button switches to turn all relays ON or OFF without the presence of any programming.
5. **Backup and Restore:** The controller shall be equipped with an internal memory backup and restore capability. It shall have the ability to back up all internal programming into additional onboard memory, verify present programming with backup, and restore programming.
6. **Runtime Logging:** The controller shall be equipped with memory to log the runtime of each relay. It shall be capable of storing up to 30 days or 1092 hours of data and be able to be exported in a delimitative format.
7. **Non-Volatile Memory:** Controller shall contain a minimum of 4 Mb of nonvolatile EEPROM memory with data retention of >200 years and electrostatic discharge protection of >4000V.
8. **Power Input Surge Suppression:** The controller's 24VAC power input shall be equipped with double surge suppression to protect the electronics from transient over-voltages. Protection shall clamp over-voltages up to 123 volts.
9. **Data Line Surge Suppression:** The controller data line communications shall be equipped with transient voltage suppression protection that will protect the electronics from electrostatic discharge and other transient over-voltages. Protection shall clamp transients up to 8kv direct discharges and 15kv air discharges.
10. **Data Line Communications:** The controller shall be equipped with serial communications through RJ45 connectors for communicating on CAT-5 cable with other panels and devices. It shall also be equipped with a separate local port for communicating with devices. The communications shall consist of 2-RS485 data lines.
11. **USB Serial Communications:** A USB port shall be provided for programming and interfacing the system with the use of a personal computer.
12. **TCP/IP Communications:** A TCP/IP port shall be provided for programming and interfacing the system with a personal computer over a network (LAN) or the internet (WAN).
13. **Optional Module Interface:** The controller shall contain 4 ports for interfacing optional modules which include communications and power. Optional modules shall be able to be mixed on each controller.

D. **Switching and Control Devices:**

1. **Device Node Capacity:** The lighting controller shall support switch input control of up to 64 data line devices locally per panel and 254 per network for up to 16,510 devices. The first 8 device nodes shall be powered by the lighting controller. The addition of a power supply or power supply/repeater shall be required for each additional 20-device node. Each device shall have a unique address and shall be capable of being programmed to the applicable functions described in the Switched Input Types heading in this specification.
2. **Data Line Media:** The data line shall consist of RS485 communications protocol transmitted over CAT-5, CAT-5E, or CAT-6 Cable. The cable shall have male RJ45 connectors installed on each end for interfacing controllers and devices. Both daisy-chain and "T" (3-direction branching) of cable runs shall be permitted. "T" branching shall be accomplished by the addition of power supply/repeaters. It shall be able to be wired in a home-run configuration for devices by the addition of a Hub.
3. **Switch Stations:** Data line switch stations shall be available in momentary push button (1-7 switches and pilots) and each switch shall have an associated pilot light. It shall be provided with optional dimming Raise and Lower buttons. Switches can be provided as Scene Multi-zone, Scene Stations, Multi-zone Stations, or Non-Dim Stations. Each button shall control any or all the relays in the lighting controllers or the dimmer outputs on the network. There shall be an option to program each pilot LED to indicate the state of any Relay, Group, Preset, Scene, and static ON or OFF. It shall also have the capability to reverse the status: LED is ON if the relay is OFF etc.

It shall be available with an optional Bluetooth interface option for interfacing and programming panels with an app. It shall have an optional 915 MHz radio with point-to-point capabilities. It shall communicate 100 feet of line-of-sight with the wireless devices.

4. **Photocell Controllers:** The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs on the network.
5. **Input Modules:** The input module shall provide 4 inputs that accept momentary, momentary PB, and maintained switch closures. Each input shall be optically isolated and can accept dry contact closures or 12-24VDC signals. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs on the network. It shall provide four pilot outputs that provide the true status of relays, groups, and presets. It shall be installed in the control panel or remotely mounted.
6. **Disable Key Switch:** The disable switch shall provide an RJ45 connector that shall disable all devices down line with the closure of a key switch. It shall also provide two RJ45 connectors to pass data through. It shall indicate with an LED when the disable switch is active.
7. **Occupancy Sensor Input Module:** The occupancy sensor input module shall provide power and inputs for motion sensors. It shall have 4 or 8 independent inputs that shall be able to interface multiple sensors. Each input shall control any or all of the relays in the lighting controllers or the dimmer outputs on the network. It shall have the ability to set AND/OR conditional logic. It shall be installed in the control panel or remotely mounted.
8. **0-10V Dimmer Output Module:** The 0-10VDC dimmer output module shall be designed to control dimmable ballasts or other 0-10VDC devices. Each module shall have 4 independent output channels that can control up to 200 devices per output at .5mA per device. It shall have the capability to vary its level 256 steps between 0 and 10VDC. It shall be able to respond to photo controllers, switch inputs, DMX512 signals, and timers. Each output shall be galvanically isolated up to 1500V to protect electronics. It shall be installed in the control panel or remotely mounted.
9. **Motor Control Output Module:** The motor control output module shall be designed to control shade motors, louver motors, blind motors, skylights, or any other class 2 DC motors. Each module shall have 4 independent outputs that can be controlled by a switch input, photocell, or timer. The control time shall be selectable from .1 to 300 seconds. Each lighting controller shall handle up to 8 modules with 4 outputs on each. Each output shall be equipped with a limit switch input for each direction of the motor.
10. **Graphical Touch Screen Control Station:** The Touch screen control station shall display the status and control the lighting control panel relay outputs via pre-programmed control objects on standard or custom bitmap screens.

E. **Special Purpose Modules:** The following special-purpose controller nodes shall be available. Four modules shall be permitted per controller.

1. **BACnet Control:** This module shall communicate directly to the lighting controller through serial communications from the BAS system using BACnet MSTP or BACnet IP protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.
2. **DMX Control:** This module shall support the control of relays using the standard USITT DMX512 protocol used by theatrical lighting systems. Each relay in the lighting panel shall be configured to be controlled by any DMX channel. It shall contain a frame filter that can be set from 1 – 16 frames. It shall have a priority setting for switch inputs or DMX signals. It shall have the capability to control any 0 – 10V dimming output throughout the network. It shall display current DMX levels from the keypad.

3. **DMX Driver:** This module shall send DMX signals from the lighting control panels using the standard USITT DMX512 protocol used by theatrical lighting systems. Each module added to the panel shall control up to 64 channels. Each dimming output channel shall be able to be mapped to 1-512 DMX channels. It shall be 1 to 1 mapped or programmed with free software. It shall be installed in the control panel or remotely mounted.
4. **Modbus Control:** This module shall communicate directly to the lighting controller through RS485, RS232, or TCP serial communications from the BAS system using Modicon Modbus RTU or ASCII protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.
5. **N2 Control:** This module shall communicate directly to the lighting controller through serial communications from the BAS system using the Metasys-N2 protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.
6. **Protocol Input Control:** This module shall allow serial communications from a Modbus, N2, or BACnet network. It shall be capable of emulating LightSync switches or photocells for direct control and status of relays, dimmers, or motor controls.

F. **Programming:** Programmable controllers shall be capable of being programmed, monitored, backed up, or controlled through any of the below methods. All programming changes shall take effect immediately as they are programmed and shall not suspend or disable switches or other system functions. The same functions shall be available for any of the connection types.
1. **Local Keypad and Display:** The system user shall be able to program, monitor, and control any of the controller features and functions through the use of a simple menu-driven self-prompting user interface consisting of a 4-line 20-character backlit LCD display and 8 selection keys that change function based on the current operating mode.
2. **USB Serial Direct Connect:** The system user shall be able to program, monitor, or control any of the controller features and functions utilizing Pro Windows-based graphical user interface software using a USB port from a PC.
3. **TCP/IP Connect:** The system user shall be able to remotely program, monitor, or control any of the controller features and functions utilizing Pro Windows-based graphical user interface software using a PC with TCP/IP on a LAN or WAN.

G. **Diagnostics:** Programmable controllers shall have the ability to do the following diagnostics.
1. **Power Status:** Each programmable lighting controller shall be provided with an LED on the controller and each output board shall indicate that power is present.
2. **Keypad:** System users shall be able to view thru the keypad the status of any relay, input, group, or preset and force any ON or OFF.
3. **Software:** System users shall be able to view thru the Pro software the status of any relay, input, group, or preset and force any ON or OFF. It shall also be able to scan the network for devices and controllers and then poll them to verify network quality.
4. **Relay Cycle Test:** The controller shall have a cycle test for relays to turn them off/on/off and then return them to the original state to verify proper operation. It shall display the results for each relay for turning the relay ON and OFF.
5. **Device Finder:** It shall have the capability through the keypad to find devices, dimmer devices, and motor devices on the network.
6. **Switch Test Mode:** It shall be able to enter a switch test mode, where a switch input status LED will light when switch inputs are activated. It shall disable normal control when in this mode.
7. **Demo Clock:** It shall have the ability to speed the clock’s time by 10, 30, or 60 times for testing timer functions.

H. **Power Failure and Power-Up:** Each programmable lighting controller shall be provided with circuitry that shall automatically shut down the controller whenever the incoming power fails to be delivered to the controller within the required limits. When power is returned to the controller, one of the following power-up modes will be implemented for each controlled relay output in the system.
   1. **No Action:** Upon restoration of incoming control power, the controller electronics shall be restarted and resume normal operations and all circuits will be maintained in the condition they were last in.
   2. **Turn ON:** Controller shall turn the selected relay output to the ON state after power-up.
   3. **Turn ON if Input Closed:** Controller shall turn the selected relay output to the ON state after power-up if the local input selected is closed. It shall be able to select any input to monitor.
   4. **Turn OFF:** Controller shall turn the selected relay output to the OFF state after power-up.
   5. **Turn OFF if Input Closed:** Controller shall turn the selected relay output to the OFF state after power-up if the local input selected is closed. It shall be able to select any input to monitor.
   6. **On if Open Time, OFF if Closed Time:** Controller shall turn the selected relay output to the ON state during Open hours and shall turn selected relay outputs to the OFF state during Closed hours. This shall be used in conjunction with OPEN/CLOSED timers.
   7. **OFF if Open Time, ON if Closed Time:** Controller shall turn the selected relay output to the OFF state during Open hours and shall turn selected relay outputs to the ON state during Closed hours. This shall be used in conjunction with OPEN/CLOSED timers.
   8. **Time of Day:** Controller shall turn the selected relay output to the ON or OFF state based on the time of day in 30-minute increments for every day of the week.

I. **True Relay Status Feedback:** Each controller shall be provided with circuitry that shall monitor the actual status of each relay via a set of pilot contacts mechanically linked to the relay main contacts.

J. **Switch Input Details:** All switch inputs shall have the following options:
   1. **Input Flexibility:** Each switch input shall accept a 2 or 3-wire maintained or momentary switch. It shall be capable of accepting a dry contact, open collector closure, or a 12-24VDC signal. Each switch shall be able to have 2 switch types associated with it in an A/B form.
   2. **Input to Output Programmability:** Any switch input shall be programmed to control any or all the controller's relay outputs without limitations in the network.
   3. **Input Logic Conditionals:** All switch inputs shall have 2 conditionals that add a logic "AND" or "OR" dependent on a relay on, a relay off, an "on" input opened or closed, and an "off" input opened or closed. It shall also have a priority level setting.
   4. **Input Active Times:** All switch inputs shall have a time-of-day or open/close time of action. This shall change the switch type on the time of day every 30 minutes or change per open/closed times.
   5. **Input Types:**
      a) **Momentary ON/OFF:** When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON. When momentary contact is made between OFF and COM, relay outputs controlled by this input shall be turned OFF.
      b) **Momentary ON/OFF w/Blink:** When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON. When momentary contact is made between OFF and COM, relay outputs controlled by this input shall blink and postpone being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each

relay twice prior to turning it OFF. If an ON command is received during the blink alert time, relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.

c) **Momentary Push-Button ON/OFF:** When momentary contact is made between the ON and COM, relay outputs controlled by this input are turned ON and OFF alternately, based on the current state, each time contact is made.

d) **Momentary Push-Button ON:** When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON.

e) **Momentary Push-Button OFF:** When momentary contact is made between ON and COM, relay outputs controlled by this input shall be turned OFF.

f) **Momentary Push-Button Toggle:** When momentary contact is made between ON and COM, relay outputs controlled by this input shall toggle from the present state.

g) **Maintained ON/OFF:** When contact is made between the ON and COM, relay outputs controlled by this input are turned ON. When contact is broken between ON and COM, relay outputs controlled by this input are turned OFF.

h) **Maintained Multi-way:** When contact is either made or broken between the ON and COM, relay outputs controlled by this input will be toggled between ON and OFF conditions. This function shall be similar to that of standard 3 and 4-way switches.

i) **Maintained ON/OFF w/Blink:** When contact is made between the ON and COM, relay outputs controlled by this input are turned ON. When contact is broken between ON and COM, relay outputs controlled by this input shall blink and postpone being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning OFF. If an ON command is received during the blink alert time, relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.

j) **Timed ON:** The timed-ON input shall operate either from the input closure or open. If programmed to operate from the closure, the relays turn ON when the input closes and turn OFF after the time duration. The relays do nothing when the input opens. If programmed to operate from the open, the relays turn ON when the input closes and remain ON. When the input opens, the relays turn OFF after the timed-ON duration.

k) **HID Bi-Level:** This feature requires the configuration of ON/OFF relay outputs and HI/LOW relay outputs. The first momentary contact between ON and COM sets the ON relay outputs to ON and the HI/LOW outputs to HI (for at least 15 Minutes). The second contact switches the HI/LOW outputs to LOW. Additional contact closures will toggle the HI/LOW relay outputs. The cycle then repeats until momentary contact is made between the switch input OFF and COM. then the ON/OFF outputs and HI/LOW outputs are turned OFF.

l) **Two-Step Alternating Sequence:** The first time the switch is activated, relay outputs programmed as “Group A” are turned ON, and relay outputs programmed as “Group B” are turned OFF. The second time the switch is activated, “Group A” relay outputs are turned OFF, and “Group B” relay outputs are turned ON. The third time the switch is activated, the pattern begins again at step one.

m) **Four-Step Alternating Sequence:** The first time the switch is activated, relay outputs programmed as “Group A” are turned ON, and relay outputs programmed as “Group B” are turned OFF. The second time the switch is activated, “Group A” relay outputs are turned OFF, and “Group B” relay outputs are turned ON. The third time the switch is activated; both “Group A” and “Group B” relay outputs are turned ON. The fourth time the switch is activated; both “Group A” and “Group B” relays are turned OFF. The fifth time the switch is activated, the process begins again at step one.

n) **Set Preset:** When momentary contact is made between the ON and COM, the selected preset scene will be activated.
o) **Set Scene:** When momentary contact is made between the ON and COM, the selected scene will be activated.
p) **Force Timer:** When momentary contact is made between the ON and COM, the selected timer will be activated.

K. **Timer Functions:** Each of the programmable lighting controllers shall have the described timer options listed below for the relay outputs.
1. **Time-of-Day Timers:** Each programmable lighting controller shall be provided with a minimum of 128 available timers (scheduled events) for use in developing time-of-day automated schedules. Each timer shall have the ability to turn any or all relay outputs ON or OFF at any time in 1-minute increments. Timers shall be day-of-week selectable and may be programmed to activate on any combination of days of the week. Each shall be capable of being programmed to be enabled or disabled for any day of the calendar year.
2. **Astronomical Scheduling:** Each controller shall contain an astronomical time clock that shall calculate sunrise and sunset times based on the geographical latitude and longitude positioning. Sunrise and sunset times may be used as activation times for any system timer. In addition to sunrise and sunset time activation, the control shall be capable of programming activation time before and after these times based on an offset of 1-999 minutes.
3. **Open/Closed Time Control:** The user shall also have the option of controlling relay outputs in relation to the Open/Closed times of the facility. The Open/Closed times may vary for different days of the week and may be programmed for each day of the year. In addition to Open/Closed time activation, the control shall be capable of programming activation time before and after these Open/Closed times based on an offset of 1-999.
4. **Off-Hour Sweeps:** The system shall also support after-hours OFF sweeps of selected relays or groups of relays at user-defined one, two, or three-hour intervals.

L. **Relay Output OFF Options:** Each relay shall have the option to control the relay OFF in a certain way other than the default OFF.
1. **Single Blink Alert:** Each relay output within the programmable lighting controller shall be individually programmable to blink and postponed prior to being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning OFF with a timer OFF sweep to warn occupants of the upcoming OFF event. If an ON command is received during the blink alert time, the relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
2. **Double Blink Alert:** Each relay output within the programmable lighting controller shall be individually programmable to blink and postponed prior to being turned OFF and then blinked 1 minute before turning OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice for each alert to warn occupants of the upcoming OFF event. If an ON command is received during the blink alert time, the relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
3. **HID Delay:** Each relay output within the programmable lighting controller shall have the ability to be controlled like a Single Blink Alert as described above but without the blink, alert to prevent damage to HID lamps.
4. **Alarm ON:** Relays shall be capable of performing a momentary ON function. The ON function shall be programmable from 1 to 99 seconds.
5. **Alarm OFF:** Relays shall be capable of performing a momentary OFF function. The OFF function shall be programmable from 1 to 99 seconds.

6. **Alarm Pulsed ON:** Relays shall be capable of being cycled ON and OFF at 1-second intervals and returning to the OFF state. It shall be programmable from 1 to 90 seconds.
7. **Alarm Pulsed OFF:** Relays shall be capable of being cycled OFF and ON at 1-second intervals and returning to the ON state. It shall be programmable from 1 to 90 seconds.
8. **Automatic Control Switch-OFF:** Relays shall be capable of being cycled OFF for 5 seconds and then returned to the ON state for controlling Sentry or AS110 switches.
9. **Automatic Control Switch-Blink:** Relays shall be capable of being cycled OFF for 1.5 seconds and then returned to the ON state for controlling Delay-OFF mode on AS110 switches.

M. **Presets:** The lighting controller shall support up to 256 user-defined presets of ON/OFF relay patterns. The presets shall be invoked by a switch or timer actuation.

N. **Descriptive Names:** The system shall support the optional assignment of descriptive names (up to 10 characters) to the lighting controller, relay outputs, relay groups, inputs, timers, and presets. These names shall be able to switch from custom names to default names.

O. **Password Protection:** Each Programmable controller shall have user-definable 6-digit alphanumeric passwords with 2 levels of access. It shall have control and edit for level 1 and control-only access for level 2.

P. **Networking:**
1. **Network Capacities:** In addition to the data line devices mentioned in Section D, Controllers shall be linked together on the data line to form a Local Area Network (LAN) of up to 254 controller nodes.
2. **Network Features:** The network manager shall allow the connection of up to 254 controllers and 254 data line devices (on top of the 64 devices per panel) and provide USB communications. It shall have a high-speed scanner, 4 gateway device ports, power for devices, and TCP/IP.
3. **Network Universe:** The network of panels shall be capable to connect to other networks over a network (LAN) or over the internet (WAN) to interconnect multiple systems.
4. **Network Gateway:** The following special-purpose gateways shall be available and provides network-wide control from a single point for its specialized function:
   a) **Modbus Control:** The Modbus gateway shall support communications from the BAS system using Modicon Modbus protocol from a single-point connection. All network input status, relay status, and control shall be supported.
   b) **N2 Control:** The N2 gateway shall support communications from the BAS system using a Metasys-N2 protocol from a single-point connection. Network-wide group status and control shall be supported.
   c) **BACnet Control:** The BACnet gateway shall support communications from the BAS system using BACnet MSTP or BACnet IP protocol from a single point connection. It shall allow up to 500 single relays, 100 multiple relays, 48 groups, and 48 presets.

   d) **Advanced BACnet Control:** The Advanced BACnet gateway shall support communications from the BAS system using BACnet IP protocol from a single-point connection. It shall allow up to per panel; 20 Relays, 20 Dimmers, 16 devices (128 maintained inputs), 64 Groups/Presets, and 48 Scenes.
5. **BAS System / Lighting Control System:** Programmable lighting controllers integrated/interfaced with other building control and alarm systems must remain completely functional and continue to process all programmed commands, including time schedules and local switching.

Q. **Runtime Logging and Trending:** Each lighting control panel shall be capable of logging Runtime and Trending data for each relay. This data shall be able to be harvested and exported from the entire system.

1. **Runtime Logging:** The controller shall be able to internally log the runtime of each relay for up to 30 days. This data shall be able to be harvested with a personal computer at 1-minute intervals.
2. **Logging and Trending Software:** Runtime Logging and Trending software shall be available for harvesting data from the lighting control panels. It shall have a dedicated personal computer connected to the system through a LAN or USB cable to the panel or network controller.
    a) **Load Configuration:** Each relay in the system shall be able to have a wattage load assigned to it to represent the actual load on the relay. Loads shall be able to be named, or names shall be exported directly from the system programming software.
    b) **Combined Loads:** Up to 254 combined relay loads shall be allowed, for total wattage recording of areas in the facility. The combined loads shall allow relays from any panel in the network. Combined loads shall be able to be named for identification in reports and graphs.
    c) **Daily or Monthly Usage Report:** The software shall be capable of generating spreadsheet reports in a daily or monthly format for each relay or combined relays in the system.
    d) **Export Data:** The compiled reports shall be able to be exported to a .csv (comma-separated value) file. These files when exported shall be coded for the year, month, and date.
    e) **Daily or Monthly Usage Graphs:** The software shall be capable of generating usage graphs in a daily or monthly format for each relay or combined relays in the system.
    f) **Printing:** Daily or monthly usage graphs shall have the capability to be directly printed from the software.
    g) **Live Usage Graphs:** The software shall have 1 to 9 live usage meter dials to display the present wattage of combined loads.
    h) **Calendar View:** It shall provide a full-year calendar that shall display the number of calendar events.

R. **Graphical Control Interface (InSite Software):** The software shall be a Windows-based graphical interface that allows monitoring and control of panels using icons on custom or standard graphical screens.

1. **Graphical Background Screens:** Graphical background screen shall consist of any bitmap image with any resolution or number of colors. There shall be virtually limitless numbers of screens with a limit to the capacity of the computer.
2. **Multiple Interfaces:** It shall support an unlimited number of satellite computers controlling the same system. (1 Main computer, multiple remote computers).
3. **Virtual PC:** It shall support web access via a virtual computer.
4. **Fault Log:** It shall log and notify of any relay or network faults.
    a) The software shall monitor itself and restart if there is a communication issue with the system.
    b) It shall automatically send an e-mail to the user(s) notifying them of the problem.
    c) An alarm shall report if a relay does not turn on or off correctly with real-time status updates.
    d) It shall log the loss of communications of each network and every node per network. It shall log when it goes offline and when it goes back online.
5. **Control Icons:** Control icons shall be unlimited per screen and shall be chosen from an extensive library. It shall be able to use custom control icons that can be created and saved as BMP, JPEG, or GIF images. Control icons shall be able to be placed anywhere on the screen and edited at any time. Control icons shall control relays, LL Groups, LL Presets, LL Scenes, LL Timers, or dimmer scenes.

6. **Control Options:** It shall have the following capabilities for control and setup.
   a) **Flood:** It shall have the capability to flood areas or change the color of a defined section of the screen (floor plan) for depicting On/Off states.
   b) **Sounds:** It shall be able to trigger custom sound WAV files for on/off triggers.
   c) **Verify:** There should be settings to verify control action and relay sweep commands.
   d) **Toggle:** This shall be a selectable action for relays which shall include always, never, or selective relays.
   e) **Sweep Enable:** There shall be an option for a sweep command.
   f) **Grid:** A grid shall be available for the design and placement of icons on the screens. This shall be adjustable for size and color, plus it shall be able to allow a snap-to-grid feature.
   g) **Tool Tips:** It shall have an optional Tool Tips option that can display text when hovered over an icon.
   h) **Extra Loads:** It shall have the capability to add extra loads to a single relay control icon.
   i) **Import:** It shall have the capability to import LightLEEDer settings and objects.
   j) **Synchronize InSite Screens:** Remote computers shall have the capability to synchronize screens with a single button push.
   k) **Text Icons:** Text icons can be added to any screen and shall be able to be placed anywhere on the screen and edited at any time. They should be adjustable for size, color, font, and transparency.
   l) **UDP Command:** It shall support UDP command strings for special functions in the system.
7. **Navigation Icons:** These shall have navigation buttons for going from one screen to another. These icons shall have the capability to be Global and be visible on all screens. Icons shall have standard sizes that shall be editable for color, size, and font. It shall be able to use custom control icons that can be created and saved as BMP, JPEG, or GIF images. Navigation icons shall be able to be placed anywhere on the screen and edited at any time.
8. **Sequence Control:** It shall be able to sequences with up to 16 transitions over a 12-hour period for events. It shall be able to turn on/off single relays, LL Groups, set a Preset, or LL Scenes in a sequence.
9. **Dimmer and Motor Control:**
   a) **Single Slider:** Slide dimmers shall be available for single control and/or status of a 0-10V output or an sACN slot.
   b) **Pop-up Multi-Sliders:** It shall have up to 16 pop-up control sliders. Each shall be able to be linked to any dimmer(s) in the system. It shall have the capability to have a slider to control all dimmers, direct or proportional.
   c) **Motor Controls:** It shall be able to create icons for controlling motor controls. Icons shall have standard sizes that shall be editable for color, size, and font. It shall control the motor “positive or negative” from .1 seconds to 300 seconds.
10. **Security and User Access:**
   a) It shall have an Administrator lock-out for specific screens and for specific users during an event in the facility.
   b) It shall support up to 5 levels of user security.
   c) There shall be advanced managed user access for up to 32 users.
   d) A settable administrator timeout shall be settable from 15 minutes to 4 hours.
   e) The Administrator shall be able to assign users’ access and passwords.
11. **Multi Network:** It shall be able to link together up to 32 networks with up to 254 nodes per network to operate as one system.
12. **Schedules:** It shall have programmable schedules that send commands to each network and each node in the system.
   a) It shall have up to 4000 programmable schedules.
   b) It shall automatically control relays, groups, scenes, presets, or trigger a sequence.

c) Schedules shall be based on a fixed time, shared time, or before-at-after sunrise-sunset.
d) It shall have settable Latitude, Longitude, and time-zone settings with adjustable DST settings.
e) It shall have a search option for all schedules that include relays, LL Groups, LL Presets, InSite Presets, and Sequences.

13. **Runtime Monitoring:** It shall incorporate the “Runtime Logging and Trending” software as specified in section “Q”.
14. **Diagnostics Dashboard:** It shall have a tool to monitor all of the relays and devices in the system.
15. **Serial Interfaces:**
    a) **sACN Interface:** It shall have the capability to view sACN via (no interface needed for viewing) and control sACN through an Interactive Technologies Interface optional add-on.
    b) **DMX Control:** It shall have an optional DMX output for lighting fixtures and ILC dimmer outputs
    c) **BACnet IP:** It shall have an optional serial input for status and control from InSite. It shall have up to 750 control points and status for InSite Groups, InSite Presets, or InSite Sequence. It shall have an export to .csv file for documentation.

S. **Emergency UL 924 Lighting Controller Option:** Each lighting controller shall have the option to provide an emergency lighting bypass without the use of external devices. It shall be UL 924 listed and clearly marked.
1. **Bypass Control:** If normal power is lost, if selected, the panel shall force the EM relays to the ON position. It shall also force any 0-10V dimming to 100%.
2. **Control Type:** It shall have the option to select the EM relay control for Force On, Force Off, and No change.
3. **Phase Monitoring:** It shall be able to monitor up to three phases of normal power. Upon loss of any phase, the panel will go into an emergency state. It shall be selectable for each phase monitored. It shall be able to monitor 120/277 VAC circuits.
4. **Isolation:** It shall have barriers to separate Normal and Emergency circuits.
5. **Remote Testing:** It shall be provided with input for remote testing. It shall also be provided an output for driving a remote status LED.

2.2 LIGHTING CONTROLLERS:

A. **Controller:** Each controller shall be designed to be remotely installed and provide control of 4 remote load control relays. This controller shall have the same features as the Programmable Lighting Control Panels excluding add-ons and naming.
1. **Enclosure:** Each controller shall be provided with a NEMA 1 galvanized steel enclosure with a removable screw cover. It shall also be provided with a 1/2" nipple and pre-drilled mounting holes.
2. **Plenum Rated:** Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
3. **Listing:** Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
4. **Controller Power Supply:** Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC or optional 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.
5. **High Voltage Connections:** Each controller shall be provided with 6” wire leads for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
6. **Low Voltage Connections:** Controllers shall also be provided with RJ45 connectors for the data lines, and the relay connections. It shall also be provided push-to-connect

connectors for occupancy sensors, and photo sensor inputs. All connections shall be made to clearly and permanently labeled termination points

7. **Occupancy Sensor Inputs:** It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 200mA w/4 devices connected to the controller
   - 160mA w/5 devices connected to the controller
   - 120mA w/6 devices connected to the controller
   - 90mA w/7 devices connected to the controller
8. 60mA w/8 devices connected to the controller

   Photocell Inputs: It shall provide 2 integrated interfaces for ILC photocell heads. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.
9. **Local Data Line Port:** It shall provide an RJ45 data line port for up to 61 data line devices. It shall provide power for devices as described in #7 or additional power added with an optional Power Supply Repeater.
10. **Real-Time Clock:** Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.
11. **Pre-Configured Programs:** Each controller shall have up to 16 selectable pre-configured lighting application programs and 1 default contractor program.

B. **Room Controller:** Each controller shall be designed to be remotely installed and provide control of 4 load control relays. This controller shall have the same features as the Programmable Lighting Control Panels excluding add-ons and naming.

1. **Enclosure:** Each controller shall be provided with a NEMA 1 galvanized steel enclosure with a removable screw cover. It shall also be provided with a 1/2" nipple and pre-drilled mounting holes.
2. **Plenum Rated:** Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
3. **Listing:** Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
4. **Controller Power Supply:** Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC or optional 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.
5. **High Voltage Connections:** Each controller shall be provided with 6” wire leads for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
6. **Low Voltage Connections:** Controllers shall also be provided with RJ45 connectors for the data lines, and the relay connections. It shall also be provided push-to-connect connectors for occupancy sensors, and photo sensor inputs. All connections shall be made to clearly and permanently labeled termination points.
7. **Occupancy Sensor Inputs:** It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs.

Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:

- 200mA w/4 devices connected to the controller

8. **Photocell Inputs:** It shall provide 2 integrated interfaces for ILC photocell heads. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.
9. **Local Data Line Port:** It shall provide an RJ45 data line port for up to 4 data line devices. It shall provide power for devices as described in #7 or additional power added with an optional Power Supply Repeater.

C. **Integrated -4 -8 Relay Controller:** Each controller shall be designed to be remotely installed and provide control of 4 or 8 integrated load control relays. This controller shall have the same features as the Programmable Lighting Control Panels excluding add-ons and naming.

1. **Enclosure:** Each controller shall be provided with a NEMA 1 galvanized steel enclosure with a removable screw cover. It shall also be provided with 1/2" knockouts and pre-drilled mounting holes.
2. **Plenum Rated:** Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
3. **Listing:** Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
4. **Controller Power Supply:** Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
5. **Relay Ratings:** It shall be provided with 4- or 8- 50A load relays that shall be de-rated for 16 amps for durability. It shall control 16A for each set of 4 outputs:
   - 16A, 120/277VAC Electronic Ballast (LED)
   - 16A 120/277VAC Tungsten
   - 1/4 HP @ 120 VAC Motor Load
6. **High Voltage Connections:** Each controller shall be provided with terminal blocks for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
7. **Low Voltage Connections:** Controllers shall also be provided with RJ45 connectors for the data lines, and photo sensor connections. It shall also be provided push-to-connect and screw connectors for occupancy sensors, dimming, and low-voltage inputs. All connections shall be made to clearly and permanently labeled termination points
8. **Occupancy Sensor Inputs:** It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 60mA w/4 devices connected to the controller
   - 50mA w/5 devices connected to the controller
   - 40mA w/6 devices connected to the controller
   - 20mA w/7 devices connected to the controller
   - 0mA w/8 devices connected to the controller
9. **Photocell Inputs:** It shall provide an integrated interface for 1 ILC photocell head. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.

10. **Local Data Line Port:** It shall provide an RJ45 data line port for up to 17 data line devices. It shall provide power for devices as described in #8 or additional power added with an optional Power Supply Repeater.
11. **Dimming:** It shall be provided with 4 or 8 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
12. **Real-Time Clock:** Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.
13. **Pre-Configured Programs:** Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.

D. **Integrated 2 Relay Controller:** Each controller shall be designed to be remotely installed and shall provide 2 integrated load control relays with dimming.
1. **Enclosure:** Each controller shall be provided with a polycarbonate plastic enclosure provided with a ½" nipple and mounting tab.
1. **Plenum Rated:** Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
2. **Listing:** Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
3. **Controller Power Supply:** Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
4. **Relay Ratings:** It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
   - 16A, 120/277VAC Electronic Ballast (LED)
   - 20A 120/277VAC General
   - 1/4 HP @ 120 VAC Motor Load
5. **High Voltage Connections:** Each controller shall be provided with color-coded wire leads. All connections shall be made to clearly and permanently labeled terminations.
6. **Low Voltage Connections:** Controllers shall also be provided with RJ45 connectors for the data lines, occupancy sensor, and photo sensor connections. Dimming shall be provided with color-coded wire leads. All connections shall be permanently labeled terminations.

   Occupancy Sensor Inputs: It shall have 1 input with power provided. The input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 70mA w/1 device connected to the controller
   - 60mA w/2 devices connected to the controller
   - 50mA w/3 devices connected to the controller
   - 40mA w/4 devices connected to the controller
7. **Photocell Inputs:** It shall provide an integrated interface for 1 ILC photocell head. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.

8. **Local Data Line Port:** It shall provide an RJ45 data line port for up to 17 data line devices. It shall provide power for devices as described in #7 or additional power added with an optional Power Supply Repeater.
9. **Dimming:** It shall be provided with 2 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
10. **Pre-Configured Programs:** Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.

E. **Integrated 2 Room Controller:** Each controller shall be designed to be remotely installed and shall provide 2 integrated load control relays with dimming.
1. **Enclosure:** Each controller shall be provided with a polycarbonate plastic enclosure provided with a ½" nipple and mounting tab.
2. **Plenum Rated:** Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
3. **Listing:** Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
4. **Controller Power Supply:** Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
5. **Relay Ratings:** It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
   - 16A, 120/277VAC Electronic Ballast (LED)
   - 20A 120/277VAC General
   - 1/4 HP @ 120 VAC Motor Load
6. **High Voltage Connections:** Each controller shall be provided with color-coded wire leads. All connections shall be made to clearly and permanently labeled terminations.
7. **Low Voltage Connections:** Controllers shall also be provided with RJ45 connectors for the data lines, occupancy sensor, and photo sensor connections. Dimming shall be provided with color-coded wire leads. All connections shall be permanently labeled terminations.
8. **Occupancy Sensor Inputs:** It shall have 1 input with power provided. The input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
   - 70mA w/1 device connected to the controller
   - 60mA w/2 devices connected to the controller
   - 50mA w/3 devices connected to the controller
9. **Photocell Inputs:** It shall provide an integrated interface for 1 ILC photocell head. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.
10. **Local Data Line Port:** It shall provide an RJ45 data line port for up to 3 data line devices. It shall provide power for devices as described in #8 or additional power added with an optional Power Supply Repeater.
11. **Dimming:** It shall be provided with 2 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
12. **Pre-Configured Programs:** Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.

2.3 LIGHTING CONTROL RELAYS:

A. **Single Pole Relay:** It shall be designed for controlling high-inrush single pole lighting circuits. It shall employ 4 latching nickel-silver contacts.
   1. **Listing:** Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
   2. **Labeling:** Lighting control relays shall bear labels for relay current and SCCR ratings.
   3. **Endurance:** Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
   4. **SCCR:** Lighting relays shall have an SCCR rating of 18,000 amps up to 347 VAC.
   5. **Relay Ratings:** It shall be rated for the following:
      - 16A, 120/277/347 VAC Electronic Ballast (LED)
      - 40A 120/277/347 VAC Ballast
      - 40A 120/277/347 VAC Tungsten
      - 1/5 HP @ 120 VAC Motor Load
      - It shall be suitable for plug-loads
   6. **Latching:** Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
   7. **Auxiliary Contacts:** Each Lighting control relay shall contain an auxiliary set of contacts rated at 1 AMP 30 VAC/VDC electrically isolated but mechanically linked to the main contacts for the purpose of true status monitoring and pilot light activation.
   8. **Mounting:** Relays shall be capable of panel mounting.
   9. **Lock-Out:** Relays shall be equipped with an Enable/Disable switch to lock out On/Off control from the controller.
   10. **Actuator:** Relays shall be equipped with a manual actuator switch for turning the relay ON or OFF along with status indication.

B. **2 and 3 Pole Relay:** It shall be designed for controlling high-inrush 2-, 3-pole lighting circuits. Each pole shall employ 4 latching nickel-silver contacts.
   1. **Listing:** Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
   2. **Labeling:** Lighting control relays shall bear labels for relay current and SCCR ratings.
   3. **Endurance:** Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
   4. **SCCR:** Lighting relays shall have an SCCR rating of 18,000 amps up to 347 VAC.
   5. **Relay Ratings:** Each relay shall be designed for the control of 208, 240, and 480 VAC lighting loads at the following per pole.
      - 16A, 120/277/347 VAC Electronic Ballast (LED)
      - 40A 120/277/347 VAC Ballast
      - 40A 120/277/347 VAC Tungsten
      - 1/5 HP @ 120 VAC Motor Load
      - It shall be suitable for plug-loads
   6. **Latching:** Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
   7. **Auxiliary Contacts:** Each Lighting control relay shall contain an auxiliary set of contacts rated at 1 AMP 30 VAC/VDC electrically isolated but mechanically linked to the main contacts for the purpose of true status monitoring and pilot light activation.
   8. **Mounting:** Relays shall be capable of panel mounting.
   9. **Lock-Out:** Relays shall be equipped with an Enable/Disable switch to lock out On/Off control from the controller.
   10. **Actuator:** Relays shall be equipped with a manual actuator switch for turning the relay ON or OFF along with status indication.

11. **Mechanical Link:** Poles within the relay shall be electrically isolated but mechanically linked so as to open and close together without the possibility of one pole being closed while the other remains open. Systems that utilize two single-pole relays to accomplish this function are not acceptable.

C. **Remote Single Pole Relay:** The remote relay shall be designed to be mounted to a junction box or fixture and shall control 1 load up to a 16 Amp circuit.
1. **Listing:** Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
2. **Plenum:** It shall be plenum rated.
3. **Labeling:** Lighting control relays shall bear labels for relay current and SCCR ratings.
4. **Endurance:** Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
5. **SCCR:** Lighting relays shall have an SCCR rating of 5,000 amps up to 347 VAC.
6. **Relay Ratings:** It shall be rated for the following:
   - 16A, 120/277/347 VAC Electronic Ballast (LED)
   - 16A 120/277/347 VAC Ballast
   - 16A 120/277/347 VAC Tungsten
   - 16A 120/277/347 VAC Resistive
   - 1/5 HP @ 120 VAC Motor Load
   - It shall be suitable for plug-loads
7. **Latching:** Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
8. **Mounting:** It shall have a ½" nipple for mounting to an enclosure or fixture

D. **Remote Single Pole Relay W/Dimming:** The remote relay shall be designed to be mounted to a junction box or fixture and shall control 1 load up to 16 Amp circuit and 0-10V dimming.
1. **Listing:** Lighting control relays shall be individually UL and CUL listed and shall bear labels indicating compliance.
2. **Plenum:** Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
3. **Labeling:** Lighting control relays shall bear labels for relay current ratings.
4. **Endurance:** Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
5. **SCCR:** Lighting relays shall have an SCCR rating of 5,000 amps up to 277 VAC.
6. **Relay Ratings:** It shall be rated for the following:
   - 16A, 120/277/347 VAC Electronic Ballast (LED)
   - 16A 120/277/347 VAC Ballast
   - 16A 120/277/347 VAC Tungsten
   - 16A 120/277/347 VAC Resistive
   - 1/5 HP @ 120 VAC Motor Load
   - It shall be suitable for plug-loads
7. **Dimming:** Shall be able to control 0-10V dimming ballast and be able to sink up to 100 mA.
8. **Latching:** Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
9. **Mounting:** It shall have a ½" nipple for mounting to an enclosure or fixture

E. **Remote 20 Amp Dimming Relay with Emergency Bypass:** The remote relay shall be designed to be mounted to a junction box or fixture and shall control 2- load up to 20 Amps

circuits and 0-10V dimming. It shall combine normal relay operation with UL924 bypass relay.

1. **Listing:** Lighting control relays shall be individually UL/CUL/UL924 listed and shall bear labels indicating compliance.
2. **Plenum:** Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
3. **Labeling:** Lighting control relays shall bear labels for relay current ratings.
4. **Endurance:** Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
5. **SCCR:** Lighting relays shall have an SCCR rating of 5,000 amps up to 347 VAC.
6. **EM Function:** It shall have one normal power relay and one EM relay. Both shall be controlled by a controller. Upon loss of power, the EM relay shall be forced to the ON state. During the EM state, 0-10 V dimming shall be forced to 100%.
7. **Relay Ratings:** It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
   - 16A, 120/277VAC Electronic Ballast (LED)
   - 20A 120/277VAC General
   - 1/4 HP @ 120 VAC Motor Load
   - It shall be suitable for plug-loads
8. **Latching:** Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
9. **Mounting:** It shall have a ½" nipple for mounting to an enclosure or fixture.
10. **Test Button:** It shall have a test button for testing the EM function.
11. **Test Input:** It shall have an input for testing the EM function from a remote location.
12. **Wireless Communications:** It shall have a 915Mhz radio with point-to-point capabilities. It shall communicate 100 feet line-of-sight with the wireless devices.

F. **ILC EM20 Emergency Bypass Relay:** The remote relay shall be designed to be mounted to a junction box or fixture. It shall provide automatic bypass for emergency power.

1. **Listing:** Lighting control relays shall be individually UL/CUL/UL924 listed and shall bear labels indicating compliance.
2. **Labeling:** Lighting control relays shall bear labels for relay current ratings.
3. **SCCR:** Lighting relays shall have an SCCR rating of 5,000 amps up to 2777 VAC.
4. **Loads:** Lighting bypass relays shall be designed for bypass of 120 or 277 VAC @ 20 amps.
5. **Bypass:** It shall automatically bypass normal power upon loss of emergency power
6. **Mounting:** It shall have a ½" nipple for mounting to an enclosure or fixture.

PART 3 EXECUTION

3.1 INSTALLATION

A. **Installation:** Where shown in the drawings, the contractor shall furnish and install programmable lighting controllers of the quantities, sizes, and types shown on the drawings or specified herein.

B. **Requirements:** All equipment shall be installed in accordance with manufacturer requirements and in compliance with all applicable local and national codes and requirements.

3.2 MANUFACTURES SERVICES

A. **Factory Programming:** All controllers shall be factory programmed upon request in accordance with the project specifications prior to shipment.

B. **Installation Assistance:** During the installation process, the manufacturer shall provide, at no cost, technical support via a toll-free telephone line to the installing contractor or owner's representative to answer questions and supply additional information when required.

C. **System Start-Up:** The system manufacturer shall provide a factory authorized field technician to the project site after installation has been completed and prior to the system being energized for the purpose of testing and adjustment of the system. Factory field technician shall test and verify all system functions and ensure proper operation of the system components in accordance with the specifications and on-site conditions. The installing contractor shall notify the system manufacturer in writing that the system is completely wired and ready to be energized and tested 4 weeks prior to scheduling a field technician for the start-up of the system. Should the field technician arrive on the job site and find the installation incomplete, the installing contractor shall pay the cost of any future visits by the field technician required to complete the system start-up.

D. **On-Site Programming:** During the start-up procedure, the factory field technician shall provide programming assistance and guidance to the building operating personnel to program the systems for initial operation.

E. **Instruction:** During the start-up procedure, the factory field technician shall provide training to the building operating personnel in the operation, programming, and maintenance of the lighting control system.

F. **As-Built Drawings:** After completion of the system installation and testing, the manufacturer shall provide 3 sets of "as-built" drawings.

G. **Operation and Maintenance Manuals:** After completion of the system installation and testing, the manufacturer shall provide 3 sets of Operations and Maintenance Manuals.

H. **Lifetime Telephone Support:** The system manufacturer shall provide a direct telephone number to the system user and shall allow access to free telephone support for the life of the system.

END OF SECTION 26 09 23

SECTION 26 09 26 - LIGHTING CONTROL DEVICES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following lighting control devices:
   1. Time switches.
   2. Indoor occupancy sensors.
   3. Lighting contactors.
   4. Emergency shunt relays.

B. Related Sections include the following:
   1. Division 26 Section "Wiring Devices" for wall-box dimmers, wall-switch occupancy sensors, manual light switches, and timer wall-switches.

1.2 DEFINITIONS

A. LED: Light-emitting diode.

B. PIR: Passive infrared.

1.3 SYSTEM DESCRIPTION

A. Permanently installed
   1. Wall switch occupancy sensors
   2. Ceiling mounted occupancy sensors
   3. Switchpacks
   4. Day Lighting Sensor Control

1.4 SUBMITTALS

A. Submit product data and shop drawings in accordance with Division 01 and Division 26 Section “Common Work Results for Electrical” for products specified under PART 2 - PRODUCTS.

B. Product Data: For each type of product indicated. Include dimensions, size, voltage ratings and current ratings.

C. Maintenance Data: Include instructions for replacing and maintaining coil and contacts.

D. Shop Drawings: Prepared by factory or authorized representative; based on devices proposed for inclusion in the Work. Include dimensioned plans, elevations, and installation details, including the following:
   1. Dimensioned locations of occupancy and light-level sensors.
   2. Coverage patterns for occupancy and light-level sensors.
   3. Interconnection diagrams showing field-installed wiring.

E. Field quality-control test reports.

F. Operation and Maintenance Data: For lighting control device, to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation And Maintenance Data," include the following:
   1. Manufacturer's written instructions for adjusting devices after installation.

1.5 QUALITY ASSURANCE

A. Manufacturers Certification for Occupancy Sensor layout: Provide letter from sensor manufacturer stating that locations indicated on shop drawings are arranged to achieve not less than 90 percent coverage of areas indicated.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70.

1.6 COORDINATION

A. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including but not limited to luminaires, HVAC equipment, smoke detectors, fire-suppression system, and partition assemblies.

1.7 LIGHTING CONTROL APPLICATIONS

A. Lighting control performance to comply with IECC 2021.
   1. Occupancy/vacancy requirements – Provide an occupancy/vacancy sensors with Manual On/ Automatic Off or Automatic On/ Automatic Off functionality. Spaces with multiple occupants or where line of sight might be obscured ceiling or corner mount sensors and Manual wallstations would be required. Automatic On of lighting via occupancy sensor cannot exceed 50% of lighting in open plan office spaces less than 300ft/sq. Systems that do that allow the user to select Occupancy or Vacancy Mode shall not be acceptable.
   2. Bi-Level switching – Provide multi-level switching and/or variable dimming for maximum energy savings where required. (Qualifies for EPACT tax deductions of $0.60 per foot)
   3. Task Lighting / Receptacle Control – Provide automatic shut off of non-essential plug loads and task lighting in all spaces. Provide Manual On or Automatic On of receptacles whenever spaces are occupied. Receptacle Control will only be shut off when no occupancy is detected within the space. Systems that do not provide receptacle control for a full 20 Amp circuit shall not be acceptable.
   4. Daylight Zones – Primary and Secondary sidelit or toplit areas within an enclosed space shall be controlled in conjunction with other space controls by a multi-level photocontrol device. Adjustments to the daylight zones must be provided by a simple to use, intuitive remote handheld device.
   5. Provide smooth and continuous daylight dimming for areas marked on drawings.
   6. Provide the ability to adjust the high end and low end trim of the dimmers to ensure the lighting automatically provides energy saving even when daylighting calls for full illumination.
   7. Provide the ability for the dimmers and the relays to function separately. Systems where the 0-10V dimmers and relays are tied together reduce design capabilities and shall not be acceptable.

PART 2 PRODUCTS

2.1 SENSOR PERFORMANCE REQUIREMENTS

A. Sensing mechanism:
   1. Infrared: Utilize multiple segmented lens, with internal grooves to eliminate dust and residue build-up.
   2. Ultrasonic:
      a. Utilize an operating frequency of 32 kHz or 40 kHz that shall be crystal controlled to operate within plus or minus 0.005% tolerance.
      b. Utilize Doppler shift ultrasonic detection technology.

3. Dual technology:
   a. Utilize multiple segmented lens, with internal grooves to eliminate dust and residue build-up.
   b. Utilize an operating frequency of 32 kHz or 40 kHz that shall be crystal controlled to operate within plus or minus 0.005% tolerance.
   c. Incorporate Doppler shift ultrasonic and passive infrared motion detection technologies. Products that react to noise or ambient sound shall not be considered.

B. Power failure memory:
   1. Controls incorporate non-volatile memory. Should power be interrupted and subsequently restored, settings and parameters saved in protected memory shall not be lost.

C. Designed and tested to withstand discharges without impairment of performance when subjected to discharges of 15,000 volts per IEC 801-2.

D. Products tested in identical manner, complaint to NEMA WD 7 -2011 Occupancy Motion Sensors Standards.

E. Sensor shall have time delays from 10 to 30 min. Time out shall be set 20 min unless noted otherwise.

F. All sensors shall provide an LED as a visual means of indication at all times to verify that motion is being detected during both testing and normal operation.

G. All sensors shall have readily accessible, user adjustable settings for time delay and sensitivity. Settings shall be located on the sensor (not the control unit) and shall be recessed to limit tampering.

H. Where specified, sensor shall have an internal additional isolated relay with Normally Open, Normally Closed, and Common outputs for use with HVAC control, Data Logging and other control options. Sensors utilizing separate components or specially modified units to achieve this function are not acceptable.

2.2 LOW VOLTAGE CEILING MOUNTED VACANCY SENSORS

A. Product: Cooper VAC-DT-2000-R,VAC-DT-1000-R, ILC controls, Leviton

B. Provide all necessary mounting hardware and instructions.

C. Sensors shall be Class 2 devices.

D. When requested, be able to provide customizable mask to block off unwanted viewing areas for all ceiling mounted sensors using infrared technology.

E. Provide an internal additional isolated relay with Normally Open, Normally Closed and Common outputs for use with HVAC control, Data Logging and other control options.

2.3 LOW VOLTAGE CEILING MOUNTED OCCUPANCY SENSORS

A. Product: Cooper OAC-DT-2000-R,OAC-DT-1000-R, ILC controls, Leviton

B. Provide all necessary mounting hardware and instructions.

C. Sensors shall be Class 2 devices.

D. When requested, be able to provide customizable mask to block off unwanted viewing areas

for all ceiling mounted sensors using infrared technology.

E. Provide an internal additional isolated relay with Normally Open, Normally Closed and Common outputs for use with HVAC control, Data Logging and other control options.

2.4 LINE VOLTAGE CEILING MOUNTED OCCUPANCY SENSORS

A. Product:
   1. Cooper OAC-DT-2000-MV,OAC-DT-2000-DMV

B. Provide all necessary mounting hardware and instructions.

C. Provide a mechanical air-gap on/off function for all sensors.

D. Capable of detection of occupancy at desktop level up to 300 square feet, and gross motion up to 1000 square feet

E. Shall accommodate loads from 0-800 watts at 120 volts; 0 to 1200 watts at 277 volts and shall have 180 degree coverage capability.

F. Shall be able to have their visible plastic parts replaced, for color changes in the field, without removing the body of the control from the wall and without requiring special tools.

G. Shall utilize Zero Crossing Circuitry which increases relay life, protects from the effects of inrush current, and increases sensor's longevity.

H. Shall have no leakage current to load, in manual or in Auto/Off Mode for safety purposes and shall have voltage drop protection.

I. Where specified, sensors shall offer daylighting foot-candle adjustment control and be able to accommodate dual level lighting.

J. Where specified, dual relay sensors shall offer daylighting foot-candle adjustment control for either or both relays.

K. Where specified, dual relay sensors shall offer a Bathroom Mode which keeps the second relay ON for an addition 8 minutes after the first relay has been turned off.

L. Sensors shall be RoHS compliant

M. Where specified, sensors shall offer integral Bi-level Automatic On (just one lighting level comes on automatically when occupancy is detected)

2.5 WALL / CORNER MOUNTED SENSORS

A. Product:
   1. QCooper OAWC-P-120W, OAWC-P-120W-R

B. Provide all necessary mounting hardware and instructions.

C. Sensors shall be Class 2 devices.

D. Provide an internal additional isolated relay with Normally Open, Normally Closed and Common outputs for use with HVAC control, Data Logging and other control options.

E. Where specified, sensors shall offer daylighting footcandle adjustment control

F. Sensors shall be RoHS compliant.

G. Where specified, sensors shall offer integral Bi-level Automatic On (just one lighting level comes on automatically when occupancy is detected)

2.6 VACANCY WALL SWITCHES

A. Product:
   1. Cooper VNW-P-1001-MV-*, VNW-P-1001-DMV-MV

B. Requires Manual On to activate lighting.

C. Cannot be modified to provide Automatic ON capabilities.

D. Provide a mechanical air-gap on/off function for all sensors.

E. Capable of detection of occupancy at desktop level up to 300 square feet, and gross motion up to 1000 square feet

F. Shall accommodate loads from 0-800 watts at 120 volts; 0 to 1200 watts at 277 volts and shall have 180 degree coverage capability.

G. Shall be able to have their visible plastic parts replaced, for color changes in the field, without removing the body of the control from the wall and without requiring special tools.

H. Shall utilize Zero Crossing Circuitry which increases relay life, protects from the effects of inrush current, and increases sensor's longevity.

I. Shall have no leakage current to load, in manual or in Auto/Off Mode for safety purposes and shall have voltage drop protection.

J. Where specified, wall switch sensors shall provide a field selectable option to convert sensor operation from Automatic On to Manual On.

K. Where specified, sensors shall offer daylighting foot-candle adjustment control and be able to accommodate dual level lighting.

L. Where specified, dual relay sensors shall offer daylighting foot-candle adjustment control for either or both relays.

M. Where specified, dual relay sensors shall offer a Bathroom Mode which keeps the second relay On for an addition 8 minutes after the first relay has been turned off.

N. Where specified, sensors shall feature a universally recognized light bulb icon for end user ease of identification of use.

O. Where specified, dual relay sensors shall feature universally recognized light bulb and fan icons for end user ease of identification of use.

P. Sensors shall be RoHS compliant.

Q. Where specified, sensors shall have an EcoMeter that provides a visual indicator of energy usage, increasing end user awareness and reminding individuals to take control of their lighting to maximize energy savings.

R. Where specified, low voltage sensors shall have a Tracking/HVAC Mode that allows the load connected to the Form C BAS relay to remain on when the lights are turned off manually.

S. Where specified, sensors shall have a tamper-proof Automatic Only Mode that automatically turns lighting ON and OFF without requiring a user to push a button.

2.7 OCCUPANCY WALL SWITCHES

A. Product:
   1. Cooper OSW-P-0451-MV-*

B. Provide a mechanical air-gap on/off function for all sensors.

C. Capable of detection of occupancy at desktop level up to 300 square feet, and gross motion up to 1000 square feet

D. Shall accommodate loads from 0-800 watts at 120 volts; 0 to 1200 watts at 277 volts and shall have 180 degree coverage capability.

E. Shall be able to have their visible plastic parts replaced, for color changes in the field, without removing the body of the control from the wall and without requiring special tools.

F. Shall utilize Zero Crossing Circuitry which increases relay life, protects from the effects of inrush current, and increases sensor's longevity.

G. Shall have no leakage current to load, in manual or in Auto/Off Mode for safety purposes and shall have voltage drop protection.

H. Where specified, wall switch sensors shall provide a field selectable option to convert sensor operation from Automatic On to Manual On.

I. Where specified, sensors shall offer daylighting footcandle adjustment control and be able to accommodate dual level lighting.

J. Where specified, dual relay sensors shall offer daylighting footcandle adjustment control for either or both relays.

K. Where specified, dual relay sensors shall offer a Bathroom Mode which keeps the second relay On for an addition 8 minutes after the first relay has been turned off.

L. Where specified, sensors shall feature a universally recognized light bulb icon for end user ease of identification of use.

M. Where specified, dual relay sensors shall feature universally recognized light bulb and fan icons for end user ease of identification of use.

N. Sensors shall be RoHS compliant.

O. Where specified, sensors shall have an EcoMeter that provides a visual indicator of energy usage, increasing end user awareness and reminding individuals to take control of their lighting to maximize energy savings.

P. Where specified, low voltage sensors shall have a Tracking/HVAC Mode that allows the load connected to the Form C BAS relay to remain on when the lights are turned off manually.

Q. Where specified, sensors shall have a tamper-proof Automatic Only Mode that automatically turns lighting on and off without requiring a user to push a button.

2.8 SENSOR SWITCHPACKS

A. Product:
   1. Cooper SP20-MV, SPD20-MV-NO, SPRC-R-20-120, SP-R-20-120

B. Plenum rated

C. Control wiring between sensors and control units shall be Class 2, 18-24 AWG, stranded U.L. Classified, TEFLON jacketed cable suitable for use in plenums.

D. Integrated, self-contained unit consisting internally of an isolated load switching control relay.

E. Shall be compatible with incandescent, magnetic or electronic low voltage, and magnetic or electronic fluorescent, as well as motor loads.

2.9 CONDUCTORS AND CABLES

A. Power Wiring to Supply Side of Remote-Control Power Sources: Not smaller than No. 12 AWG. Comply with requirements in Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

B. Classes 2 and 3 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 18 AWG or larger if otherwise required by manufacturer.

C. Class 1 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 18 AWG or larger if otherwise required by manufacturer.

PART 3 EXECUTION

3.1 SENSOR INSTALLATION

A. Install and aim sensors in locations to achieve not less than 90 percent coverage of areas indicated. Do not exceed coverage limits specified in manufacturer's written instructions.

3.2 WIRING INSTALLATION

A. Wiring Method: Comply with Division 26 Section "Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size shall be 1/2 inch (13 mm).

B. Wiring within Enclosures: Comply with NECA 1. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.

C. Size conductors according to lighting control device manufacturer's written instructions, unless otherwise indicated.

D. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

3.3 IDENTIFICATION

A. Identify components and power and control wiring according to Division 26 Section "Identification for Electrical Systems."
   1. Identify controlled circuits in lighting contactors.
   2. Identify circuits or luminaries controlled by photoelectric and occupancy sensors at each sensor.

B. Label time switches and contactors with a unique designation.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to perform the following field tests and inspections and prepare certified test reports:
   1. After installing time switches and sensors, and after electrical circuitry has been energized, adjust and test for compliance with requirements.
   2. Operational Test: Verify operation of each lighting control device, and adjust time

delays.

B. Lighting control devices that fail tests and inspections are defective work. Remove and replace units that do not pass tests and inspections and retest as specified above.

3.5 ADJUSTING

A. Time-Schedule Adjustments: Times indicated in documents represent initial settings known at time of design documentation. Coordinate final program settings for time-of-day and holiday schedules with Owner prior to Substantial Completion. When requested within 3 months of date of Substantial Completion, provide on-site assistance in adjust schedules to suit Owner. Provide up to one visit to Project during other-than-normal occupancy hours for this purpose.

B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting sensors to suit occupied conditions. Provide up to one visit to Project during other-than-normal occupancy hours for this purpose.

3.6 CLEANING

A. Clean components according to manufacturer's written instructions.

B. On completion of device box installation but before any wiring devices are installed, inspect interior of boxes and perform the following:
   1. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

C. On completion of wall plate installation, inspect exterior surfaces and perform the following:
   1. Remove paint splatters and other spots.
   2. Replace cracked or damaged wall plates.
   3. Wipe down all wall plates with approve cleaning agent to remove fingerprints and dust.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's personnel to adjust, operate, and maintain lighting control devices. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 26 09 26

SECTION 26 22 00 - LOW-VOLTAGE TRANSFORMERS

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following types of dry-type transformers rated 600 V and less, with capacities up to 1000 kVA:
   1. Distribution transformers.

1.2 SUBMITTALS

A. Submit product data and shop drawings in accordance with Division 01 and Division 26 Section “Common Work Results for Electrical” for products specified under PART 2 - PRODUCTS.

B. Product Data: Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.
   1. Include typical manufacturer’s test data reports for each type and size transformer. Reports shall include but not be limited to the following data:
      a. Maximum Efficiency in accordance with DOE 10 CFR PART 431, Subpart K
      b. Efficiency at 50-percent and 100-percent load.
      c. Percent voltage regulation at 80-percent and 100-percent power factor.
      d. Losses in kVA at no load and full load conditions.
      e. Percent X and Percent R values,
      f. Maximum sound level of transformer in enclosure (in dBA).
      g. Maximum 30-Deg hot spot and average temperature rise over a 40 degree C ambient.
      h. Percent Impedance

C. 10 year product warranty certificate

D. Field quality-control test reports.

E. Operation and Maintenance Data: For transformers, to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section 01 78 23 "Operation And Maintenance Data," include the following:
   1. Manufacturer's routine maintenance requirements for transformers and all installed components.

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain each transformer type through one source from a single manufacturer, unless otherwise indicated.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with IEEE C57.12.91, "Test Code for Dry-Type Distribution and Power Transformers."

1.4 DELIVERY, STORAGE, AND HANDLING

A. Prepare equipment for shipment.

1. Provide suitable crating, blocking, and supports so equipment will withstand expected domestic shipping and handling shocks and vibration.
2. Weatherproof equipment for shipment. Close connection openings to prevent entrance of foreign material during shipment and storage.

B. Installation Pathway: Coordinate delivery of equipment to allow movement into designated space.
1. Deliver in shipping splits in sizes that can be moved past obstructions in delivery path.
2. Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving equipment into place.

C. Store equipment indoors in clean dry space with uniform temperature in accordance with manufacturer's requirements to prevent condensation. Protect equipment from exposure to dirt, fumes, water, corrosive substances, and physical damage.

D. Handle equipment components according to manufacturer's written instructions. Use factory-installed lifting provisions.

1.5 COORDINATION

A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor- bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of structure-hanging supports with actual transformer provided.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Eaton Electrical Inc.; Cutler-Hammer Products.
2. ABB
3. Square D; Schneider Electric.
4. Siemens

2.2 GENERAL TRANSFORMER REQUIREMENTS

A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.

B. Cores: High grade, grain-oriented, non-aging silicon steel with high magnetic permeability and low hysteresis and eddy current losses.

C. Coils: Continuous windings without splices except for taps.
1. Internal Coil Connections: Brazed or pressure type.
2. Coil Material: Copper

D. Enclosure:
1. Indoors: Type 2
2. Indoors wet location: Type 2 with drip hood

2.3 DISTRIBUTION TRANSFORMERS

A. Comply with NEMA ST 20, and list and label as complying with UL 1561.

B. Energy Efficiency for Transformers Rated 15 kVA and Larger:
1. Complying with NEMA TP 1, Class 1 efficiency levels.
2. Tested according to NEMA TP 2.

C. Cores: One leg per phase.

D. Enclosure for Interior Transformers: Ventilated, NEMA 250, Type 2, unless otherwise indicated.
   1. Core and coil shall be encapsulated within resin compound, sealing out moisture and air.

E. Transformer Enclosure Finish: Comply with NEMA 250. The entire enclosure shall be finished utilizing a continuous process consisting of degreasing, cleaning and phosphatizing, followed by electrostatic deposition of a polymer polyester powder coating and baking cycle to provide uniform coating of all edges and surfaces.
   1. Finish Color: ANSI Gray.

F. Taps for Transformers Smaller Than 3 kVA: One 5 percent tap above normal full capacity.

G. Taps for Transformers 7.5 to 14 kVA: Two 5 percent taps below normal full capacity.

H. Taps for Transformers 15 kVA and Larger: Two 2.5 percent taps above and four 2.5 percent taps below normal full capacity.

I. Insulation Class: Materials in accordance with NEMA ST20 220 deg C, UL-component-recognized insulation system with a maximum of 150 deg C rise above 40 deg C ambient temperature.

J. Electrostatic Shielding: Each winding shall have an independent, single, full-width copper electrostatic shield arranged to minimize interwinding capacitance.
   1. Arrange coil leads and terminal strips to minimize capacitive coupling between input and output terminals.
   2. Include special terminal for grounding the shield.

K. Low-Sound-Level Requirements: Meet NEMA ST 20 standard

1. 0 – 9 kVA → ≤ 40 Db

2. 10 – 50 kVA → ≤ 45 dB

3. 51 – 150 kVA → ≤ 50 dB

4. 151 – 300 kVA → ≤ 55 dB

5. 301 – 500 kVA → ≤ 60 dB

2.4 SOURCE QUALITY CONTROL

A. Test and inspect transformers according to IEEE C57.12.91.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATION

A. Transformer Mounting
1. 15 kVA or less: Floor mounted or suspended, as indicated.
2. 30 kVA and 45kVA: floor mounted or suspended, as indicated.
3. 75 kVA: Floor mounted or rack mounted, as indicated.
4. Greater than 75 kVA: Floor mounted, unless otherwise indicated.

3.3 INSTALLATION

A. Comply with NECA 409, “Recommended Practice for Installing and Maintaining Dry-Type Transformers” as published by the National Electrical Contractors Association.

B. Construct concrete bases and anchor floor-mounting transformers according to manufacturer's written instructions and requirements of Division 26 Section 26 05 29 "Hangers and Supports for Electrical Systems.”

C. Construct steel channel support system for rack-mounted or suspended transformers according to manufacturer's written instruction and requirements of Division 26 Section 26 05 29 "Hangers and Supports for Electrical Systems.”

3.4 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division 26 Section 26 05 53 "Identification for Electrical Systems."

B. Transformer Nameplates: Label each transformer with Engraved, laminated-plastic or metal nameplate for each transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Division 26 Section 26 05 53 "Identification for Electrical Systems."

3.5 CONNECTIONS

A. Ground equipment according to Division 26 Section 26 05 26 "Grounding and Bonding for Electrical Systems."
1. Ground transformer before it is energized.

B. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

C. Provide flexible metal conduit with a minimum 12" to a maximum 24” length for wiring connections to transformer enclosure.

3.6 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare certified test reports:
1. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Section 7.2 for dry-type transformers. Certify compliance with test parameters.

B. Correct Deficiencies and Report:
   1. Correct unsatisfactory conditions, and retest to demonstrate compliance; replace transformers, conductors, units, and devices as required to bring system into compliance.
   2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   3. Prepare a report that identifies transformer, connection, conductors and devices checked and describes results. Include notation of deficiencies detected, remedial action taken, and observations and test results after remedial action.

C. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

D. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

3.7 CLEANING

A. Clean components according to manufacturer's written instructions.

B. On completion of installation, inspect interior and exterior surfaces and perform the following:
   1. Remove paint splatters and other spots.
   2. Vacuum dirt and debris; do not use compressed air to assist in cleaning.
   3. Repair exposed surfaces to match original finish.

3.8 PROTECTION

A. Temporary Heating: Maintain a clean dry space with uniform temperature in accordance with manufacturer’s requirements to prevent condensation. Apply temporary heating as required.

B. Protect equipment from exposure to dirt, fumes, water, corrosive substances, and physical damage.

END OF SECTION 26 22 00

SECTION 26 24 13 - SWITCHBOARDS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Low-voltage switchboards.

B. Overcurrent protective devices.

1.2 RELATED REQUIREMENTS

A. Section 26 09 13 - Electrical Power Management System

B. Section 26 43 13 - Low-Voltage Power Circuit Breakers

C. Section 26 36 00 - Automatic/Nonautomatic Transfer Switches

D. Section 26 43 13 - Surge Protective Devices for Power Circuits.

1.3 ABBREVIATIONS AND ACRONYMS

A. EMI: Electromagnetic interference.

B. EPMS: Electrical power management system.

C. ERMS: Energy reduction maintenance setting.

D. RFI: Radio-frequency interference.

E. SPD: Surge protective device.

1.4 DEFINITIONS

A. Switchboards may also be identified as SWBD.

1.5 SUBMITTALS

A. Provide sufficient information to determine compliance with Contract Documents. Identify submittal data with specific equipment tags and/or service descriptions to which they pertain. Identify specific model numbers, options, and features of equipment proposed.

B. Indicate deviations from Contract Documents with reference to corresponding drawing or specification number and written justification for deviation.

C. Product Data: Provide manufacturer's standard catalog pages and data sheets for switchboards, enclosures, overcurrent protective devices, components, and accessories.

D. Shop Drawings: Indicate dimensions, voltage, bus ampacities, overcurrent protective device arrangement and sizes, short circuit current ratings, conduit entry locations, conductor terminal information, instruments, features, and accessories.
   1. Include dimensioned plan and elevation views of switchboards; indicate dimensions, weights, shipping splits, and required clearances.
   2. Include single-line diagram.

E. Manufacturer's qualification statement.

F. Installer's qualification statement.

G. Operation and Maintenance Data:
   1. Provide detailed information on system operation, equipment programming and setup, replacement parts, and recommended maintenance procedures and intervals.
      a. Include manufacturer, supplier, support, and repair center contact information.
      b. Include manufacturer's standard operation and maintenance data assembled for each size and type of equipment furnished.
      c. Include contact information for parts stocking location closest to Owner.
      d. Identify critical spare parts associated with long lead times and/or those critical to unit operation.
      e. Identify maintenance spare parts required to regularly perform scheduled equipment maintenance including, but not limited to, consumable parts required to be exchanged during scheduled maintenance periods.
   2. Digital Record Keeping:
      a. Provide maintenance logbook application/website available on PC/mobile device to assist in compliance with NFPA 70B.
      b. Include access to manufacturer's standard documentation, equipment serial number, as-built drawings, assembly and testing results, device settings, and spare parts list.
      c. Provide password-protected access to Owner.
      d. Provide access via scannable QR code on front face of equipment.

H. Specimen Warranty: Statement of standard warranty and extended warranty options/costs

I. Project Record Documents:
   1. Configured settings/parameters for adjustable components updated to as-installed and commissioned state, noted if different from factory default.

J. Maintenance Materials: Furnish the following for Owner's use in maintenance of project:
   1. Spare Parts: For each type and size of unit installed.
      a. Provide minimum spare parts recommended by manufacturer.
      b. Touch-up paint for finishes.
      c. Package and mark spare parts for long-term storage. Provide separate anti-static containers for printed circuit boards.
   2. Tools: Manufacturer-specific special tools required to install, remove, test, and maintain switchboard components.
      a. Accessory Set: Tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.
      b. Portable Test Set: For testing functions of solid state trip devices without removal from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.
      c. Equipment Configuration Software: PC-based or mobile device application; provide one of each different communication interface cable required to connect computer/device configuration and programming.
      d. Equipment Configuration Files: For future upload into replaced/repaired components, in media format acceptable by Owner.

1.6 QUALITY ASSURANCE

A. Comply with the following:
   1. NFPA 70.
   2. Requirements of local authorities having jurisdiction.
   3. Applicable local codes.

B. Manufacturer Qualifications:
   1. Firm engaged in manufacture of specified products of types and sizes required, and whose products have been in satisfactory use in similar service for minimum of 20 years.
   2. Certified in accordance with ISO 9001 with applicable quality assurance system regularly reviewed and audited by third-party registrar. Develop and control manufacturing, inspection, and testing procedures under guidelines of quality assurance system.
   3. Service, repair, and technical support services available 24 hours per day, 7 days per week from manufacturer or their representative.
   4. Certified in accordance with ISO 14001, with product environmental profiles (PEPs) for specified products.

C. Installer Qualifications: Firm with minimum 10 years of experience with equipment of similar type and scope; approved by manufacturer's representative.

D. Product Listing Organization Qualifications: Organization recognized by OSHA as Nationally Recognized Testing Laboratory (NRTL) and acceptable to authorities having jurisdiction.

1.7 WARRANTY

A. Manufacturer Warranty: Provide manufacturer warranty for defects in material and workmanship for 12 months from substantial completion.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Schneider Electric; Square D

B. ABB

C. Siemens

D. Eaton Corporation

E. Source Limitations: Furnish products produced by same manufacturer as other electrical distribution equipment for project

2.2 LOW-VOLTAGE SWITCHBOARDS

A. Switchboard Ratings/Configurations: As indicated on drawings.

B. Switchboard
   1. Available Access: For front only
   2. Incoming Connection Type: As indicated on drawings

C. Switchboard Assemblies:
   1. Comply with NEMA PB 2; list and label as complying with UL 891.
   2. Provide front and rear alignment of adjacent sections.

3. Provide barriers between sections.

D. Short Circuit Current Rating: Where not specified, provide switchgear with listed short circuit current rating not less than the available fault current at the installed location as indicated on the drawings

E. Ground Fault Protection: List and label as complying with UL 1053.

F. Cable Terminations for Incoming Conductors:
1. Provide lugs in quantity and size required for conductors indicated on drawings.
2. Lug Type: Copper mechanical lugs, suitable for terminating copper conductors only unless otherwise indicated; rate for 167 degrees F (75 degrees C).

G. Bussing:
1. Bus Density Rating: Standard, in accordance with UL 891 temperature rise requirements
2. Bus Material: Hard-drawn, silver-plated copper of 98 percent conductivity unless otherwise indicated.
3. Plating: Apply to bus surfaces except cut edges. Plating on contact surfaces only is not permitted.
4. Phase and Neutral Horizontal Bus: Ampacity equal to or greater than switchboard system rating. Tapered bus is not permitted.
5. Group-Mounted Feeder Vertical Bus Stack:
   a. Provide capability to mount feeder breakers with different frame sizes/poles across from one another on bus stack.
   b. Design to remove nonconducting surface films during circuit breaker installation by wiping action of circuit breaker jaws.
   c. Design in conjunction with circuit breaker jaws to create blow-on forces under fault conditions.
   d. Bolted connections for group-mounted feeder breakers are not permitted.
6. Ground Bus:
   a. Size in accordance with NFPA 70 and UL 891.
   b. Bus Material: Hard-drawn copper of 98 percent conductivity.
   c. Equip with pressure connectors for feeder and branch circuit equipment grounding conductors.
   d. Busway Feeders: Extend insulated equipment grounding cable to busway ground connection. Support cables at intervals in vertical run.

H. Enclosures:
1. Construction: Steel.
2. UL 50E Rating, Unless Otherwise Indicated:
   a. Indoor Clean, Dry Locations: Type 1.
   b. Indoor Locations with Fire Sprinkler Protection: Type 1 with drip hood.
   c. Outdoor Locations: Type 3R.
3. Front Covers: Removable with single tool.
4. Doors: Hinged with removable hinge pins.
5. Finish: Manufacturer's standard paint color over rust-inhibiting primer on treated metal surface.

I. Future Provisions:
1. Future Switchboard Sections: Equip horizontal bus with splicing hardware for

additional switchboard sections.

2. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit breaker compartment.

J. Markings and Labeling:
1. Provide identification and warning labels/nameplates exterior to equipment resistant to weather, UV, and intended installation environment.
2. Provide engraved nameplate identifying project-specific equipment tag and service description.
3. Provide one-line diagram on etched laminate plate.
4. Provide warning labels/nameplates complying with ANSI Z535.4 at access locations to advise personnel of possible hazards in accordance with listing, NFPA 70, NFPA 70E, and other applicable standards.
5. Provide scannable QR code on front face of equipment for access to maintenance logbook application/website available on PC/mobile device.

K. Control Power:
1. Control Circuits: 120 VAC control power transformer
2. Control Wiring: Factory install with bundling, lacing, and protection. Provide flexible conductors for size 8 AWG and smaller, across hinges, and for interconnections between shipping units.
3. Electrically Interlocked Main and Tie Circuit Breakers: Connect two control power transformers with interlocking relays to primary side of each control power transformer at line side of associated main circuit breaker. Provide 120 V secondaries connected through automatic transfer relays to enable automatic transfer scheme.

L. Switchboards with Drawout Circuit Breakers: Provide overhead circuit breaker lifting device mounted at top front of switchboard.

M. Maintenance Mode Switches:
1. Description: Local, lockable switch with blue status indicator light that permits selection of maintenance mode with alternate electronic trip unit settings for reduced fault clearing time in accordance with NFPA 70.
2. Provide for circuit breakers 1,200 A and larger unless providing other means of reducing clearing time in accordance with NFPA 70.
3. Switch Type: Provide energy reduction maintenance settings (ERMS) switches where circuit breakers are capable; otherwise provide maintenance mode settings (MMS) switches
   a. ERMS Switches: Clearing time of less than 50 milliseconds when activated.
   b. MMS Switches: Clearing time of less than 80 milliseconds when activated.
4. Insulated Case Circuit Breakers (ICCBs) and Power Circuit Breakers (PCBs) with ERMS: Provide Android/iOS mobile application that enables remote maintenance mode activation, at distance typically greater than 33 feet (10.1 m) line-of-sight.

N. Surge Protective Device (SPD):
1. Externally mounted; refer to SPD/TVSS Specification for more information.

O. Power Metering:
1. Factory installed, integrated within switchboard.
2. Applications:

a. Low-Voltage Mains: Power quality meter
b. Low-Voltage Feeders: Power and energy meter

3. Power Quality Meters:
   a. Capable of monitoring for network management, energy cost allocation, power quality analysis, asset management, operational efficiency, and compliance reporting.
   b. Products:
      1) Schneider Electric; PowerLogic ION9000 Meter or equal
4. Power and Energy Meters:
   a. Capable of monitoring for network management, energy cost allocation, asset management, operational efficiency, and compliance reporting.
   b. Products:
      1) Schneider Electric PowerLogic PM5563 Meter or equal

P. Communications:
1. Provide internal wired communications network for connection to Owner's network for power monitoring and equipment status/alarm information via:
   a. Connection to building management system, electrical power management system (EPMS), or other software.
   b. Access to each breaker's embedded web pages through standard web browser for maintenance review, troubleshooting, and monitoring.
2. Communications Protocol: Ethernet Modbus TCP/IP network connected via daisy-chain architecture from each circuit breaker and separate meters (where specified) upstream to switchboard Ethernet port.
3. Embedded Web Pages for Power Circuit Breakers: Provide access to drawout breaker/cradle status (where specified), energy monitoring, historical trending, maintenance indicators/logging, email alerts, and communications diagnostics.
4. Preconfigure and factory-test network communication system with user-configurable final addressing. Provide network drawings with device addresses.
5. Provide software for adjusting circuit breaker trip/alarm points, displaying trip curves, and updating firmware.
6. Internal Network Wiring: Shielded cables with pluggable connectors to facilitate connection across shipping splits.
7. Panel Server:
   a. Capable of acting as solution- and services-enabler for energy management system located on premises or cloud based, remote from building.
   b. Support IEEE 802.11 a/b/g/n (Wi-Fi).
   c. Provide two Ethernet ports, configurable either as bridged ports or separated ports with one IP address for each.
   d. Capable of serving as wired gateway to access downstream serial- and Ethernet-connected Modbus-enabled electrical devices and values in real time.
   e. Support IEEE 802.15.4 (Zigbee) as data concentrator for close distance, wireless devices.
   f. Collects and stores WAGES (Water, Air, Gas, Electricity, Steam) consumption readings.
   g. Provide integral web pages for accessing stored data including views of real-time data for each connected device and summary of connected devices; access to login page via HTPPS.
   h. Designed through secured development lifecycle in accordance with IEC 62443-4-1.
   i. Provide option to disable ports or protocols not used.

Q. Electrical Power Management System Capabilities:
1. Provide communications connectivity and functionality to support electrical power management system (EPMS), including but not limited to:
a. Communications connectivity via Ethernet network and protocols of EPMS and related equipment, either through communications gateway or integral interface.
b. Internal wired communications network for multiple sections/devices to provide single point of connection to EPMS network.
c. Compliance with recognized cybersecurity requirements.
d. Breaker aging modeling for electronic trip circuit breakers.
e. Remote EPMS capability for equipment configuration, operational control, electrical power monitoring, power quality monitoring, compliance, and correction; alarm monitoring with event log.
2. Provide factory-tested native software compatibility, including the following:
a. Capability for pre-engineered, interactive graphical display screens to view and analyze real-time device data.
b. Pre-mapping of registers to standard measurement names without need for additional configuration or internal device registers.
c. Automatic collection and logging of device data by EPMS software without additional configuration.

2.3 OVERCURRENT PROTECTIVE DEVICES

A. Circuit Breakers:
1. Interrupting Capacity: As required to provide short circuit current rating indicated.
2. Insulated Case Circuit Breakers (ICCBs):
a. Description: Quick-make, quick-break circuit breakers with two-step stored energy closing mechanism; maximum five-cycle closing time.
b. Listed and labeled as complying with UL 489.
c. Construction:
1) Provide fixed-mount circuit breakers unless otherwise indicated
d. Electronic Trip Units:
1) Microprocessor based, with circuit breaker status display and LED trip indicators.
2) Provide energy reduction maintenance settings (ERMS).
3) Provide network monitoring capability for amperage, voltage, power, energy, and harmonics.
4) Provide capability to upgrade by uploading digital modules without requiring replacement/modification of hardware.
5) Where indicated on drawings, provide electronic trip units with field-adjustable long-time, short-time, instantaneous, and ground-fault protection settings.
e. Provide the following where indicated or required:
1) Shunt Trip: Provide 120 VAC coil energized from separate circuit.
2) Auxiliary Contacts: One SPDT switch
3) Undervoltage Release: For tripping circuit breaker between 35 and 75 percent of rated voltage
4) Remote trip indication and control.
5) Key Interlock: Externally mount to prohibit circuit breaker operation; key removable only when circuit breaker is in off position.
f. Control Voltage: 120 VAC
3. Power Circuit Breakers (PCBs):
a. Description: Quick-make, quick-break circuit breakers with two-step

stored energy closing mechanism; maximum five-cycle closing time.

b. Listed and labeled as complying with UL 1066.

c. Construction:

1) Provide fixed-mount circuit breakers unless otherwise indicated

d. Electronic Trip Units:

1) Microprocessor based, with circuit breaker status display and LED trip indicators.

2) Provide energy reduction maintenance settings (ERMS).

3) Provide network monitoring capability for amperage, voltage, power, energy, and harmonics.

4) Provide capability to upgrade by uploading digital modules without requiring replacement/modification of hardware.

5) Where indicated on drawings, provide electronic trip units with field-adjustable long-time, short-time, instantaneous, and ground-fault protection settings.

e. Provide the following where indicated or required:

1) Shunt Trip: Provide 120 VAC coil, energized from separate circuit.

2) Auxiliary Contacts: One SPDT switch for indicating status of circuit breaker contacts.

3) Undervoltage Release: For tripping circuit breaker between 35 and 75 percent of rated voltage

4) Remote trip indication and control.

5) Key Interlock: Externally mount to prohibit circuit breaker operation; key removable only when circuit breaker is in off position.

f. Control Voltage: 120 VAC

4. Molded Case Circuit Breakers (MCCBs):

a. Comply with FS W-C-375; listed and labeled as complying with UL 489.

b. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.

c. Circuit Breaker Type:

1) Provide thermal magnetic circuit breakers unless otherwise indicated.

d. Electronic Trip Units:

1) Microprocessor based, with circuit breaker status display and LED trip indicators.

2) Where indicated on drawings, provide electronic trip units with field-adjustable long-time, short-time, instantaneous, and ground-fault protection settings.

3) Provide network monitoring capability for amperage, voltage, and power where indicated.

e. Provide the following where indicated or required:

1. Shunt Trip: Provide 120 VAC coil, energized from separate circuit.
2. Auxiliary Contacts: One SPDT switch for indicating status of circuit breaker contacts.
3. Undervoltage Release: For tripping circuit breaker between 35 and 75 percent of rated voltage
4. Remote trip indication and control.
5. Key Interlock: Externally mount to prohibit circuit breaker operation; key removable only when circuit breaker is in off position.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine equipment exterior and interior for damage, including but not limited to, structure, moisture, and mildew.

B. Examine for conditions detrimental to completion of work, including:
   1. Verify concrete pads are level and free of irregularities.
   2. Verify installation space is enclosed and weatherproof.
   3. Verify wet work located in or in close proximity to switchboard installation location is completed and dry.
   4. Verify work above ceilings is complete.

3.2 INSTALLATION

A. Install equipment in accordance with manufacturer's written instructions.

B. Install switchboards in accordance with NECA 1, NECA 400, and NEMA PB 2.1.

C. Unless otherwise indicated, install and anchor switchboards on raised concrete pad high

D. Set field-adjustable circuit breaker tripping function settings as determined by coordination study.

E. Identify switchboard operating instructions, including but not limited to control and key interlocking sequences and emergency procedures.
   1. Use metal frame with clear acrylic cover. Mount on front of switchboard unless otherwise indicated.

3.3 FIELD QUALITY CONTROL

1. Include necessary material, equipment, labor, and technical supervision.
2. Replace damaged or malfunctioning equipment and report discrepancies or installation issues.
3. Identify switchboards with label indicating inspection/testing agency and date of service.

A. Operational Readiness Testing:
   1. Inspect and test equipment and associated systems for conformance to Contract Documents, including equipment manufacturer's recommendations, and readiness for operation.
      a. Visually inspect for physical damage and proper installation.
      b. Perform tests in accordance with manufacturer's instructions.
      c. Perform tests to verify compliance with Contract Documents.
      d. Perform tests to verify equipment is ready for operation.
      e. Touch-up paint chips and scratches with manufacturer-supplied paint.
      f. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit.
      g. Measure, using high potential testing, insulation resistance of each bus structure phase-to-phase and phase-to-ground for one minute each, at minimum test voltage of 1,000 VDC.
         1) Comply with manufacturer's documented specific testing procedures.
         2) Minimum Insulation Resistance: 1 megohm.
      h. Physically test key interlock systems for proper functionality prior to energizing.
      i. Test continuity of each circuit.
      j. Perform each electrical test and visual/mechanical inspection listed in NETA ATS as applicable. Certify compliance with test parameters.

1) Switchboards: See Section 7.1.
2) Fusible Switches: See Section 7.5.
3) Circuit Breakers: See Section 7.6.
4) Relays: See Section 7.9.
5) Instrument Transformers: See Section 7.10.
6) Meters: See Section 7.11.
7) Ground Fault Protection Systems: See Section 7.14.

B. Correct deficiencies and replace damaged or defective switchboards or associated components.

3.4 CLOSEOUT ACTIVITIES

A. Training:
1. Train Owner's personnel on operation and maintenance of system.
a. Accommodate minimum of twenty attendees.
b. Provide not less than two repeated session(s) with four hours of classroom and hands-on training.
c. Training Reference: Provide manuals and documentation for each participant
d. Instructor: Factory-trained manufacturer's representative.
e. Location: Project site.
2. Provide sufficient time and detail in each session to cover the following at minimum:
a. Operation theory.
b. Major equipment components.
c. Equipment operation.
d. Equipment configurations.
e. Maintenance, troubleshooting, and repair.
f. Component-level parts replacement.

3.5 PROTECTION

A. Protect installed switchboards from subsequent construction operations.

END OF SECTION

SECTION 26 24 16 - PANELBOARDS

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes service and distribution panelboards rated 600 V and less, including the following:
   1. Distribution panelboards.
   2. Lighting and appliance branch-circuit panelboards.

B. Equipment specified in this Section includes distribution equipment that may be installed as part of an Integrated Power System Switchboard. Refer to Drawings for devices that may be installed together as Integrated Power System Switchboard.

1.2 DEFINITIONS

A. DPM: Multifunction Digital-Metering Monitor

B. EMI: Electromagnetic interference.

C. GFCI: Ground-fault circuit interrupter.

D. GFEP: Ground-fault equipment protection.

E. RFI: Radio-frequency interference.

F. RMS: Root mean square.

G. SPDT: Single pole, double throw.

1.3 PERFORMANCE REQUIREMENTS

A. Overcurrent Protective Device Coordination: All overcurrent protective devices proposed for inclusion in the Work shall be selected to be selectively coordinated with the overcurrent protective devices installed on their supply side such that an overcurrent event (overload, short- circuit, or ground-fault) occurring at the lowest level in the system (branch circuit) cannot cause the feeder protective device supplying the branch circuit panelboard to open. This coordination shall be carried through each level of distribution for all branches of normal and emergency power. Refer to Division 26 Section 26 05 73 "Overcurrent Protective Device Coordination Study" for additional requirements.

1.4 SUBMITTALS

A. Simultaneous Action Submittals: Panelboard Product Data submittal shall be made in conjunction with action submittals required under Division 26 Section “Overcurrent Protective Device Coordination Study.”

B. Product Data: For each type of panelboard, overcurrent protection device, accessory, and related component, include the following:
   1. Manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.
   2. Rated capacities, features, operating characteristics, furnished specialties, factory settings, accessories and time-current characteristic curves for individual relays and overcurrent protective devices.
      a. Time-current curves for each type of overcurrent protection device. Include hardcopy of characteristic curve and TCC Number for use with Power Tools by

Easy Power. Indicate available setting points and selectable ranges for each type of adjustable overcurrent protection device.

C. Shop Drawings: For each panelboard and related equipment, include the following:
   1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show method of field assembly and location and size of each field connection. Include the following:
      a. Tabulation of installed devices with features and ratings.
      b. Enclosure types and details.
      c. Outline and general arrangement drawing showing dimensions, shipping sections, and weights of each assembled section.
      d. Bus configuration with size and number of conductors in each bus run, including phase, neutral, and ground conductors of main and branch buses.
      e. One-line diagram.
      f. Bus current and voltage ratings.
      g. Short-time and short-circuit current rating of equipment assembly.
      h. Feeder entry locations and lug configuration.
      i. Elevation drawing showing locations for anchor bolts**.**
      j. Nameplate legends.
   2. Wiring Diagrams: For each type of panelboard and related equipment, include the following:
      a. Power, signal, and control wiring.

D. Panelboard Directories: For installation in panelboards.

E. Field quality-control Test Method and Procedure: List of procedures to be used during functional and operations sequence testing. Method of Procedure should include but not be limited to the following:
   1. Tabulation of Testing Equipment and PPE required for tests.
   2. Schedule of Shutdowns required.
   3. Manufacturer’s Recommended Pre-Start Checklists for the following:
      a. Overcurrent Protection Devices
   4. Step-by-Step Testing Operations and Criteria for tests listed below “Field quality-control”.

F. Field quality-control test reports including the following:
   1. Test results that comply with requirements.
   2. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

G. Operation and Maintenance Data: For electrical equipment, accessories and components to be included in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section 01 78 23 "Operation and Maintenance Data," include the following:
   1. Manufacturer's routine maintenance requirements for panelboard and all installed components.
   2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
   3. Time-current curves, including selectable ranges for each type of relay and overcurrent protective device. Include directory listing each adjustable breaker included in the Work and their final set points.
   4. Manufacturer's sample system checklists and log sheets.

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and

accessories through one source from a single manufacturer, unless otherwise indicated.
1. Breaker Manufacturer: Manufacturer for breakers shall be the same as the manufacturer of other breakers proposed for other portions of the Work.

B. Product Options: Drawings indicate spatial allocation for panelboards, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum spatial allocation. Refer to Division 01 Section 01 40 00 "Quality Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. Comply with NFPA 70.

E. Comply with NEMA PB 1 “Panelboards”.

1.6 COORDINATION

A. Coordinate layout and installation of panelboard and components with other construction that penetrates floors, ceilings or walls or are supported by them, including but not limited to conduit, piping, other electrical equipment, light fixtures, HVAC equipment, fire-suppression-system components and adjacent surfaces. Maintain required clearances for workspace and equipment access doors and panels.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Keys: Six spares for each type of panelboard cabinet lock.
2. Touchup Paint: Three 0.5 pint (250 mL) containers of paint matching enclosure finish.
3. Indicating Lights: one for every ten of each type and rating installed. Furnish at least one of each type.
4. Spare Fuses for the following:
   a. Potential Transformer Fuses: One for every ten of each type and rating installed. Furnish at least one of each type.
   b. Control-Power Fuses: One for every ten of each type and rating installed. Furnish at least one of each type.
   c. Fuses for Fusible Power-Circuit Devices: One for every ten of each type and rating installed. Furnish at least three of each type.
5. Molded-Case Circuit Breakers rated 100 amperes and less: 1 for every 100 of each type and rating installed. Furnish at least one of each type.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide products by the following:
1. Cutler-Hammer, Inc.; Eaton Corporation.
2. Siemens
3. ABB
4. Square D; Schneider Electric

2.2 RATINGS

A. Suitable for application in 3-phase, 60-Hz, solidly grounded-neutral system, unless otherwise indicated.

B. Nominal System Voltage: As indicated on the Drawings.

C. Main-Bus: Amperage as indicated on the Drawings. Provide continuous rating across entire length of main-bus.

D. Short-Time and Short-Circuit Current: Match rating of highest-rated overcurrent protective device in panelboard assembly.
   1. Available Short-Circuit Current: As indicated on the Drawings. Refer to Division 26 Section "Overcurrent Protective Device Coordination Study" for additional requirements.

2.3 GENERAL REQUIREMENTS FOR PANELBOARDS

A. Enclosures: Flush- and surface-mounted cabinets, as indicated. NEMA PB 1.
   1. Rated for environmental conditions at installed location.
      a. Indoor Locations: NEMA 250, Type 1.
      b. Outdoor Locations: NEMA 250, Type 3R.
      c. Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
      d. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
   2. Front Cover: Provide the following, unless otherwise indicated:
      a. Hinged Front Cover: Door-in-Door construction with entire front trim hinged to box and with standard door within hinged trim cover to access device handles.
   3. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor.
   4. Gutter Extension and Barrier: Same gage and finish as panelboard enclosure; integral with enclosure body. Arrange to isolate individual panel sections.
   5. Enclosure Finish for Outdoor Units: Factory-applied finish in manufacturer's standard ANSI Gray enamel over corrosion-resistant treatment or rust-inhibiting primer coat, undersurfaces treated with corrosion-resistant undercoating.
   6. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard ANSI Gray enamel over corrosion-resistant treatment or rust-inhibiting primer coat.
   7. Directory Card: Inside panelboard door, mounted in transparent card holder metal frame with transparent protective cover.

B. Incoming Mains Location: Top or bottom.

C. Buses and Connections: Three phase, four wire, unless otherwise indicated.
   1. Phase- and Neutral-Bus Material: Hard-drawn copper, 98 percent conductivity.
   2. Ground Bus: Hard-drawn copper of 98 percent conductivity, Adequate for feeder and branch-circuit equipment ground conductors; bonded to box. Equipped with compression connectors for feeder and branch-circuit ground conductors.
   3. Neutral Buses: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads.
   4. Bus Size: Comply with UL 489, including allowance for spare circuit breakers and spaces for future circuit breakers. Include bus to extend the full length of vertical sections.
   5. Feed-Through Lugs where indicated on Drawings: Mechanical type suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
   6. Isolated Equipment Ground Bus, where indicated on Drawings: Adequate for branch-circuit equipment ground conductors; insulated from box.

D. Service Equipment Label: UL labeled for use as service equipment for panelboards with main service disconnect switches.

E. Future Device Provision:. Provide bussing for full length of enclosure section. All un-used spaces in each panelboard shall be filled spare 20A/1P breakers.

F. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals. Assembly listed by an NRTL for 100 percent interrupting capacity.

G. Panelboards and overcurrent protective devices rated 240 V or less shall have short-circuit ratings as shown on Drawings, but not less than 22,000 A rms symmetrical.

H. Panelboards and overcurrent protective devices rated above 240 V and less than 600 V shall have short-circuit ratings as shown on Drawings, but not less than 25,000 A rms symmetrical.

I. DISTRIBUTION PANELBOARDS
   1. Panelboards: NEMA PB 1, power and feeder distribution type.
   2. Doors: Secured with vault-type latch with tumbler lock; keyed alike.
      a. For doors more than 36 inches high, provide two latches, keyed alike.
   3. Mains: Circuit breaker or Lugs only. As per schedule.
   4. Branch Overcurrent Protective Devices for Circuit-Breaker Frame Sizes 125 A and Smaller: Bolt-on circuit breakers.

J. LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS
   1. Panelboards: NEMA PB 1, power and feeder distribution type.
   2. Mains: Circuit breaker or lugs only.
   3. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.
   4. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.
   5. Column-Type Panelboards: Narrow gutter extension, with cover, to overhead junction box equipped with ground and neutral terminal buses.
   6. Panelboards that accept plug-on breakers are not permitted.

2.4 OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breaker Requirements: UL 489, NEMA AB 3, with interrupting capacity rating to meet available fault current.
   1. Thermal-Magnetic Circuit Breakers for 150 amp and smaller unless noted otherwise: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits.
   2. Electronic trip-unit circuit breakers larger than 150 amp:
      a. RMS sensing
      b. Field-replaceable rating plug or electronic trip
      c. Digital display of settings, trip targets, and indicated metering displays.
      d. Integral test jack for connection to portable test set or laptop computer.
      e. Field-adjustable settings:
         1) Long- and short-time pickup levels.
         2) Long- and short-time time adjustments.
         3) Instantaneous trip.
         4) Ground-fault pickup level, time delay, and I^2t response, where indicated.
         5) Ground-fault indication alarm, where indicated.
         6) Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection and short-time trip function.
   3. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
   4. GFCI Circuit Breakers: Single- and two-pole configurations with 6-mA trip sensitivity. Provide as indicated and as required by NFPA 70:2020 for personnel protection.
   5. GFEP Circuit Breakers: Single- and two-pole configurations with 30-mA trip sensitivity. Provide as indicated and as required by NFPA 70:2020 for equipment protection.
   6. AFCI Circuit Breakers: Single- and two-pole configurations. Provide as indicated and

as required by NFPA 70:2020 for personnel protection.

B. Molded-Case Circuit-Breaker Features: Standard frame sizes, trip ratings, and number of poles. Provide the following features for all included in the Work:
   1. Lugs: Mechanical style with compression lug kits, suitable for number, size, trip ratings, and conductor material shown on plans.
   2. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HACR for heating, air-conditioning, and refrigerating equipment.
   3. Lock-Out Tag Provisions: For installing at least three Lock-Out tags on each circuit breaker to secure the breaker and prevent movement mechanism.
   4. Communication Capability: Communication module with functions and features compatible with power monitoring and control system
   5. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.

C. Circuit-Breaker Accessories: Standard frame sizes, trip ratings, and number of poles. Provide the following accessories where indicated:
   1. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces where equipment will be installed for compliance with installation tolerances, required clearances, and other conditions affecting performance.

B. Examine roughing-in of conduits to verify the following:
   1. Wiring entries comply with layout requirements.
   2. Entries are within conduit-entry tolerances specified by manufacturer and no feeders will have to cross section barriers to reach load or line lugs.

C. Verify that ground connections are in place and that requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" have been met.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA 407, “Recommended Practice for the Installing and Maintaining Panelboards” as published by the National Electrical Contractors Association.

B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from panelboards and components once unit is secured in place.

C. Comply with mounting and support requirements specified in Division 26 Section "Hangers and Supports for Electrical Systems."

D. Mount top of trim 90 inches above finished floor, unless otherwise indicated.

E. Mount plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish.

F. Install overcurrent protective devices, controllers, and instrumentation.

G. Install filler plates in unused spaces.

H. Arrange conductors in gutters into groups and bundle and wrap with wire ties.

I. For Recessed Panels: Stub four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future.

J. Close unused conduit opening or other unused holes in sides of box with proper mating blank- off plates.

K. Do not use gutters of panelboards as raceways for routing feeder conductors from bottom entrance to top-feed lugs or vice versa; an external gutter or conduit shall be used for this purpose.

3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components and provide warning signs as specified in Division 26 Section "Identification for Electrical Systems."

B. Equipment Identification Nameplates: Label each panelboard with engraved Equipment Identification Label as specified in Division 26 Section "Identification for Electrical Systems."

C. Distribution Panelboard Feeder OCPD Labels: Label each OCPD with nameplate that indicates the device it feeds using engraved Equipment Identification Label as specified in Division 26 Section "Identification for Electrical Systems."

D. Panelboard Directory: Create a directory to indicate name/descriptions of installed circuit loads, including final room numbers**.** Obtain approval before installing within clear plastic pocket inside panelboard cover. Use a computer or typewriter to create directory; handwritten directories are not acceptable.

E. Diagram and Instructions:
   1. Frame and mount the following items in clear acrylic plastic holder on the front of panelboard.
      a. Operating Instructions: Printed basic instructions for panelboard, including control and emergency procedures where applicable.
   2. Storage for Maintenance Manual: Include a rack or holder, near the operating instructions, for a copy of maintenance manual.

3.4 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:
   1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.

B. Perform the following field tests and inspections and prepare test reports:
   1. Inspect panelboard installation, including wiring, components, connections, and equipment. Test and adjust components and equipment.
   2. Verify that electrical control wiring installation complies with manufacturer's submittal by means of point-to-point continuity testing. Verify that wiring installation complies with requirements.
   3. After installing panelboard but before equipment is energized, verify that grounding system at panelboard tests to specified value or better.
   4. Complete installation and startup checks according to manufacturer's written instructions.

C. Correct Deficiencies, Retest and Report:
   1. Correct unsatisfactory conditions, and retest to demonstrate compliance; replace

conductors, units, and devices as required to bring system into compliance.

2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Prepare a report that identifies switchboards, units, conductors and devices checked and describes results. Include notation of deficiencies detected, remedial action taken, and observations and test results after remedial action.

D. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING

A. Set field-adjustable overcurrent protection device trip characteristics according to settings provided by Engineer-of-Record.
   1. Settings will be provided by Engineer-of-Record after the submittal process and review of report required by Division 26 Section 26 05 73 "Overcurrent Protective Device Coordination Study." are completed.

B. Adjust moving parts and operable component to function smoothly, and lubricate as recommended by manufacturer.

C. Load Balancing: After Substantial Completion, but not more than 60 days after Final Acceptance, measure load balancing and make circuit changes.
   1. Measure as directed during period of normal system loading.
   2. Perform load-balancing circuit changes outside normal occupancy/working schedule of the facility and at time directed. Avoid disrupting critical 24-hour services such as fax machines and on-line data processing, computing, transmitting, and receiving equipment.
   3. After circuit changes, recheck loads during normal load period. Record all load readings before and after changes and submit test records.
   4. Tolerance: Difference exceeding 20 percent between phase loads, within a panelboard, is not acceptable. Rebalance and recheck as necessary to meet this minimum requirement.

3.6 PROTECTION

A. Temporary Heating: Maintain a clean dry space with uniform temperature in accordance with manufacturer’s requirements to prevent condensation. Apply temporary heating as required.

B. Protect equipment from exposure to dirt, fumes, water, corrosive substances, and physical damage.

END OF SECTION 26 24 16

SECTION 26 25 00 - ENCLOSED BUS ASSEMBLIES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following:
   1. Feeder-bus assemblies.

1.2 SUBMITTALS

A. Shop Drawings: For each type of bus assembly.
   1. Show fabrication and installation details for enclosed bus assemblies. Include plans, elevations, and sections of components. Designate components and accessories, including clamps, brackets, hanger rods, connectors, straight lengths, and fittings.
   2. Show fittings, materials, fabrication, and installation methods for listed fire-stop barriers.
   3. Indicate required clearances, method of field assembly, and location and size of each field connection.
   4. Detail connections to switchgear, switchboards, transformers, and panelboards.
   5. Wiring Diagrams: Power, signal, and control wiring.

B. Coordination Drawings: Submit Coordination Drawings including:
   1. Bus-assembly routing plans and elevations, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
      a. Structural members in the paths of bus assembly.
      b. HVAC, plumbing items, and architectural features in the paths of conduit groups. Denote where systems share common supports.
      c. Vertical and horizontal enclosed bus-assembly runs, offsets, and transitions.
      d. Clearances for access above and to the side of enclosed bus assemblies.
      e. Vertical elevation of enclosed bus assemblies above the floor or bottom of structure.
      f. Support locations, type of support, and weight on each support.
      g. Location of adjacent construction elements including but not limited to luminaires, HVAC and plumbing equipment, fire sprinklers and piping, signal and control devices, and other equipment.

C. Product Certificates: For each type of enclosed bus assembly, signed by product manufacturer.

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain enclosed bus assemblies through one source from a single manufacturer.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NEMA BU 1, "Busways."

D. Comply with UL 857, "Busways."

E. Comply with NFPA 70.

1.4 COORDINATION

A. Coordinate layout and installation of enclosed bus assemblies and suspension system with other construction that penetrates ceilings or floors or is supported by them, including but not limited to luminaires, HVAC equipment, fire-suppression system, and partition assemblies.

B. Coordinate size and location of concrete curbs around openings for vertical bus. Concrete, reinforcement, and formwork requirements are specified in Division 03.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Eaton Electrical Inc.; Cutler-Hammer Products.
   2. ABB
   3. Square D; Schneider Electric.
   4. Siemens

2.2 ENCLOSED BUS ASSEMBLIES

A. Feeder-Bus Assemblies: NEMA BU 1, low-impedance bus assemblies in nonventilated housing; single-bolt joints; ratings as indicated.
   1. Voltage: As Indicated on Drawings
   2. Neutral Capacity: 200 percent rated.
   3. Temperature Rise: 55 deg C above 40 deg C ambient maximum for continuous rated current.
   4. Bus Materials: Current-carrying copper conductors, fully insulated with Class 130C insulation except at joints; plated surface at joints.
   5. Ground:
      a. 50 percent capacity ground utilizing integrated housing ground.
   6. Enclosure: Steel or Aluminum with manufacturer's standard finish.
      a. NEMA-3R
   7. Fittings and Accessories: Manufacturer's standard.
   8. Mounting: Arranged flat, edgewise, or vertically without derating.
   9. Provide detailed assembly and installation instructions including NEMA BU1.1 requirements with the equipment.

PART 3 EXECUTION

3.1 INSTALLATION

A. Do not install enclosed bus assemblies when bus assembly is not protected from moisture.

B. Install enclosed bus assemblies in accordance with the requirements of NEMA BU 1.1.

C. Comply with NECA 408, “Standard for Installing and Maintaining Busways” as published by the National Electrical Contractors Association.

D. Comply with mounting and support requirements specified in Division 26 Section 26 05 29 "Hangers and Supports for Electrical Systems."

E. Support bus assemblies independent of supports for other elements including but not limited to equipment enclosures at connections to panelboards and switchboards, pipes, conduits, ceilings, and ducts.

F. Install expansion fittings at locations where bus assemblies cross building expansion joints. Install at other locations so distance between expansion fittings does not exceed

manufacturer's recommended distance between fittings.

G. Construct rated fire-stop assemblies where bus assemblies penetrate fire-rated elements such as walls, floors, and ceilings. Seal around penetrations.

H. Install weatherseal fittings and flanges where bus assemblies penetrate exterior elements such as walls or roofs. Seal around openings to make weathertight.

I. Coordinate bus-assembly terminations to equipment enclosures to ensure proper phasing, connection, and closure.

J. Tighten bus-assembly joints with torque wrench or similar tool recommended by bus-assembly manufacturer. Tighten joints again after bus assemblies have been energized for 30 days.

K. Install bus-assembly, plug-in units. Support connecting conduit independent of plug-in unit.

L. Where busway is installed outdoors it shall have a stainless steel custom fabricated shroud places over the bus to prevent rain from collecting on top of the busway. The shroud shall cover the busway until indoors.

3.2 CONNECTIONS

A. Ground equipment according to Division 26 Section 26 05 26 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Division 26 Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.3 SLEEVE AND SLEEVE SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Apply Sleeve and Sleeve Seal where raceways, cables, wireways, cable trays, or busways penetrate concrete slabs, concrete or masonry walls, or fire-rated floor and wall assemblies.

3.4 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare certified test reports:
   1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
   2. Visual and Mechanical Inspections
      - Verify correct alignment and fit of all busway sections and fittings.
      - Check mechanical and electrical joints for tightness; re-torque to manufacturer’s values.
      - Verify phase sequence and phasing identification.
      - Inspect for proper grounding connections and bonding jumpers across expansion fittings.
      - Verify that firestop and weather seals are installed per UL-listed systems.
   3. Insulation Resistance Testing
      - Perform megger test on each phase bus and ground bus.
      - Test at 1000 VDC for systems up to 600 V.
      - Minimum insulation resistance: 100 megohms or manufacturer’s published value.
   4. Continuity Testing
      - Verify electrical continuity of phase, neutral, and ground buses throughout the entire assembly.
      - Verify bolted joint continuity by low-resistance ohmmeter (DLRO).
   5. Ground-Fault Integrity Testing
      - Verify effective grounding path per NEC 250.4.

- Test continuity of all bonding jumpers, housing grounds, and neutral-to-ground connections (where required).

6. Infrared Thermographic Scan
   - After load energization and 30 days of operation, perform IR scan of all accessible busway joints and connections.
   - Document any hot spots >30°C above ambient; re-torque and retest.

3.5 PROTECTION

A. Temporary Heating: Maintain a clean dry space with uniform temperature in accordance with manufacturer's requirements to prevent condensation. Apply temporary heating as required.

B. Protect equipment from exposure to dirt, fumes, water, corrosive substances, and physical damage.

C. Provide final protection to ensure that moisture does not enter bus assembly.

END OF SECTION 26 25 00

SECTION 26 25 50 – GENERATOR DOCKING STATION

PART 1 GENERA

1.1. QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ETL/UL LISTED to 1008 Standards

C. UL 50 LISTED

1.2. COORDINATION

A. Coordinate layout and installation of Generator Docking Station, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels

1.3. GUARANTEE/WARRANTY

A. Manufacturer Warranty shall be provided for a minimum of 1 Year,
   1. Extended Warranty will be supplied upon at user's request at an additional charge from Manufacturer.

B. The equipment installed under this contract shall be left in proper working order

C. New materials and equipment shall be guaranteed against defects in composition, design or workmanship. Guarantee certificates shall be furnished.

PART 2 PRODUCTS

2.1. DOCKING STATION

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. TRYSTAR
   2. ASCO

2.2. GENERAL REQUIREMENTS

A. Enclosure
   1. NEMA 3R Rain-Tight Aluminum Enclosure
      a. Pad-lockable front door shall include a hinged access plate at the bottom for entry of temporary cabling that prevents unauthorized tampering while in use.
      b. NEMA 3R Integrity shall be maintained while temporary cabling is connected during use
      c. Front and Side shall be accessible for maintenance
      d. Top, Side, and Bottom shall be accessible for permanent cabling
   2. Powder coat
      a. Paint after fabrication shall be Hammer tone Gray

B. Phase, Neutral, and Ground Busbar

1. Material: Silver-plated Copper
2. Equipment Ground Bus: bonded to box.
3. Isolated Ground Bus: insulated from box.
4. Ground Bus: 50% of phase size.
5. Neutral Bus: Neutral bus rated 100 percent of phase bus.

C. Temporary generator connectors shall be Camlok style mounted on gland plate.
1. Camlok shall be 16 Series model and color coded according to system voltage requirements.
2. Camlok connections shall be Bus Bar Style, Cabling or Double Set Screw is not acceptable
3. Camlok connection shall be protected against accidental contact while not in use

D. Permanent Connection shall be factory installed broad range set-screw mechanical type, located behind a physical barrier

E. Short Circuit & Withstand Rating
1. Shall be minimum 100 KAIC unless otherwise indicated on drawings

F. Factory Installed Phase Rotation Monitor Device:
1. Phase monitoring relay to be Siemens 3U4512-1AR20 or equal and factory installed

G. Additional accessories shall be included in submittal drawing as follows: A: SCADA Terminal Port

PART 3 EXECUTION

1.1. EXAMINATION

A. Examine elements and surfaces to receive Generator Docking Station for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected

1.2. INSTALLATION

A. Base Mounted
1. Install anchor bolts to elevations required for proper attachment to Generator Docking Station.

B. Provide all necessary interconnections from SCADA Terminal Port to owners Schneider EcoStrucutre SCADA system.

1.3. IDENTIFICATION

A. Comply with requirements in Division 26 Section "Identification for Electrical Systems."

B. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.

C. Label each enclosure with engraved metal or laminated-plastic nameplate.

END OF SECTION

SECTION 26 27 13 - ELECTRICAL MEETING

PART 1 - GENERAL

1.1 SUMMARY

A. Defines all equipment requiring electricity metering.
   1. Distribution panels
   2. Switchgear
   3. All other equipment as noted within electrical drawings

1.2 SCOPE

A. The contractor shall furnish, install, and test the electricity metering system as indicated on the electrical plans, wiring diagrams, panel schedules, and as specified herein.

1.3 REFERENCES

A. UL - Underwriters Laboratories Inc.

B. ETL - Edison Testing Laboratories (Intertek)

C. ANSI C12.1 - Code for Electricity Metering

D. NFPA 70, Article 100

E. NECA 1 - Standard for Good Workmanship in Electrical Construction

F. CSA-C22.2 NO. 61010-1-12

1.4 SUBMITTALS

A. Product Data: Provide dimensions, materials, finishes, and accessories. Describe electrical operating conditions and all features. Include the following:
   1. Electricity metering equipment

B. Manufacturer's Instructions: Include wire diagrams, shop drawings, instructions for handling, examination, preparation, and installation of product(s).

1.5 REGULATORY REQUIREMENTS

A. Conform to requirements of ANSI C12.1 & NFPA 70, Article 100.

B. Products shall be listed and/or recognized by UL or ETL.

PART 2 - PRODUCTS

2.1 AVAILABLE MANUFACTURERS

A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.

2.2 EQUIPMENT FOR ELECTRICITY SUBMETERING

A. Manufacturers:
   1. Packet Power or approved equal

B. Kilowatt-Hour/Demand Meter: Electronic single- and three-phase meters, measuring

electricity use and demand.

1. Voltage and Phase Configuration: Meter shall be designed for use on circuits with voltage rating and phase configuration indicated for its application.
2. Display: OLED, indicating accumulative kilowatt hours, current demand, and current (A) load.
3. Communication interface
   a. Web-based user interface to allow review of real time data and enable mass firmware updates.
   b. 3rd party integration via supported protocols (SNMP, Modbus TCP, BACnet, MQTT)
4. Current Transformers: Current-sensing type, with current or voltage output, selected for optimum range and accuracy for ratings of circuits indicated for this application.
   a. Split-core current transformers or Rogowski coils with output of 333mV available for 15-10,000A.
   b. Shunted and individually replaceable via Molex quick disconnect.
   c. Wire lead lengths are customizable and can be extended up to 100’.

2.3 SYSTEM DESCRIPTION - SINGLE ELECTRICITY METER

A. Provides metering of a single circuit for 1P/2W, 2P/3W, 3P/3W, and 3P/4W loads.

B. Meters must be capable of metering all voltage types up to 480V L-L.

C. Metering units must be capable of metering loads between 15A and 10,000A.

D. System accuracy must be +/- 1% or less.

E. Electrical failure powering the device shall not result in a loss of energy cumulation.

F. Metering units support custom CT lead lengths and pre-configured wire harnesses.

2.4 SYSTEM DESCRIPTION - MULTI-CIRCUIT ELECTRICITY METER

A. Provides metering for 1-72 poles for 1P/2W, 2P/3W, 3P/3W, and 3P/4W loads.

B. Metering units must be configurable to meter 72 single-pole circuits, 36 two-pole circuits, or 24 three-pole circuits.

C. Metering units must be configurable to meter 32 single-pole circuits, 16 two-pole circuits, or 10 three-pole circuits.

D. Metering units must be configurable to meter 16 single-pole circuits, 8 two-pole circuits, or 5 three-phase circuits.

E. Meters must be capable of metering all voltage types up to 480V L-L.

F. Metering units must be capable of metering loads between 15A and 10,000A.

G. System accuracy must be +/- 1% or less.

H. Electrical failure powering the device shall not result in a loss of energy cumulation.

I. Metering units support custom CT lead lengths and pre-configured wire harnesses

2.5 SYSTEM DESCRIPTION - BRANCH CIRCUIT ELECTRICITY METER

A. Provides metering for 32-192 poles for 1P/2W, 2P/3W, 3P/3W, and 3P/4W loads.

B. Metering units must be configurable to meter 192 single-pole circuits, 96 two-pole circuits, or 64 three-pole circuits.

C. Metering units must be configurable to meter 128 single-pole circuits, 64 two-pole circuits, or 42 three-pole circuits.

D. Metering units must be configurable to meter 64 single-pole circuits, 32 two-pole circuits, or 21 three-pole circuits.

E. Meters must be capable of metering all voltage types up to 480V L-L.

F. Metering units must be capable of metering loads between 15A and 10,000A.

G. System accuracy must be +/- 1% or less.

H. Electrical failure powering the device shall not result in a loss of energy cumulation.

I. Metering units support custom CT lead lengths and pre-configured wire harnesses

2.6 SYSTEM MEASUREMENTS - SINGLE METER, MULTI-CIRCUIT, BRANCH CIRCUIT

A. Voltage (V) - all phases

B. Amperage (A) - all phases

C. Real Power (W) - all phases

D. Apparent Power (VA)

E. Energy (Wh) - per phase and total

F. Voltage and Current Phase Angle

G. Frequency (Hz)

H. Power Factor (PF)

2.7 METER COMMUNICATIONS AND DATA COLLECTION

A. The Systems shall be as described below:
   1. Consists of wireless communication enabled electricity meters, Ethernet Gateway collection device.
   2. Web based software
      a. Software package shall be web based with no limit to the number of users.
      b. Cloud based software is fully functional without software other than standard web browsers including, but not limited to, Internet Explorer, Google Chrome, and Firefox.
      c. Software shall support an unlimited number of metering points but are billed on a per device basis.
      d. Software shall have the ability to define circuits and display friendly names.
      e. Software shall be used for the collection, analysis, and reporting or energy data
   3. Third party software used to collect and display data or to allow all data collected to IP based applications including third party software such as DCIM, BMS, and billing systems.
   4. Data Acquisition Device
      a. The data acquisition device can be used to verify real-time data from

electricity meters.

b. Device shall operate under the following conditions: 32° to 104°F (0° to 40°C); 10% to 90% non-condensing

c. The device shall use modem and/or Ethernet connections for internet access allowing either static IP or DHCP.

5. No consumer grade protocols such as WiFi, Bluetooth, Zigbee, etc. shall be permitted for wireless data transmission due to security and performance factors.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with equipment installation requirements in NECA 1 and manufacturers' provided manuals

3.2 FIELD QUALITY CONTROL

A. Test Owner's electricity-metering installation for proper operation, accuracy, and usability of output data.

1. Connect a load of known kilowatt rating, 1.5 kW minimum, to a circuit supplied by metered feeder.
2. Turn off circuits supplied by metered feeder and secure them in off condition.
3. Run test load continuously for eight hours, minimum, or longer to obtain a measurable meter indication. Use test load placement and setting that ensures continuous, safe operation.
4. Check and record meter reading at end of test period and compare with actual electricity used based on test load rating, duration of test, and sample measurements of supply voltage at test load connection. Record test results.
5. Repair or replace deficient or malfunctioning metering equipment, or correct test setup; then retest. Repeat for each meter in installation until proper operation of entire system is verified.

END OF SECTION 26 27 13

SECTION 26 27 26 - WIRING DEVICES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
1. Receptacles, receptacles with integral GFCI, and associated device plates.
2. Hospital-grade receptacles.
3. Tamper-proof receptacles.
4. Twist-locking receptacles.
5. Snap switches and wall-box dimmers.
6. Wall-box motion sensors.
7. Wall-switch occupancy sensors and time switches.
8. Pendant cord-connector devices.
9. Poke-through assemblies, and multioutlet assemblies.

1.3 DEFINITIONS

A. EMI: Electromagnetic interference.

B. GFCI: Ground-fault circuit interrupter.

C. PVC: Polyvinyl chloride.

D. RFI: Radio-frequency interference.

E. TVSS: Transient voltage surge suppressor.

F. UTP: Unshielded twisted pair.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.
1. Receptacles, switches, plates, floor outlets, poke through assemblies, and multioutlet assemblies.

B. Samples: One for each type of device and wall plate specified, in each color specified.

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of wiring device through one source from a single manufacturer.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70 latest edition or edition enforced by state or local code authority.

D. Comply with NFPA 99 latest edition or edition enforced by state or local code authority.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Receptacles: Duplex 125 V, 20 A:
   a. Hubbell - HBL 5362.
   b. Leviton Mfg. Company Inc.-5362.
   c. Pass & Seymour-CRB5362.
   d. Pass & Seymour -PT5362A (Plug Tail Device).
2. Receptacles: Duplex: Hospital Grade 125 V, 20 A:
   a. Hubbell - HBL 8300.
   b. Leviton Mfg. Company Inc.-8300
   c. Pass & Seymour-PS8300.
   d. Pass & Seymour -PT8300.
3. Receptacles: Duplex: Hospital Grade Tamper Resistant 125 V, 20 A:
   a. Hubbell - HBL8300SG
   b. Leviton - 8300-SG.
   c. Pass & Seymour - TR63-H
4. GFI Receptacles: Weather Resistant 125 V, 20 A:
   a. Hubbell Incorporated- BR20WR
   b. Leviton Mfg. Company Inc.-WBR20
   c. Pass & Seymour- WR5362.
5. GFI Receptacles: Weather Resistant and Tamper Resistant 125 V, 20 A:
   a. Hubbell - BR2WRTR.
   b. Leviton Mfg. Company Inc.-TWR20
   c. Pass & Seymour- WR20TR.
6. Receptacles: Tamper Resistant 125 V, 20 A:
   a. Hubbell - BR20TR.
   b. Leviton Mfg. Company Inc.-TWR20
   c. Pass & Seymour- TR5362.
7. Switches-Single Pole:
   a. Hubbell- HBL 1221.
   b. Pass & Seymour - PS20AC1.
   c. Leviton Mfg. Company, Inc.- 1221-1
8. Switches-Three Pole:
   a. Hubbell- HBL1223
   b. Leviton Mfg. Company, Inc.-1223-2.
   c. Pass & Seymour-PS20AC3.
9. Switches – Occupancy Sensor Wall Type:
   a. Hubbell - LH-MT
   b. Leviton - OD15-ID
   c. Sensor Switch - WSD-PD
   d. Watt Stopper - WA-200
10. Switches – Key Operated / Security Switches:
    a. Hubbell - HBL1221RKL.
    b. Leviton - 1221-2KL
    c. Pass & Seymour - PS20AC1-KL.
11. Dimmer Switches Line Voltage:
    a. Lutron Nova T
    b. Pass & Seymour CD2000

* Dimmer must be compatible with Ballast or LED Driver.

12. Dimmer Switches 0-10V:
    a. Synergy ISD

b. Cooper SF10P

* Dimmer must be compatible with Ballast or LED Driver.

2.2 RECEPTACLES

A. Straight-Blade-Type Receptacles: Comply with UL 498, 20 amp.

B. Straight-Blade and Locking Receptacles: Heavy-Duty grade 20 amp.

C. GFCI Receptacles: Straight blade, feed-through type, Heavy-Duty grade, with integral NEMA WD 6, Configuration 5-20R duplex receptacle; complying with UL 498 and UL 943. Design units for installation in a 2-3/4-inch- (70-mm-) deep outlet box without an adapter.

D. Hospital grade and tamper resistant in all patient and pediatric.

E. Tamper resistant in all public areas.

2.3 CORD AND PLUG SETS

A. Description: Match voltage and current ratings and number of conductors to requirements of equipment being connected.
   1. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and equipment-rating ampacity plus a minimum of 30 percent.
   2. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

2.4 SWITCHES

A. Single- and Double-Pole Switches: Comply with UL 20, 20 amp.

B. Snap Switches: Heavy-Duty grade, quiet type 20 amp, 120/277 volt.

C. Live Voltage Dimmer: 120V, 2000 watt, slide to-off. Dimmer must be compatible with ballast or driver.

D. 0-10V Dimmer: 120/277VAC, capable of three way, max wattage 1200 w 120VAC, 150000 277 VAC, Dimmer must be compatible with ballast or driver. 100% to 1% continuous.

2.5 WALL PLATES

A. Single and combination types to match corresponding wiring devices.
   1. Plate-Securing Screws: Metal with head color to match plate finish.
   2. Material for Finished Spaces: As selected by Architect.
   3. Material for Unfinished Spaces: Galvanized steel.
   4. Material for Wet Locations: Cast aluminum with spring-loaded lift cover, and listed and labeled for use in "wet locations."

B. Wet-Location, Weatherproof Cover Plates:
   1. NEMA 250, complying with type 3R weather-resistant while-in-use metalor impact-resistant thermoplastic with lockable cover; non-removable gasket between the mounting plate/base and cover; stainless steel hinges and mounting hardware

2.6 POKE-THROUGH ASSEMBLIES

A. Description: Factory-fabricated and -wired assembly of below-floor junction box with multichanneled, through-floor raceway/firestop unit and detachable matching floor service outlet assembly.

1. Service Outlet Assembly: Flush type with four simplex receptacles and space for four RJ-45 jacks.
2. Size: Selected to fit cored holes in floor and matched to floor thickness.
3. Fire Rating: Unit is listed and labeled for fire rating of floor-ceiling assembly.
4. Wiring Raceways and Compartments: For a minimum of four No. 12 AWG conductors; and a minimum of four, 4-pair, Category 6 voice and data communication cables.

2.7 SPECIAL CONFIGURATION & TWIST-LOCKING RECEPTACLES

A. General: NEMA and Non-NEMA configurations as indicated on Drawings.
   1. Comply with NEMA WD 1, NEMA WD 6; and UL 498.
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Hubbell
      b. Leviton
      c. Pass & Seymour

2.8 MULTIOUTLET ASSEMBLIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Hubbell Incorporated; Wiring Device-Kellems.
   2. Wiremold Company

B. Components of Assemblies: Products from a single manufacturer designed for use as a complete, matching assembly of raceways and receptacles. Power receptacles meeting the requirements for receptacles listed in this section above, unless otherwise indicated.

C. Raceway Material: As indicated on Drawings.

D. Finish: As selected by Architect

E. Wire: No. 12 AWG, unless otherwise noted.

F. Power Receptacle:Devices as indicated on Drawings

G. Voice and Data Communication Outlet: Devices as Indicated on Drawings.

2.9 FINISHES

A. Color:
   1. Wiring Devices Connected to Normal Power System: As selected by Architect, unless otherwise indicated or required by NFPA 70.2.
   2. Wiring Devices Connected to Emergency Power System: Red.
   3. If there is UPS furnished by T.G.HS with outlets not in the UPS, receptacle needs to be blue.

PART 3 EXECUTION

3.1 INSTALLATION

A. Install devices and assemblies level, plumb, and square with building lines.

B. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical, and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

C. Remove wall plates and protect devices and assemblies during painting.

D. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.

E. Install weather resistant receptacles in damp and wet locations per N.E.C. requirements.

F. Mounting Heights: Comply with applicable codes and requirements of Authorities Having Jurisdiction. Mount devices as indicated on Drawings, including but not limited to Architectural elevations. Coordinate all above counter receptacles with backsplash to avoid interferences. All dimensions are given to centerline of box above finished floor (AFF), unless otherwise indicated.

G. Device Plates and Covers:
   1. Do not use oversized or extra-deep plates.
   2. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.
   3. Install weather-proof-while-in-use covers over receptacles in wet, damp and exterior locations.
   4. Group adjacent devices under single, multigang wall plates.

H. Floor Service Outlets, Service Poles and Poke-Thru Device
   1. Adjust locations of floor service outlets and Poke-Thru devices to suit arrangement of partitions and furnishings. Coordinate revised location with Structural Engineer.

3.2 APPLICATION

A. Receptacles in Patient Care Areas: Install Hospital Grade devices where device is located within a Patient Care Area as defined by NFPA 70 Article 517 or the Authorities Having Jurisdiction.

B. GFCI Receptacles: Install in locations as indicated but in no case less than those listed below:
   1. Where device is located on the exterior of the building, provide with Wet-Location Weatherproof Cover Plate.
   2. Where device is located within kitchen.
   3. Where device is located in an elevator pit.
   4. Where device is located within 6 feet (2-m) of a lavatory or sink

C. Tamper-Resistant Receptacles: Install in locations as indicated but in no case less than those listed below:
   1. Public Lobbies.
   2. Waiting Rooms.
   3. Play Rooms and other similar rooms that children are expected to occupy.

3.3 CONNECTIONS

A. Ground equipment according to Division 16 Section "Grounding and Bonding."

B. Connect wiring according to Division 16 Section "Conductors and Cables."

C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values.

3.4 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. After installing wiring devices and after electrical circuitry has been energized, test for proper polarity, ground continuity, and compliance with requirements.
2. Test GFCI operation with both local and remote fault simulations according to manufacturer's written instructions.

B. Remove malfunctioning units, replace with new units, and retest as specified above.

3.5 CLEANING

A. On completion of wall plate installation, inspect exterior surfaces and perform the following:
1. Remove paint splatters and other spots.
2. Remove all temporary markings and labels.
3. Replace cracked or damaged wall plates.
4. Wipe down all wall plates with approve cleaning agent to remove fingerprints and dust.

END OF SECTION 26 27 26

SECTION 26 28 11 - LOW-VOLTAGE POWER CIRCUIT BREAKERS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Low-voltage power circuit breakers.

1.2 Related Requirements

A. Section 26 09 13 - Electrical Power Management System

B. Section 26 24 13 - Switchboards - Schneider Electric Square D FlexSeT / QED-2.

1.3 ABBREVIATIONS AND ACRONYMS

A. LVPCB: Low-voltage power circuit breakers.

B. ERMS: Energy reduction maintenance setting.

C. HMI: Human machine interface.

1.4 DEFINITIONS

A. Operator Interface Terminal (OIT): Locally mounted HMI device that provides remote monitoring and functions of connected equipment.

1.5 SUBMITTALS

A. Provide sufficient information to determine compliance with Contract Documents. Identify submittal data with specific equipment tags and/or service descriptions to which they pertain. Identify specific model numbers, options, and features of equipment proposed.

B. Indicate deviations from Contract Documents with reference to corresponding drawing or specification number and written justification for deviation.

C. Product Data: Provide manufacturer's standard catalog pages and data sheets for circuit breakers, enclosures, and other installed components and accessories.

D. Manufacturer's qualification statement.

E. Operation and Maintenance Data:
   1. Provide detailed information on system operation, equipment programming and setup, replacement parts, and recommended maintenance procedures and intervals.
      a. Include contact information for parts stocking location closest to Owner.
      b. Identify critical spare parts associated with long lead times and/or those critical to unit operation.

F. Specimen Warranty: Statement of standard warranty and extended warranty options/costs.

G. Maintenance Materials: Furnish the following for Owner's use in maintenance of project:
   1. See Section 016000 - Product Requirements for additional provisions.
   2. Spare Parts: For each type and size of unit installed.
      a. Provide minimum spare parts recommended by manufacturer, including trip coils, switches, and spring charging motors.
      b. Package and mark spare parts for long-term storage. Provide separate anti-static

containers for printed circuit boards.

3. Tools: Manufacturer-specific special tools required to install, remove, test, and maintain circuit breakers and components.
   a. Equipment Configuration Software: PC-based or mobile device application; provide one of each different communication interface cable required to connect computer/device for configuration and programming.

1.6 QUALITY ASSURANCE

A. Comply with the following:
   1. NFPA 70.
   2. Requirements of local authorities having jurisdiction.
   3. Applicable local codes.

B. Manufacturer Qualifications:
   1. Firm engaged in manufacture of specified products of types and sizes required, and whose products have been in satisfactory use in similar service for minimum of 10 years.
   2. Certified in accordance with ISO 9001 with applicable quality assurance system regularly reviewed and audited by third-party registrar. Develop and control manufacturing, inspection, and testing procedures under guidelines of quality assurance system.
   3. Service, repair, and technical support services available 24 hours per day, 7 days per week from manufacturer or their representative.
   4. Certified in accordance with ISO 14001, with product environmental profiles (PEPs) for specified products.

1.7 Warranty

A. Manufacturer Warranty: Provide manufacturer warranty for defects in material and workmanship for 12 months from date of substantial completion.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Schneider Electric; Square D

B. ABB

C. Siemens

D. Eaton Corporation

E. Source Limitations: Furnish products produced by same manufacturer as other electrical distribution equipment for project

2.2 LOW-VOLTAGE POWER CIRCUIT BREAKERS

A. Listed as complying with UL 1066.

B. Provide sealed low-voltage power circuit breaker (LVPCB), operated as indicated on drawings , with integrally mounted electronic trip units.

C. Provide fixed or drawout mounted as indicated on drawings circuit breakers.
   1. Drawout Mounted Circuit Breakers: Provide racking mechanism integral to stationary circuit breaker chassis to reduce movable weight and improve serviceability. When racking mechanism is integral to circuit breaker, provide spare breaker per frame.

D. Circuit Breaker Rating: 100 percent rated.

E. Interrupting Rating: Available up to 130 kAIR RMS at 635 V, 200 kAIR RMS at 508 V, and 200 kAIR RMS at 254 V without fuses.

F. Thirty-Cycle Withstand Ratings: Comply with application requirements.

G. Close-and-Latch Rating: Up to 150 kA peak current.

H. Maximum Closing Time:
   1. Provide maximum 5-cycle closing time.
   2. Ratings Less than 800 A: 50 milliseconds.
   3. Ratings Between 800 A and 4,000 A: 70 milliseconds.
   4. Ratings Greater than 4,000 A: 80 milliseconds.

I. Service Life:
   1. Frame Size of 3,200 A or Less: Certified for 10,000 operations without maintenance.
   2. Frame Size Greater than 3,200 A: Certified for 5,000 operations without maintenance.
   3. Provide visual contact wear indicator.

J. Operation:
   1. Provide two-step, fully-stored energy devices for quick-make, quick-break operation.
      a. Capable of open-close-open cycle without recharging.
      b. Automatically charge motor operator when breaker is closed.
      c. Step One: Actuation of operating handle or operation cycle of circuit breaker motor charges closing springs.
      d. Step Two: Operation of local close button closes circuit breaker contact, automatically charging opening springs.
   2. Anti-Pumping Function: Remains in open position if opening/closing commands occur simultaneously; after fault tripping or intentional opening using manual or electrical controls, requires closing order to be discontinued and reactivated.
   3. Provide OPEN and CLOSE buttons with lockable clear cover.
   4. Provide breaker contact and close spring status indicators; indicate "charged-not OK to close" if closing springs are charged but circuit breaker is not ready to close.
   5. Locking Provisions: For locking in connected, test, or disconnected position.
      a. Pad-Lock Provisions: One to three.
      b. Key-Lock Provisions: One to two.
   6. Support auxiliary status contacts for open/close (ON/OFF), tripped, ready to close, ready to open, and spring mechanism is charged to provide local or remote indications of proper breaker system functionality.
   7. Provide safety interlock to keep circuit breaker open if trip unit is not installed.
   8. Shunt Trip and Shunt Close Coils: Continuous-duty rated; intermittent duty rated coils dependent on coil clearing contact may be used where spare coil is provided for each breaker.

K. Construction:
   1. Case: Polyester thermoset material with high dielectric strength.
   2. Current-Carrying Components: Isolated from accessory mounting area and double-insulated from operator with accessory cover in place.
   3. Isolate each phase and ground.
   4. Equipped with metal filters to reduce effects of interruption on surfaces surrounding circuit breaker.
   5. Comply with Registration Evaluation and Authorization and Restriction of Chemicals (REACH) and Restriction of Hazardous Substances (RoHS).

L. Electronic Trip Units:
   1. Digital Modules:

a. Provide capability to upgrade trip unit functions by uploading digital modules without requiring replacement/modification of hardware.
b. Electronically manage trip unit protection functions independently of measurement functions by dedicated application-specific integrated circuit (ASIC).
c. Support uploading of digital modules to trip unit without removing power from circuit breaker.

2. Provide local and remote trip indication with cause of trip (e.g., overload, short circuit, or ground fault).
3. Visually indicate circuit breaker operating status (normal, warnings, alarms, energy reduction maintenance setting) via color-changing backlit display.
4. Provide capability to set breaker locally, via smart mobile device, or remotely through communications.
5. Provide sealable door to block use of local display for deterrence of unwanted protection setting changes.
6. Support extraction of trip cause data from trip unit and adjustment of protection settings without 24 VDC power supply or when main circuit breaker is OFF using portable power supply connected through USB port, including battery pack, smart mobile device (USB OTG), or laptop PC.
7. Provide true RMS sensing through 40th harmonic; indicate long-time pickup with LEDs.
8. Coils: Provide status, self-diagnostics (functionality and number of coil operations), and wiring diagnostics. Coils without these features to be provided with separate system to communicate status/alarms to remote monitoring system.
9. Where indicated on drawings, provide electronic trip units with the following field-adjustable protection settings:
    a. Long-Time (ANSI 49RMS/51):
        1) Pickup: Adjustable from 40 to 100 percent of nominal current rating in 1 A increments; where 1 A increments are not possible, provide complete set of rating plugs for each breaker.
        2) Delay: Adjustable from 0.5 to 24 seconds at 600 percent of long-time pickup in 0.5-second increments.
    b. Short-Time (ANSI 50TD/51):
        1) Pickup: Adjustable from 150 to 1,000 percent of long-time pickup in increments of 1 percent.
        2) Delay: Adjustable from 10 to 40 percent of I2t for ON and 0 to 40 percent of I2t for OFF in increments of 0.1 second.
    c. Instantaneous (ANSI 50):
        1) Pickup: Adjustable from 150 percent to 1,500 percent of nominal current rating.
        2) Provide OFF setting where short-time pickup is also provided.
        3) Selectable Breaking Times:
            (a) Standard: For selective coordination.
            (b) Fast: For limiting let-thru energy; between 25 and 30 milliseconds.
    d. Ground-Fault (ANSI 50N-TD/51N):
        1) Available for solidly grounded 3-phase, 3-wire or 4-wire systems.
        2) Types Supported: Residual, source ground return, and modified differential.
        3) Circuit Breakers 1,200 A or Less: Adjustable pickup from 20 to 100 percent of nominal current rating in 10 percent increments.
        4) Circuit Breakers Greater than 1,200 A: Adjustable pickup from 500 A to 1,200 A.
        5) Provide independent ground fault alarm, with separate setting.
10. Where required for selective coordination as determined by power system study, provide inverse definite minimum time lag (IDMTL) to enable adjustment of long-time

delay protection slope.

11. When voltage(s) exceeds upper or lower limits, circuit breaker trips
12. Provide active power function to trip circuit breaker when active power is negative and exceeds settings.
13. Provide dual trip curve settings for each protection function (LSIG) with separate settings for utility, generator set, or grid sources; selectable by digital input through I/O module, Ethernet, or local display.
14. Energy Reduction Maintenance Setting (ERMS):
    a. Trip Unit: Provide separate trip curve for arc energy reduction maintenance setting selected via physical selector switch or smart mobile device; operate in fast instantaneous trip mode (25 to 30 milliseconds), when trip curve is active.
    b. Limit access to engaging/disengaging ERMS mode or changing settings using padlocks or passwords.
    c. Provide remote indicator light to indicate trip unit is in ERMS mode.
15. Measurement and Analysis Functions:
    a. Provide trip unit embedded measurement for real-time metering. Where trip unit embedded measurement is not available, provide external meter.
    b. Metering Accuracy:
        1) Current and Voltage: 0.5 percent.
        2) Power and Energy: 1 percent.
        3) Specified accuracies are for total measurement system, including CT and meter.
        4) Full scale over range of 10 to 120 percent of long-time pickup.
    c. Energy Measurement:
        1) Imported and exported energy on each phase of power system network.
        2) Active, reactive, and apparent energy, per phase and total.
    d. Harmonic Analysis and Waveform Capture: Individual harmonics of voltages and currents up to 40th harmonic, calculated every 200 milliseconds in accordance with IEC 61000-4-30.
    e. Support display of measurements on breaker HMI display, smart mobile device via Bluetooth, connected remote operator interface terminal, or remote monitoring system via Modbus TCP/IP.
    f. Event Management:
    1) Provide event management to assist in compliance with NFPA 70B.
        2) Provide notification of alarms and traceability, including event history of trips, protection setting changes, diagnostics, metering, configuration, and operation.
        3) Record date and time entry was made and user ID associated with change.
        4) Support alarm activation based on measurement or counters.
        5) Support availability of events by communication via Bluetooth and Modbus TCP/IP or by software engineering tool.
    g. Internal Monitored Functions:
        1) Circuit Breaker: Coil electrical continuity checks, circuit breaker closing time, gear motor charging time, circuit breaker closing and opening counter, circuit breaker time stamp closing and opening history log.
        2) Trip Unit: Internal sensor continuity (CTs), external sensor disconnection (ENCT, ground-fault sensor, I/O modules), internal failure discrimination (ASIC, sensor plugs, internal battery, trip solenoid), wireless communication failure (Bluetooth low energy, Ethernet).
16. Smart Mobile Device App:
    a. Communicate trip cause information to smart mobile device without requiring power to trip unit.
    b. Provide virtual assistance in reclosing breaker after trip event utilizing information extracted from breaker, including waveform capture on trip event.
    c. Display circuit breaker event information, potential trip causes, list of additional

investigations needed to determine if power can be restored, and recommendations for power restoration.

17. Auto-Test Function: Monitor and communicate trip unit state, battery state, contact state, circuit breaker remaining life estimate (algorithm based), opening/closing function, and spring charging function; indicate by health state LED, embedded HMI display, and smart mobile device app.
18. Support remote open/close operation via wired communication.
19. Communications:
    a. Provide USB communication/test port to check electronic and trip mechanism operation without requiring manufacturer's special hardware tool.
    b. Provide wireless communication interface for protection settings and health checks using near field communications (NFC) and Bluetooth low energy (BLE) protocols.
    c. Provide communication interface with two Modbus TCP/IP 10/100 Mbps ports (dual-port, single network) for connection to Ethernet network for real-time access to data and settings.
    d. Provide embedded web page interface accessed via standard PC and web browser without requiring additional hardware or software.
    e. Comply with Device Profile for Web Services (DPWS) for auto-discovery on local area network (LAN).
    f. Capable of reporting drawout circuit breaker cradle position, viewable in embedded web page and over data connection to external monitoring software.
    g. Trip unit and communication accessories for all Ethernet network accessible LV circuit breakers shall comply with cyber security global standards such as ISA/IEC 62443-4-1, ISA/IEC 62443-4-2, US cyber security regulations SB327, HB2395, NFPA 70 (NEC) 240.6 (D), UL 5500, DODI 8510.01, US data privacy regulations, and shall be part of a certified ISA/IEC 62443-3-3 reference architecture.

M. Operator Interface Terminal:
1. Provide locally mounted operator interface terminals (OIT) remote from circuit breaker for each group of circuit breakers connected via Ethernet network.
    a. Provide real-time display of monitored devices.
    b. Support simple control of devices and load.
    c. Circuit Breaker Functions Displayed:
        1) Energy consumption.
        2) Electrical network data.
        3) Alarms and events.
        4) Energy quality.
        5) Device status (e.g., open, close, and tripped), indication of fault types (e.g., LT, ST, instantaneous, and ground fault), faulty phases, and interrupted current.
        6) Predictive maintenance monitoring contact wear rate, load profile, and circuit breaker counter values.

N. Electrical Power Management System Capabilities:
1. See Electrical Power System Management specification for additional requirements.
2. Provide communications connectivity and functionality to support electrical power management system (EPMS), including but not limited to:
    a. Communications connectivity via Ethernet network and protocols of EPMS and related equipment, either through communications gateway or integral interface.
    b. Remote EPMS capability for equipment configuration, operational control, electrical power monitoring, power quality monitoring, compliance, and correction; alarm monitoring with event log.
3. Provide factory-tested native software compatibility, including the following:
    a. Capability for pre-engineered, interactive graphical display screens to view and

analyze real-time device data.

b. Pre-mapping of registers to standard measurement names without need for additional configuration or internal device registers.

c. Automatic collection and logging of device data by EPMS software without additional configuration.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine equipment exterior and interior for damage, including but not limited to, structure, moisture, and mildew.

B. Examine for conditions detrimental to completion of work.

3.2 INSTALLATION

A. Install circuit breakers in accordance with manufacturer's written instructions.

END OF SECTION 26 28 11

SECTION 26 28 13 - FUSES

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following:
   1. Cartridge fuses rated 600 V and less for use in switches and controllers.

1.2 PERFORMANCE REQUIREMENTS

A. Overcurrent Protective Device Coordination: All overcurrent protective devices proposed for inclusion in the Work shall be selected to be selectively coordinated with the overcurrent protective devices installed on their supply side such that an overcurrent event (overload, short- circuit, or ground-fault) occurring at the lowest level in the system (branch circuit) cannot cause the feeder protective device supplying the branch circuit panelboard to open. This coordination shall be carried through each level of distribution for all branches of normal and emergency power. Refer to Division 26 Section "Overcurrent Protective Device Coordination Study" for additional requirements.

1.3 SUBMITTALS

A. Product Data: Include the following for each fuse type indicated:
   1. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
   2. Let-through current curves for fuses with current-limiting characteristics.
   3. Time-current curves, coordination charts and tables, and related data. Include hardcopy of characteristic curve and TCC Number for use with Power Tools by Easy Power.
   4. Tabulated schedule which indicates type, characteristics, and ratings of individual fuses and lists the devices and equipment in which they will be applied.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain fuses from a single manufacturer.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70.

1.5 PROJECT CONDITIONS

A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F (5 deg C) or more than 100 deg F (38 deg C), apply manufacturer's ambient temperature adjustment factors to fuse ratings.

1.6 COORDINATION

A. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size. Provide fuses to match utilization equipment requirements.

1.7 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fuses: Quantity equal to one for every ten of each type and rating installed. Furnish at

least three of each type.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Cooper Bussman, Inc.
   2. Eagle Electric Mfg. Co., Inc.; Cooper Industries, Inc.
   3. Ferraz Shawmut, Inc.
   4. Tracor, Inc.; Littelfuse, Inc. Subsidiary.

2.2 CARTRIDGE FUSES

A. Characteristics: NEMA FU 1, nonrenewable cartridge fuse; class and current rating indicated; voltage rating consistent with circuit voltage.

B. End Caps: End caps shall be capable of being tested if fuse is blown.

C. Indicating Feature: Fuse shall have an indicating feature which clearly indicates when fuse is blown.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.

B. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FUSE APPLICATIONS

A. Motor Branch Circuits: Class RK1, time delay.

3.3 INSTALLATION

A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.

3.4 IDENTIFICATION

A. Install labels indicating fuse replacement information on inside door of each fused switch.

B. Install labels indicating Type and Rating of fuse installed on outside of door of each fused switch.

END OF SECTION 26 28 13

SECTION 26 28 16 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 GENERAL

1.1 SUMMARY

A. This Section includes the following individually mounted, enclosed switches and circuit breakers:
   1. Fusible switches.
   2. Nonfusible switches.
   3. Molded-case circuit breakers.
   4. Enclosures.

1.2 DEFINITIONS

A. GFCI: Ground-fault circuit interrupter.

B. GFEP: Ground-fault equipment protection.

C. HD: Heavy duty.

D. RMS: Root mean square.

E. SPDT: Single pole, double throw.

1.3 SUBMITTALS

A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.
   1. Features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
   2. Time-current curves for each type of overcurrent protection device. Include hardcopy of characteristic curve and TCC Number for use with Power Tools by Easy Power. Indicate available setting points and selectable ranges for each type of adjustable circuit breaker.

B. Shop Drawings: For each enclosed circuit breaker, switch and related equipment.
   1. Dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings. Include the following:
      a. Enclosure types and details for types other than NEMA 250, Type 1.
      b. Bus configuration, current, and voltage ratings.
      c. Short-circuit current rating of device and overcurrent protective devices.
   2. Wiring Diagrams: Power, signal, and control wiring.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories through one source from a single manufacturer, unless otherwise indicated.
   1. Breaker Manufacturer: Manufacturer for breakers shall be the same as the manufacturer of other breakers proposed for other portions of the Work.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 FUSIBLE AND NONFUSIBLE SWITCHES

A. Manufacturers:
   1. Eaton Corporation; Cutler-Hammer Products.
   2. General Electric Co.; Consumer and Industrial Division.
   3. Square D/Group Schneider.
   4. Siemens

B. Fusible Switch, 1200 A and Smaller: NEMA KS 1, Type HD, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.

C. Nonfusible Switch, 1200 A and Smaller: NEMA KS 1, Type HD, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.

D. Accessories:
   1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
   2. Neutral Kit: Internally mounted; insulated, capable of being grounded, and bonded; and labeled for copper and aluminum neutral conductors.
   3. Auxiliary Contact Kit: Auxiliary set of contacts arranged to open before switch blades open.

E. Fuses are specified in Division 26 Section "Fuses."

2.3 MOLDED-CASE CIRCUIT BREAKERS AND SWITCHES

A. Manufacturers:
   1. Eaton Corporation; Cutler-Hammer Products.
   2. General Electric Co.; Electrical Distribution & Control Division.
   3. Square D/Group Schneider.
   4. Siemens

B. Molded-Case Circuit Breaker Requirements: UL 489, NEMA AB 3, with interrupting capacity rating to meet available fault current.
   1. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
   2. Electronic trip-unit circuit breakers: RMS sensing, field-replaceable rating plug, and the following field-adjustable settings:
      a. Long- and short-time pickup levels.
      b. Long- and short-time time adjustments.
      c. Instantaneous trip.
      d. Ground-fault pickup level, time delay, and I^2t response, where indicated.
      e. Ground-fault indication alarm, where indicated.
   3. GFCI Circuit Breakers: Single- and two-pole configurations with 6-mA trip sensitivity. Provide as indicated and as required by NFPA 70 for personnel protection.

4. GFEP Circuit Breakers: Single- and two-pole configurations with 30-mA trip sensitivity. Provide as indicated and as required by NFPA 70 for equipment protection.
5. Plug on breakers shall not be permissible.

C. Molded-Case Circuit-Breaker Features: Standard frame sizes, trip ratings, and number of poles. Provide the following features for all included in the Work:
1. Lugs: Mechanical style with compression lug kits, suitable for number, size, trip ratings, and conductor material; UL 486 B listed, dual rated and marked for use with copper- or aluminum load-side conductors.
2. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HACR for heating, air-conditioning, and refrigerating equipment.
3. Lock-Out Tag Provisions: For installing at least three Lock-Out tags on each circuit breaker to secure the breaker and prevent movement mechanism.
4. Plug on breakers shall not be permissible.

D. Circuit-Breaker Accessories: Standard frame sizes, trip ratings, and number of poles. Provide the following accessories where indicated:
1. Ground-Fault Protection: Provide integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.

E. Molded-Case Switch Features and Accessories:
1. Lugs: Mechanical style with compression lug kits suitable for number, size, trip ratings, and material of conductors.
2. Application Listing: Type HACR for heating, air-conditioning, and refrigerating equipment.

2.4 ENCLOSURES

A. NEMA AB 1 and NEMA KS 1 to meet environmental conditions of installed location as follows, unless otherwise indicated:
1. Indoor Locations: NEMA 250, Type 1.
2. Outdoor Locations: NEMA 250, Type 3R,
3. Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
4. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.

B. Enclosure Finish for Outdoor Units: Factory-applied finish in manufacturer's standard ANSI Gray enamel over corrosion-resistant treatment or rust-inhibiting primer coat, undersurfaces treated with corrosion-resistant undercoating.

C. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard ANSI Gray enamel over corrosion-resistant treatment or rust-inhibiting primer coat.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces where equipment will be installed for compliance with installation tolerances, required clearances, and other conditions affecting performance.

B. Examine roughing-in of conduits to verify the following:
1. Wiring entries comply with layout requirements.
2. Entries are within conduit-entry tolerances specified by manufacturer and no feeders will have to cross section barriers to reach load or line lugs.

C. Verify that ground connections are in place and that requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" have been met.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATION

A. Fused Power Circuit Device Operating Mechanism: Mechanical Trip, except Electrical Trip for switches with ground-fault protection or remotely tripped switches.

B. Molded-Case Circuit Breakers OCPD Type: Adjustable Instantaneous-Trip Circuit Breakers, unless otherwise indicated.

3.3 INSTALLATION

A. Comply with applicable portions of NECA 1, NEMA PB 1.1, and NEMA PB 2.1 for installation of enclosed switches and circuit breakers.

B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

C. Comply with mounting and support requirements specified in Division 26 Section "Hangers and Supports for Electrical Systems."

D. Mount individual wall-mounting switches and circuit breakers with tops at uniform height, unless otherwise indicated.

E. Anchor floor-mounting switches to concrete base.

F. Mount top of trim 74 inches (1880 mm) above finished floor, unless otherwise indicated.

G. Mount plumb and rigid without distortion of box. Mount recessed equipment with fronts uniformly flush with wall finish.

H. Install overcurrent protective devices, controllers, and instrumentation.

I. Install filler plates in unused spaces.

J. Arrange conductors in gutters into groups and bundle and wrap with wire ties.

K. Close unused conduit opening or other unused holes in sides of box with proper mating blank- off plates.

L. Do not use gutters of equipment as raceways for routing feeder conductors from bottom entrance to top-feed lugs or vice versa; an external gutter or conduit shall be used for this purpose.

3.4 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs as specified in Division 26 Section 26 05 53 "Identification for Electrical Systems."

B. Enclosure Nameplates: Label each enclosure with engraved Equipment Identification Label as specified in Division 26 Section 26 05 53 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:
   1. Test insulation resistance for each equipment bus, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.

3.6 ADJUSTING

A. Set field-adjustable overcurrent protection device trip characteristics according to settings provided by Engineer-of-Record.

3.7 CLEANING

A. Clean components according to manufacturer's written instructions.

B. Prior to installation of front trim and cover plates inspect interior surfaces and perform the following:
   1. Remove paint splatters and other spots.
   2. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

C. On completion of front trim and cover installation, inspect exterior surfaces and perform the following:
   1. Remove paint splatters and other spots.
   2. Remove all temporary markings and labels.
   3. Vacuum dirt and debris; do not use compressed air to assist in cleaning.
   4. Repair exposed surfaces to match original finish.

END OF SECTION 26 28 16

SECTION 26 32 13 - DIESEL GENERATOR SETS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes packaged engine-generator sets suitable for use in commercial healthcare applications with the features as specified and indicated. Engine generators will be used as the Standby power source for the system, the generator shall supply life safety and optional standby loads.

1.3 DEFINITIONS

A. Emergency Standby Power (ESP): Per ISO 8528: The maximum power available during a variable electrical power sequence, under the stated operating conditions, for which a generating set is capable of delivering in the event of a utility power outage or under test conditions for up to 200 hours of operation per year with the maintenance intervals and procedures being carried out as prescribed by the manufacturers. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 70 percent of the ESP unless otherwise agreed by the RIC engine manufacturer.

B. Prime Power (PRP): Per ISO 8528: The maximum power which a generating set is capable of delivering continuously while supplying a variable electrical load when operated for an unlimited number of hours per year under the agreed operating conditions with the maintenance intervals and procedures being carried out as a prescribed by the manufacturer. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 70 percent of the PRP unless otherwise agreed by the RIC engine manufacturer.

C. Limited Time running Power (LTP): Per ISO 8528: The maximum power available, under the agreed operating conditions, for which the generating set is capable of delivering for up to 500 hours of operation per year with the maintenance intervals and procedures being carried out as prescribed by the manufacturers.

D. Continuous Operating Power (COP): Per ISO 8528: The maximum power which a generating set is capable of delivering continuously while supplying a constant electrical load when operated for an unlimited number of hours per year under the agreed operating conditions with the maintenance intervals and procedures being carried out as a prescribed by the manufacturer.

E. Data Center Continuous (DCC): The maximum power which a generating set is capable of delivering continuously whilst supplying a variable or constant electrical load when operated for an unlimited number of hours in a data center application under the agreed operating conditions with the maintenance intervals and procedures being carried out as a prescribed by the manufacturer. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 100 percent of the DCC rating.

F. Operational Bandwidth: The total variation from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:

1. Thermal damage curve for generator.
2. Time-current characteristic curves for generator protective device.
3. Sound test data, based on a free field requirement.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, and location and size of each field connection.
1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.
2. Wiring Diagrams: Control interconnection, Customer connections.

C. Certifications:
1. Submit statement of compliance which states the proposed product(s) is certified to the emissions standards required by the location for EPA, stationary emergency application.

1.5 INFORMATIONAL SUBMITTALS

A. Source quality-control test reports.
1. Certified summary of prototype-unit test report. See requirements in Part 2 "Source Quality Control" Article Part A. Include statement indicating torsional compatibility of components.
2. Certified Test Report: Provide certified test report documenting factory test per the requirements of this specification, as well as certified factory test of generator set sensors per NFPA110 level 1.
3. List of factory tests to be performed on units to be shipped for this Project.
4. Report of exhaust emissions and compliance statement certifying compliance with applicable regulations.

B. Warranty:
1. Submit manufacturer’s warranty statement to be provided for this Project.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Manufacturer Qualifications: A qualified manufacturer. Maintain a service center capable of providing training, parts, and emergency maintenance repairs within 12 hours of reported problem.

C. Source Limitations: Obtain packaged generator sets and auxiliary components through one source from a single manufacturer.

D. Comply with NFPA 37 (Standard For the Installation and Use of Stationary Combustion Engines and Gas Turbines).

E. Comply with NFPA 70 (National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701, and 702).

F. Comply with NFPA 110 (Emergency and Standby Power Systems) requirements for Level 1 emergency power supply system.

G. Comply with UL 2200.

1.7 PROJECT CONDITIONS

A. Environmental Conditions: Engine-generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:
1. Ambient Temperature: 4.44 deg C (40.0 deg F) to 51.11 deg C (124.0 deg F).
2. Relative Humidity: 0 to 95 percent.
3. Altitude: Sea level to 60.0 feet (18.29 m).

1.8 WARRANTY

A. Base Warranty: Manufacturer shall provide base warranty coverage on the material and workmanship of the generator set for a minimum of twenty-four (24) months from substantial completion.

B. Extended Warranty: Manufacturer shall offer extend coverage of 5 years from date of registered commissioning and start-up.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: The following manufacturers are approved. All others shall seek prior approval.
1. Cummins Power Generation
2. MTU
3. Taylor Power

B. Automatic Transfer Switch: Generator must be furnished with an ASCO transfer switch. No substitutions shall be permitted.

2.2 ENGINE-GENERATOR SET

A. Factory-assembled and -tested, engine-generator set.

B. Mounting Frame: Maintain alignment of mounted components without depending on concrete foundation; and have lifting attachments.
1. Rigging Information: Indicate location of each lifting attachment, generator-set center of gravity, and total package weight in submittal drawings.

C. Capacities and Characteristics:
1. Power Output Ratings: Electrical output power rating for Standby operation of not less than 750.0kw, at 80 percent lagging power factor, 277/480, Series Wye, Three phase, 4 -wire, 60 hertz. Output breaker rating shall be: 1200/3P
2. Nameplates: For each major system component to identify manufacturer's name and address, and model and serial number of component. The engine-generator nameplate shall include information of the power output rating of the equipment.

D. Generator-Set Performance:
1. Steady-State Voltage Operational Bandwidth: 1 percent of rated output voltage from no load to full load.
2. Transient Voltage Performance: Not more than 10 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within 0.5 seconds.
3. Steady-State Frequency Operational Bandwidth: 0.25 percent of rated frequency from no load to full load.
4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.
5. Transient Frequency Performance: Not more than 10 percent variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within 3 seconds.
6. Output Waveform: At full load, harmonic content measured line to line or line to neutral shall not exceed 2 percent total with no slot ripple. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50.
7. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 300 percent of rated full-load current for not less than 8 seconds without damage to generator system components. For a 1-phase, bolted short circuit at system output terminals,

system shall regulate both voltage and current to prevent over-voltage conditions on the non-faulted phases.

8. Start Time: Comply with NFPA 110, Level 1, Type 10, system requirements.
9. Ambient Condition Performance: Engine generator shall be designed to allow operation at full rated load in an ambient temperature under site conditions, based on highest ambient condition. Ambient temperature shall be as measured at the air inlet to the engine generator for enclosed units, and at the control of the engine generator for machines installed in equipment rooms.

2.3 ENGINE

A. Fuel: ASTM D975 #2 Diesel Fuel

B. Rated Engine Speed: 1800RPM.

C. Lubrication System: The following items are mounted on engine or skid:
   1. Lube oil pump: shall be positive displacement, mechanical, full pressure pump.
   2. Filter and Strainer: Provided by the engine manufacturer of record to provide adequate filtration for the prime mover to be used.
   3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.

D. Engine Fuel System: The engine fuel system shall be installed in strict compliance to the engine manufacturer's instructions

E. Main Fuel Pump: Mounted on engine. Pump ensures adequate primary fuel flow under starting and load conditions.

F. Integral Panelboard: Generator shall include integral 208Y/120V 3Ø 4W panelboard. Panelboard shall be pre-wired to Coolant Jacket Heater, battery charger, unit lighting, etc. Contractor shall connect panelboard to life safety panel as indicated on plan.

G. Coolant Jacket Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity and performance.
   1. Designed for operation on a single 480 VAC, Three phase, 60Hz power connection. Heater voltage shall be shown on the project drawings.
   2. Installed with isolation valves to isolate the heater for replacement of the element without draining the engine cooling system or significant coolant loss.
   3. Provided with a 24VDC thermostat, installed at the engine thermostat housing

H. Governor: Adjustable isochronous, with speed sensing. The governing system dynamic capabilities shall be controlled as a function of engine coolant temperature to provide fast, stable operation at varying engine operating temperature conditions. The control system shall actively control the fuel rate as appropriate to the state of the engine generator. Fuel rate shall be regulated as a function of starting, accelerating to start disconnect speed, accelerating to rated speed, and operating in various isochronous states.

I. Cooling System: Closed loop, liquid cooled
   1. The generator set manufacturer shall provide prototype test data for the specific hardware proposed demonstrating that the machine will operate at rated standby load in an outdoor ambient condition of 40 deg C.
   2. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
   3. Size of Radiator overflow tank: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.
   4. Expansion Tank: Constructed of welded steel plate and rated to withstand maximum closed-loop coolant system pressure for engine used. Equip with gage glass and petcock.

5. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.
6. Duct Flange: Generator sets installed indoors shall be provided with a flexible radiator duct adapter flange.

J. Muffler/Silencer: Selected with performance as required to meet sound requirements of the application, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements. For generator sets with outdoor enclosures the silencer shall be inside the enclosure.

K. Air-Intake Filter: Engine-mounted air cleaner with replaceable dry-filter element and restriction indicator.

L. Starting System: 12 or 24V, as recommended by the engine manufacturer; electric, with negative ground.
1. Components: Sized so they will not be damaged during a full engine-cranking cycle with ambient temperature at maximum specified in Part 1 "Project Conditions" Article.
2. Cranking Cycle: As required by NFPA 110 for level 1 systems.
3. Battery Cable: Size as recommended by engine manufacturer for cable length as required. Include required interconnecting conductors and connection accessories.
4. Battery Compartment: Factory fabricated of metal with acid-resistant finish.
5. Battery-Charging Alternator: Factory mounted on engine with solid-state voltage regulation. The battery charging alternator shall have sufficient capacity to recharge the batteries with all parasitic loads connected within 4 hours after a normal engine starting sequence.
6. Battery Chargers: Unit shall comply with UL 1236, provide fully regulated, constant voltage, current limited, battery charger for each battery bank. It will include the following features:
   a. Operation: Equalizing-charging rate based on generator set manufacturer’s recommendations shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.
   b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 20 deg C to plus 40 deg C to prevent overcharging at high temperatures and undercharging at low temperatures.
   c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.
   d. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.
   e. Provide LED indication of general charger condition, including charging, faults, and modes. Provide a LCD display to indicate charge rate and battery voltage. Charger shall provide relay contacts for fault conditions as required by NFPA110.
   f. Enclosure and Mounting: NEMA, Type 1, wall-mounted cabinet.

2.4 FUEL OIL STORAGE

A. Comply with NFPA 30.

B. Sub Base-Mounted Fuel Oil Tank: Provide a double wall secondary containment type sub base fuel storage tank. The tank shall be constructed of corrosion resistant steel and shall be listed and labeled. The fuel tank shall include the following features:

1. Capacity: Fuel for 96 Hour(s) continuous operation at 100 percent rated power output.
2. Tank rails and lifting eyes shall be rated for the full dry weight of the tank, genset, and enclosure.
3. Electrical stub up(s)
4. Normal & emergency vents
5. Lockable fuel fill
6. Mechanical fuel level gauge
7. High and low level switches to indicate fuel level
8. Leak detector switch
9. Sub base tank shall include a welded steel containment basin, sized at a minimum of 110% of the tank capacity to prevent escape of fuel into the environment in the event of a tank rupture.
10. Fill port with overfill prevention valve (OFPV)
11. 5 gallon fill/spill dam or bucket
12. Tank design shall meet the regional requirements for the Project location

2.5 CONTROL AND MONITORING

A. Engine generator control shall be microprocessor based and provide automatic starting, monitoring, protection and control functions for the unit.

B. Automatic Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of generator set. When mode-selector switch is switched to the on position, generator set starts. The off position of same switch initiates generator-set shutdown. (Switches with different configurations but equal functions are acceptable.) When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

C. Manual Starting System Sequence of Operation: Switching on-off switch on the generator control panel to the on position starts generator set. The off position of same switch initiates generator-set shutdown. When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

D. Configuration: Operating and safety indications, protective devices, system controls, engine gages and associated equipment shall be grouped in a common control and monitoring panel. Mounting method shall isolate the control panel from generator-set vibration. AC output power circuit breakers and other output power equipment shall not be mounted in the control enclosure.

E. Indicating and Protective Devices and Controls: As required by NFPA 110 for Level 1 system, and the following:
   1. AC voltmeter (3-phase, line to line and line to neutral values).
   2. AC ammeter (3-phases).
   3. AC frequency meter.
   4. AC kW output (total and for each phase). Display shall indicate power flow direction.
   5. AC kVA output (total and for each phase). Display shall indicate power flow direction.
   6. AC Power factor (total and for each phase). Display shall indicate leading or lagging condition.
   7. Ammeter-voltmeter displays shall simultaneously display conditions for all three phases.
   8. Emergency Stop Switch: Switch shall be a red “mushroom head” pushbutton device complete with lock-out/tag-out provisions. Depressing switch shall cause the generator set to immediately stop the generator set and prevent it from operating.
   9. Fault Reset Switch: Supply a dedicated control switch to reset/clear fault conditions.
   10. DC voltmeter (alternator battery charging).
   11. Engine-coolant temperature gauge.
   12. Engine lubricating-oil pressure gauge.
   13. Running-time meter.
   14. Generator-voltage and frequency digital raise/lower switches. Rheostats for these functions are not acceptable. The control shall adjustment of these parameters in a range of plus or minus 5% of the voltage and frequency operating set point (not nominal voltage and frequency values.) The voltage and frequency adjustment functions shall be disabled when the paralleling breaker is closed.
   15. Fuel tank derangement alarm.
   16. Fuel tank high-level shutdown of fuel supply alarm.
   17. AC Protective Equipment: The control system shall include over/under voltage, reverse kVAR, reverse kW, over load (kW) short circuit, over current, loss of voltage reference, and over excitation shut down protection. There shall be a ground fault alarm for generator sets rated over 1000 amps, overload warning, and overcurrent warning alarm.
   18. Status LED indicating lamps to indicate remote start signal present at the control, existing shutdown condition, existing alarm condition, not in auto, and generator set running.
   19. A graphical display panel with appropriate navigation devices shall be provided to view all information noted above, as well as all engine status and alarm/shutdown conditions (including those from an integrated engine emission control system). The display shall also include integrated provisions for adjustment of the gain and stability settings for the governing and voltage regulation systems.
   20. Panel lighting system to allow viewing and operation of the control when the generator room or enclosure is not lighted.
   21. Data Logging: The control system shall log the latest 20 different alarm and shut down conditions, the total number of times each alarm or shutdown has occurred, and the date and time the latest of these shutdown and fault conditions occurred.
   22. DC control Power Monitoring: The control system shall continuously monitor DC power supply to the control, and annunciate low or high voltage conditions. It shall also provide an alarm indicating imminent failure of the battery bank based on degraded voltage recover on loading (engine cranking).

F. Control Heater: Generator sets that are installed in outdoor enclosures, or are in tropical or coastal environments shall be provided with control heaters for anti-condensation protection.

G. Remote Alarm Annunciator: Comply with NFPA 110. An LED labeled with proper alarm conditions shall identify each alarm event and a common audible signal shall sound for each alarm condition.

H. Remote Emergency-Stop Switch: Flush; wall mounted, unless otherwise indicated; and labeled. Push button shall be protected from accidental operation.

2.6 GENERATOR OVERCURRENT AND FAULT PROTECTION

A. Generator Overcurrent Protection: The generator set shall be provided with a UL Listed/CSA Certified protective device that is coordinated with the alternator provided to prevent damage to the generator set on any possible overload or overcurrent condition external to the machine. The protective device shall be listed as a utility grade protective device under UL category NRGU. The control system shall be subject to UL follow-up service at the manufacturing location to verify that the protective system is fully operational as manufactured. Protector shall perform the following functions:
1. Initiates a generator kW overload alarm when generator has operated at an overload equivalent to 110 percent of full-rated load for 60 seconds. Indication for this alarm is integrated with other generator-set malfunction alarms.
2. Under single phase or multiple phase fault conditions, or on overload conditions, indicates an alarm conditions when the current flow is in excess of 110% of rated current for more than 10 seconds.
3. Under single phase or multiple phase fault conditions, operates to switch off alternator excitation at the appropriate time to prevent damage to the alternator.
4. The operator panel shall indicate the nature of the fault condition as either a short circuit or an overload.
5. Senses clearing of a fault by other overcurrent devices and controls recovery of rated voltage to avoid overshoot greater than 120% of nominal voltage.
6. The protective system provided shall not include an instantaneous trip function.

2.7 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

A. Comply with NEMA MG 1.

B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.

C. Electrical Insulation: Class H

D. Temperature Rise: 105 / Class F environment.

E. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, over speed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.

F. Permanent Magnet Generator (PMG) shall provide excitation power for optimum motor starting and short circuit performance.

G. Enclosure: Drip-proof.

H. Voltage Regulator: Solid-state type, separate from exciter, providing performance as specified. The voltage regulation system shall be microprocessor-controlled, 3-phase true RMS sensing, full wave rectified, and provide a pulse-width modulated signal to the exciter. No exceptions or deviations to these requirements will be permitted.

I. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.

J. Subtransient Reactance: 12 percent maximum, based on the rating of the engine generator set.

2.8 OUTDOOR GENERATOR-SET ENCLOSURE

A. Description: Sound Attenuated Aluminum housing. Multiple panels shall be lockable and provide adequate access to components requiring maintenance. Instruments, control, and battery system shall be mounted within enclosure.

B. Construction:
   1. Louvers: Equipped with bird screen to permit air circulation when engine is not running while excluding birds and rodents.
   2. Hinged Doors: With padlocking provisions. Restraint/Hold back hardware to prevent door to keep door open at 180 degrees during maintenance. Rain lips over all doors.
   3. Exhaust System:
      a. Muffler Location: Within enclosure.
   4. Hardware: All hardware and hinges shall be stainless steel.
   5. Wind Rating: Wind rating shall be 150 mph
   6. Mounting Base: Suitable for mounting on sub-base fuel tank or housekeeping pad.
   7. A weather protective enclosure shall be provided which allows the generator set to operate at full rated load with a static pressure drop equal to or less than 0.5 inches of water.
   8. Inlet ducts shall include rain hoods

C. Engine Cooling Airflow through Enclosure: Housing shall provide ample airflow for engine generator operation at rated load in an ambient temperature of 40 deg C.
   1. Louvers: Fixed-engine, cooling-air inlet and discharge.
   2. Motorized Louvers: At engine cooling-air inlet and discharge. Dampers shall be closed to reduce enclosure heat loss in cold weather when unit is not operating. Dampers shall be of a “fail open” design to allow airflow in the event of failure

D. Sound Performance: Reduce the sound level of the engine generator while operating at full rated load to a maximum of 78 dBA measured at any location 23 ft from the engine generator in a free field environment.

E. Electrical Provisions
   1. Compliance with NEC: Package shall comply with the requirements of the National Electrical Code for all wiring materials and component spacing.
   2. Provide an internally mounted and wired electrical distribution panel to serve the engine generator and enclosure; including:
      a. 100 amp distribution panelboard connected to a 120/208VAC 3Ø utility service by the installer.
      b. Two duplex GFI receptacles, one inside the enclosure, and a weatherproof receptacle on the outside of the enclosure.
      c. Factory wired normal AC service from the panelboard to the engine coolant heater, alternator heater, and battery charger.
      d. Interior Lights with Switch: Two three-way switches controlling three AC lamps mounted in vapor tight and gasketed fixtures
   3. External Electrical Connections: All power and control interconnections shall be made within the perimeter of the enclosure.

F. Site Provisions:
   1. Lifting: Complete assembly of engine generator, enclosure, and sub base fuel tank (when used) shall be designed to be lifted into place as a single unit, using spreader bars.

2.9 VIBRATION ISOLATION DEVICES

A. Vibration Isolation: Generators installed on grade shall be provided with elastomeric isolator pads integral to the generator, unless the engine manufacturer requires use of spring isolation.
   1. IBC Compliance: Isolators complying with IBC requirements shall be specified in the equipment documentation, as well as the installation requirements for the unit.

2.10 FINISHES

A. Indoor and Outdoor Enclosures and Components: Powder-coated and baked over corrosion-resistant pretreatment and compatible primer. Manufacturer’s standard color or as directed on the drawings.

2.11 SOURCE QUALITY CONTROL

A. Prototype Testing: Factory test engine-generator set using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.
   1. Tests: Comply with NFPA 110, Level 1 Energy Converters. In addition, the equipment engine, skid, cooling system, and alternator shall have been subjected to actual prototype tests to validate the capability of the design under the abnormal conditions noted in NFPA110. Calculations and testing on similar equipment which are allowed under NFPA110 are not sufficient to meet this requirement.

B. Project-Specific Equipment Tests: Before shipment, factory test engine-generator set manufactured specifically for this Project. Perform tests at rated load and power factor. Include the following tests:
   1. Test engine generator set manufactured for this Project to demonstrate compatibility and functionality.
   2. Full load run.
   3. Maximum power.
   4. Voltage regulation.
   5. Steady-state governing.
   6. Single-step load pickup.
   7. Simulated safety shutdowns.
   8. Provide 14 days' advance notice of tests and opportunity for observation of tests by Owner's representative.

PART 3 EXECUTION

3.1 INSTALLATION

A. Comply with packaged engine-generator manufacturers' written installation, application, and alignment instructions and with NFPA 110.

B. Equipment shall be installed by the contractor in accordance with final submittals and contract documents. Installation shall comply with applicable state and local codes as required by the authority having jurisdiction. Install equipment in accordance with manufacturer's instructions and instructions included in the listing or labeling of UL listed products.

C. Installation of equipment shall include furnishing and installing all interconnecting wiring between all major equipment provided for the on-site power system. The contractor shall also perform interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

D. Contractor shall coordinate remote pushbutton location (when required) with engineer prior to installation. Provide allowance for 75’ of conduit and required cabling unless otherwise located on plans.

E. Equipment shall be installed on concrete housekeeping pads. Equipment shall be permanently fastened to the pad in accordance with manufacturer’s instructions and seismic requirements of the site.

F. Equipment shall be initially started and operated by representatives of the manufacturer. All protective settings shall be adjusted as instructed by the consulting engineer.

G. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired prior to final system testing. Equipment shall be thoroughly cleaned to remove all dirt and construction debris prior to initial operation and final testing of the system.

H. On completion of the installation by the electrical contractor, the generator set supplier shall conduct a site evaluation to verify that the equipment is installed per manufacturer's recommended practice.

3.2 ON-SITE ACCEPTANCE TEST

A. The complete installation shall be tested to verify compliance with the performance requirements of this specification following completion of all site work. Testing shall be conducted by representatives of the manufacturer, with required fuel supplied by Contractor. The Engineer shall be notified in advance and shall have the option to witness the tests. The generator set manufacturer shall provide a site test specification covering the entire system. Tests shall include:

B. Prior to start of active testing, all field connections for wiring, power conductors, and bus bar connections shall be checked for proper tightening torque.

C. Installation acceptance tests to be conducted on site shall include a "cold start" test, a two hour full load (resistive) test, and a one-step rated load pickup test in accordance with NFPA 110. Provide a resistive load bank and make temporary connections for full load test, if necessary.

D. Perform a power failure test on the entire installed system. This test shall be conducted by opening the power supply from the utility service, and observing proper operation of the system for at least 2 hours. Coordinate timing and obtain approval for start of test with site personnel.

3.3 TRAINING

A. The equipment supplier shall provide training for the facility operating personnel covering operation and maintenance of the equipment provided. The training program shall be not less than 4 hours in duration and the class size shall be limited to 20 persons. Training date shall be coordinated with the facility owner.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

3.5 SERVICE AND SUPPORT

A. The generator set supplier shall maintain service parts inventory for the entire power system at a central location which is accessible to the service location 24 hours per day, 365 days per year. The inventory shall have a commercial value of $3 million or more. The manufacturer of the generator set shall maintain a central parts inventory to support the supplier, covering all the major components of the power system, including engines, alternators, control systems, paralleling electronics, and power transfer equipment.

B. The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical power system replacement parts in the local service location. Service vehicles shall be stocked with critical replacement parts. The service organization shall be on call 24 hours per day, 365 days per year. The service organization shall be able to respond to a service call within 12 hours of receipt.

C. The manufacturer shall maintain model and serial number records of each generator set provided for at least 20 years.

END OF SECTION 26 32 13

SECTION 23 63 00 - AUTOMATIC TRANSFER SWITCHES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes transfer switches rated 600 V and less, including the following:
   1. Automatic transfer switches
   2. Remote annunciation systems
   3. Bypass/isolation switches

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, weights, operating characteristics, furnished specialties, and accessories.
   1. Technical data on all major components of all transfer switches and other products described in this section. Data is required for the transfer switch mechanism, control system, cabinet, and protective devices specifically listed for use with each transfer switch. Include steady state and fault current ratings, weights, operating characteristics, and furnished specialties and accessories.
   2. Single Line Diagram: Show connections between transfer switch, power sources and load. Including all bypass connections.

B. Shop Drawings: Dimensioned plans, elevations, sections, and details showing minimum clearances, conductor entry provisions, gutter space, installed features and devices, and material lists for each switch specified.
   1. Dimensioned outline drawings of assembly, including elevations, sections, and details including minimal clearances, conductor entry provisions, gutter space, installed features and devices and material lists for each switch specified.
   2. Internal electrical wiring and control drawings.
   3. Interconnection wiring diagrams, showing recommended conduit runs and point-to-point terminal connections to generator set.
   4. Installation and mounting instructions, including information for proper installation of equipment to meet seismic requirements.

C. Manufacturer and Supplier Qualification Data
   1. The transfer switch manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.
   2. Manufacturer shall be capable of providing documentation of:
      a. A minimum of 50 documented installations of similar products in service within the United States.
      b. Certification that the manufacturer maintains a service and parts support network capable of providing response within 12 hours.

D. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 78 23 Section "Operation and Maintenance Data," include the following:
   1. Features and operating sequences, both automatic and manual.
   2. List of all factory settings of relays, timers and protective devices; provide setting and calibration instructions where applicable.

E. Warranty documents demonstrating compliance with the project’s contract requirements.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: The equipment supplier shall maintain a service center capable of providing training, parts, maintenance and emergency repairs to equipment, including transfer switch generator sets and remote monitoring equipment (if applicable) at the site within a response period of less than (eight hours or appropriate time period designated for Project) from time of notification.
   1. The transfer switch shall be serviced by technicians employed by, and specially trained and certified by, the generator set supplier and the supplier shall have a service organization that is factory-certified in both generator set and transfer switch service. The supplier shall maintain an inventory of critical replacement parts at the local service organization, and in service vehicles. The service organization shall be on call 24 hours per day, 365 days per year.
   2. Submit names, experience level, training certifications, and locations for technicians that will be responsible for servicing equipment at this site.
   3. The manufacturer shall maintain model and serial number records of each transfer switch provided for at least 20 years.

B. Source Limitations: All transfer switches are to be obtained through one source from a single manufacturer. The generator set manufacturer shall warrant transfer switches to provide a single source of responsibility for products provided.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked as suitable for use in emergency, legally required or optional standby use as appropriate for the connected load.

D. The automatic transfer switch installation and application shall conform to the requirements of the following codes and standards:
   1. Transfer switches and enclosures shall be UL 1008 listed and labeled as suitable for use in emergency, legally required, and optional standby applications.
   2. CSA 282, Emergency Electrical Power Supply for Buildings, and CSA C22.2, No. 14-M91 Industrial Control Equipment
   3. NFPA 70, National Electrical Code. Equipment shall be suitable for use in systems in compliance with Articles 700, 701 and 702.
   4. Comply with NEMA ICS 10-1993 AC Automatic Transfer Switches
   5. IEEE 446 – Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications
   6. EN55011, Class B Radiated Emissions and Class B Conducted Emissions
   7. IEC 1000-4-5 (EN 61000-4-5); AC Surge Immunity
   8. IEC 1000-4-4 (EN 61000-4-4) Fast Transients Immunity
   9. IEC 1000-4-2 (EN 61000-4-2) Electrostatic Discharge Immunity
   10. IEC 1000-4-3 (EN 61000-4-3) Radiated Field Immunity
   11. IEC 1000-4-6 Conducted Field Immunity
   12. IEC 1000-4-11 Voltage Dip Immunity
   13. IEEE 62.41, AC Voltage Surge Immunity
   14. IEEE 62.45, AC Voltage Surge Testing

E. Comply with NFPA 110 – Emergency and Standby Power Systems. The transfer switch shall meet all requirements for Level 1 systems, regardless of the actual circuit level.

F. The manufacturer shall warrant the material and workmanship of the transfer switch equipment for a minimum of five (5) year from the warranty start date. The warranty start date is the date of substantial completion.

G. The warranty shall be comprehensive. No deductibles shall be allowed for travel time, service hours, repair parts cost, and etc. during the minimum noted warranty period described above.

1.5 COORDINATION

A. Size and location of concrete bases and anchor bolt inserts shall be coordinated. Concrete, reinforcement and formwork must meet the requirements specified in Division 03.

B. If Project calls for bypass switch(es) mounted on a concrete base, the base must be designed to accommodate the requirements of the drawout mechanism (extension rails and/or wheeled carriage) of the bypass switch.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. ASCO
2. Trystar (Docking stations & Manual Transfer Switches)

B. Switches manufactured by other manufacturers that meet the requirement of this specification are acceptable, if approved not less than two weeks before scheduled bid date. Proposals must include a line-by-line compliance statement based on this specification.

C. Transfer switches utilizing molded case circuit breakers do not meet the requirements of this specification and will not be accepted.

2.2 GENERAL TRANSFER-SWITCH PRODUCT REQUIREMENTS

A. Provide transfer switches in the number and ratings that are shown on the drawings.

B. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer.

C. Fault-Current Closing and Withstand Ratings: UL 1008 WCR ratings must be specifically listed as meeting the requirements for use with protective devices at installation locations, under specified fault conditions. Withstand and closing ratings shall be based on use of the same set of contacts for the withstand test and the closing test.

D. Solid-State Controls: All settings should be accurate to +/- 2% or better over an operating temperature range of - 40 to + 60 degrees C (- 40 to + 140 degrees F).

E. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.41. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.

F. Electrical Operation: Accomplished by a non-fused, momentarily energized solenoid or electric motor operator mechanism, mechanically and electrically interlocked in both directions (except that mechanical interlock is not required for closed transition switches).

G. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
1. Switches using molded-case switches or circuit breakers, or insulated case circuit breaker components are not acceptable.
2. Transfer switches shall be double-throw, electrically and mechanically interlocked, and mechanically held in the Source 1 and Source 2 positions.
3. Main switch contacts shall be high pressure silver alloy. Contact assemblies shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.
4. Contacts shall be operated by a high-speed electrical mechanism that causes contacts to open or close within three electrical cycles from signal.

5. Transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with components that could be operating at line voltage levels.
6. The transfer switch shall include the mechanical and control provisions necessary to allow the device to be field-configured for operating speed. Transfer switch operation with motor loads shall be as is recommended in NEMA MG1.
   a. Phase angle monitoring/timing equipment is not an acceptable substitute for this functionality
7. Transfer switches designated on the drawings as “4-pole” shall be provided with a switched neutral pole switched which is switched simultaneously with phase poles.
8. All transfer switches in this project shall be by-pass isolation.

H. Control: Transfer switch control shall be capable of communicating with the genset control, other switches and remote programming devices over a high-speed network interface.

I. Factory wiring: Transfer switch internal wiring shall be composed of pre-manufactured harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plug(s), to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism

J. Terminals: Terminals shall be pressure type and appropriate for all field wiring. Control wiring shall be equipped with suitable lugs, for connection to terminal strips.

K. Enclosures: All enclosures shall be third-party certified for compliance to NEMA ICS 6 and UL 508, unless otherwise indicated:
1. The enclosure shall provide wire bend space in compliance to the latest version of NFPA70, regardless of the direction from which the conduit enters the enclosure.
2. Exterior cabinet doors shall provide complete protection for the system’s internal components. Doors must have permanently mounted key-type latches. Bolted covers or doors are not acceptable.
3. Transfer switches shall be provided in enclosures that are third party certified for their intended environment per NEMA requirements.
4. Indoor transfer switches shall be NEMA-1. Outdoor transfer switches shall be NEMA-3R.

2.3 AUTOMATIC TRANSFER SWITCHES

A. Comply with requirements for Level 1 equipment according to NFPA 110.

B. Indicated current ratings:
1. Refer to the Project drawings for specifications on the sizes and types of transfer switch equipment, withstand and closing ratings, number of poles, voltage and ampere ratings, enclosure type, and accessories.
2. Main contacts shall be rated for 600 VAC minimum.
3. Transfer switches shall be rated to carry 100% of rated current continuously in the enclosure supplied, in ambient temperatures of -40 to +60 degrees C (-40 to +140 degrees F), relative humidity up to 95% (non-condensing), and altitudes up to 10,000 feet (3000 meters).

C. Relay Signal: Control shall include provisions for addition of a pre-transfer relay signal, adjustable from 0 to 60 seconds, to be provided if necessary for elevator operation, based on equipment provided for the project.

D. Control: Transfer switch control shall be provided with necessary equipment and software to communicate with the genset control, other transfer switches, remote annunciation equipment, and other devices over a high speed control network.

E. Neutral Switching: Transfer switches designated on the drawings as 4-pole shall be provided with a switched neutral pole. The neutral pole shall be of the same construction and have the same ratings as the phase poles. All poles shall be switched

simultaneously using a common crossbar. Substitute equipment using overlapping neutral contacts is not acceptable.

F. Automatic Transfer Switch Control Features
1. The transfer switch control system shall be configurable in the field for any operating voltage level up to 600 VAC. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions that are not field configurable are not acceptable.
2. All transfer switch sensing shall be configurable from an operator panel or from a Windows XP or later PC-based service tool. Designs utilizing DIP switches or other electromechanical devices are not acceptable.
3. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device for load shedding purposes. On receipt of this signal, the transfer switch shall switch to a neutral position when connected to Source 2. If Source 1 is available when the load-shed signal is received, the transfer switch shall connect to Source 1.
4. The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device to prevent transfer to the generator service.
5. The transfer switch shall provide a relay contact signal prior to transfer or re-transfer. The time period before and after transfer shall be adjustable in a range of 0 to 60 seconds.
6. The control system shall be designed and prototype tested for operation in ambient temperatures from - 40 degrees C to + 60 degrees C (- 40 to +140 degrees F). It shall be designed and tested to comply with the requirements of the noted voltage and RFI/EMI standards.
7. The control shall have optically isolated logic inputs, high isolation transformers for AC inputs and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.
8. The transfer switch network monitoring equipment, when supplied, shall be provided with a battery-based auxiliary power supply to allow monitoring of the transfer switch when both AC power sources are non-operational.

G. Transfer Switch Control Panel: The transfer switch shall have a microprocessor-based control with a sealed membrane panel incorporating pushbuttons for operator-controlled functions, and LED lamps for system status indicators. The panel shall also include an alphanumeric display for detailed system information. Panel display and indicating lamps shall include permanent labels.
1. The indicator panel LEDs shall display:
    a. Which source the load is connected to (Source 1 or Source 2)
    b. Which source or sources are available
    c. When switch is not set for automatic operation, the control is disabled
    d. When the switch is in test/exercise mode
2. The indicator shall have pushbuttons that allow the operator to activate the following functions:
    a. Activate pre-programmed test sequence
    b. Override programmed delays, and immediately go to the next operation
    c. Reset the control by clearing any faults
    d. Test all of the LEDs by lighting them simultaneously
3. The alphanumeric digital display shall be vacuum fluorescent-type, clearly visible in both bright sunlight and no-light conditions over an angle of 120 degrees, and shall display the following:
    a. AC voltage for all phases, normal and emergency
    b. Source status: connected or not connected.
    c. Load data, including voltage, AC current, frequency, KW, KVA, and power factor.
4. The display panel shall be password-protected, and allow the operator to view and make adjustments:
    a. Set nominal voltage and frequency for the transfer switch
    b. Adjust voltage and frequency sensor operation set points

c. Set up time clock functions
d. Set up load sequence functions
e. Enable or disable control functions including program transition
f. View real-time clock data, operation log (hours connected, times transferred, failures) and service history

H. Control Functions: Functions managed by the control shall include:
1. Software adjustable time delays:
a. Engine start (prevents nuisance genset starts in the event of momentary power fluctuation): 0 to 120 seconds (default 3 sec)
b. Transfer normal to emergency (allows genset to stabilize before load is transferred): 0 to 120 seconds (default 3 sec)
c. Re-transfer emergency to normal (allows utility to stabilize before load is transferred from genset): 0 to 30 minutes (default 3 sec)
d. Engine cooldown: 0 to 30 minutes (default 10 min)
e. Programmed transition: 0 to 60 seconds (default 3 sec)
2. Voltage imbalance sensing:
a. Dropout: 2 to 10% (default 4%)
b. Pickup: 90% of dropout
c. Time delay: 2.0 to 20 seconds (default 5 sec)
d. Bar graph meter panel, to display 3-phase AC Amps, 3-phase AC Volts, Hz, KW load level, and load power factor. The display shall be color-coded, with green scale indicating normal or acceptable operating level, yellow indicating conditions nearing a fault, and red indicating operation in excess of rated conditions for the transfer switch.
3. Phase rotation sensing:
a. Time delay: 100 msec
4. Loss of single-phase detection:
a. Time delay: 100 msec

I. Control features shall include:
1. Programmable genset exerciser: A field-programmable control shall periodically start and run the generator with or without transferring the load for a preset time period, then re-transfer and shut down the generator after a preset cool-down period.
2. In event of a loss of power to the control, all control settings, real-time clock setting and the engine start-time delay setting will be retained.
3. The system continuously logs information including the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. An event recorder stores information, including time and date-stamp, for up to 50 events.
4. Re-Transfer Inhibit Switch: Inhibits automatic re-transfer control so automatic transfer switch will remain connected to emergency power source as long as it is available regardless of condition of normal source.
5. Transfer Inhibit Switch: Inhibits automatic transfer control so automatic transfer switch will remain connected to normal power source regardless of condition of emergency source.

J. Control Interface
1. Provide one set Form C auxiliary contacts on both sides, operated by transfer switch position, rated 10 amps 250 VAC.
2. The transfer switch shall be provided with a network communication card, and configured to allow network-based communication with the transfer switch and other network system components, including the generator set(s) provided for the Project.
3. Unassigned Auxiliary Contacts: Two normally open, 1-pole, double-throw contacts for each switch position, rated 10A at 240 VAC.

K. Engine Starting Contacts
1. One isolated and normally closed pair of contacts rated 10A at 32 VDC minimum.

2.4 BYPASS/ISOLATION SWITCHES

A. Comply with requirements for Level 1 equipment according to NFPA 110.

B. Description: Transfer switches that are designated on the drawings as “bypass isolation” transfer switches shall be provided with a manually-operated bypass switch arranged to select and connect either source of power directly to load, isolating transfer switch from load and from both power sources. Include the following features for each combined automatic transfer switch and bypass/isolation switch:

1. The bypass switch shall be enclosed in the same cabinet as the automatic transfer switch, and UL-listed as an assembled product.
2. The bypass isolation switch shall provide a means for manually bypassing the transfer switch from either source (Normal or Emergency) to the load, while under load if necessary, and to isolate the transfer switch from both sources for maintenance or repair without a power interruption or disturbance.
    a. Designs that bypass to only one source are not acceptable under this specification.
3. The bypass switch shall be operable without the use of tools, and shall include the ability to isolate the automatic switch mechanism without the use of tools and without opening the exterior cabinet door(s).
4. Operability: Switch shall be constructed so load bypass and transfer-switch isolation can be performed by one person in no more than two operations, in 15 seconds or less.
5. Bypass isolation switch equipment shall be UL listed per Standard 1008 and CSA approved, with continuous current rating, voltage and frequency ratings, and withstand and closing ratings equal to the transfer switch ratings at the specified conditions of ambient temperature, humidity, and altitude.
6. The bypass isolation and transfer switches shall be mechanically held in each position. Switching mechanisms shall be break-before-make on all poles, including the neutral pole on 4-pole switches except where closed transition transfer is specified as defined in section "CLOSED-TRANSITION TRANSFER SWITCHES". The switch mechanism shall be an over-center toggle device which provides stored energy contact operation during both opening and closing. The speed of contact operation shall be independent of the force applied to the operating handles, which permit manual operation under load.
7. Provide means to lock bypass/isolation switch in the position that isolates transfer switch with an arrangement that permits complete electrical testing of transfer switch while isolated. While isolated, interlocks shall prevent transfer-switch operation, except for testing or maintenance.
8. Bypass switch shall be a fully-rated, manually-operated switch, rated for the same loads as the automatic transfer switch. Bypass switch shall provide bypass to either normal or emergency source by use of a door mounted, keyed source selector switch and a permanently mounted external operating handle. Equipment shall provide manual bypass without disturbance of the power supply to the load.
    a. Equipment requiring load isolation before bypass is not acceptable for use on this Project.
9. Maintainability: Fabricate to allow convenient removal of major components from front without removing other parts or main power conductors.
10. Contact temperatures of bypass/isolation switches shall not exceed those of automatic transfer-switch contacts when they are carrying rated load.
11. Positive mechanical interlocks shall prevent all possible source-to-source interconnections via the bypass switch. The interlock system shall assure a properly sequenced, mechanically guided bypass and isolation action.
    a. Designs which depend on electrical interlocks to prevent source to source interconnections, or which intentionally interconnect the sources via the bypass switch, are not acceptable.
12. The equipment shall utilize automatic, mechanical stops to prevent manually bypassing to a dead source.
    a. Equipment that does not prevent dead source bypass is not acceptable.

13. A drawout isolation mechanism shall provide closed-door isolation of the transfer switch. The isolation mechanism shall be interlocked so that either the transfer switch must be bypassed or the transfer switch must be open before the mechanism will permit isolation of the transfer switch. Drawout arrangement must provide physical separation from live parts and accessibility for testing and maintenance operations.
14. The isolation mechanism shall provide for three-position operation: Connected, Test, and Isolated. In the Connected position, isolation contacts shall be fully engaged and closed, with the transfer switch control cable connected. In the Test position, isolation contacts shall be open and the transfer switch control cable connected. The Test position shall allow operational testing of transfer switchs and controls without power disruption to the load. In the Isolated position, the transfer switch and control shall be completely isolated from all power sources. In the Isolated position, the transfer switch shall be capable of being withdrawn from the cabinet.
15. The bypass and isolation process for the automatic transfer switch shall be capable of being fully accomplished without opening the cabinet door.
16. Interconnection of bypass/isolation switch with automatic transfer switch shall consist of factory-installed copper bus bars, plated at connection points and braced for the indicated available short-circuit current.
17. Note the size and access requirements for the transfer switch with bypass isolation and provide equipment that will fit into the space allowed as well as complying with code-specified access requirements.
18. Manufacturer's standard legend for control labels and instruction signs shall describe operating instructions.

C. Interconnection of Bypass/Isolation Switches with Automatic Transfer Switches: Factory-installed copper bus bars, plated at connection points and braced for the indicated available short-circuit current.

2.5 REMOTE ANNUNCIATOR SYSTEM

A. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches. Annunciation shall include the following:
1. Sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
2. Switch position.
3. Switch in test mode.
4. Failure of communication link.

B. Annunciator Panel: LED-lamp type with audible signal and silencing switch.
1. Indicating Lights: Grouped for each transfer switch monitored.
2. Label each group, indicating transfer switch it monitors, location of switch, and identity of load it serves.
3. Switch in test mode.
4. Lamp Test: Push-to-test or lamp-test switch on front panel.

C. Malfunction of annunciator or communication link shall not affect functions of automatic transfer switch. In the event of failure of communication link, automatic transfer switch automatically reverts to stand-alone, self-contained operation.

D. Automatic transfer-switch sensing, controlling, or operating function shall not depend on remote panel for proper operation. The remote annunciation system shall not prevent transfer to the alternate source when the primary power source fails, nor prevent return to the primary source if the alternate source fails

2.6 MANUAL TRANSFER SWITCHES (MTS)

A. The transfer switch unit shall be manually operated and mechanically held. The switch shall be mechanically interlocked to ensure only one of three possible positions, Source 1, Source 2, or Center Off Fused disconnect type switches shall not be acceptable.

B. The switch shall be positively locked and unaffected by momentary outages so that contact pressure is maintained at a constant value and temperature rise at the contacts is minimized for maximum reliability and operating life.

C. All main contacts shall be silver composition. Switches rated 600 amperes and above shall have segmented blow-on construction for high withstand current capability and be protected by separate arcing contacts.

D. Inspection of all contacts shall be possible from the front of the switch without disassembly of operating linkages and without disconnection of power conductors.

E. Designs utilizing components of molded-case circuit breakers, contactors, or parts thereof which are not intended for continuous duty, repetitive switching or transfer between two active power sources are not acceptable.

F. Where neutral conductors must be switched, the MTS shall be provided with fully- rated neutral transfer contacts.

G. Where neutral conductors are to be solidly connected, a neutral terminal plate with fully-rated AL-CU pressure connectors shall be provided.

H. The MTS shall be tested in accordance with UL 1008 for transfer switches. Switch ratings of 260 amperes and less shall have endurance rating of 6000 cycles, 400 ampere shall have endurance rating of 4000 cycles, and 600 – 1200 ampere shall have endurance rating of 3000 cycles.

I. Operation:
   1. The transfer switch shall be arranged for manually actuated manual operation.
   2. The manual transfer shall be actuated via a mechanical operating mechanism.
   3. The manual operating handle shall be capable of external operation without opening the enclosure door.
   4. It shall have the same contact to contact speed as automatic operation
   5. There shall be three positions for manual operation:
      a. Connected to Source 1 (preferred)
      b. Connected to Source 2 (alternate)
      c. Connect to center off (disconnected position)
   6. Switch position when connected to Source 1, or Source 2 shall be pad - lockable

J. Additional Features:
   1. Mechanical position indicators (yellow) visible to the operator shall be included for Source 1 (preferred), Source 2, (alternate), and Center Off (disconnected).
   2. LED indicators for Source 1 (preferred), and Source 2 (alternate).
   3. Auxiliary position indicating contacts, rated 10 amps, 250 Vac shall be provided consisting of one closed when the MTS is connected to Source 1 (preferred), and one contact closed when the MTS is connected to Source 2 (alternate)
   4. A form A contact shall be provided to indicate switch is in the Center Off (disconnected) position.
   5. Auxiliary Contacts: Position indicating contacts, rated 10 amps, 250 Vac shall be provided consisting of two closed when the MTS is connected to Source 1 (preferred), and two contact closed when the MTS is connected to Source 2 (alternate).
   6. Integrated Quick Connects: contains quick connects which provide a connecting means for connecting a portable generator.
      a. Quick connects shall be located on Source 2 (emergency):
         i. For 400A and below models, there shall be one (1) row of up to five (5) series single pole connections.
         ii. For 600A - 800A models, there shall be two (2) rows of up to five (5) single pole connections.
         iii. For 1000A-1200A models, there shall be three (3) rows of up to 5 single pole connections.

b. All electrical connections shall be 16 cam type single pole connectors, available color coded as per industry standard practice.

K. Withstand and Closing Ratings:

1. The MTS shall be rated to close on and withstand the available RMS symmetrical short circuit current at the MTS terminals with the type of overcurrent protection shown on the plans. WCR MTS ratings @ 480v shall be as follows when used with specific circuit breakers or current limiting fuses:

MTS Ampacity	Withstand & Closing Rating MCCB	W/CLF
150-600	50,000A	200,000
800-1200	65,000A	200,000

PART 3 EXECUTION

3.1 INSTALLATION

A. Floor-Mounting Switch: Anchor to floor by bolting.

1. Floor-mounted transfer switches (except drawout switches supported by wheeled carriages, which must be rolled out at floor level) shall be mounted on concrete bases complying with the following requirements:
   a. Concrete Bases: 4 inches (100 mm) high, reinforced, with chamfered edges. Extend base no more than 4 inches (100 mm) in all directions beyond the maximum dimensions of switch, unless otherwise indicated or unless required for seismic support. Construct concrete bases according to Division 26 Section "Hangers and Supports for Electrical Systems."

B. Annunciator Panel Mounting: Flush in wall, unless otherwise indicated.

C. Identify components according to 26 05 53 "Identification for Electrical Systems."

D. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

3.2 CONNECTIONS

A. Wiring to Remote Components: Match type and number of cables and conductors to control and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.

B. Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

C. Transfer switch shall be provided with AL/CU mechanical lugs sized to accept the full output rating of the switch. Lugs shall be suitable for the number and size of conductors shown on the drawings.

D. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems." Refer to drawings for details.

E. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: The supplier of the transfer switch(es) and associated equipment shall inspect, test, and adjust components, assemblies, and equipment installations, including connections, and report results in writing.

B. Manufacturer's representative shall perform tests and inspections and prepare test reports.

C. After installing equipment and after electrical circuitry has been energized, installer shall test for compliance with requirements.
   1. Perform recommended installation tests as recommended in manufacturer's installation and service manuals.
   2. After energizing circuits, demonstrate interlocking sequence and operational function for each switch.
      a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
      b. Verify time-delay settings.
      c. Verify that the transfer switch is accurately metering AC voltage and current.
      d. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

3.4 DEMONSTRATION

A. After generator set installation, the generator and transfer switch supplier shall conduct a complete operation, basic maintenance, and emergency service seminar covering generator set and transfer switch equipment, for up to 10 people employed by the Owner.
   1. The seminar shall include instruction on operation of the transfer equipment, normal testing and exercise, adjustments to the control system, use of the PC based service and maintenance tools provided under this contract, and emergency operation procedures.
   2. The class duration shall be at least 4 hours in length, and include practical operation with the installed equipment.

END OF SECTION 23 36 00

SECTION 26 41 13 - LIGHTNING PROTECTION SYSTEM

PART 1 GENERAL

1.1 WORK INCLUDED

A. This Section specifies the lightning protection system for the building(s) or structure(s). This system provides safety for the building and occupants by preventing damage to the structure caused by lightning. The design of this system is to be in strict accordance with this section of the specification and all contract drawings that apply.

B. The work covered under this section of the specifications consists of furnishing labor, materials and services required for the completion of a functional and unobtrusive lightning protection system.

C. A firm actively engaged in the installation of certified lightning protection systems and listed with Underwriters' Laboratories, Inc. and the Lightning Protection Institute shall install the system.

1.2 STANDARDS

A. The entire lightning protection system shall be designed and installed in accordance with:
1. National Fire Protection Assoc. (NFPA) Document # 780
2. Underwriters' Laboratories, Inc. (UL) Standard # 96A
3. Lightning Protection Institute (LPI) Standard # 175
4. National Electrical Code (NEC)

1.3 SYSTEM DESIGN

A. The work covered under this section of the specifications consists of furnishing labor, materials and services required for the completion of a functional and inconspicuous lightning protection system approved by the Architect and Owner. The design of this system is to be in strict accordance with this section of the specifications and all contract drawings that apply.

B. If any departure from the contract drawings or submittal drawings covered below are deemed necessary by the Contractor, details of such departures and reasons therefore shall be submitted as soon as practical to the architect and engineer for approval.

1.4 QUALITY ASSURANCE

A. The contractor shall furnish a UL Master Label or Letter of Findings upon completion of the installation.

B. The system installation shall be made under the supervision of an LPI Certified Master Installer, and the LPI System Certification shall be delivered upon completion of the installation.

C. The installation shall comply with the requirements of NFPA 780, UL 96A, and LPI 175.

D. The installing lightning protection contractor company shall be listed with the Lightning Protection Institute, and Underwriters' Laboratories, Inc. The installation contractor shall have personnel on staff Certified by the LPI as a Master Installer or Master Designer of lightning protection systems.

E. LPI qualified staff shall provide supervision of the installation to the Standards.

1.5 SUBMITTALS

A. Specification Compliance Review: Mark up a complete copy of the specification section for the product to indicate a) acknowledgement of the specification requirement (Comply), or b) acknowledgement that the particular specification requirement does not apply to this specific project (Not Applicable) or, c) acknowledgement that the specification requirement cannot be made or that a variance is being submitted for review to the Architect/Engineer/Owner (Does Not Comply, Explanation:) Do not submit an outline form of compliance, submit a complete copy with the product data.

B. Complete design submittal drawings showing the type, size, and location of all grounding, roof conductors, down conductors, through-roof connectors and air terminals, and shop drawings shall be submitted to the architect and engineer for approval prior to the commencement of work.
   1. Product Data: Provide dimensions and materials of each component, and include indication of listing in accordance with UL 96 and LPI 175 standards.
   2. Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.
   3. Submit certificate of compliance from Underwriters' Laboratories and Lightning Protection Institute indicating approval of lightning protection systems.
   4. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, and installation.
   5. A complete shop drawing shall be submitted to the architect and engineer for review prior to commencement of the installation. The shop drawing shall show the extent of the system layout designed for the structure along with details of the products to be used in the installation.

PART 2 PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Manufacturers: Only firms regularly engaged in the manufacture of lightning protection system components whose products have been in satisfactory use in similar service shall be used.
   1. Beijing Arrow Advanced Technology Co., Ltd.
   2. East Coast Lightning Equipment, Inc.
   3. ERICO, Inc.
   4. Harger, Inc.
   5. Heary Brothers Lightning Protection Co., Inc.
   6. Independent Protection Company, Inc.
   7. Preferred Lightning Protection
   8. Robbins Lightning, Inc.
   9. Thompson Lightning Protection, Inc.
   10. Cooper Power Systems
   11. Bonded Lighting Protection

2.2 PRODUCTS

A. All materials shall comply in weight, size, and composition with the requirements of the UL 96 Materials Standards. All equipment shall be UL listed and properly labeled. The system furnished under this specification shall be the standard product of a manufacturer regularly engaged in the production of lightning protection equipment and a member of LPI.

B. Equipment shall be the manufacturer's latest approved design of construction to suit the application where it is to be used in accordance with accepted industry standards and with NFPA, LPI, & UL requirements.

2.3 MATERIALS

A. Class I materials shall be used for systems on structures not exceeding 75 feet in height and Class II materials shall be used for systems on structures exceeding 75 feet above grade.

B. Copper shall be of the grade ordinarily required for commercial electrical work, generally designated as being 95 percent conductive when annealed. Aluminum conductors shall be of electrical grade aluminum alloy.

C. Lightning protection materials shall be coordinated with building construction materials to assure compatibility. Aluminum lightning protection materials shall not be embedded in concrete or masonry, installed on or below copper surfaces, or used for the in-ground system. Copper lightning protection materials shall not be installed on aluminum surfaces. Copper system components within 2 feet of chimney exhausts shall be tin coated to protect against deterioration.

D. Strike termination devices shall be provided to place the entire structure under a zone of protection as defined by the Standards. Air terminals shall project a minimum of 10 inches above protected areas or objects. Air terminals shall be located within 2 feet of exposed corners and roof edges.

E. Metallic bodies having a thickness 3/16” or greater may serve as strike termination devices without the addition of air terminals. These bodies shall be made a part of the lightning protection system by connection(s) according to the Standards using main size conductors and bonding fittings with 3 square inches of surface contact area.

F. Cable conductors shall provide a two-way path from strike termination devices horizontally and downward to connections with the ground system. Cable conductors shall be free of excessive splices and sharp bends. No bend of a conductor shall form a final included angle of less than 90 degrees nor have a radius of bend less than 8 inches. Structural elements and design features shall be used whenever possible to minimize the visual impact of exposed conductors.

G. Cable down conductors shall be concealed within the building construction. At existing structures, cable down conductors may be enclosed within PVC conduit from roof to grade level and exact locations shall be coordinated with the Architect to minimize visual impact of exposed down conductors. Down conductors shall be spaced at intervals averaging not more than 100 feet around the protected perimeter of the structure. In no case shall any structure have fewer than two down conductors. Where down conductors are exposed to environmental hazards at grade level, schedule 80 PVC conduit shall be used to protect the conductor to a point eight feet above grade.

H. In the case of structural steel frame construction, cable down conductors shall be omitted and roof conductors shall be connected to the structural steel frame at intervals averaging not more than 100 feet around the protected perimeter of the structure.

I. Exposed cable conductors shall be secured to the structure at intervals not exceeding 3 feet – 0 inches. Fasteners, nails, screws, or bolts shall be of suitable configuration for the intended application and of the same material as the conductor or of electrolytically compatible materials. Galvanized or plated steels are not acceptable.

J. Connectors and splicers shall be of suitable configuration and type for the intended application and of the same material as the conductors or of electrolytically compatible materials.

K. Ground terminations suitable for the soil conditions shall be provided for each downlead conductor. Where the structural steel framework is utilized as main conductors for the

system, perimeter columns shall be connected to the grounding system at intervals averaging 60 feet or less on the protected perimeter. For any structure in excess of 60 ft. in vertical elevation above grade, a ground loop interconnecting all ground terminals and other building grounded systems shall be provided. Refer to the electrical grounding specifications for additional information.

PART 3 EXECUTION

3.1 INSTALLATION

A. The installation of the lightning protection system components shall be performed in a neat and workmanlike manner.

B. Roof penetrations required for down conductors or for connections to structural steel framework shall be made using through-roof assemblies with solid bars and appropriate roof flashings. The roofing contractor shall furnish the methods and materials required at roofing penetrations of the lightning protection components and any additional roofing materials or preparations required by the roofing manufacturer for lightning conductor runs to assure compatibility with the warranty for the roof. The roofing contractor shall be responsible for sealing and flashing all lightning protection roof penetrations as per the roof manufacturer's recommendations. Refer to the roofing specifications for the lightning protection roof penetrations and/or method of conductor attachment.

C. LPI certification requires a signature by a representative of the owner at three stages of installation – the in-ground system, the concealed portion of the work, and the exposed or roof level section. UL certification requires inspection by their third-party field staff after completion of the installation. Upon completion of the lightning protection installation, the installing contractor shall provide to the Owner an as-built drawing of the system, along with copies of the UL and LPI Certificates of completion.

END OF SECTION 26 41 13

SECTION 26 43 13 - SURGE PROTECTION FOR LOW-VOLTAGE ELECTRICAL POWER CIRCUITS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes field-mounted SPDs for low-voltage (120 to 600 V) power distribution and control equipment.

1.3 DEFINITIONS

A. I-nominal: Nominal discharge current.

B. MCOV: Maximum continuous operating voltage.

C. Mode(s), also Modes of Protection: The pair of electrical connections where the VPR applies.

D. MOV: Metal-oxide varistor; an electronic component with a significant non-ohmic current-voltage characteristic.

E. OCPD: Overcurrent protective device.

F. SCCR: Short-circuit current rating.

G. SPD: Surge protective device.

H. VPR: Voltage protection rating.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
   2. Copy of UL Category Code VZCA certification, as a minimum, listing the tested values for VPRs, I nominal ratings, MCOVs, type designations, OCPD requirements, model numbers, system voltages, and modes of protection.
   3. Copies of test reports from a recognized independent testing laboratory, capable of producing 200kA surge current waveforms, verifying the suppressor can survive published surge current rating on a per mode basis using the ANSI/IEEE C62.41 impulse waveform C3 (8 x 20 microsecond, 20kV/10kA). Test data on an individual module is not acceptable. In house testing will not be accepted.
   4. Copy of warranty statement clearly establishing the terms and conditions to the building/facility owner/operator.

1.5 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

B. Sample Warranty: For manufacturer's special warranty.

C. Testing: Third Party Independent Testing

1.6 CLOSEOUT SUBMITTALS

A. Maintenance Data: For SPDs to include in maintenance manuals.

1.7 WARRANTY

A. Manufacturer's Warranty: The SPD system shall have a limited product warranty when installed in compliance with applicable national/local electrical codes and manufacturer’s installation manual.
   1. Warranty Period: Twenty (20) years from date of Substantial Completion. TYPE “C”
   2. Warranty Period: Fifteen (15) years from date of Substantial Completion. TYPE “A” &”B”

PART 2 - PRODUCTS

2.1 GENERAL SPD REQUIREMENTS

A. SPD with Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NFPA 70.

C. Comply with UL 1449.

D. MCOV of the SPD shall be the nominal system voltage. MCOV shall be a tested value per section 37.7.3 of UL1449 4th Edition.

2.2 SERVICE ENTRANCE AND TRANSFER SWITCH SUPRESSOR (TYPE C)

A. Basis of Design: Subject to compliance with requirements. Provide comparable product to the following:
   1. Current Technology “SL3” Series.
   2. Approved equivalent provided all specification requirements met within. Submission package must be received by engineer two weeks prior to bid date shall fully comply with all performance characteristics included in this specification.

B. SPDs: Listed as Type 1 SPD per UL1449 4th Edition
   1. SPDs with the following features and accessories:
      a. Integral disconnect switch (where breaker not provided).
      b. Internal thermal protection that disconnects the SPD before damaging internal suppressor components.

c. Indicator light display for protection status.
d. Form-C contacts: one normally open and one normally closed, for remote monitoring of protection status, and Advanced monitoring with status, surge counter and history log of events.

C. Comply with UL 1283 with a maximum attenuation of 54dB based on 50ohm insertion loss test per MIL-STD-220B

D. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per mode shall not be less than 200 kA (400kA per phase). The peak surge current rating shall NOT be the arithmetic sum of the ratings of the individual MOVs in a given mode. SPD manufacturer shall provide independent 3rd party testing validating unit is capable of surviving a single surge at the specified rating or up to and not to exceed 200,000 kA.

E. Protection modes and UL 1449 VPR for grounded wye circuits with 480Y/277V or 208Y/120V, three-phase, four-wire circuits shall not exceed the following:
1. Line to Neutral: [1200 V for 480Y/277 V] [700 V for 208Y/120 V].
2. Line to Ground: [1200 V for 480Y/277 V] [700 V for 208Y/120 V].
3. Line to Line: [1800 V for 480Y/277 V] [1200 V for 208Y/120 V].

F. Protection modes and UL 1449 VPR for 240/120 V, single-phase, three-wire circuits shall not exceed the following:
1. Line to Neutral: 700 V.
2. Line to Ground: [700 V] [1000 V].
3. Line to Line: 1200 V.

G. SCCR: Equal or exceed 200 kA.

H. I nominal Rating: 20 kA and compliance to all UL96A requirements for ac surge protection.

I. Repetitive Surge: SPD shall survive a minimum of 14,000 repetitive category C3(20kV/10kVA) surges with no more than 10% deterioration. Calculated repetitive surge values will not be accepted. SPD manufacturer shall provide repetitive surge test report.

J. Temporary Over Voltages: SPD shall be able to prevent common temporary over voltage from damaging the MOVs, increasing longevity and ability of SPD unit to protect the critical load. SPD shall limit the voltage per the following chart.

Overvoltage seen by MOVs as % of Nominal				
	available current			
time	30A	100A	500A	1000A
1 cycle	120%	130%	150%	160%
10 cycles	130%	150%	160%	160%
30 cycles	140%	150%	160%	160%

K. Temporary Over Voltage: SPD shall be able to withstand a minimum of 100 temporary over voltage events, as defined by: 30A available fault current, 30 cycles of duration, with 10 seconds between events.

2.3 PANEL SUPPRESSORS (Type B and A)

A. Basis of Design: Subject to compliance with requirements. Provide comparable product by the following:

1. Current Technology “TG3”.
2. ASCO 570 SERIES
3. Approved equivalent provided all specification requirements met within. Submission package must be received by engineer two weeks prior to bid date shall fully comply with all performance characteristics included in this specification.

B. SPDs: Listed as Type 1 SPD per UL1449 4th Edition
1. Include LED indicator lights for power and protection status.
2. Internal thermal protection that disconnects the SPD before damaging internal suppressor components.
3. Include Form-C contacts rated at 2 to 5A and 24-V ac to 250-V ac, one normally open and one normally closed, for remote monitoring of protection status.

C. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per mode shall not be less than 100kA (Type B), 200kA per Phase and 50kA (Type C) 100kA per Phase. The peak surge current rating shall NOT be the arithmetic sum of the ratings of the individual MOVs in a given mode. SPD manufacturer shall provide independent 3rd party testing validating unit is capable of surviving a single surge at the specified rating.

D. Comply with UL 1283 with a maximum attenuation of 34dB based on 50ohm insertion loss test per MIL-STD-220B

E. Protection modes and UL 1449 VPR for grounded wye circuits with 480Y/277V or 208Y/120V, three-phase, four-wire circuits shall not exceed the following:
1. Line to Neutral: [1200 V for 480Y/277 V] [700 V for 208Y/120 V].
2. Line to Ground: [1200 V for 480Y/277 V] [700 V for 208Y/120 V].
3. Neutral to Ground: [1000 V for 480Y/277 V] [700 V for 208Y/120 V].
4. Line to Line: [2000 V for 480Y/277 V] [1200 V for 208Y/120 V]

F. Protection modes and UL 1449 VPR for 240/120-V, single-phase, three-wire circuits shall not exceed the following:
1. Line to Neutral: 700 V.
2. Line to Ground: 700 V.
3. Neutral to Ground: 700 V.
4. Line to Line: 1200 V.

G. SCCR: Equal or exceed 200 kA.

H. Inominal Rating: 20 kA

2.4 ENCLOSURES

A. Indoor Enclosures: NEMA 250, Type 1.

B. Outdoor Enclosures: NEMA 250, Type 3R.

2.5 CONDUCTORS AND CABLES

A. Power Wiring: SPD SHALL be equipped with mechanical lugs that can accept up to #2 AWG wire. Where conductors between SPD and switchgear exceed 10’ in total length, they shall be “High Performance Interconnect” (HPI) cables with Ultra Low impedance characteristics at 10kHz and above.

B. Class 2 Control Cables: Multi-conductor cable with copper conductors not smaller than No. 18 AWG, complying with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

C. Class 1 Control Cables: Multi-conductor cable with copper conductors not smaller than No. 14 AWG, complying with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1.

B. Install an OCPD or disconnect as required to comply with the UL listing of the SPD.

C. Install SPDs with conductors between suppressor and points of attachment as short and straight as possible and adjust circuit-breaker positions to achieve shortest and straightest leads. Do not splice and extend SPD leads unless specifically permitted by manufacturer. Do not exceed manufacturer's recommended lead length. Do not bond neutral and ground. If installed lead length exceeds 10', SPD manufacturer shall provide a low impedance cable that improves the installed performance.

D. Use crimped connectors and splices only. Wire nuts are unacceptable.

E. Wiring:
1. Power Wiring: Comply with wiring methods in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
2. Controls: Comply with wiring methods in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.2 FIELD QUALITY CONTROL

A. Contractor shall perform the following tests and inspections with the assistance of a factory-authorized service representative.
1. Compare equipment nameplate data for compliance with Drawings and Specifications.
2. Inspect anchorage, alignment, grounding, and clearances.
3. Verify that electrical wiring installation complies with manufacturer's written installation requirements.

B. An SPD will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.3 SYSTEM TESTING

A. Upon completion of installation, provide the start-up and testing services of a factory-authorized and factory-trained local service representative. The tests shall include:
1. Off-line Testing: Impulse injection to verify the system tolerances as well as verification of proper facility neutral-to-ground bond. Compare field test results to factory benchmark test parameters supplied with each individual unit.

2. On-line Testing: Verify that suppression and filtering paths are operating with 100% protection as well as verification of proper facility neutral-to-ground bond by measuring neutral-to-ground current and voltage and by visual inspection.
3. Voltage measurements from Line-to-Ground (L-G), Line-to-Neutral (L-N), Line-to-Line (L-L), and Neutral-to-Ground (N-G), taken at the time of the testing procedure.

3.4 DOCUMENTATION AND REPORTING

A. Record results of field testing and compare to factory benchmark test parameters supplied with each individual surge protective device. Indicate that the integrity of neutral-to-ground bonds were verified through testing and visual inspection, and that grounding bonds were observed to be in place.

B. Submit to the Owner's representative and to the Architect/Engineer copies of the startup test results and the factory benchmark testing results for confirmation of proper suppression filter system function, as required by this section. Provide the number of copies as required by Division One and the Electrical General Provisions section; and three copies where not otherwise specified.

END OF SECTION 26 43 13

SECTION 26 50 00 - LIGHTING

PART 1 GENERAL

1.1 LIGHTING SCHEDULE

A. The Contractor shall install lighting fixtures and accessories as shown on the drawings and/or described herein. The Contractor shall also install lamps for all fixtures.

1.2 SUBMITTALS & PRIOR APPROVAL

A. Prior approvals and/or submittals shall submit the following:
   1. Cutsheets clearly indicating fixture options selected.
   2. Photometric calculations of the floor plan including point by point calculations and a calculation schedule which shall include the following foot-candle measurements for each room and site plan.
      a. Maximum value
      b. Minimum value
      c. Max/Min Ratio
      d. Average

PART 2 PRODUCTS

2.1 LED LIGHTING

A. Lighting fixtures with LED light sources shall meet the following fixture and light source requirements:
   1. LED Color Temperature – Refer to plans
   2. Line Voltage – Universal Voltage 120-277 volts
   4. Expected Lamp Life – Minimum L70 ≥ 60,000 hours at 25°C per LM-80 data.
   5. Driver – Components must be fully encased in potting material for moisture resistance, and must comply with IEC and FCC standards
   6. Surge Protection – Surge protection must be provided including separate sure protection built into electronic driver
   7. Mechanical – Luminaire LED system components to be low copper aluminum, with high performance heat sink(s) designed specifically for LED luminaires. No active cooling features (Fans, etc.). Luminaire configuration must allow for modular upgradability and/or field repair of all electrical components (i.e. LED modules, Driver(s), etc.). Drivers and vertical light bars must be all mounted to a twist-lock tool-less assembly for ease of installation and trouble- shooting.
   8. CRI – Minimum of 80CRI

2.2 LIGHTING ACCESSORIES

A. All lighting shall be equipped with the appropriate housing for the ceiling type shown on the architectural reflected ceiling plan.

   1. GYP Ceilings –
      a. 1’X4’ 2’X2’ & 2’X4’ Troffers: Provide flange kit or surface mount kit. If not explicitly indicated on plan contractor shall price based on the more costly product and submit an RFI to Engineer prior to purchase.
      b. Downlights: Provide recessed housing and appropriate flange kit.
      c. Strip lighting: Provide surface mount kit. In areas with ceiling heights greater than 10’ contractor shall provide chain suspension hardware.
      d. Architectural linear fixtures: Where indicated as recessed contractor shall provide flange kit or mud-in kit as required. If not explicitly indicated on plan contractor shall price based on the more costly product and submit an RFI to Engineer prior

to purchase.

2. Grid Ceilings – Provide appropriate mounting hardware to recess fixtures into grid.

B. Fire ratings: Lighting in fire rated ceiling shall be equipped with fire padding, caulking, and/or housings as required to maintain fire ratings. Contractor shall refer to architectural plans for all fire ratings prior to bid.

C. Emergency battery backup and inverters:
1. Where remote battery backup is utilize contractor shall coordinate all remote test switch locations with owner/architect prior to rough in. They shall not be located in ceiling adjacent to fixture.
2. Where integral battery backup is utilized the fixture shall include self-diagnostics. This shall not be required if specified fixture does not include a self-diagnostic option.
3. Provide UL924 transfer devices as required to provide emergency power to all fixtures on life safety branch.

2.3 FIXTURES

A. Fixtures as described in the Fixture Schedule on the drawings shall be furnished by the Contractor and shall be properly installed.

B. Where fixtures are specified with emergency remote test switches contractor shall coordinate location of remote test switch with Owner/Architect prior to installation.

PART 3 EXECUTION

3.1 INSTALLATION

A. Unless otherwise specified, lighting fixtures shall be permanently installed and connected to the wiring system.

B. The Contractor shall support each fixture, independently from the building structure. Ceiling framing members shall not be used to support fixtures except in specified areas where ceiling supports for this purpose have been specified elsewhere in these specifications. Each fixture shall have at least two fixture supports.

C. Flexible conduit used for fixture whips shall be at least twelve (12) inches, but not more than 48 inches long.

D. Site lighting poles shall include a foundation with a minimum depth below grade of 8’. Those located within parking areas shall extend from grade 3’ in pedestrian areas a reduction in foundation height is permitted, refer to foundation drawings for specific pedestrian area requirements.

3.2 CEILING COMPATIBILITY

A. Catalog numbers shown on the drawings or descriptions of lighting fixtures contained herein may indicate fixture compatibility with certain types of ceiling construction. Contractor shall determine exact type of ceiling actually to be furnished in each area and shall obtain fixtures to suit, deviation from specified catalogue numbers or descriptions only where necessary and only to the extent necessary to insure fixture/ceiling compatibility.

3.3 LIGHT LEAKS

A. The Contractor shall, at the end of this project, adjust all recessed lighting fixtures so that

there will be no light leaks between the fixture trim and the ceiling. Contractor shall also adjust recessed fluorescent fixtures to eliminate any light leaks between fixture trim and ceiling grid member.

3.4 LAMPS

A. The Contractor shall install lamps in all fixtures and shall obtain replacement lamps should any not properly operate or become damaged during construction.

3.5 EXIT FIXTURES

A. Exit fixtures shall be installed according to Life Safety Code requirements, with face(s) plainly visible and directional arrows indicating the proper direction of egress.

END OF SECTION 26 50 00

DIVISION

27

COMMUNICATIONS

SECTION 27 00 00 – STRUCTURED CABLING SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 PURPOSE

A. This document defines the products and the execution requirements required to furnish and install a complete distribution system utilizing a structured cabling system.

B. All cables and related terminations, support and grounding hardware shall be furnished, installed, tested, and documented by the structured cabling contractor as detailed in this document.

C. The distribution system shall be all inclusive and represent a complete installation at the sites shown on the attached drawings and in the attached specifications. The Vendor shall be responsible for all parts, labor, and all other associated apparatus necessary to completely install, test and turnover for acceptance to the Customer the cabling system detailed herein.

D. Product specifications and general design considerations are provided in this document. Quantities of telecommunication outlets, typical installation details, cable routing and outlet types will be provided as an attachment to this document. The successful vendor shall meet or exceed all requirements for the cable system described in this document.

E. Refer to contract drawings for additional requirements to include color coding of faceplates, jacks and cables, labeling, installation, etc.

1.3 RELATED REQUIREMENTS

A. Drawings and general provision of Contract, including General and Supplementary Conditions, Division 1 Specification, and Electrical sections apply to work in this section.

B. Install raceways for auxiliary systems.

C. Interior conduit EMT, minimum 1” unless noted otherwise.

D. Conduit to extend from wall and floor outlets to above accessible ceiling and terminate with a bushing.

E. All conduits indicated as spare shall have nylon pullcord.

1.4 REFERENCE STANDARDS

A. ANSI/TIA/EIA-568B.1-Commercial building Telecommunications Cabling Standard, Part 1: General Requirements

B .ANSI/TIA/EIA-568-B.2-Commercial Building Telecommunications Cabling Standard, Part 2: Balanced Twisted Pair Cabling Components.

C. ANSI/TIA/EIA-568-B.3- Optical Fiber Cabling Components Standard.

D. ANSI/TIA/EIA-569B-Commercial Building Standard for Telecommunications Pathways and spaces.

E. ANSI/TIA/EIA-606(A)-The Administration Standard for the Telecommunications Infrastructure of Commercial Buildings.

F. ANSI-J-STD-607(A)- Commercial Building Grounding and Bonding Requirements for Telecommunications.

G. TIA-526-7-OFSTP-7 Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant.

I. ANSI/TIA/EIA-758(A)- Customer-Owned Outside Plant Telecommunications Cabling Standard.

J. TIA TSB-140 Additional Guidelines for Field Testing Length, Loss and Polarity of Optical

K. ANSI/TIA/EIA 568 B-2.10- 10GIG ETHERNET

L. Install Cabling in accordance with the most recent edition of BICSI publications.
1. BICSI-Telecommunications Distribution Methods Manual.
2. BICSI-Installation Transport Systems information Manual.
3. BICSI-Network Design Reference Design Manual.
4. BICSI-Outside Plant Design Reference Manual.

M. Federal, State and local codes, rules, regulations, and ordinances governing the work, are fully part of the specifications as if herein repeated or hereto attached.

N. If the contractor should note items in the drawings or the specifications, construction of which would be a code violation, promptly call them to the attention of the owner's representative in writing.

O. Where the requirements of other sections of the specifications are more stringent than applicable codes, rules, regulations, and ordinances, the specifications shall apply.

P. All material shall be listed by UL or other National Independent testing standard shall apply.

Q. If this document and any of the documents listed above are in conflict, then the more stringent requirement shall apply. All construction documents listed are believed to be the most current. The Vendor has the responsibility to determine and adhere to the most recent release when developing the proposal for installation.

R. This document does not replace any code, either partially or wholly. The Contractor must be aware of local codes that may impact this project.

1.5 APPROVED CONTRACTOR

A. The Contractor shall have total responsibility for the coordination and installation of the work shown and described in the Drawings and Specifications. The Contractor shall be a company specializing in the design, fabrication and installation of integrated telecommunication systems.

B. The installation of all cable, equipment, terminations, & associated services shall be performed by a company that is a Manufacture’s Certified Structured Cabling System Installer in good standing with a minimum of three (3) years of experience on similar systems.

C. A copy of certification documents must be submitted with the product submittals for quote to

be valid. The telecommunications contractor is responsible for workmanship and installation practices in accordance with the manufacturer's written policies.

D. The cable or connectivity manufacturer will extend a 25-year manufacturer's warranty for all products installed in this project to the end user once the telecommunications contractor fulfills all requirements under these specifications.

E. The contractor must have an office with qualified service and installation personnel within 100 miles of the project site.

F. The Telecommunications cabling contractor must provide a reference list with contact names and phone numbers for three (3) projects of similar scope.

G. The contractor shall employ a full-time RCDD to perform the role of Project Manager. RCDD shall be available for consultation and to attend project meetings. The contractor shall not subcontract a third party RCDD.

H. A BICSI certified installer shall be employed by the contractor and be on site as the installation manager.

I. The owner reserves the right to require the Vendor to remove from the project any such employee the Owner deems to be incompetent, careless or insubordinate.

J. All clean up activity related to work performed, will be the responsibility of the Contractor and must be completed daily before leaving he site.

1.6 COORDINATION WITH OTHER TRADES

A. The Contractor shall coordinate telecommunications work with that of other Sections as required ensuring that the entire telecommunications work will be carried out in an orderly, complete and coordinated fashion.

1.7 SUBMITTALS

A. Submit to the engineer/designer shop drawings, product data (including cut sheets and catalog information), and samples required by the contract documents. Submit shop drawings, product data, and samples with such promptness and in such sequence as to cause no delay in the work or in the activities of other contractors. The engineer/designer will indicate approval of shop drawings, product data, and samples submitted to the engineer by stamping submittals "APPROVED" with a stamp. Submitted shop drawings shall be initialed or signed by the contractor's legitimate firm name.
   1. By submitting shop drawings, product data, and samples, the Vendor represents that he/she carefully reviewed and verified materials, quantities, field measurements, and field construction criteria related thereto. It also represents that the Vendor has checked, coordinated, and verified that information contained within shop drawings, product data, and samples conform to the requirements of the work and of the contract documents.
   2. The engineer's/designer's approval of shop drawings, product data, and samples submitted by the Vendor shall not relieve the Vendor of responsibility for deviations from requirements of the contract documents, unless the Vendor has specifically informed the engineer/designer in writing of such deviation at time of submittal, and the engineer/designer has given written approval of the specific deviation. The vendor shall continue to be responsible for deviations from requirements of the contract documents not specifically noted by the Vendor in writing, and specifically approved by the engineer in writing.
   3. The engineer's/designer's approval of shop drawings, product data, and samples shall not relieve the Vendor of responsibility for errors or omissions in such shop drawings,

product data, and samples.
4. Storage and handling requirements and recommendations.
5. Installation method.

B. Shop Drawings: Show compliance with requirements on isometric schematic diagram of network layout, showing cable routings, telecommunication closets, rack and enclosure layouts and locations, service entrance, and grounding, prepared and approved by BICSI Registered Communications Distribution Designer (RCDD).

C. Submit proof from manufacturer that the contractor is in good standing with the manufacturer's warranty program.

D. Submit letter from manufacturer stating that the manufacturer will provide twenty-five (25) year warranty in accordance with the requirements stated in this document.

E. Submit copy of RCDD certification.

F. Upon request by the engineer/designer, furnish a list of references with specific information regarding type of project and involvement in providing of equipment and systems.

G. Submit references as required.

H., At completion of project, Contractor shall submit the following:
1. Horizontal certification test results printed and saved to USB drive.
2. Backbone certification test results printed and saved to USB drive.
3. Project Record Documents: Prepared and approved by BICSI Registered Communications Distribution Designer (RCDD). The record documents shall be bound and consist of the following:
   a. Product cut sheets for all products supplied.
   b. Test reports for horizontal cabling.
   c. Test reports for backbone cabling.
   d. Manufactures warranties.
   e. "D-Size" As built drawings.

I. As built drawings should accurately record location of service entrance conduit, termination backboards, outlets boxes, cable raceways, cable trays, pull boxes, and equipment racks electronically using AutoCAD 2000 or later version and on minimum "D" size reproducible paper prints.

J. The contractor shall prepare an 18" x 24" as-built serving zone drawing for each Telecommunication Room. The drawing shall be laminated, framed and secured to the wall in the Telecom Room.

K. Work shall not proceed without the Engineer's approval of the submitted items. The Contractor shall receive approval from the Engineer on all substitutions of material. No substituted materials shall be installed except by written approval from the engineer.

1.8 QUALITY ASSURANCE

A. Equipment and materials required for installation under these Specifications shall be the current model and new (less than one (1) year from the date of manufacture), unused and without blemish or defect.

B. Equipment and materials of the type for which are independent standard testing requirements, listings, and labels, shall be listed and labeled by the independent testing laboratory.

C. Material and equipment shall be new, and conform to grade, quality, and standards

specified. Equipment and materials of the same type shall be a product of the same manufacturer throughout installation.

D. Product Requirements:
   1. The product shall be manufactured by an ISO 9001-2000 Certified Facility.
   2. Product shall be free from defects in material and workmanship.
   3. The manufacturer must have a field representative who holds an RCDD who will perform quality control inspections monthly, during the life of the project.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Products must be stored according to manufacturers' recommendations.

B. Keep stored products clean and dry.

C. If the Telecommunications Contractor wishes to have a trailer on site for storage of materials, arrangements shall be made with the owner.

1.10 DRAWINGS

A. It shall be understood that the electrical details and drawings provided with the specification package are diagrammatic. They are included to show the intent of the specifications and to aid the Telecommunications Contractor in bidding for the job. The Telecommunications Contractor shall make allowance in bid proposal to cover whatever work is required to comply with the intent of the plans and specifications.

B. The Telecommunications Contractor shall verify all dimensions at the site and be responsible for their accuracy.

C. Prior to submitting the bid, the telecommunications Contractor shall call the attention of the Engineer to any materials or apparatus the Telecommunication Contractor believes to be inadequate and to any necessary items of work omitted.

1.11 WARRANTY

A. See Section "Closeout Submittals" for additional warranty requirements.

B. The Contractor shall provide a manufactures warranty to guarantee end-to-end high performance cabling systems that meet application requirements. The guarantee shall include all Horizontal drops and Backbone fiber optic cable and connectivity components and have one point of contact for all cabling system issues. The system shall be warranted for a period of 25 years.

C. Materials and workmanship hereinafter specified shall be fully guaranteed by the vendor for a (1) one year period after Date of Substantial Completion against any defects. Defects which may occur as the result of faulty materials or workmanship within one year after installation and acceptance by The Customer shall be corrected by the Vendor at no additional cost to the Customer. The Vendor shall promptly, at no cost to The Customer, correct re-perform (including modifications or additions as necessary) any nonconforming or defective work within one year after completion of the project of which the work is part.

1.12 SEPARATION FROM EMI SOURCES

A. Comply with BICSI TDMM and ANSI/TIA/EIA-569-B recommendations for separating unshielded copper voice and data communication cable from potential EMI sources, including electrical power lines and equipment.

B. Separation between open communications cables or cables in nonmetallic raceways and

unshielded power conductors and electrical equipment shall be as follows:
1. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.
2. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches.
3. Electrical Equipment Rating More than 5 kVA: A minimum of 12 inches.

C. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows.
1. Electrical Equipment Rating Less than 2 kVA: A minimum of 2 ½ inches.
2. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches.
3. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches.

D. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:
1. Electrical Equipment Rating Less than 2 kVA: No requirement.
2. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches.
3. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches.

E. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches.

F. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 12 inches.

PART 2 - PRODUCTS

2.1 EQUIVALENT PRODUCTS

A. Due to the nature and type of communications all products, including but not limited to racks, patch panels, jacks, faceplates, patch cords, J-hooks shall be manufactured by Hubbell, Siemon, or Panduit.

B. Provide products of manufacturers as named in individual articles.

C. Where no manufacturer is specified, provide products of manufacturers in compliance with requirements.

D. Where equipment is identified by manufacturer and catalog number, it shall be a base of requirements for quality and performance. Where manufacturers for equipment are identified by name, the Contractor may submit for approval, similar equipment of other manufactures as substitution. The Engineer’s decision as to whether the submitted equipment is acceptable shall be final and binding.

E. The request for substitutions must be received (10) ten days prior to bid opening by Engineer in writing, listing all physical and technical differences between product specified and product request for substitution. Product samples of each item must accompany written request.

F. Accepted substitutions will be approved by means of addendum.

G. All fiber shall be single mode.

2.2 CATEGORY 6 HORIZONTAL DISTRIBUTION CABLE

A. All Horizontal station cables shall terminate on modular patch panels in their respective Telecommunication Room or Equipment Room as specified on the drawings.

B. All cable, workstation jack modules and patch panel jack modules shall be the same color as

designated on prints. If colors are not designated Coordinate color with Engineer. See details.

C. Unshielded Twisted-Pair Cabling:
1. Cable construction shall be 23 AWG with four twisted pairs of insulated solid bare annealed copper conductors with separator.
2. Outer jacket shall meet NEC requirements and have a Nominal Cable diameter not to exceed .200 for CMP (in)
3. Cable shall have a minimum bend radius of 1.0 (in).
4. Contain “Crossweb” Filler
5. Must have positive PSACR beyond 250 MHz.
6. Application assurance warranty.
7. All transmission performance parameters shall be independently verified by UL or ETL third party testing organization.
8. Contractor will use a plenum rated cable jacket unless being installed in slab and below grade.
9. Approved Manufacturer - Category 6 Horizontal Cable:

Manufacturer	CMR	CMP
Hubbell	HC6RRx	HC6RPx
Siemon	9C6R4-E4-(XX)-RBA	9C6P4-E4-(XX)-RBA
Panduit	PUR6504xx-UY	PUP6504xx-UY

D. ANY CABLE LOCATED IN SLAB BELOW GRADE SHALL BE RATED FOR WET LOCATIONS.
1. Approved Manufacturer - Indoor/Outdoor Rated Cable:

Manufacturer	CMP
Hubbell	C6IOSPBK
Siemon	9U6W4-A5-12-R1A
Panduit	PUO6AS04BL-G

2.3 CATEGORY 6A HORIZONTAL DISTRIBUTION CABLE

A. All Horizontal WAP Cable shall terminate on modular patch panels in their respective Telecommunication Room or Equipment Room as specified on the drawings.

B. All cable and patch panel jack modules shall be the same color as designated on prints. If colors are not designated Coordinate color with Engineer. See details.

C. Unshielded Twisted-Pair Cabling:
1. Cable construction shall be 23 AWG with four twisted pairs of insulated solid bare annealed copper conductors with separator.
2. Outer jacket shall meet NEC requirements and have a reduced diameter not to exceed .265 for CMP (in)
3. Cable shall have a minimum bend radius of 1.0 (in).
4. Contain “Crossweb” filler.
5. +7dB of Headroom Above Standards to suppress Alien Crosstalk
6. High Power PoE (4PPoE) Read
7. All transmission performance parameters shall be independently verified by UL or ETL third party testing organization.
8. Approved Manufacturer - Category 6A Horizontal Cable:

Manufacturer	CMR	CMP

Hubbell	C6ASRDSY	C6ASPDSY
Siemon	9C6R4-A5-05AR1A	9C6P4-A5-05AR1A
Panduit	PUR6AV04YL-G	PUP6AV04YL-G

2.4 WORK AREA OUTLETS

A. WAO shall consist of a single gang 2 Port or 4 Port thermoplastic face plate.

B. Work area outlets shall each be terminated at their designated work area location in the connector types described below.

C. The same orientation and positioning of jacks and connectors shall be utilized throughout the installation. Prior to installation, the Telecommunications Contractor shall submit the proposed configuration for each outlet assembly, with labeling, for review by the owner.

D. The wiring scheme for this project shall be T568B unless otherwise directed by the owner.

E. Category 6 Modular Jack:
1. Third Party Verified Category 6 Component
2. Cobra-Lock Termination Technology
3. Wires Secured Under Constant Compression
4. Easily Re-Terminate
5. 25 IDC Re-termination Cycles
6. Qualified to 150% of 802.3bt PoE Current Level
7. Where color is not indicated coordinate with Engineer prior to installation.
8. Approved Manufacturer - Category 6 Modular Jack (WAO):

Manufacturer	Modular Jack
Hubbell	HJU6xx
Siemon	U6-K0xx
Panduit	CJ688TGxx

F. Jacks at WAO and patch panels shall be color-coded with appropriate colored jacks or icons as follows:
1. Two port face plates:
   a. The left jack shall be BLUE, and the right jack RED. Contractor shall be responsible for making sure the color at the patch panel coordinates with jack at WAO.
2. Four port face plates:
   a. The upper left jack shall be BLUE, the upper right.
   jack shall be RED, the bottom-left jack shall be GREEN, and the bottom right jack shall be GRAY.

2.5 WIRELESS ACCESS POINT OUTLET

A. WAP outlets shall consist of a minimum of two (2) Category 6A cables be terminated above ceiling using a Cat6A Yellow jack in a 2-port Surface Box or using a Cat6A MPTL assembly. Either option shall leave a 10-foot service loop on the horizontal cable run.

B. Each WAP location shall be identified with a 1”x 2” black phenolic tag with white lettering affixed to the underside of the ceiling grid. It shall be the contractor’s responsibility to verify measurements of the ceiling grid prior to ordering the phenolic tags, so as not to create an overhang by the label.

C. Each cable shall be identified with a printed wire wrap label.

D. The wiring pattern for this project shall be T568B unless otherwise directed by the owner.

E. The wiring pattern of jacks and connectors shall be utilized throughout the installation. Prior to installation, the Telecommunications Contractor shall submit the proposed configuration for each outlet assembly, with labeling, for review by the owner.

F. Category 6A Modular Jack:
1. Third Party Verified Category 6 Component
2. Cobra-Lock Termination Technology
3. Wires Secured Under Constant Compression
4. Easily Re-Terminate
5. 25 IDC Re-termination Cycles
6. Qualified to 150% of 802.3bt PoE Current Level
7. Where jack color is not indicated coordinate with Engineer prior to installation.
   a. Approved Manufacturer - Category 6A Modular Jack Assembly (WAP):

Manufacturer	Jack	Surface Box
Hubbell	HJU6AY	HSB2W(P)
Siemon	U6A-K05	MX-SMZ2-02
Panduit	CJ688TGYL	CBX2IW-AY

   b. Approved Manufacturer - Category 6A Modular Plug (WAP):

Manufacturer	Modular Plug
Hubbell	SCP6A
Siemon	ZP1-6AS-01S
Panduit	FP6X88MTG

2.6 COPPER PATCH CABLES

A. Patch Cables shall be factory terminated with modular plugs featuring a tangle-free latch design and clear strain-relief boots to support easy moves, adds and changes. Each patch cord shall be 100% performance tested at the factory to the TIA/EIA Category 6 standard. *Each patch cord shall be made by the same factory as the Cat6 jacks and patch panels used in the project*.

B. Contractor shall provide one 5ft patch cable for each cable terminated at patch panel. Contractor shall provide one patch cable for each terminated WAO, with half the WAO patch cables being 10ft and remaining half being 15ft. Provide an additional 5% surplus equally divided between 5ft, 10ft & 15ft. Confirm lengths and color with owner prior to ordering and transmittal.

C. Approved Manufacturer - Patch Cable:

Manufacturer	5ft Cat6	10ft Cat6	15ft Cat6
Hubbell	HCL6x05	HCL6x10	HCL6x15
Siemon	MC6-05-xx-28	MC6-10-xx-28	MC6-15-xx-28
Panduit	UTP28SP5xx	UTP28SP10xx	UTP28SP15xx

Manufacturer	5ft Cat6A	10ft Cat6A	15ft Cat6
Hubbell	HCL6x01	HCL6x07	HCL6Ax01
Siemon	SP6A-05-xx	SP6A-10-xx	SP6A-15-xx
Panduit	UTP28X5xx	UTP28X10xx	UTP28X15xx

2.7 MODULAR PATCH PANELS

A. All horizontal voice, data and wireless, CCTV & AV cables shall be installed in a modular rack mount patch panel. Each patch panel shall have strain relief bars for each row of 24 ports (a 48-port panel gets 2 relief bars).

B. Approved Manufacturer - Patch Panel:

Manufacturer	24 Port	48 Port	Strain Relief
Hubbell	HPJ24	HPJ48	CMBR
Siemon	KPNL-F1-24-01S	KPNL-F2-48-01S	KPNL-RWM
Panduit	CPPL24WBLY	CPPL48WBLY	SRB19BLY

2.8 HIGH IMPACT THERMOPLASTIC FACEPLATES WITH LABEL FIELDS

A. Verify color of faceplate with architect and engineer prior to ordering.

B. Approved Manufacturer -Faceplate:

Manufacturer	1-Port	2-Port	4-Port
Hubbell	IFP11W	IFP12W	IFP14W
Siemon	KFP-S-01-02	KFP-S-02-02	KFP-S-04-02
Panduit	CFPL1W	CFPL2W	CFPL4W

2.9 BACKBONE FIBER OPTIC CABLE

A.. Furnish and install a minimum of one (1) 12 strand fiber optic cable from the MDF to each IDF, unless otherwise indicated on backbone Riser diagram.

B. All indoor fiber optic cable shall be tight buffered construction with Interlocked Armored Plenum rated.

C. All outdoor or underground fiber optic cables shall be an indoor/outdoor jacket with tight buffered construction.

D. Approved Manufacturer - Indoor Interlocking Armored Fiber Optic Cable:

Manufacturer	Singlemode (OS2)
Hubbell	HFCD15012PS
Siemon	9BC5P012G-E205
Panduit	FSPP912Y

E. Approved Manufacturer - Indoor/Outdoor Fiber Optic Cable:

Manufacturer	Singlemode (OS2)
Hubbell	HFCD14012PSBK
Siemon	9GD8012G-E201
Panduit	FSCP912Y

2.10 FIBER OPTIC RACK MOUNT ENCLOSURE

A. Enclosure shall be mounted in standard 19" rack or cabinet. Shall have front and rear access on all modules via molded-hinged doors. Must have radius control and cable management for fiber patch cords. Shall have multiple cable entry locations. Include fiber optic cable routing kit (grommets, cable ties, saddle clips, strain relief bracket and ID/caution labels for various cable management solutions.

B. Approved Manufacturer - Rack Mount Fiber Optic Enclosure:

Manufacturer	1U	2U	4U
Hubbell	FCR1U3SPT	FCR2U6SPT	FCR4U15SPT
Siemon	LVE-1U-MD-P01A	LVE-2U-MD-P01A	LVE-4U-MD-P01A
Panduit	FCE1U	FCE2U	FCE4U

2.11 FIBER OPTIC ADAPTER PANELS

A. All adapter panels shall be LC form factor and use zirconia ceramic split sleeves. Use blank adapters in each empty port in each fiber optic enclosure.

B. Fill unused slots of fiber enclosure with blank panels

B. Approved Manufacturer - LC Adapter Panel:

Manufacturer	LC 12-Port OS2	LC 12-Port OM4	Blank Panel
Hubbell	FSPNLCDS6AQ	FSPNLCDS6AQ	FSPNB
Siemon	LVA12-LCQ-BC-A	LVA12-LCQ-BC-A	LVA-BLANK-01A
Panduit	FAP6WBUDLCZ	FAP12WAQDLCZ	FAPB

2.12 FIBER OPTIC CONNECTORS

A. Fiber connectors shall have a LC UPC interface. Connectors may be a mechanical or splice-on type connector.

B. Approved Manufacturer - Fiber Optic Connectors:

Manufacturer	LC; OS2 Mechanical	LC; OM4 Mechanical	LC; OS2 Splice-On
Hubbell	FCLC900KSM12	FCLC900K50GM12	FCLCF900SMBP
Siemon	FC1-LB-LCU-9BL	FC1-LB-LC5-9AQ	FC-F-LCU-29BL
Panduit	FLCSSCBUY	FLCSMCXAQY	FLCS2/9SOCU9BU

2.13 FIBER OPTIC PATCH CABLES

A. Contractor shall provide six (6) duplex fiber patch cords for each 12 strands of fiber installed. Patch cables shall be capable of connecting from fiber patch panel to owner provided equipment.

B. Fiber patch cables shall be manufactured in the USA.

C. Approved Manufacturer - Fiber Patch Cables Products:

Manufacturer	OS2; LC/LC; 1M; YL; Plenum	OM4; LC/LC; 1M; AQ; Plenum
Hubbell	DFHPCLCLCS1SM	DFHPCLCLCF1MM
Siemon	FPSLDLD001M	FP4LDLD001M
Panduit	F92RPU1U1ONM001	FZ2RPU1U1ONM001

2.14 Network/EQUIPMENT CABINETS

A. Secure cabinet per manufactures instructions and install 18" Ladder Rack from top of each rack to wall.

B. Each ladder rack shall utilize a "waterfall" or cable drop out at each 2-post rack to maintain the bend radius to each vertical cable manager.

C. Ground each cabinet per ANSI/TIA/EIA-607 Requirements.

D. Maintain 36" clearance from the front and rear of cabinet and on one side.

E. Where no dedicated MDF/IDF closet is available or space will not allow for the use of a floor mounted cabinet use a Wall Mount Swing Gate Style Cabinet

F. Where space is extremely narrow use Hubbell REBOX Part Number: RE4XB or equivalent.

G. Reference riser diagram to determine Cabinet type.
   1. Approved Manufacturer - Cabinets:
      a. Floor Cabinet

Manufacturer	45RU Floor Cabinet
Hubbell	H3S4748
Siemon	V62B-2AB121-45
Panduit	XG84822BS0005

      b. Wall Mount Cabinets

Manufacturer	24”H x 26”D Wall Cabinet	36”H x 26”D Wall Cabinet
Hubbell	HSQ2426	HSQ3626
Siemon	WC2-P101-12	WC2-P101-18
Panduit	PZWMC12W	PZWMC1830W

2.15 EQUIPMENT RACKS

A. Secure each 2-post relay rack to floor per manufactures instructions and install 18" Ladder Rack from top of each rack to wall.

B. Each ladder rack shall utilize a "waterfall" or cable drop out at each 2-post rack to maintain the bend radius to each vertical cable manager.

C. Ground each rack per ANSI/TIA/EIA-607 Requirements.

D. Maintain 36" clearance from the front and rear of rack and on one side.

E. If more than one rack is installed, install all racks in a straight line, side by side with vertical wire management between each rack (see section 2.26.B).

F. Where no dedicated MDF/IDF closet is available or space will not allow for the use of a floor mounted rack use a Wall Mounted Cabinet.

G. Reference riser diagram to determine rack type.
   1. Approved Manufacturer – Floor Racks:

Manufacturer	2-Post; 45RU Rack	4-Post; 45RU Rack
Hubbell	HPW84RR19	SF841929T
Siemon	RS1-07-S	RSQ1-07-S
Panduit	R2P	R4P

2.16 CABLE MANAGEMENT

A. Vertical Cable management shall be provided on each side and between each set of racks.

B. Install 6” vertical cable management at the end of each rack row and 10” vertical cable management between each rack.

C. Reference drawings for further detail:

D. Approved Manufacturer – Vertical Cable Manager:

Manufacturer	45RU; 6 in; Vert Cable Mgr	45RU; 10 in; Vert Cable Mgr
Hubbell	VM620	VM1020
Siemon	VCM-6D	VCM-10D
Panduit	PR2VD06	PR2VD10

E. Approved Manufacturer – Horizontal Cable Manager:

Manufacturer	Horz. Cable Mgr
Hubbell	HM277C
Siemon	RS-RWM-2DS
Panduit	CMPH2

2.17 LADDER TRAY FOR TELECOMMUNICATION ROOMS

A. All ladder tray shall be 18" in width and have 1 1/2" x 3/8" stringers, unless instructed otherwise per drawings,

B. Ladder tray shall be made of tubular steel; and the finish shall be black powder coat.

C. Furnish and install 18" ladder tray from each floor mount rack/server cabinet to wall. Furnish and install 18" ladder tray around wall as required to support cables. (A minimum of (2) walls shall be completely covered by ladder tray).

D. Furnish and install cable retaining post on each side of tray every 4ft as required to support cables.

E. A "waterfall" or cable drop out shall be utilized for each transition from ladder tray to vertical cable manager. A proper bend radius shall be maintained at all times.

F. All raw ladder tray ends shall be covered with a protective cap to match the color of the ladder tray itself.

G. Provide necessary accessories from original ladder rack manufacturer for a complete solution.

H. Approved Manufacturer – Ladder Tray:

Manufacturer	12 in Ladder Tray	18 in Ladder Tray
Hubbell	HLS0612B	HLS1018B
Legrand	TRT10-12B	TRT10-18B

2.18 RACK MOUNT PDU

A. ontractor shall provide and install (1) 30A/208V metered/switched vertical PDU in each cabinet or 4 post rack specified on project, and (1) 30 amp basic rack mount horizontal PDU in each floor mount 2 Post rack.

B. Approved Manufacturer – Power Distribution:

Manufacturer	Horizontal PDU	Vertical PDU
Hubbell	PHJB02	PV72IC30EBD-10
Panduit	P12B47M	P24E28M

2.19 COPPER BACKBONE CABLING

A. Furnish, install and terminate a minimum Cat3 100pr 24awg solid copper cable from the MDF to each IDF unless indicated otherwise on the Riser Diagram.

B. All indoor conductors are to be terminated on 100pr wall mount 110 terminal block kits. Each 100pr 110 block shall be terminated with C5 blocks.

C. Where cable routes above ceiling provide a plenum rated cable. Where cable routes underground provide an outdoor PE-89 type cable with building entrance protector at each end.

D. Approved Manufacturers – 100 Pair Cable:

Manufacturer	Indoor 100Pr Plenum	Outdoor 100Pr PE-89
Essex	18-799-36	09-104-92
Prysmian	2131758	7525819

E. Approved Manufacturers - 110 Block Kits:

Manufacturer	100pr 110 Terminal Block Kit with C5 blocks
Hubbell	18-799-36
Siemon	S110AA2-100FT
Panduit	P110KB1005Y

F. The building entrance protector shall be a 100 pair 110 in/110out with cover and splice chamber. Unit shall be 16awg powder coated and allow up to 22awg line termination. Unit shall be stackable for future expansion and equipped with internal fuse link and accommodate industry standard 5-pin protection modules. The unit shall be UL497 approved. Contractor shall fully populate each 5-Pin protector port with the specified protector module.

1. Approved Manufacturers – Building Entrance Protectors:

Manufacturer	100pr Building Entrance Protector	5-pin protection modules
CircaMax	1880ECA1-100	3B1E
Tii Technologies Inc.	24100-110-M110C	75-3C1EW-N

2.20 CATV HORIZONTAL CABLES

A. Coax Cable shall be Series 6 quad shield plenum rated.

1. Approved Manufacturers – Series 6 Cable:

Manufacturer	Series 6 Quad Shield; Plenum
Essex	78-14C-91
Prysmian	2131758

B. Coax Terminations & Connectors :

1. All coax shall be terminated with compression style connectors. All corresponding strippers and crimp tools shall be used for complete and proper termination.

2. Approved Manufacturers – Series 6 Connectors:

Manufacturer	Series 6 Compression Connectors
Hubbell	FRG625
Siemon	RG6C
Panduit	FSNS6U

2.21 GROUNDING AND BONDING

A. Grounding shall conform to ANSI-J-STD607(A)- Commercial building Grounding and bonding Requirements for Telecommunications, National Electrical Code, ANSI/NECA/BICSI-568 and manufacture's grounding requirements as minimum.

B. Bond and ground equipment racks, housings, messenger cables, and raceways.

C. Connect cabinets, racks, and frames to single-point ground which is connected to building ground system via (minimum #6) green insulated copper grounding conductor.

D. Contractor shall verify actual measurement of the Telecommunication Bonding Backbone (TBB) and size the bonding backbone accordingly.

E. Approved Products:

Manufacturer	Primary Bonding Busbar (PBB)	Secondary Bonding Busbar (SBB)	Compression Lug; 2-Hole	Ladder Tray Bonding Jumper Kit
Hubbell	HBBB14416H	HBBB14212	HGBLxxxx	HGRKTKA9KA5
Burndy	BBB14416H	BBB14212N	BGBLxxxx	BGRKTKA9KA5

F. Contractor to provide all additional necessary components, including but not limited to C-Taps, H-Taps, RB, RBC, TEBC

2.22 J-HOOKS

A. The cable support used must maintain complete horizontal and vertical 1" bend radius control.

B. Do not exceed EIA/TIA standards or manufactures recommendations of 40% fill ratio in each cable support.

C. All J-Hooks are to be placed no more than 4-5 feet apart.

D. Approved Products:
1. Hubbell
2. Caddy
3. B-Line

PART 3 - EXECUTION

3.1 PRE-INSTALLATION SITE SURVEY

A. Prior to start of system, meet at the project site with owner's representative and representatives of trades performing related work to coordinate efforts. Review areas of potential interference and resolve conflicts before proceeding with the work. Facilitation with the General Contractor will be necessary to plan the crucial schedule completions of the equipment room and telecommunication closet.

B. Examine areas and conditions under which the system is to be installed. Do not proceed with work until satisfactory conditions have been achieved.

3.2 INSTALLATION GUIDELINES

A. The work included under this specification, consist of furnishing all labor, equipment, material, and supplies and performing all operations necessary to complete the installation of this structured cabling system in compliance with the specifications and drawings. The Telecommunications contractor will provide and install all of the required material to form a complete system whether specifically addressed in the technical specification or not.

B. All work performed on this project will be installed in accordance with the current edition of the National Electrical code, the current edition of The National Electrical Safety Code, the current issue of the National Electrical Code, The current edition of ANSI/NECA/BICSI-568-Standard for Installing Commercial Building Telecommunications Cabling, the current edition of the BICSI Telecommunications Distribution Methods Manual, the current edition of the BICSI Cabling Installation Manual, the latest issue of ANSI/TIA/EIA Standards as published Global Engineering Documents as ANSI/TIA/EIA Telecommunications Building Wiring Standards, and all local codes and ordinances. Should conflicts exist with the foregoing, the authority having jurisdiction for enforcement will have responsibility for making interpretation.

C. If this document and any other documents listed above are in conflict, then the more stringent requirements shall apply. All documents listed are believed to be the most current release of the documents. The Vendor has the responsibility to determine and adhere to the most current release.

D. This document does not replace any code, either partially or wholly. The Vendor must be aware of local codes that may impact this project. All, local, State and federal codes are to be followed.

E. All materials shall be UL Listed or listed by other National Independent testing agency and shall be marked as such.

F. Section Includes: Equipment, materials, labor, and services to provide a complete structured cabling system including, but not limited to:
   1. Furnish and install a complete telecommunication wiring infrastructure.
   2. Furnish, install, terminate and test all copper and Optical fiber cables.
   3. Furnish and install Raceway, boxes, and cable tray.
   4. Furnish and install all wall plates, jacks, patch panels, and patch cords as described.
   5. Furnish and install all required cabinets and/or racks as required and as indicated.
   6. Furnish any other material required to form a complete system.
   7. Perform Link testing (100% of horizontal and/or backbone links) and certification of all components. All test must meet or exceed link testing requirements as specified in this document.
   8. Furnish test results of all cabling to the owner on disk and paper format, listed by each closet, then by workstation ID.
   9. Provide owner test results and documentation. (Testing documentation and as-built drawings).
   10. Removal of abandoned cable, if required.

3.3 WORK NOT INCLUDED

A. Unless otherwise indicated, the Vendor is not responsible for providing data concentrators, hubs, switches, servers, computers, and other active devices such as PBX's.

3.4 INSTALLATION

A. Install materials and equipment in accordance with applicable standards, codes, requirements, and recommendations of national, state, and local authorities having jurisdiction, and current National Electrical Code and with manufacturer's instructions.

B. Install in accordance with manufacturer's instructions.

C. All cable shall conform to the requirements for communications circuits defined by the National Electrical code (Article 800). Cable listed to NEC Article 800-51(a) will be used for "Plenum" installations. Cable listed to NEC Article 800-51(b) shall be installed in vertical runs penetrating more than one floor.

D. Adhere to manufacturer’s specifications for pulling tension, minimum bend radii, and sidewall pressure when installing cables.
   1. Where manufacturer does not provide bending radii information, minimum-bending radius shall be 15 times cable diameter. Arrange and mount equipment and materials in a manner acceptable to the engineer and the owner.

E. Penetrations through floor and fire-rated walls shall utilize intermediate metallic conduit (IMC) or galvanized rigid conduit (GRC) sleeves and shall be fire stopped after installation and testing, utilizing a fire stopping assembly for that application. Contractor may also utilize EZ Path fire rated pathway or equivalent.

F. Install station cabling to the nearest telecommunications room (TR), unless otherwise noted.

G. Installation shall conform to the following basic guidelines.
Use of approved wire, cable, and wiring devices.
Neat and uncluttered wire termination.

H. Where cable tray is not used, attach cables to permanent structure with suitable attachments at intervals of 48 to 60 inches. Support cables above removable ceilings.

I. Follow manufactures recommendations on spacing and number and type of cables installed in j-hooks or cable tray to avoid cable stress.

J. Separation and physical barriers between communication cabling and power cables must be always maintained.

K. Install adequate support structure for 10-foot service slack at each TR.

L. Support riser cables every (3) floors and at top of run with cable grips.

M. Limit number of four-pair data riser cables per grip to fifty (50).

N. Install cables in one continuous piece. Splices or taps will not be allowed.

O. Provide overvoltage protection on both ends of cabling exposed to lightning or accidental contact with power conductors.

3.5 LABELING

A. Label each outlet with permanent self-adhesive label.

B. Label each cable within 1" of termination on each end.

C. Use labels on the face of patch panels. Provide facility assignment records in a protective cover at each telecommunications closet location that is specific to the facilities therein.

D. Use color-coded labels for each termination field that conforms to ansi/TIA/EIA-606(A)

standard color codes for termination blocks.

E. Labels shall be machine-printed. Handwritten labels shall not be acceptable.

F. Mark up floor plans showing outlet locations, type, and cable marking of cables. Turn these drawings over to the owner two (2) weeks prior to move in date.

G. Three (3) sets of as-built drawings shall be delivered to the owner within four (4) weeks of acceptance of project by the owner. A set of as-built drawings shall be provided to the owner in electronic form utilizing CAD software that is acceptable to the owner. The electronic media shall be delivered to the owner within six (6) weeks of acceptance of project by owner.
NETWORK CABLING COLORING GUIDE:
Wired IT – Blue
Wireless IT – Green
Fire Alarm – Red
GE Vitals – White
Security Cameras – Orange
Nurse Call – Purple
Card Access – Yellow

3.6 TESTING

A. Testing shall conform to ANSI/TIA/EIA-568-B.1 standard. Testing shall be accomplished using a level IIe or higher field testers.

B. All testing shall meet or exceed Manufactures recommendation for 25-year warranty program,

C. Test each pair and shield of each cable for open shorts, grounds, and pair reversal. Correct grounded and reversed pairs.

D. If copper backbone cable contains more than one (1) percent bad pairs, remove and replace entire cable.

E. If horizontal cable contains bad conductors or shield, contractor shall remove and replace cable at no additional cost to owner.

F. Test optical cable with a light source and power meter utilizing procedures as stated in ANSI/TIA/EIA-526-7 Measurements of Optical Power Loss of Installed Singlemode Fiber Cable Plant. Measure results shall be plus/minus 1 dB of submitted loss budget calculations. Correct improper splices and replace damaged cables at no charge to the owner.
1. Cables shall be tested at 1310 and 1550 for singlemode optical fiber.
2. Testing procedures shall utilize "Method B"- one jumper reference.
3. Bi-directional testing of optical fiber is required.
4. Submit printout for each cable tested. The use of handwritten test results will not be acceptable.

3.7 FIELD QUALITY CONTROL

A. Employ job superintendent or project manager during the course of the installation to provide coordination of work of this specification and of other trades and provide technical information when requested by other trades. This person shall maintain current RCDD (Registered Communication Designer) registration and shall be responsible for quality control during installation, equipment set-up, and testing.

B. Installation personnel shall meet manufacturer's training and education requirements for implementation of extended warranty program.

END OF SECTION 27 00 00

SECTION 27 11 00 - COMMUNICATIONS EQUIPMENT ROOM FITTINGS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Telecommunications mounting elements.
   2. Backboards.
   3. Telecommunications equipment racks and cabinets.
   4. Telecommunications service entrance pathways.
   5. Grounding.

1.2 DEFINITIONS

A. BICSI: Building Industry Consulting Service International.

B. Channel Cable Tray: A fabricated structure consisting of a one-piece, ventilated-bottom or solid-bottom channel not exceeding 12 inches (152 mm) in width.

C. Ladder Cable Tray: A fabricated structure consisting of two longitudinal side rails connected by individual transverse members (rungs).

D. LAN: Local area network.

E. RCDD: Registered Communications Distribution Designer.

F. Solid-Bottom or Non-ventilated Cable Tray: A fabricated structure consisting of a bottom without ventilation openings within integral or separate longitudinal side rails.

G. Trough or Ventilated Cable Tray: A fabricated structure consisting of integral or separate longitudinal rails and a bottom having openings sufficient for the passage of air and using 75 percent or less of the plan area of the surface to support cables.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for equipment racks and cabinets. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings: For communications equipment room fittings. Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.
   3. Grounding: Indicate location of grounding bus bar and its mounting detail showing standoff insulators and wall mounting brackets.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.
   1. Layout Responsibility: Preparation of Shop Drawings shall be under the direct supervision of RCDD.
   2. Installation Supervision: Installation shall be under the direct supervision of a

Registered Technician who shall be present at all times when Work of this Section is performed at Project site.

3. Field Inspector: Currently registered by BICSI as RCDD to perform the on-site inspection.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Telecommunications Pathways and Spaces: Comply with TIA/EIA-569-D.

D. Grounding: Comply with ANSI-J-STD-607-D.

PART 2 PRODUCTS

2.1 PATHWAYS

A. General Requirements: Comply with TIA/EIA-569-D.

B. Conduit and Boxes: Comply with requirements in Division 26 Section 26 05 33 "Raceway and Boxes for Electrical Systems."
1. Outlet boxes shall be 4”x4” with plaster ring
2. A double gang outlet box will be necessary for drops containing 4, 4 pair UTP cables.

2.2 BACKBOARDS

A. Backboards: Plywood is to be installed from the finished floor to a height of 8’ on all communications closet walls. The plywood is to be fire retardant treated, ¾”, Lumber Core, void free and painted with fire retardant paint.

2.3 GROUNDING

A. Comply with requirements in Division 26 Section 26 05 26 "Grounding and Bonding for Electrical Systems." for grounding conductors and connectors.

B. Telecommunications Main Bus Bar:
1. Connectors: Mechanical type, cast silicon bronze, solderless compression type wire terminals, and long-barrel, two-bolt connection to ground bus bar.
2. Ground Bus Bar: Copper, minimum 1/4 inch thick by 4 inches wide with 9/32-inch holes spaced 1-1/8 inches apart.
3. Stand-Off Insulators: Comply with UL 94

C. Comply with ANSI-J-STD-607-D.

2.4 LABELING

A. Comply with TIA/EIA-606-D and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

PART 3 EXECUTION

3.1 FIRESTOPPING

A. Seal penetrations through fire and smoke barriers.

B. Sleeves for Future Cables: Install capped sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.

C. Comply with TIA/EIA-569-D, Annex D, "Firestopping." Sections 07 81 00, 07 84 13

D. Comply with BICSI TDMM, "Firestopping Systems" Article.

E. Comply with 3M 4” Pass Through Firestopping system installation guidelines.

3.2 GROUNDING

A. Install grounding according to BICSI Telecommunications Distribution Methods Manual (TDMM), "Grounding, Bonding, and Electrical Protection" Chapter.

B. All sections of the ladder rack and equipment racks shall be connected to each other by bonding straps.

C. Comply with ANSI-J-STD-607-D.

D. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall allowing at least 2-inch clearance behind the grounding bus bar. Connect grounding bus bar with a minimum No. 4 AWG grounding electrode conductor from grounding bus bar to suitable electrical building ground.

E. Locate grounding buss bar away from horizontal/vertical cable paths.

F. Bond metallic equipment to the grounding bus bar, using not smaller than No. 6 AWG equipment grounding conductor.
   1. Bond the shield of shielded cable to the grounding bus bar in communications rooms and spaces.

3.3 IDENTIFICATION

A. Owner’s IT representative shall review the identification plan.

B. Identify system components, wiring, and cabling complying with TIA/EIA-606-D. Comply with requirements in Division 26 Section 26 05 53 "Identification for Electrical Systems." For fire-resistant plywood, do not paint over manufacturer's label.

3.4 FIELD QUALITY CONTROL

A. After installing pathway components and after electrical circuitry has been energized, survey for compliance with requirements. Perform the following field quality-control survey:
   1. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in pathway components, vibration, and thermal expansion and contraction conditions, which may cause or have caused damage.
   2. Verify that the number, size, and voltage of cables in pathways do not exceed that permitted by NFPA 70. Verify that communication or data-processing circuits are separated from power circuits by barriers.
   3. Verify that there is no intrusion of such items as pipe, hangers, or other equipment that could damage cables.
   4. Remove deposits of dust, industrial process materials, trash of any description, and any blockage of pathway ventilation.
   5. Check for missing or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.

B. Report results in writing.

3.5 PROTECTION

A. Protect installed pathways.
   1. Repair damage to galvanized finishes with zinc-rich paint recommended by j-hook and cable tray manufacturer.

2. Install temporary protection for cables in pathways to protect exposed cables from falling objects or debris during construction. Temporary protection for cables and pathways can be constructed of wood or metal materials until the risk of damage is over. Must be removed afterwards.

END OF SECTION 27 11 00

DIVISION

28

ELECTRONIC SAFETY AND SECURITY

SECTION 28 31 00 - FIRE DETECTION AND ALARM

PART 1 - GENERAL

1.1 INCLUDED IN THIS SPECIFICATION

A. Provide a complete fire alarm system per this project's plans and specifications. The system shall include a state-of-the-art, software-based control panel using addressable and analog type initiating.

B. These specifications and the accompanying Drawings define the intent of the fire alarm system to be provided. In addition to the system as specified herein and shown on the Drawings, the Contractor shall provide all planning, design, calculations, equipment, devices, raceways, boxes, cabling, system programming and any other component or service required for a complete, fully operational and code compliant system.

1.2 REFERENCES

A. Electrical Industries Association (EIA):
1. RS-232-D – Interface Between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange
2. RS-485 – Electrical Characteristics of Generators and Receivers for Use in Balanced Multipoint Systems

B. National Fire Protection Association (NFPA):
1. NFPA 12 – Standard on Carbon Dioxide Extinguishing Systems.
2. NFPA 13 – Installation of Sprinkler Systems.
3. NFPA 15 – Standard for Water Spray Fixed Systems for Fire Protection.
4. NFPA 16 – Standard for the Installation of Foam-Water Sprinkler and Foam-Water Spray Systems.
5. NFPA 16A – Standard for the Installation of Closed Head Foam-Water Sprinkler Systems.
6. NFPA 70 – National Electrical Code (NEC).
7. NFPA 72 – National Fire Alarm Code 2010 Edition
8. NFPA 90A – Standard for the Installation of Air Conditioning and Ventilating Systems.
9. NFPA 101 – Life Safety Code 2012 Edition
10. NFPA 750 – Standard on Water Mist Fire Protection Systems.
11. NFPA 5000 – Building Construction and Safety Code.
12. IBC Chapters 9 & 10 2012 Edition
13. ADAAG Americans with Disabilities Act Application Guidelines

C. Fire Alarm Control Panel Equipment: System shall comply with applicable provisions of the following UL standards and classifications:
1. UL 864 9th Edition
2. UOJZ, Control Units, System.
3. SYZV Control Units, Releasing Device.
4. UOXX, Control Unit Accessories, System.

D. The Fire Alarm Control Panel's U.L. Listed signaling types shall be:
1. Digital alarm communicator
2. Other Technology

1.3 SUBMITTALS

A. Equipment Submittal Brochures:

1. Provide minimum 10 copies of submittal brochures and shop drawings.
2. Submittal brochures shall be bound my means of 3 ring binders, binding combs or similar. Stapled brochures will be rejected.
3. Provide one submittal brochure in color, highlighted and reserved for use by the Louisiana State Fire Marshal Plan Review Office. This copy shall become the record copy for the project.
4. Include a cover page that indicates the following minimal information:
   a. Project name and address.
   b. Engineered systems distributor's name and contact information.
   c. Installing contractor's name and contact information.
   d. The date of the equipment submittals and date of any subsequent required re-submittals. Indicate on revised submittals the original submittal date and re-submittal date.
   e. Architectural project review number assigned by the Louisiana State Fire Marshal's Office.
5. Provide a Scope of Work Narrative describing the system's basic operating premise in written word.
6. Provide a detailed Sequence of Operation Matrix Grid tailored for this project indicating the cause and effect of all fire alarm system control panels, input and output functions.
7. Include a system bill of material prepared specifically for this project. Include the make, model, description, quantity and manufacturer for every component to be installed in the project.
8. Provide manufacturer's data sheet for each component to be installed in the project. For data sheets that include multiple part numbers, options and accessories, the components included or pertinent to this project shall be highlighted in yellow.
9. Include the U.L. (Underwriters Laboratories) Certification for each component to be installed in the system. The U.L. Certification shall be placed directly behind its corresponding data sheet.
10. Manufacturers device compatibility documentation shall be included proving testing and operational compatibility between control panels and peripheral devices.
11. Separate battery calculations shall be provided for each control panel and prepared on manufacturer's official worksheets.

B. Shop Drawings
1. Shop drawings shall be prepared with the contractor's own title block which shall include:
   a. Project name and address.
   b. Contractor's name, address and phone number.
   c. Date.
   d. Drawing pages shall be numbered.
   e. Bound with spines and stapled.
   f. Floor plan scale.
   g. Louisiana State Fire Marshal architectural assigned project number.
   h. Revision number with re-submittal dates.
2. Drawings shall contain one floor per page. If a floor must be split use match lines and references that refer sheet number to match lines.
3. Floor plan shop drawings shall be prepared in AutoCAD.
4. Prepare floor plans to a 1/8" = 1'-0" scale unless directed otherwise by the architect.
5. Show all equipment, control panels, and device locations.
6. Include a distinct address for every device including panels, initiating, notification, auxiliary, and peripheral devices. All visual notification appliances shall have their candela indicated.

7. Floor plans shall include the following:
   a. Door swings.
   b. Room names and numbers.
   c. Reflected ceiling plan overlay.
   d. Ceiling heights.
   e. Fire and smoke barriers.
   f. Office furnishings when available.
8. Include a symbol schedule of devices for this project.
9. Include the necessary details and general notes for mounting heights, device placement restrictions, etc.
10. End-of-line symbols shall be shown on the floor plans.
11. Riser locations shall be indicated on the floor plan by a bold circle.
12. A detailed riser shall be provided as part of the shop drawings. The riser shall include:
    a. Control panels, power supplies, annunciators, demark cabinets, each identified with its own address and description matching the symbol schedule.
    b. Operating power requirements with breaker panel and breaker number identification.
    c. All system circuits including initiating, notification, SLC, power, control, monitor, network, audio, riser, fiber optic, phone, category cable and auxiliary circuits. Circuits shall be individually addressed indicating wire type, size, quantity and color.
    d. Provide a point to point diagram of every system device on its riser circuit using the exact device symbol as the floor plan. Provide the corresponding device address and candela rating next to each device.
    e. Provide the cumulative current draw at the end of each notification appliance circuit.
    f. Indicate location and placement of surge suppressors.
    g. Provide detail circuit diagrams for connections with systems from other trades.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to site in manufacturer’s original, unopened containers and packaging, with labels clearly identifying product name, number and manufacturer.

B. Store materials in clean, dry area indoors in accordance with manufacturer’s instructions.

C. Protect materials from damage during handling and installation.

1.5 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Personnel shall be trained and certified by manufacturer for installation of units required for this Project and shall be supervised by a Nicet Level III Supervisor.
   2. Manufacturer’s product shall have been in satisfactory operation on three installations of similar size, type and design as this project, for approximately 3 years.
   3. The installing contractor shall have been actively engaged in the business of designing, selling, installing, and servicing fire alarm systems for at least ten (10) years.
   4. The installing contractor shall provide 24-hour, 365 days per year emergency service with factory trained, state licensed service technicians.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Source Limitations: Fire-Alarm System and Components: Obtain fire-alarm system from single source from single manufacturer.

1.6 MAINTENANCE AGREEMENT

A. Contractor shall warranty material and installation against defects in manufacturing and workmanship for a period of one year beginning on the date of final acceptance of the project. Warranty related service calls shall be provided at no charge during the contractor's normal working hours.

B. Initial Maintenance Service: Beginning at Substantial Completion, provide full inspection and maintenance by skilled employees of manufacturer's designated service organization during the Warranty period, including any special warranty period specified.
   1. Include inspection, maintenance, testing, and repair contract in compliance with the manufacturer's recommended routine preventive maintenance program and NFPA 72 requirements necessary to maintain full ongoing listing on the complete installed system.
   2. Provide parts and supplies same as those used in the manufacture and installation of the original equipment.
   3. The contractor performing the contract services shall be qualified and listed to maintain ongoing certification and listing of the completed system.

C. Extended Maintenance Service: Offer for the Owner's consideration and evaluation at the time of Product Data Submittal, a priced inspection, maintenance, testing, and repair contract in compliance with the manufacturer's recommended routine preventive maintenance program and NFPA 72 requirements necessary to maintain full ongoing listing on the complete installed system.
   1. The services offered under this contract shall begin after the completion of the Initial Maintenance Service and Warranty Period.
   2. The Owner shall have the option of renewing for single or multiple years, up to five years, at the price quoted upon completion of the Warranty period.
   3. The contractor performing the contract services shall be qualified and listed to maintain ongoing certification and listing of the completed system.

1.7 COORDINATION

A. Coordinate installation and operational requirements for automatic elevator recall, including but not limited to the recall signal time frame, with Division 14 and with authorities having jurisdiction.

B. Coordinate installation and operational requirements for fire-protection systems, including but not limited to water-based sprinkler system, pre-action system and clean agent extinguishing system, with Division 21.

C. Coordinate installation and operational requirements for smoke control systems with Division 23.

D. Coordinate installation and operational requirements for kitchen fire-suppression systems with hood manufacturer, fire-suppression system manufacturer and with Division 23.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. The following are acceptable manufacturers and series for control panels. No substitutions are allowed.
   1. Edwards EST4 Series
   2. Notifier Inspire N16 Series

2.2 FIRE ALARM SYSTEM OPERATIONAL DESCIRIPTION

A. The fire alarm system shall be fully addressable with notification and initiation devices as shown on drawings. Additional components shall be provided as required for a complete, functional, and code compliant system.

B. Alarm Signals:

   1. Fire Alarm signal initiation shall be by one or more of the following devices and/or systems:
      a. Manual Pull Stations
      b. Heat Detectors
      c. Smoke Detectors
      d. Heat detectors in elevator shaft and pit.
      e. Automatic sprinkler system water flow
      f. Fire-extinguishing system operation including but not limited to fire suppression for kitchen, dry-pipe sprinkler system and pre-action sprinkler systems.
   2. Supervisory signal initiation shall be by one or more of the following devices and/or actions:
      a. Duct-Mounted smoke detectors.
      b. Valve supervisory switch. (Operation of a fire-protection system valve tamper switch.)
      c. Low-air-pressure switch of a dry-pipe sprinkler system.
      d. Low-air-pressure switch of a pre-action sprinkler system.
      e. Fire-pump running.
      f. Fire-pump power failure, including a dead-phase or phase-reversal condition.
      g. Elevator shunt-trip supervision.
   3. System trouble signal initiation shall be by one or more of the following devices and/or actions:
      a. Open circuits, shorts, and grounds in designated circuits.
      b. Opening, tampering with, or removing alarm-initiating and supervisory signal initiating devices.
      c. Loss of primary power at fire-alarm control unit.
      d. Ground or a single break in fire-alarm control unit internal circuits.
      e. Abnormal ac voltage at fire-alarm control unit.
      f. Break in standby battery circuitry.
      g. Failure of battery charging.
      h. Abnormal position of any switch at fire-alarm control unit or annunciator.

C. Specialized Alarm Actions:
   1. Elevator Recall: Activate elevator recall system to start in accordance with ANSI Standard A17.1 and NFPA 72. Comply with the following:
      a. Initiate Elevator Recall Sequence to return elevators to their primary or alternate recall floors upon receipt of a General Alarm by the Fire Alarm

Control Panel (FACP).

b. Smoke detectors designated for Elevator Recall shall be connected to fire-alarm system. Initiate a General Alarm upon detection of smoke.

c. Actuation of the elevator lobby detector located on the designated primary recall floor shall signal the cars to move to the alternate recall floor.

2. Elevator Shunt-Trip Operation: Heat detectors designated for elevator power removal shall be connected to fire-alarm system. Alarm-initiating devices, except those listed, shall not start elevator power removal.

a. Actuation of heat detectors in the locations indicated below shall shut down power, via a shunt trip operator, to the elevators associated with the location without time delay:

1) Heat detector in elevator machine room; locate detector within two feet of each sprinkler head.

2) Heat detectors in elevator hoistway; locate detector within two feet of each sprinkler head.

3. Air-Handling System Shut-Down: Upon receipt of a General Alarm by the Fire Alarm Control Unit perform the following, unless otherwise indicated in sequence for smoke control system or sequence for smoke venting system in a windowless anesthetizing locations:

a. Operate control relay contacts to signal shutdown of the Air-Handling system(s) serving the evacuation signaling zone where the alarm signal originated. Signal shall remain on until alarm conditions are cleared and fire-alarm system is reset. Signal shall not stop in response to alarm acknowledge or signal silence commands. Coordinate and interface with Division 23.

b. Shut the smoke or combination fire/smoke dampers at that specific air-handling units' supply and return connections.

c. Shut all smoke and combination fire/smoke dampers associated with the air handling system.

d. Provide for an adjustable time delay, initially set at 20 seconds, to delay the transmission of close signals to the dampers. The intent of this time delay is to allow the air-handling unit fan(s) to receive the stop signal and slow down before closing any dampers in order to avoid a high static-pressure alarm/trip on the air-handling system.

4. Duct-mounted smoke detector: Duct-mounted smoke detector shall initiate the following functions, unless otherwise indicated in sequence for smoke control system or sequence for smoke venting system in a windowless anesthetizing locations:

a. Initiate a Supervisory Alarm.

b. Shutdown the associated air-handling unit.

c. Shut the smoke or combination fire/smoke dampers associated with that specific smoke detector and shut the smoke or combination fire/smoke dampers at the associated air-handling unit.

d. Provide for an adjustable time delay, initially set at 20 seconds, to delay the transmission of close signal to the dampers. The intent of this time delay is to allow the air-handling unit fan(s) to receive the stop signal and slow down before closing any dampers in order to avoid a high static-pressure alarm/trip on the air-handling system.

5. Kitchen Fire-Suppression: An alarm signal from the kitchen fire-suppression system shall initiate the following functions prior to discharge of fire extinguishing agent:

a. Initiate General Alarm when the kitchen fire-suppression system is activated.

b. Operate control relay contacts to remove power from equipment located equipment under kitchen hood. Relay control shall open circuit breaker

via use of breaker-mounted shunt trip operator(s).

c. Operate control relay contacts to close solenoid valve(s) to shut-off fuel supply to kitchen equipment under kitchen hood.

d. Operate control relay contacts to initiate the smoke evacuation system. Coordinate and interface with Division 23.

2.3 CONTROL PANEL

A. General Requirements:

1. The system shall have the capability of being activated into alarm, supervisory and trouble modes of operation from both manual and automatic devices.
2. Field-programmable, microprocessor-based, modular, power-limited design with electronic modules, complying with UL 864

B. System Cabinet

1. Shall be all metal with a textured finish suitable for surface or semi-flush mounting. Cabinets containing anything non-metal are not acceptable.
2. Front door of steel construction with lockout or dead-front inner door of steel construction to conceal internal circuitry and wiring.
3. Cabinet shall be capable of housing batteries.
4. Cabinet shall be pre-fabricated to accept all available internal circuitry. Installations with loosely hanging internal panel components will not be accepted.

C. Main Power Supply

1. Shall incorporate the latest power-saving switching technology using no step-down transformers.
2. Shall provide minimum 7 amps of continuous rated output to supply all necessary power under normal and emergency conditions.
3. Shall include an internal battery charger capable of charging up to 55 amp hour batteries while under full load.
4. The incoming power to the system shall be supervised so that any power failure must be audibly and visually indicated at the fire alarm control panel. A green “power on” LED shall be displayed continuously while incoming power is present at the building fire alarm control panel.

D. Batteries

1. Provide U.L. Listed batteries of sufficient capacity to provide power for the entire system automatically upon loss of AC power for a period of 24 hours with 15 minutes of alarm signaling at the end of the 24 hour period.
2. Battery connectors shall be the exact size and type required for the standby battery posts or tabs.
3. Connect batteries to the main panel with minimum 14 AWG stranded hook up wire. Red for positive and black for negative. Use fully insulated crimp style connectors.

E. Battery Cabinets

1. Provide U.L. listed metal battery cabinet and enclosures with key lockable door for installations requiring batteries too large to be housed in control panels.
2. Battery cabinet shall be textured painted to match the control panel it is housing the batteries for.

F. Display

1. Main control panel shall include a color touch screen display for user interface.
2. Display shall be capable of a minimum 200 characters.
3. The touch screen communications shall be textual RS-485 based with the capability of being mounted locally or remotely.

4. The display shall provide both audible and visual annunciation of all system events.
5. Separate LED's shall be dedicated for:
   a. AC (normal power): Green
   b. Fire: Red
   c. Hazard: Blue
   d. Supervisory: Yellow
   e. Trouble: Yellow
   f. Silenced: Yellow
6. Pre-programmed keys shall be on board for:
   a. Menu
   b. Fire Drill
   c. System Reset
7. Display shall contain a minimum 5 keys that can be custom programmed for system functions
8. The display shall be suitable to be remotely installed as a remote annunciator up to 3,000 feet away from the main CPU cabinet. The remote display shall be available with a manufacturer's custom metal cabinet suitable for surface or semi flush installation complete with a lockable see through door and textured finish matching the main control cabinet.

G. Main System CPU
1. System CPU shall incorporate a 32-bit RISC multiprocessor design on a single circuit board. An isolated watchdog circuit shall monitor the microprocessor and shall activate system trouble on the display upon any failure. The system program shall not be lost upon any loss of power. The CPU software shall support control-by-event (CBE) programming using Boolean logic including AND, OR, NOT, XOR and TIMING functions to provide complete custom programming flexibility. An auto programming option shall be available where only devices that are present on the SLC shall activate.
2. System shall be programmed via the manufacturer's proprietary field configuration program (FCP), allowing the project configuration custom programming to be uploaded and downloaded via a portable laptop computer at the project.
3. An RJ-45 Ethernet port shall be provided to accept downloaded programs from a portable computer, or provide 80-column readout of all alarms, troubles, location descriptions, time, and date. Communication shall operate at 10/100 speeds.
4. An on-board supervised RS-232C Serial Output shall be included to operate remote printers and video terminals.
5. The system CPU shall include an on-board supervised RS-485 Serial Output for connection and communication to system modules. The RS-485 port shall allow for communication with remote annunciator modules up to 3,000' from the cabinet.
6. Smoke detector alarm verification shall be a standard software option while allowing other devices such as manual stations and sprinkler flow to create immediate alarms. This feature shall be selectable for smoke sensors that are installed in environments prone to nuisance or unwanted alarms.
7. Standard software shall provide for the analog drift compensation of smoke detectors allowing each smoke detector to automatically adjust its sensitivity to accommodate changes caused by the effects of component aging or its surrounding environment including dust. Each sensor shall maintain its actual sensitivity under adverse conditions to respond to alarm conditions while ignoring factors which generally contribute to nuisance alarms. System trouble circuitry shall activate, display smoke detectors that require cleaning and maintenance.
8. System software shall automatically test each analog smoke sensor a minimum of 3 times daily. Test shall be a recognized functional test of each photocell

(analog photoelectric sensors) and ionization chamber (analog ionization sensors) as required annually by NFPA 72. Failure of sensor test shall activate system trouble circuitry, display “Test Failed” indication, and identify individual device that failed.

9. The system control panel shall be capable of setting any detector or sensor into Positive Alarm Sequence mode. Positive Alarm Sequence will operate in the following manner. Any alarms received from a device will activate an alarm at the control panel but will not execute any output functions (e.g. turning on the strobes or fire horns). The operator has 30 seconds to “acknowledge” the event or the system will activate a general alarm and sound all the fire horn and strobes. If the operator does acknowledge the vent within thirty (30) seconds, the panel will start a timer for 180 seconds (3 minutes) in which time the operator must find the device in alarm and reset the device. If the operator has not performed a reset within 180 seconds or a second device reports an alarm, the system will immediately sound the general alarm.
10. The CPU display shall have the option of being configured as an additional remote annunciator. This annunciator shall be mounted in its own metal cabinet with lockable door.
11. The CPU shall maintain a 4100 event history log. The log shall be maintained upon loss of any power.
12. 24 volt D.C. power-limited 1 amp outputs shall be provided for both resettable and non-resettable power. The outputs shall be screw terminal on board the CPU board.
13. Manufacturer’s standard software shall accommodate a 1 man walk test feature.

H. Signaling Line Circuits
1. Provide 1 SLC loop for this project. Projects including more than 1 floor shall include a second SLC loop. Each SLC shall be capable of being wired Class B Style 4 or Class A Style 6 and shall operate in NFPA Style 7 configuration when equipped with isolator modules.
2. Each SLC shall accommodate a maximum 159 analog sensors and 159 monitor/control devices.

I. Notification Appliance Circuits
1. The CPU shall include a minimum 4 on-board polarized NAC circuits rated at 2 amps DC each. Each NAC shall be capable of being wired Class B, Style Y or Class A, Style Z.

J. Dry Contacts
1. Form C dry contacts with a 2 amp at 30VDC resistive rating shall be included on-board the CPU for alarm, trouble and supervisory events.

K. DACT
1. Fire alarm control panel shall include a Digital Alarm Communicator Transmitter (DACT) for signaling to central station. DACT shall contain “Dialer-Runaway” feature preventing unnecessary transmissions as result of intermittent faults in system and shall be Carrier Access Code (CAC) compliant, accepting up to 20-digit central station telephone numbers. Fire department shall be consulted as to authorized central station companies serving municipality. Fire alarm system shall transmit both alarm and trouble signals, with alarm having priority over trouble signal. Contractor shall be responsible for all installation charges and Owner will be responsible for line lease charges
2. DACT shall be a U.L. listed internal component of the main control panel and shall be capable of transmitting specific detailed point by point system events to the monitoring station.
3. Systems using external standalone digital communicators will not be accepted.

L. Cellular/IP COMMUNICATOR
1. Provide a dual path commercial fire communicator as part of this project.
2. Acceptable manufacturers:
3. Fire-Lite Alarms Model IPGSM-4G by Honeywell. All equipment must be available "over the counter" through security equipment distributor network markets and can be installed by dealerships who are independent of the manufacturer. No substitutions allowed.
4. The central station's supervisory equipment shall be Honeywell's AlarmNet Network Control Center.
5. Contract the services of a monitoring company sub-contractor or distributor to provide, program the communicator and provide monitoring of the system.
6. The communicator shall use the internet or GSM cellular network as a primary transmission format.
7. IPGSM-4G Communicator is connected to any Fire Alarm Control Panel DACT telephone ports, the system shall be capable of transmitting Contact ID formatted alarms, supervisory or troubles to a Honeywell's AlarmNet Network Control Center equipped with a Honeywell AlarmNet receiver via Ethernet over a private or public WAN/LAN, Intranet or Ethernet.
8. The IPGSM-4G Communicator shall include connections to the Fire Alarm Control Panel's phone outputs and shall convert the contact ID protocol into Ethernet Packets.
9. The IPGSM-4G Communicator shall be completely field-programmable locally from a 7720P Programming Tool.
10. The IPGSM-4G Communicator shall be capable of transmitting events in contact ID format.
11. Communication shall include vital system status such as:
    a. Independent Zone (Alarm, trouble, non-alarm, supervisory)
    b. Independent Addressable Device Status
    c. AC (Mains) Power Loss
    d. Low Battery and Earth Fault
    e. System Off Normal
    f. 24 Hour Test Signal
    g. Abnormal Test Signal (per UL requirements)
12. The IPGSM-4G Communicator shall support independent zone reporting via the Contact ID format. This format shall enable the central station to have details concerning the location of the fire for emergency response. The IPGSM-4G Communicator shall be capable of providing simulated phone lines to the Fire Alarm Control Panel. The IPGSM-4G Communicator shall communicate over IP or GSM primary and shall be transparent to the Fire Alarm Control Panel normal operation over phone lines.

2.4 VOICE EVACUATION PANEL

A. Provide a standalone voice evacuation panel from one of the approved manufactures

B. The voice evacuation panel shall be a single assembly complete with metal lockable enclosure, power supply, amplifier, audio controller board and supervised hand-held microphone.

C. Provide a system with 4 on-board circuits capable of supervising U.L. listed speakers.

D. The amplifier shall provide a minimum of 50 watts of output power on either 25 or 70.7 Vrms circuits.

E. The panel shall support a minimum of two pre-recorded messages and have the

capability of adding application specific messages through the use of a P.C.

F. The system audio notification emergency message shall initiate automatically from a supervised D.C. polarity reversing fire alarm notification appliance circuit.

G. The power supply shall be capable of charging up 18 amp hours batteries.

H. The audio controller board shall be complete with form C dry trouble and alarm contacts, and LED's for the following:
   1. Speaker circuit trouble
   2. Alarm
   3. Microphone trouble
   4. Ground fault
   5. Low battery
   6. Power fail

I. The system shall be available with a U.L. listed remote microphone accessory manufactured for the system.

2.5 REMOTE ANNUNCIATOR

A. Description: Annunciator functions shall match those of fire-alarm control unit for alarm, supervisory, and trouble indications. Manual switching functions shall match those of fire-alarm control unit.

B. Display Type and Functional Performance: Alphanumeric display and LED indicating lights shall match those of fire-alarm control unit.

2.6 GRAPHICAL WORKSTATION

A. UL-Listed Monitoring and Control System: Graphical workstation that includes a custom pictorial image of the protected premises. Include multiple PC-based workstations with graphics capability, with its operating system and application software, connected to data transmission network.
   1. UL Listed Monitoring and Control Locations: Provide a Graphic Workstation PC with Control Capabilities at the following locations.
      a. Central Plant
   2. Monitoring Only Locations: Provide a Monitor Only PC at the following locations.
      a. Reception

B. PC: Contractor shall provide PC cable of running all required software.

C. UPS: Desktop-Mounted Self-contained power source to supply computer and associated LCD monitor for a minimum of 6 hours of operation of workstation station equipment, including 2 hours of alarm printer operation.

D. Applications Software: Listed and labeled by an NRTL as an integral part of fire-alarm system.
   1. Fully compatible with and based on the approved operating system.
   2. Password-protected setup functions.
   3. Password-protected operator login and access; three levels, minimum.
   4. Capability of creating, deleting, and copying files; and automatically maintaining a directory of all files, including size and location of each sequential and random-ordered record.
   5. Capability for importing custom icons into graphic views to represent alarms and I/O devices.
   6. Automatic and encrypted backups for database and history; automatically stored at central control PC and encrypted with a nine-character alphanumeric password, which must be used to restore or read data contained in backup.
   7. Operator audit trail for recording and reporting all changes made to user-defined

system options.

8. Data Formats:
   a. User-programmable export and import of data to and from commonly used Microsoft Windows spreadsheet, database, billing, and other applications; using dynamic data exchange technology.
   b. Option to convert reports and graphics to HTML format.
   c. Interactive graphics.
   d. Option to send preprogrammed or operator designed e-mail reports.
9. Graphics: Interactive color-graphics platform with pull-down menus and mouse-driven generation of life safety system graphics, in formats widely used for such drafting; to include the following:
   a. Site Plan
   b. Floor Plans
   c. Equipment Elevations
   d. Single-line diagrams
10. User-Defined Monitoring and Control Events: Display and record with date and time stamps accurate to 0.1 second, and including the following:
   a. Operator log on/off.
   b. Attempted operator log on/off.
   c. All alarms.
   d. Equipment operation counters.
11. Reporting: Display data acquired in real-time from different devices, in historical format over user-defined time; unlimited as to interval, duration, or quantity of trends. User commands initiate the reporting of a list of current alarm, supervisory, and trouble conditions in system or a log of past events.
   a. Print a record of user-defined alarm, supervisory, and trouble events on workstation printer.
   b. Sort and report by device name and by function.
   c. Report type of signal (alarm, supervisory, or trouble), description, date, and time of occurrence.
   d. Differentiate alarm signals from other indications.
   e. When system is reset, report reset event with same information concerning device, location, date, and time.
   f. Spreadsheet functions of sum, delta, percent, average, mean, standard deviation, and related functions applied to recorded data.
   g. Charting, statistical, and display functions of standard Windows-based spreadsheet.
   h. Ability to produce all reports required in latest edition of NFPA 72 for system maintenance and record logs.

2.7 PRINTERS

A. A printer shall not be required for this project.

2.8 SUPPLEMENTARY NOTIFICATION APPLIANCE POWER SUPPLIES

E. The following are acceptable manufacturers and series for supplementary notification appliance circuit power supplies. No substitutions are allowed. It is the intent of this specification that all notification equipment must be available over the counter through security equipment distributor network markets
   1. APS6 of APS10 with the appropriate amp.

F. The supplementary NAC power supply shall offer up to 6.0 amps continuous regulated 24-volt power. The power supply shall include the following features:
   1. Integral Charger: Charge up to 35.0 amp-hour batteries and support 60-hour standby.
   2. 2 Input Triggers. Input trigger shall be Notification Appliance Circuit (from fire

alarm control panel) or supervised addressable relay.
3. Surface-mount back box.
4. Ability to delay AC fail delay in accordance with applicable NFPA requirements.
5. Power limited circuitry in accordance with applicable UL standards.
6. Operates as sync follower or a sync generator.
7. Shall have on-board built in sync capability for System Sensor and Wheelock brand appliances.

G. Do not exceed 75% of the power supply's available listed current. Provide the necessary quantity of power supplies to satisfy this requirement with the quantity of devices indicated on the plans.

2.9 SYSTEM PERIPHERALS

A. Every device's address shall be set by means of a rotary-decimal switch using a standard screwdriver. Devices using or requiring binary switches, handheld device programmers or addressed only through software mapping shall not be acceptable.

B. Smoke detectors

1. General Description:
   a. UL 268 listed, operating at 24-V dc, nominal.
   b. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to the FACP.
   c. Integral Visual-Indicating Light: LED type. Indicating detector has operated and power-on status.
2. Photoelectric Smoke Detectors:
   a. Sensor: LED or infrared light source with matching silicon-cell receiver.
   b. Detector Sensitivity: Between 2.5 and 3.5 percent/foot (0.008 and 0.011 percent/mm) smoke obscuration when tested according to UL 268A.
3. Duct Detectors
   a. Duct detectors shall be System Sensor DNR or DNRW Series housings.
   b. Housings and all the related accessories listed below shall be provided for the each of the following:
      1) On the ductwork of every supply branch of every HVAC air handling/rooftop unit exceeding 2,000 CFM
      2) On the ductwork of every return branch of HVAC air handling/rooftop unit exceeding 2,000 CFM. Where duct detectors cannot be practically or effectively installed on return ductwork, securely fasten the duct detector on the side of the AHU and install and secure its sampling tube across the front of the return air filter.
      3) On every shown smoke and fire/smoke damper. Where duct detectors cannot be practically installed on dampers consult with the general contractor to coordinate their installation with other trades.
   c. The housing shall include the listed addressable photoelectric smoke detector head which shall twist in and lock inside the housing.
   d. Provide System Sensor DST Series sampling tube of enough length to extend 75% of the width of the duct it is being installed in. Sampling tubes in ducts exceeding widths of 6 feet shall exceed and install across the entire width of the duct and be supported by drilling a hole in the opposite side of the ductwork.
   e. A System Sensor model RTS151KEY module shall be installed for each duct detector. Provide phenolic labels identifying the related HVAC unit it is connected to. The RTS151KEY module shall mount in a standard single gang electrical box. Verify and coordinate location of RTS151KEY

modules with architect.

f. Provide one addressable relay module for each HVAC required function including:
   1) AHU Shutdown
   2) Smoke damper operation
   3) Smoke sequence/exhaust/pressurization operations

g. System designs incorporating hardwired, conventional relays for any mechanical functions are not allowed and will be subsequently rejected.

C. Pull Stations
1. Shall be fully listed and compatible with the furnished system, dual action, and constructed of Lexan with clearly visible operating instructions provided on cover. The word FIRE shall appear on front of stations in raised letters.
2. Stations shall be designed so after actuation they cannot be restored except by key reset.
3. Stations shall be keyed alike with the fire alarm control panel and NAC power supply.
4. Surface boxes shall be available as an option from the manufacturer.
5. Pull stations shall not utilize glass rods.

D. Thermal Detectors
1. Shall be listed and compatible with the furnished system.
2. Detector shall be rated at 135 degrees and shall have rate of rise element rated at 15 degrees per minute.
3. UL521 listed

E. Beam-Type Smoke Detector: Each detector shall consist of a separate transmitter and receiver, and shall have the following features:
1. UL 268 listed, operating at 24-V dc, nominal.
2. Adjustable Sensitivity: At least six sensitivity levels, settable at the receiver, measured as percent of obscuration.
3. Two selectable alarm delay settings, allowing each to be associated with a corresponding sensitivity.
4. Separate Color-Coded LEDs: Indicate normal, alarm, and trouble status with remote indicator panels.

F. Addressable Monitor Modules
1. Where required provide addressable monitor modules to monitor normally open dry contacts from other non-addressable equipment.
2. Module shall be suitable for installation on a standard 4” square electrical box 2-1/8” deep and shall include the manufacturer’s matching cover plate.
3. An LED shall be visible on the outside of the module’s cover plate and shall flash under normal conditions and remain on steady when it’s connected device is in alarm.
4. Modules not suitable for mounting directly onto a 4” square electrical box or those which wire with pigtail type connectors are not acceptable.

G. Supervised Addressable Output Module
1. Provide addressable supervised output module where required for the project to provide a supervised, programmed 24volt DC reverse polarity output.
2. Module shall be suitable for installation on a standard 4” square electrical box 2-1/8” deep and shall include the manufacturer’s matching cover plate.
3. An LED shall be visible on the outside of the module’s cover plate and shall flash under normal conditions and remain on steady when the module is activated.

H. Addressable Relay Output Module
1. Provide addressable modules suitable for installation on a standard 4” square electrical box 2-1/8” deep and shall include the manufacturer’s matching cover plate.
2. The module shall provide two isolated sets of Form-C normally open and normally closed contacts
3. Contact ratings shall be rated at minimum 2.0 amps resistive or 1.0 amp inductive
4. An LED shall be visible on the outside of the module’s cover plate and shall flash under normal conditions and remain on steady when the module is activated.

I. Audio Visual Notification Appliances
1. Shall be System Sensor SpectrAlert Advance Series listed for use on both wall and ceiling as indicated on the plans.
2. Provide devices white in color with red FIRE screened on device from manufacturer.
3. Audio visual devices shall be one complete assembly utilizing a speaker for audible notification for this project.
4. The device shall be suitable for mounting on standard electrical boxes using the manufacturer’s universal mounting plate. The strobe device shall snap into the mounting plate and secured by one fastener.
5. The manufacturer’s mounting plate shall include screw terminals to accept all field wiring.
6. Candelas shall be selectable in settings of 15, 15/75, 30, 75, 95, 110, 115, 135, 150, 177 and 185.
7. The strobe shall be listed to U.L. 1971 standards and meet all current ADAAG Guidelines.
8. The horn shall be listed to U.L. 464 approved for fire protective service and shall have three audibility options and an output to switch between a temporal three pattern and a non-temporal continuous pattern.
9. Provide manufacturer’s surface mount and weatherproof backboxes where required.

J. MAGNETIC DOOR HOLDERS
1. Description: Units are equipped for wall or floor mounting as indicated and are complete with matching doorplate.
   a. Electromagnet: Requires no more than 3 W to develop 25-lbf (111-N) holding force.
   b. Wall-Mounted Units: Flush mounted unless otherwise indicated.
   c. Rating: 24-V ac or dc.

2. Material and Finish: Match door hardware.

2.10 WIRE AND CABLE

A. The following are acceptable manufacturers:
1. Windy City Wire
2. General Cable

B. Cable shall be approved for plenum use without conduit per the NFPA 262 Flame Test

C. Cable shall be approved per NEC 800, 760; UL, CMP, FPLP UL, RoHS Complaint

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and surfaces to receive fire alarm system.
   1. Notify Architect of conditions that would adversely affect installation or subsequent use.
   2. Do not begin installation until unacceptable conditions are corrected.

3.2 INSTALLATION

A. Install fire alarm system in accordance with NFPA 72, NFPA 70, state and local codes, manufacturer's instructions, and as indicated on the Drawings.

B. Conceal conduit, junction boxes, and conduit supports and hangers in finished areas. Conceal or expose conduit, junction boxes, and conduit supports and hangers in unfinished areas.

C. Do not install smoke detectors before system programming and test period. If construction is ongoing during this period, take measures to protect smoke detectors from contamination and physical damage.

D. Flush-mount fire detection and alarm system devices, control panels, and remote annunciators in finished areas. Flush-mount or surface-mount fire detection and alarm system devices, control panels, and remote annunciators in unfinished areas.

E. Ensure manual stations are suitable for surface mounting or semi-flush mounting as indicated on the Drawings. Install not less than 42 inches, not more than 48 inches, above finished floor measured to operating handle.

F. Duct-Mounted Smoke Detectors: Comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct.

G. Heat Detectors in Elevator Shafts: Coordinate temperature rating, thermal response characteristic and location with sprinkler rating and location.

H. Remote Status and Alarm Indicators: Install near each smoke detector and each sprinkler water-flow switch and valve-tamper switch that is not readily visible from normal viewing position.

I. Smoke- or Heat-Detector Spacing:

   1. Comply with NFPA 72, "Smoke-Sensing Fire Detectors" Section in the "Initiating Devices" Chapter, for smoke-detector spacing
   2. Comply with NFPA 72, "Heat-Sensing Fire Detectors" Section in the "Initiating Devices" Chapter, for heat-detector spacing.
   3. Smooth ceiling spacing shall not exceed the listing of the detector.
   4. Spacing of detectors for irregular areas, for irregular ceiling construction, and for high ceiling areas shall be determined according to Appendix A in NFPA 72.
   5. HVAC: Locate detectors not closer than 5 feet (1.5 m) from air-supply diffuser or 3 feet(1 m) from return-air opening.
   6. Lighting Fixtures: Locate centerline of detectors not closer than 12 inches (300 mm) from any part of a lighting fixture.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Provide service of competent, factory-trained technician authorized by manufacturer to technically supervise and participate during pre-testing and acceptance testing of system.

B. Testing:
1. Conduct complete visual inspection of control panel connections and test wiring for short circuits, ground faults, continuity, and insulation before energizing cables and wires.
2. Close each sprinkler system control valve and verify proper supervisory alarm at Control Panel.
3. Verify activation of flow switches.
4. Open initiating device circuits and verify that trouble signal actuates.
5. Open signaling line circuits and verify that trouble signal actuates.
6. Open and short notification appliance circuits and verify that trouble signal actuates.
7. Ground initiating device circuits and verify response of trouble signals.
8. Ground signaling line circuits and verify response of trouble signals.
9. Ground notification appliance circuits and verify response of trouble signals.
10. Check installation, supervision, and operation of intelligent smoke detectors.
11. Introduce on system each of the alarm conditions that system is required to detect. Verify proper receipt and proper processing of signal at Control Panel and correct activation of control points.
12. Consult manufacturer's manual to determine proper testing procedures when system is equipped with optional features. This is intended to address such items as verifying controls performed by individually addressed or grouped devices, sensitivity monitoring, verification functionality, and similar.

C. Acceptance Testing:
1. Before installation shall be considered completed and acceptable by AHJ, a complete test using as a minimum, the following scenarios shall be performed and witnessed by representative approved by Engineer. Monitoring company and/or fire department shall be notified before final test in accordance with local requirements.
2. Contractor's job foreman, in presence of representative of manufacturer, representative of Owner, and fire department shall operate every installed device to verify proper operation and correct annunciation at control panel.
3. Open signaling line circuits and notification appliance circuits in at least 2 locations to verify presence of supervision.
4. When testing has been completed to satisfaction of both Contractor's job foreman and representatives of manufacturer and Owner, a notarized letter co-signed by each attesting to satisfactory completion of said testing shall be forwarded to Owner and fire department.
5. Leave fire alarm system in proper working order and, without additional expense to Owner, replace defective materials and equipment provided within 1 year (365 days) from date of final acceptance by the owner.

3.4 DEMONSTRATION

A. Provide instruction as required for operating fire alarm system.

END OF SECTION 28 31 00

DIVISION

31

EARTHWORK

SECTION 31 00 01 - EARTHWORK FOR BUILDING FOUNDATIONS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Divisions 00 & 01 Specification Sections, apply to this Section.

B. Section 310000: “Earthwork”.

C. Section 033000: “Cast-in-Place Concrete”.

D. Division 01 Section: “Testing Laboratory Services”.

1.2 SUMMARY

A. This Section includes the following:

1. Earthwork at pile-supported concrete construction.

1.3 DEFINITIONS

A. Excavation consists of removal of material encountered to subgrade elevations indicated and subsequent disposal of materials removed.

B. Unauthorized excavation consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction of Engineer. Unauthorized excavation, as well as remedial work directed by Engineer, shall be at Contractor's expense.

C. In locations other than those above, backfill and compact unauthorized excavations as specified for authorized excavations, unless otherwise directed by Engineer.

D. Structure: Pile supported concrete construction occurring above or below ground surface.

1.4 QUALITY ASSURANCE

A. Codes and Standards: Perform excavation work in compliance with applicable requirements of authorities having jurisdiction, including:
   1. Louisiana Standard Specifications: Comply with applicable requirements of "Louisiana Standard Specifications for Roads and Bridges," Latest Edition, of the Department of Transportation and Development, Office of Highways, unless requirements specified in this Section are more restrictive.
   2. Comply with applicable standards of Terrebonne Parish Department of Public Works, unless requirements specified in this Section are more restrictive, or as indicated elsewhere.
   3. OSHA.

1.5 PROJECT CONDITIONS

A. Site Information: Data in subsurface investigation reports was used for the basis of the design and are available to the Contractor for information only. Conditions are not intended as representations or warranties of accuracy or continuity between soil borings. The Owner will not be responsible for interpretations or conclusions drawn from this data by Contractor.

B. Additional test borings and other exploratory operations may be performed by Contractor, at the Contractor's option; however, no change in the Contract Sum will be authorized for such additional exploration.

C. Existing Utilities: Locate existing underground utilities in areas of excavation work. If utilities are indicated to remain in place, provide adequate means of support and protection during earthwork operations.

D. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, consult utility owner immediately for directions. Cooperate with Owner and utility companies in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of utility owner.

E. Do not interrupt existing utilities serving facilities occupied by Owner or others, during occupied hours, except when permitted in writing by Engineer and then only after acceptable temporary utility services have been provided.

F. Provide minimum of 48-hour notice to Engineer and Utility Owner and receive written notice to proceed before interrupting any utility.

G. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies for shutoff of services if lines are active.

H. Use of Explosives: Use of explosives is not permitted.

I. Protection of Persons and Property: Barricade open excavations occurring as part of this work and post with warning lights.

J. Operate warning lights as recommended by authorities having jurisdiction.

K. Protect structures, utilities, sidewalks, driveways, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.

L. Perform excavation by hand within drip-line of large trees to remain. Protect root systems from damage or dry out to the greatest extent possible. Maintain moist condition for root system and cover exposed roots with moistened burlap.

M. Protect job site from localized ponding by grading site so as to route runoff to the closest operational catch basin.

N. All clearing, and compaction operations shall be accomplished only during periods of dry weather.

O. Comply with L.R.S. 40: 1749.13 which states that no person shall excavate or demolish without first ascertaining the location of underground utilities by serving telephonic notice to a regional notification program. In the State of Louisiana, the regional notification program is Louisiana One Call (formerly DOTTIE) which may be reached by calling (504) 275-3700, or toll free at 1-800-584-4274, or by FAX (504) 272-1967.

P. Handling and Disposition of Stockpiled Material:
   1. All fill material to be delivered for the project and all excavated material to be removed from the project site shall be stockpiled on the site at a location designated by the Contractor. The edge of stockpiled material shall be at least 90 feet from proposed new

and existing pile locations.

2. The Contractor is cautioned that it is his responsibility to ensure that any excess stockpiled material is removed from the site, at no additional cost to the Owner. All necessary barriers, silt fences, and containment berms shall be installed as required to prevent storm water from washing any of the stockpiled material into the municipal storm drain system. All equipment used for transporting, moving or grading the stockpiled material will be thoroughly cleaned before they are removed from the site or taken onto public streets.

PART 2 – MATERIALS

2.1 SOIL MATERIALS

A. Fill Material: Lightweight coarse aggregate fill and backfill shall be expanded clay or approved equal produced by the rotary kiln process and meeting the requirements of ASTM C 330. No by-product slags, cinders, or by-products of a coal combustion shall be permitted. LWA shall have a proven record of durability, as estimated by ASTM C-88 and ASTM C 330; be non-corrosive; be non-plastic and free of wood, roots, clay lumps, and any other deleterious materials; and not contain more than 10% (by weight) of material passing a U.S. Standard No. 200 mesh sieve. The lightweight fill should have a gradation that allows for a maximum saturated unit weight of 70 pcf. Prior to transporting fill materials to the site, a sample shall be tested to verify its conformance to specifications.

B. Unacceptable Materials:
   1. "Spillway" sand shall not be used for any other purpose.
   2. Materials from on-site excavations shall not be used for any purpose, unless approved by Architect.
   3. Recycled material such as crushed concrete.

PART 3 – EXECUTION

3.1 EXCAVATION

A. Excavation is unclassified and includes excavation to subgrade elevations indicated, regardless of character of materials and obstructions encountered.

B. Temporary Drainage: Prior to construction, establish adequate temporary and permanent drainage to prevent ponding water and to ensure immediate runoff of rainfall. The Contractor shall maintain adequate surface drainage away from all foundation and excavation areas during construction. Provide temporary sumps and pumps to remove rainwater from shallow excavations.

C. Access: Provide temporary haul roads and matting as required to perform the work. Protect existing subgrade(s) from damage throughout construction. Wheeled or tracked construction equipment exerting excessive ground pressures should not be used during times in which the subgrade may be saturated or may become saturated.

D. Demolition: Remove construction debris and structures from the project site. Existing footings, slabs, and utilities shall be removed and backfilled with structural fill. Existing piles shall be cut off 2 feet minimum below new pile-supported concrete construction. Demolition shall comply with Section 202 of the LSSRB.

E. Clearing and Striping: Remove from project site the existing sand fill down to EL. 2.00’ (NAVD 88) at the footprint of new pile supported construction. Top of existing, sand fill shall be assumed to be at EL. 9.50’ (NAVD 88) for bidding purposes.

3.2 STABILITY OF EXCAVATIONS

A. General: Comply with local codes, ordinances, and requirements of agencies having jurisdiction.

B. Slope sides of excavations to comply with local codes, ordinances, and requirements of agencies having jurisdiction. Shore and brace where sloping is not possible because of space restrictions or stability of material excavated. Maintain sides and slopes of excavations in safe condition until completion of backfilling. Operate pumping equipment, and/or provide other materials, means and equipment as required to keep excavation free of water and subgrade dry, firm, and undisturbed until backfilling operations are complete.

C. Shoring and Bracing: Provide materials for shoring and bracing, such as sheet piling, uprights, stringers, and cross braces, in good serviceable condition. Maintain shoring and bracing in excavations regardless of time period excavations will be open. Extend shoring and bracing as excavation progresses.

D. Provide permanent steel sheet piling or pressure creosoted timber sheet piling wherever subsequent removal of sheet piling might permit lateral movement of soil under adjacent structures. Cut off tops a minimum of 2' 6" below final grade and leave permanently in place.

3.3 EXCAVATED MATERIALS

A. Remove all stripped & excavated materials as well as excess fill material from the project site.

3.4 EXCAVATION FOR STRUCTURES

A. Conform to elevations and dimensions shown within a tolerance of plus or minus 0.10 foot and extending a sufficient distance from footings and foundations to permit placing and removal of concrete formwork, installation of services, and other construction and for inspection.

3.5 COLD WEATHER PROTECTION

A. Protect excavation bottoms against freezing when atmospheric temperature is less than 35 degrees F.

3.6 BACKFILL AND FILL

A. General: Place soil material in layers to required subgrade elevations using materials specified in Part 2 of this Section.

B. Backfill excavations as promptly as work permits, but not until completion of the following:
1. Acceptance of construction below finish grade including, where applicable, damp-proofing, waterproofing, and perimeter insulation.
2. Removal of concrete formwork.
3. Removal of shoring and bracing, and backfilling of voids with satisfactory materials. Cut off temporary sheet piling driven below bottom of structures and remove in manner to prevent settlement of the structure or utilities or leave in place if required.
4. Removal of trash and debris from excavation.
5. Permanent or temporary horizontal bracing is in place on horizontally supported walls.

3.7 PLACEMENT AND COMPACTION

A. Place lightweight coarse aggregate backfill and fill material in loose lift thickness of 8 to 10

inches with each lift compacted to 50% of its relative density in accordance with ASTM D4253 and D4254. Place fill from EL. 2.00' (NAVD 88) to underside of building's first floor slab.

B. Before compaction, moisten or aerate each layer as necessary to provide optimum moisture content. Compact each layer to required percentage of maximum dry density. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.

C. Place backfill and fill materials evenly adjacent to structures, piping, or conduit to required elevations. Prevent wedging action of backfill against structures or displacement of piping or conduit by carrying material uniformly around structure, piping, or conduit to approximately same elevation in each lift.

D. Control soil and fill compaction, providing minimum percentage of density specified. Correct improperly compacted areas or lifts.

E. Moisture Control: Where subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water to surface of subgrade or layer of soil material. Apply water in minimum quantity as necessary to prevent free water from appearing on surface during or subsequent to compaction operations.

F. Remove and replace, or scarify and air dry, soil material that is too wet to permit compaction to specified density.

G. Stockpile or spread soil material that has been removed because it is too wet to permit compaction. Assist drying by discing, harrowing, or pulverizing until moisture content is reduced to a satisfactory value.

3.8 TESTING LABORATORY SERVICES

A. An Owner selected and compensated independent testing laboratory shall perform the following services:
   1. Prior to transporting fill material to the project site, a sample shall be laboratory tested to verify its conformance with these specifications.
   2. Field Density Tests: At least one field density test for each 2500 square feet of fill at each lift.
   3. Submit reports to Owner, Architect, Engineer, and Contractor.

3.9 EROSION CONTROL

A. Provide erosion control methods in accordance with requirements of authorities having jurisdiction. Provide, implement, and maintain a permitted Storm Water Pollution Prevention Plan (SWPPP).

3.10 DISPOSAL OF EXCAVATED AND WASTE MATERIALS

A. Removal from Owner's Property:
   1. Remove all excavated material, excess fill & backfill, trash, debris, and waste materials and dispose of it off Owner's property at a legal landfill.

END OF SECTION 31 00 01

SECTION 313116 - TERMITE CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Soil and wood treatment with termiticide.

B. Related Sections:

1. Section 061000 "Rough Carpentry" for wood preservative treatment by pressure process.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of termite control product.

1. Include the EPA-Registered Label for termiticide products.

1.4 INFORMATIONAL SUBMITTALS

A. Soil Treatment Application Report: After application of termiticide is completed, submit report for Owner's records and include the following:

1. Date and time of application.
2. Moisture content of soil before application.
3. Termiticide brand name and manufacturer.
4. Quantity of undiluted termiticide used.
5. Dilutions, methods, volumes used, and rates of application.
6. Areas of application.
7. Water source for application.

B. Wood Treatment Application Report: After application of termiticide is completed, submit report for Owner's records and include the following:

1. Date and time of application.
2. Termiticide brand name and manufacturer.
3. Quantity of undiluted termiticide used.
4. Dilutions, methods, volumes used, and rates of application.
5. Areas of application.

C. Warranties: Sample of special warranties.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements: Formulate and apply termiticides and termiticide devices according to the EPA-Registered Label.

B. Source Limitations: Obtain termite control products from single source from single manufacturer.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: To ensure penetration, do not treat soil that is water saturated or frozen. Do not treat soil while precipitation is occurring. Comply with requirements of the EPA-Registered Label and requirements of authorities having jurisdiction.

B. Coordinate soil treatment application with excavating, filling, grading, and concreting operations. Treat soil under footings, grade beams, and ground-supported slabs before construction.

C. Apply wood treatment after framing, sheathing, and exterior weather protection is completed but before electrical and mechanical systems are installed.

1.7 WARRANTY

A. Soil Treatment Special Warranty: Manufacturer's standard form, signed by Applicator and Contractor, certifying that termite control work, consisting of applied soil termiticide treatment, will prevent infestation of subterranean termites. If subterranean termite activity or damage is discovered during warranty period, re-treat soil and repair or replace damage caused by termite infestation.

1. Warranty Period: Five years from date of Substantial Completion.
    a. Contractor shall arrange for pre-payment of annual termite bond renewal for a period of five years to satisfy this requirement.

B. Wood Treatment Special Warranty: Manufacturer's standard form, signed by Applicator and Contractor, certifying that termite control work, consisting of applied wood termiticide treatment, will prevent infestation of subterranean termites. If subterranean termite damage is discovered during warranty period, repair or replace damage caused by termite infestation and treat replacement wood.

1. Warranty Period: 12 years from date of Substantial Completion.

1.8 MAINTENANCE SERVICE

A. Continuing Service: Beginning at Substantial Completion, provide 12 months' continuing service including monitoring, inspection, and re-treatment for occurrences of termite activity.

Provide a standard continuing service agreement. State services, obligations, conditions, terms for agreement period, and terms for future renewal options.

PART 2 - PRODUCTS

2.1 SOIL TREATMENT

A. Termiticide: Provide an EPA-Registered termiticide, complying with requirements of authorities having jurisdiction, in an aqueous solution formulated to prevent termite infestation. Provide quantity required for application at the label volume and rate for the maximum termiticide concentration allowed for each specific use, according to product's EPA-Registered Label.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following
   a. BASF Corporation; Termidor.
   b. Bayer Environmental Science; Premise Pro.
   c. FMC Corporation; Dragnet FT.
   d. Syngenta; Demon TC.
2. Service Life of Treatment: Soil treatment termiticide that is effective for not less than five years against infestation of subterranean termites.

2.2 WOOD TREATMENT

A. Borate: Provide an EPA-Registered borate temiticide, complying with requirements of authorities having jurisdiction, in an aqueous solution for spray application and a gel solution for pressure injection, formulated to prevent termite infestation in wood. Provide quantity required for application at the label volume and rate for the maximum diffusible borate concentration allowed for each specific use, according to product's EPA-Registered Label.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following
   a. Nisus Corporation; Bora-Care.
   b. NovaGuard Technologies, Inc; Shell-Guard.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Applicator present, for compliance with requirements for moisture content of soil per termiticide label requirements, interfaces with earthwork, slab and foundation work, landscaping, utility installation, and other conditions affecting performance of termite control.

B. Proceed with application only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. General: Comply with the most stringent requirements of authorities having jurisdiction and with manufacturer's written instructions for preparation before beginning application of termite control treatment. Remove all extraneous sources of wood cellulose and other edible materials such as wood debris, tree stumps and roots, stakes, formwork, and construction waste wood from soil within and around foundations.

B. Soil Treatment Preparation: Remove foreign matter and impermeable soil materials that could decrease treatment effectiveness on areas to be treated. Loosen, rake, and level soil to be treated except previously compacted areas under slabs and footings. Termiticides may be applied before placing compacted fill under slabs if recommended in writing by termiticide manufacturer.

1. Fit filling hose connected to water source at the site with a backflow preventer, complying with requirements of authorities having jurisdiction.

3.3 APPLICATION, GENERAL

A. General: Comply with the most stringent requirements of authorities having jurisdiction and with manufacturer's EPA-Registered Label for products.

3.4 APPLYING SOIL TREATMENT

A. Application: Mix soil treatment termiticide solution to a uniform consistency. Provide quantity required for application at the label volume and rate for the maximum specified concentration of termiticide, according to manufacturer's EPA-Registered Label, to the following so that a continuous horizontal and vertical termiticidal barrier or treated zone is established around and under building construction. Distribute treatment evenly.

1. Foundations: Adjacent soil, including soil along the entire inside perimeter of foundation walls; along both sides of interior partition walls; around plumbing pipes and electric conduit penetrating the slab; around interior column footers, piers, and chimney bases; and along the entire outside perimeter, from grade to bottom of footing. Avoid soil washout around footings.
2. Crawlspaces: Soil under and adjacent to foundations as previously indicated. Treat adjacent areas including around entrance platform, porches, and equipment bases. Apply overall treatment only where attached concrete platform and porches are on fill or ground.
3. Masonry: Treat voids.
4. Penetrations: At expansion joints, control joints, and areas where slabs will be penetrated.

B. Avoid disturbance of treated soil after application. Keep off treated areas until completely dry.

C. Protect termiticide solution, dispersed in treated soils and fills, from being diluted until ground-supported slabs are installed. Use waterproof barrier according to EPA-Registered Label instructions.

D. Post warning signs in areas of application.

E. Reapply soil treatment solution to areas disturbed by subsequent excavation, grading, landscaping, or other construction activities following application.

3.5 APPLYING WOOD TREATMENT

A. Application: Mix wood treatment solution to a uniform consistency. Provide quantity required for application at the label volume and rate for the maximum specified concentration of borate, according to manufacturer's EPA-Registered Label, so that wood framing, sheathing, siding, and structural members subject to infestation receive treatment.

1. Framing and Sheathing: Apply termiticide solution by spray to bare wood for complete coverage.
2. Exterior Uncoated Wood Trim and Siding: Apply termiticide solution to bare wood siding. After 48 hours, apply a seal coat of paint as specified in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."."

END OF SECTION 313116

SECTION 31 62 01 – STEEL PIPE PILES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 00 & 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Description:

1. The extent of the work is shown on the Drawings including number and location of the piling.
2. The work includes furnishing and driving required probe & job piling and performing static load tests.

B. Pile Type: This Section includes the following type of piling:

1. Open-end Steel Pipe Piling.

1.3 RELATED WORK SPECIFIED ELSEWHERE

A. Cast-in-Place Concrete: Section 033000.

B. Field Engineering: 010500

C. Shop Drawings and Submittals: 013000

D. Material and Equipment: 016000

E. Division 01 Section - Testing Laboratory Services

F. Temporary Facilities, Utilities and Operations: 015000

1.4 DAMAGE TO EXISTING PROPERTY

A. Investigation: Contractor shall investigate the existing adjacent buildings, sewers, utilities, and site improvements and shall take proper and necessary precautions to protect same from damage due to the execution of the piling work. Should damage occur due to Contractor's negligence, the cost and responsibility for repairing or replacing the work in its original condition shall be borne by the Contractor at no cost to the Owner.

B. Documentation: The Contractor shall have photographs taken of exterior and interior of adjacent buildings and site improvements showing in full any damages that now exist.

1.5 NOTIFICATION

A. Requirements: Contractor shall notify Architect forty-eight (48) hours prior to driving the initial probe and job pile. Pile driving must not commence without the testing laboratory being present.

1.6 QUALITY ASSURANCE

A. Welders Qualifications: Qualify all welders, welding processes and procedures in accordance with AWS “Code for Welding in Building Construction.”

1.7 TESTING AND INSPECTING - GENERAL

A. Test Agency: Testing and inspecting shall be performed by an Independent Testing Laboratory capable of performing the testing specified herein.

B. Services: Testing Laboratory Services will include:

1. Inspections to certify materials’ conformity to detail and material requirements.
2. Witnessing and logging all pile driving operations.
3. Continuously monitor and record vibrations at two locations with seismographs during all pile-driving operations.
4. Verify locations of monitoring equipment with Owner and Architect prior to driving piles. Pile driving operations shall immediately be terminated, and the Architect contacted, if sustained vibrations exceed .25in/sec.
5. Pile numbering plan.
6. Load tests and report with interpretation of results.
7. Visual inspection of all welds.
8. Verify welder AWS certification for the type of welding being performed.

C. Steel Piles: All steel piles shall be inspected prior to driving by the Testing Laboratory. No piles shall be driven until inspected and approved. All piles are subject to re-inspection at any time, and any piles which fail to conform to Specifications or which have been injured in handling shall be rejected.

D. Driving Records: Record driving of all piles. Include Project name, name of Contractor, pile location and number, type and size of hammer used, type of pile driving cushion used, rate of operation of pile driving equipment, pile dimensions, elevation of tip, continuous record of number of blows for each foot of penetration, pile deviation and any unusual occurrences during pile driving.

E. Promptly submit copies of all test reports to Architect, Engineer, General Contractor, Pile Driving Contractor and Owner no later than five (5) days after completion of tests. Driving logs shall be submitted daily to the Engineer.

1.8 SUBMITTALS

A. General: Submit the following to the Architect for review.

1. Mill Certificates.
2. Shop Drawings for pile indicating pile dimensions, and details.
3. Driving Equipment: Descriptive data for hammer and other accessory equipment.
4. Concrete mix design.
5. Coal-tar epoxy coating.
6. Documentation of existing conditions.
7. Pile splice locations and detail (full penetration welded splice with continuous internal backer bar rings).
8. Welder AWS certifications.

1.9 DELIVERING, STORING AND HANDLING

A. Delivery Schedule:

1. Deliver materials to Project site in quantities and at times to assure continuity of pile driving operations to Project Schedule.

B. Storage: Store piles in orderly groups above ground and block during storage to minimize possible distortion of members. Piles exhibiting variations beyond mill tolerance limits will be considered distorted and shall not be used.

1.10 MEASUREMENT AND PAYMENT

A. Basis for Payment:

1. Contract price includes all labor, materials, tools, equipment, incidentals, & performance of all work for furnishing, driving, cutting off and related work for piles in place, including all splicing and disposal of cut offs.
2. No payment will be made for rejected piles, including piles driven out of place and out of plumb, imperfect piles, or piles damaged in driving or handling.

1.11 SUBSOIL INVESTIGATION REPORT

A. The data indicated in Subsoil Investigation Report are not intended as representations or warranties of continuity of such conditions. It is expressly understood that the Contractor is responsible for his interpretations or conclusions drawn there from. Data are made available for convenience of Contractor only.

B. Test borings and other exploratory operations may be made by Contractor at no additional cost to Owner, provided such operations are acceptable to Architect.

1.12 LOAD TEST PROGRAM

A. Description: Eight (8) probe piles are to be installed at non-permanent locations within the building footprint as directed by the Engineer. The Engineer will review driving data and select, in consultation with the Project Geotechnical Engineer, two probe piles suitable for reaction pile installation and load testing. The probe piles shall be driven to the specified tip elevation or refusal (whichever occurs first).
B. Pile Design Load to verified = 80 tons (Factor-of-Safety = 2.0).
C. General: Probe piles shall be same type and size as required for permanent job piles, and be driven with the same equipment to be used for permanent job piles. Reaction piles for use in load test shall be type, length and quantity as determined by the Contractor. Reaction piles shall not be used for permanent piles.
D. Contractors Responsibilities: Provide and drive probe piles. Design, furnish, and install reaction systems consisting of steel beam attached to reaction piles, arranged to permit application of load by hydraulic jacking between beam and test pile. Contractor shall assume responsibility for design and safety of reaction system to withstand test load equal to 3 times the pile design load, using a factor of safety equal to two (2). No reaction piles shall be driven closer than 8'-0" from the test pile, or 6'-0" from other permanent job pile locations. Provide flat bearing surface at the top of the pile perpendicular to the pile axis.
E. Driving Probe Piles:
   1. Paint-mark piles and pile driver leads with stripes at 1'-0" intervals and numerals at 5'-0" graduations.
   2. Drive probe piles with equipment specified.
   3. Drive probe piles to tip elevation indicated herein or refusal, whichever occurs first. Use pile length as needed to permit driving and load testing.
F. Load Test: The testing Laboratory will supply and calibrate jacks required, apply test load, and plot required curves for the report. Two probe piles shall be load tested.
   1. Method of Testing – In accordance with ASTM D-1143: Incrementally load to 2x design load or failure (whichever occurs first). Hold 2x design load for 12 hours. Decrementally unload to zero. Incrementally, load to 3x design load or failure (whichever occurs first).
   2. Test load shall be applied in increments, as directed by ASTM D-1143.
   3. "Quick-Load" test procedure shall not be used.
   4. Do not load test pile until fourteen (14) days after the reaction piles have been installed.
G. Permanent job piles shall not be ordered until the pile load test results have been reviewed by the Engineer.
H. After load test cut off reaction and probe piles 2'-0" below new construction."

PART 2 – PRODUCTS

2.1 STEEL PIPE

A. Description: .375 inch wall thickness, 14 inch diameter open-end steel pipe. Spiral welded pipe shall not be used.

B. Steel: Weldable conforming to ASTM A-252, Grade 3, yield-strength: 45,000 psi.

C. Fill earth plug within pile with concrete. Provide (1) - #6 vertical, full-length of earth plug, extending 8 inches into foundation. Remove soil material from within pile if required to achieve bottom of concrete fill at least 15-0" below first floor.

D. Coat upper portion of piles with coal-tar epoxy conforming to USACE standards to 20 feet below first floor.

2.2 DRIVING EQUIPMENT

A. Provide a single-acting air hammer delivering 24,000 ft-lbs. of energy per blow. Vibratory hammers are not acceptable. Jetting is not acceptable.

2.3 CONCRETE

A. 3000 psi 28-day compressive strength, normal-weight.

PART 3 - EXECUTION

3.1 COORDINATION

A. Comply with all local governmental regulatory requirements related to noise ordinances and hours of operation.

B. Obtain necessary permits from governing authorities.

3.2 PRE-DRIVING WORK

A. Examination: Examine areas and conditions under which steel piles are to be installed. Notify Architect in writing of conditions detrimental to proper and timely completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected.

B. Do not drive piles within 30 feet of any concrete or masonry structure, which is less than forty-eight (48) old.

C. Pile Length Markings: Mark leads and piling by painting a horizontal line at 1'-0" intervals and number of feet at 5'-0" intervals.

3.3 DRIVING

A. General Requirements:

1. Continuously drive each pile at locations indicated, to a tip elevation of 147 feet below first floor or refusal, whichever occurs first. Each pile shall be continuously installed to the required tip elevation without stopping from one day's installation to the next. Quantity of splices shall be determined by the Contractor.
2. Carefully maintain center of gravity for each group or cluster of piles to conform to locations shown on Drawings.
3. Carefully plumb leads and pile before driving. Take care during driving to maintain alignment between spliced sections.
4. When handling and driving long piles, take special precautions to ensure against over stress and leading away from a true position when driving.
5. Pile driving operations shall be terminated, and the Architect contacted, if sustained vibrations exceed .25 in/sec.
6. Fill earth plug inside pile with concrete. Install (1) - # (6) full-length reinforcing bar at center of pile at concrete filled plug. Extend #6 bar 8" into concrete foundation.
7. Pile group installation shall start at the center of the group, working outward.

B. Tolerances: Drive piles within the following maximum tolerances:
   1. Location: 3" from location indicated for center of gravity of each single pile for pile groups.
   2. Variation From Vertical: 1-1/2% maximum (excluding battered piles).
   3. Butt Elevation: Not more than 1 inch above or below designated elevation.

C. Damaged or Misdriven Piles:

   1. Damaged piles, and piles driven outside required driving tolerances, will not be accepted.
   2. Rejected piles shall be cut off 12 inches below bottom of pile cap.
   3. Drive additional pile or piles where centerline deviation exceeds 3" and a redesign indicates a load on any pile exceeding 110% of the design load.
   4. Piles rejected after driving shall be abandoned, filled and cut off. Additional piles shall be driven to replace rejected units at newly designated locations. Fill spaces that are left by withdrawn piles, using cohesionless soil material such as gravel, sand, broken stone, and gravel-sand mixtures. Place and compact throughout the length of the space.
   5. Additional quantities of piling, concrete, reinforcing steel, labor and all other materials and incidentals required for properly constructing redesigned pile caps due to damaged and misdriven piles shall be at the expense of the Contractor. No extensions of time and no delay-related cost claims will be entertained for rejected piles or reconfigured pile caps.

D. Cutting-Off: Cut-off tops of driven piles, square with pile axis and at elevations indicated. Grind flame-cut surface, level to 1/16" tolerance, using a power-hand grinder. Dispose of excess material off site. No additional contract cost or time will be allowed, regardless of the length of cut-off to be removed.

E. Following: Not acceptable.

END OF SECTION 31 62 01

DIVISION

32

EXTERIOR IMPROVEMENTS

SECTION 323113 – CHAIN LINK FENCES AND GATES

PART 1 – GENERAL

1.1 SUMMARY

A. Section Includes:

1. Chain-link fence framework.

2. Chain-link fence fabric.

3. Chain-link fittings.

4. Chain-link wires and ties.

5. Chain-link swing gates.

B. Related Requirements:

1. Section 033000 "Cast-in-Place Concrete" for post footings.

2. Section 281500 "Integrated Access Control Hardware Devices" for gate controls.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct prior to installation.

1.3 ACTION SUBMITTALS

A. Product Data:

• Include materials, sizes, construction details, finishes for framework, fabric, fittings, and gates.

B. Shop Drawings:

• Include layout, elevations, post spacing, gate swing, hardware, and connections.

C. Samples:

• For factory-applied finishes, minimum 6-inch samples.

D. Delegated Design Submittal:

• Provide calculations signed/sealed by a licensed structural engineer, confirming fence and gate assemblies are designed for local wind loads.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data.

B. Product Certificates.

C. Product Test Reports.

D. Field Quality-Control Reports.

E. Sample Warranty.

1.5 FIELD CONDITIONS

A. Field Measurements: Verify locations and grades.

1.6 WARRANTY

A. 5-year manufacturer warranty against structural failure and finish deterioration.

PART 2 – PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Design Wind Load: Fence and gate framework shall withstand ultimate wind speed of 150 mph, Exposure Category C, as defined in ASCE/SEI 7-22 for Houma, LA.

B. Posts and framework to be sized in accordance with ASTM F1043 and CLFMI Wind Load Guide WLG2445.

C. ADA Compliance: Required for pedestrian gates.

2.2 CHAIN-LINK FENCE, GENERAL

A. Commercial-grade chain-link fence system compliant with CLFMI standards.

B. Single-source manufacturer preferred.

2.3 FRAMEWORK

A. Fence Height: 8’-0” (96 inches).

B. Material: Group IC – Electric-resistance-welded round steel pipe.

C. Pipe Sizes (minimum):

- Line Posts: 2.375 in OD, Schedule 40.
- End/Corner/Gate Posts: 2.875 in OD, Schedule 40.
- Top and Brace Rails: 1.66 in OD, Schedule 40.

D. Coating:

- External Type B: Zinc + clear polymer film over 0.9 oz/sf after welding.
- Optional: Polymer-coated, color selected by Architect per ASTM F934.

2.4 FABRIC

A. Height: 8’-0”.

B. Mesh: 2-inch diamond, 9-gauge core wire (0.148 in).

C. Finish:

- Zinc-coated per ASTM A392, Class 2 (2.0 oz/sf).
- Optional: Polymer-coated over galvanized.

D. Selvage: Knuckled both ends.

2.5 FITTINGS

A. All fittings to conform to ASTM F626.

B. Pressed steel with zinc coating min. 1.2 oz/sf.

C. Tie Wires: 9-gauge galvanized steel, matching fence fabric finish.

D. Truss Rods: Galvanized steel with turnbuckles.

2.6 TENSION WIRE

A. Metallic-coated 7-gauge (0.177 in) steel, matching fabric finish.

B. Optional: Polymer-coated for color match.

2.7 GATES

A. Swing Gates: ASTM F900, welded construction.

B. Posts:

- Single Leaf: 4.0 in OD Schedule 40.
- Double Leaf: 6.625 in OD Schedule 40.

C. Gate Frames: 1.90 in OD Schedule 40 steel.

D. Hardware:

- Hinges: 180-degree swing, tamper resistant.
- Latch: Lockable from both sides.

- Drop rods for double gates.
- Closers where required.

2.8 GROUT & ANCHORING CEMENT

A. Nonshrink grout: ASTM C1107.

B. Anchoring Cement: Hydraulic expansion, for exterior exposure.

2.9 CONCRETE

A. 2500 psi 28-day compressive strength.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Verify final grades, boundaries, and site conditions prior to installation.

3.2 PREPARATION

A. Stake layout, mark post and gate locations, identify utilities.

3.3 INSTALLATION

A. Install to ASTM F567 and manufacturer recommendations.

B. Post Installation:

- Set in concrete min. 10" dia. x 36" deep or per structural design.
- Top of concrete: 2" above finished grade, domed to shed water.

C. Post Spacing:

- Line Posts: 10' o.c. max.
- Terminal Posts: At corners, ends, and at 500' intervals.

D. Bracing:

- Horizontal rails and truss rods at mid-height.

E. Fabric:

- Attach to posts and rails with ties spaced at 15" max.
- Stretch fabric tight and secure with tension bars.

3.4 ADJUSTING

A. Adjust gates and hardware to operate freely without binding.

B. Replace or repair damaged components.

END OF SECTION 323113

TABLE OF CONTENTS

CIVIL SPECIFICATIONS

SECTION 1 INTENT OF SPECIFICATIONS
SECTION 2 REFERENCE SPECIFICATIONS
SECTION 3 WATER MAIN CONSTRUCTION
SECTION 4 SEWER SYSTEM

SECTION 1 – INTENT OF SPECIFICATIONS

1.1 It is the spirit and intent of these Specifications and the Drawings accompanying them and forming a part of the Contract Documents to which they are attached, to provide for the completion of the overall proposed project as is generally outlined in these contract documents.

1.2 The intent of the contract is to provide for performance and completion of the work described. The contractor shall furnish all labor, materials, equipment, tools, transportation and supplies required to complete the work in accordance with the plans, project specifications and terms of the contract.

1.3 When an item in the contract contains a choice to be made by the contractor, the contractor shall indicate the choice to the engineer in writing. When the project specifications reference or require the use of "manufacturer's recommendations or specifications", the contractor shall provide the engineer with a current copy of these recommendations or specifications.

1.4 The CONTRACTOR represents that it has examined all contract documents and has fully acquainted itself with all prevailing conditions relevant to the work at the site of the work and its surroundings, that it has made all investigations essential to a full understanding of the difficulties that may be encountered in performing the work, and agrees that OWNER and ENGINEER'S rules and procedures for coordinating CONTRACTOR activities with OWNER or his representative are acceptable; and is familiar with all local labor requirements, prevailing rates of wages, and general working conditions in the area. Having fully acquainted itself with the work, the site of the work, its surroundings and all risk in connection therewith, the CONTRACTOR assumes full and complete responsibility for completing the work for the compensation and within the time provided herein.

1.5 The ENGINEER retained by the OWNER is not responsible for the means, methods, techniques and safety precautions relating to the construction process. That responsibility rests with the CONTRACTOR who possesses authority over the construction site and over those performing the work on the site.

1.6 A diligent effort has been made to locate all existing underground utility lines, pipelines, telephone lines, drainage lines etc. that may be in potential conflict with this project. It is the CONTRACTOR'S responsibility to verify, at his expense, the exact location of those foreign lines both that are shown and those that are not shown that are in close proximity to the project. The CONTRACTOR is solely responsible for any damages incurred by crossing these foreign lines and agrees to "Hold Harmless" both the Project OWNER and the ENGINEER from any claims arising from damages caused by the crossing. The CONTRACTOR will cross all foreign lines in a manner acceptable to the foreign line OWNER, the Project OWNER and the ENGINEER.

1.7 This agreement contains detailed provisions requiring CONTRACTOR to conduct his work in such a fashion as to avoid injury to its employees, neighboring landowners, and members of the general public. CONTRACTOR acknowledges that compliance with these provisions and its duty to exercise reasonable care is specific obligations under this agreement.

END OF SECTION 1

SECTION 2 – REFERENCE SPECIFICATIONS

2.1 ALL WORK TO BE IN ACCORDANCE WITH THE TECHNICAL SPECIFICATIONS THAT ARE MADE PART OF THIS DOCUMENT BY REFERENCE INCLUDE THE FOLLOWING:

2.2 U.S. Dept. of Transportation, MUTCD Manual or Uniform Traffic Control Devices 2000, edition (or Latest Revision).

2.3 Louisiana Department of Transportation and Development, 2016 edition (or Latest Revision) of Louisiana Standard Specifications for Roads and Bridges unless otherwise stated. Inclusive, special attention is called to the sections listed below. All Sections exclude terms portions of each section referring to payment. These Sections can be obtained from the Louisiana Department of Transportation and Development website at **http://www.dotd.la.gov/highways/specifications/DirListing.aspx?txtPath=/highways/specifications/documents/2016 Standard Specifications for Roads and Bridges Manual**.

2.3.1 Section 101 - General Information, Definitions and Terms
2.3.2 Section 201 - Clearing and Grubbing
2.3.3 Section 202 - Removing or Relocating Structures and Obstructions
2.3.4 Section 203 - Excavation and Embankment
2.3.5 Section 204 - Temporary Erosion Control
2.3.6 Section 302 - Class II Base Course
2.3.7 Section 402 - Traffic Maintenance Aggregate
2.3.8 Section 502 - Asphalt Concrete Mixtures
2.3.9 Section 601 - Portland Cement Concrete Pavement
2.3.10 Section 701 - Culverts and Storm Drains
2.3.11 Section 702 - Manholes, Junction Boxes, Catch Basins, and End Treatments
2.3.12 Section 706 - Concrete Walks, Drives and Incidental Paving
2.3.13 Section 707 - Curbs and Gutters
2.3.14 Section 713 - Temporary Traffic Control
2.3.15 Section 726 - Bedding Material
2.3.16 Section 727 - Mobilization
2.3.17 Section 737 - Painted Traffic Striping
2.3.18 Section 740 - Construction Layout
2.3.19 Section 812 - Treated Timber
2.3.20 Section 901 - Portland Cement Concrete
2.3.21 Section 1003 - Aggregates
2.3.22 Section 1014 - Timber, Timber Connectors, and Preservatives
2.3.23 Section 1019 - Geotextile Fabrics and Geocomposite Systems

END OF SECTION 2

SECTION 3 - WATER MAIN CONSTRUCTION

3.1 GENERAL CONDITIONS:

3.1.1 GENERAL:

3.1.2 It is the intention of these specifications to provide standards for the construction of a water distribution system within Development/Subdivision within Terrebonne Parish, Louisiana.

3.1.3 Where ever a standard specification is referred to, it is intended that the latest revision effective as of the date of plan approval shall apply.

3.1.4 The PROJECT ENGINEER shall consult with the DISTRICT for standards or materials not covered by these specifications.

3.1.5 For purposes of these specifications the following definitions shall apply:

3.1.5.1 Consolidated Waterworks District No. 1 (District): The political subdivision created by a resolution of the Terrebonne Parish Consolidated Government adopted on March 23, 1994 and governed by its Board of Commissioners, and commencing operations on July 1, 1994.

3.1.5.2 Contractor: Any person, group or corporation acting as a unit or an agent thereof, licensed as required by the State of Louisiana, engaging in the construction of a water transmission system to be connected to the public water supply of the District.

3.1.5.3 Owner: The sub-divider or developer.

3.1.5.4 Project Engineer: An Engineer, registered in the State of Louisiana, retained by the sub-divider/developer to design and administer the construction of improvements in a subdivision/commercial development.

3.1.5.5 Project Representative: The PROJECT ENGINEER'S representative at the construction site.

3.2 PRODUCTS INFORMATION:

3.2.1 Manufacturer's warranty for all material and products to be furnished by the CONTRACTOR and to be incorporated into the completed work shall be furnished to the DISTRICT through the PROJECT ENGINEER.

3.2.2 The manufacturer of all material and products shall furnish complete information as to any special conditions or restrictions to be applied in the use of these items. Should the manner or method of installation, specified performance or test results as set forth in these specifications be contrary to the manufacturer's recommendations for use of the project, the manufacturer shall at once notify the PROJECT ENGINEER who shall forward same to the DISTRICT for appropriate action. Lack of such notification shall be certification by the CONTRACTOR that specification requirements will be met by the material and products under project conditions.

3.2.3 Data submitted on all material shall include complete maintenance instructions and parts list in sufficient detail to facilitate ordering replacements.

3.2.4 Manufacturer's installation guide shall be followed during construction of pipelines. Before construction begins, three (3) copies of the installation guide shall be submitted to the DISTRICT. One copy bearing the DISTRICT'S approval shall be at the job site of installation and the instructions carried out by the foreman in charge of the crew.

3.3 SPECIAL CONSTRUCTION:

3.3.1 Special construction projects, such as submarine crossings, pile crossings, bulkheads, roadway crossings, etc. shall be submitted to the DISTRICT for approval prior to construction.

3.3.2 Asbestos Concrete (AC) materials are governed under Federal, State and local laws. The contractor shall adhere to all Federal laws, State laws, and Consolidated Waterworks District No. 1 policies. This includes but not limited to OSHA, EPA, LaDEQ, and La DHH. The contractor shall either be properly licensed to perform the necessary AC work, engage the services of a properly licensed sub-contractor or engage the District through its current policies. I shall be the sole responsibility of the contractor to ensure regulatory compliance for the handling and disposal of AC materials.

3.4 CHANGES IN PLANS:

3.4.1 Should it be necessary to change the location or elevation of the waterline or any other detail as shown in the drawings after receiving DISTRICT approval, then such change shall be brought to the DISTRICT for approval prior to making the change in the construction.

3.4.2 All change in construction from that shown in the approved drawings shall be shown on the record drawings submitted for the final approval.

3.5 RECORD DRAWINGS:

3.5.1 One (1) copy of the test reports, manufacturer's submittals, record drawings and one (1) computer disk of the record drawings, shall be submitted with the PROJECT ENGINEER'S letter requesting final approval and acceptance of the waterline project. Record drawings shall indicate the location and GPS coordinates on the waterline at reasonable intervals and on all valves, hydrants and fittings greater than 45 degrees. The depth at all conflicting utility or ditch crossings shall also be shown.

3.6 STORAGE OF MATERIALS:

3.6.1 Materials shall be stored so as to insure the preservation of their quality and fitness for the work, and in such a manner that leaves the material accessible for inspection by the DISTRICT.

3.7 WATER PIPELINE MATERIAL

3.7.1 GENERAL:

3.7.2 Waterline material, as indicated on the plans, shall be Polyvinyl Chloride, bell and spigot type with single rubber gasket seals of the push-on type, or butt fused polyethylene pipe.

3.7.3 All pipes shall be in first class condition at the time it is installed in the work.

3.7.4 All pipes shall be designed for a minimum working pressure of 150 psi, plus a surge pressure of 100 psi and an overall minimum safety factor of 2.5. Design laying conditions shall be Class B, WPCF Manual of Practice No. 9 (Page 212) for a maximum cover as indicated on the plans. Design factors for pipe shall be furnished to the PROJECT ENGINEER.

3.8 POLYVINYL CHLORIDE PRESSURE PIPE:

3.8.1 All pipe 12-inches and smaller for the distribution system shall meet or exceed the requirements of ASTM D-1784, "Standard Specifications for Rigid Poly (Vinyl Chloride) compounds; and AWWA Specifications C-900, pressure rating class 150, SDR 18 with design factors as given in paragraph 1(c) herein. Pipe shall be Type I, Grade 1 (12454B) with a hydrostatic design stress of 2000 psi, designated as PVC 1120 or equivalent.

3.8.2 All plastic pipes shall have outside diameters equivalent to the OD of cast iron pipe.

3.8.3 Wall thickness and outside diameter subject to tolerance allowed in AWWA C-900 shall be as shown on the following table:

Nominal Size	Average	OD Tolerance	Wall Minimum	Thickness Tolerance
4" 4.80"	+0.009	0.267	+0.032	
6" 6.90"	+0.011	0.383	+0.046	
8" 9.05"	+0.015	0.503	+0.060	
12" 13.20"	+0.015	0.733	+0.088	

3.8.4 Polyvinyl chloride pipe shall be furnished in 20-foot lengths.

3.8.5 Rubber ring gaskets shall conform to ASTM D-1869. Couplings and gaskets shall provide automatic end separation without auxiliary spacing devices.

3.9 POLYETHYLENE (PE) PIPE:

3.9.1 All PE pipe and fittings shall be made from virgin resins exhibiting a cell classification of PE 345464C as defined in ASTM D3350 with an established hydrostatic-design-basis (HDB) rating of 1,600 psi at 73°F for water. All PE pipe and fittings shall be manufactured in accordance with AWWA C-906. The pipe shall be Series 4000, pressure Class 160, SDR11, unless specifically stated otherwise. The material shall be listed and approved for potable water in accordance with NSF Standard 61. All PE pipe shall have outside diameters (OD) equivalent to the OD of cast iron pipe.

3.9.2 Pipe joints shall be joined by means of zero leak-rate heat fusion or electro fusion method and shall be installed in strict accordance within the pipe manufacturer's recommendations.

3.10 DUCTILE IRON PIPE:

3.10.1 Pipe shall be designed in accordance with ANSI Specifications ANSI/AWWA C150/A21.50, "American National Standard for the Thickness Design of Ductile Iron Pipe". Pipe shall be designed for a working pressure of 150 psi and a minimum surge allowance of 100 psi; trench conditions Type 2, with width of d+2 feet and depth of cover 3 to 8 feet with overall minimum safety factor of 2.5.

3.10.2 Pipe shall be manufactured in accordance with AWWA Specifications ANSI/AWWA C151/A21.51 with minimum wall thickness subject to tolerance allowance allowed in said specification under Class 51 for pipe size indicated.

3.11 CAST IRON AND DUCTILE IRON FITTINGS:

3.11.1 Fittings shall be furnished in accordance with ANSI/AWWA C-110-A21.10 or C153-A21.53. Joints shall be of the type called for on the plans and shall be push-on or mechanical joints conforming to ANSI/AWWA C-111-A21.11. Consideration will be given to alternate joint

configuration; however, such alternate shall receive approval of the DISTRICT prior to installation.

3.11.2 Fittings 12 inches and smaller shall be rated for 250 psi water working pressure.

3.12 LINING AND COATING OF FITTINGS:

3.12.1 All cast iron and ductile iron fittings shall have an inside cement mortar lining conforming with Specification for Cement Lining for Cast Iron Pipe and Fittings ANSI/AWWA C104-A21.4 or manufacturer's standard specifications for seal coated "enamel-line" type cement lining or equal. Outside coating shall conform with ASA Specifications for Coal-Tar Dip Coating for Cast Iron Pipe and Fittings (A21.5; A21.10), latest revision. Thickness shall be standard thickness.

3.13 DUCTILE IRON FITTINGS - SPECIAL COATINGS:

3.13.1 Ductile iron fittings may be lined and coated, in and out, with an approved amine-cured epoxy resin. This epoxy resin is molecularly bonded to the metal assuring permanents without flaking and shall be of 12 mil thickness. This lining and coating shall be done by the manufacturer in order to insure uniformity.

3.14 P.E. FITTINGS:

3.14.1 Molded fittings shall be manufactured and tested in accordance with ASTM D 3261 and shall be so marked. Molded fittings shall be tested in accordance with AWWA C906.

3.14.2 Fabricated fittings shall be made by heat fusion joining specially machined shapes cut from pipe, polyethylene sheet stock or molded fittings. Fittings shall be molded or fabricated of the same material and manufacturer as the pipe; and in no case shall have thinner walls than those of the pipe furnished. All custom fabricated fittings shall be pressure rated for the same internal pressure rating as the mating pipe. Fittings shall be of butt fusing design and shall be produced by the same manufacturer as the pipe being bid. Fabricated fittings shall be tested in accordance with AWWA C906.

3.14.3 If required, a sample of each type fitting shall be submitted for the PROJECT ENGINEER'S approval, and his approval must be obtained before purchase of the fittings.

3.15 ACCESSORIES:

3.15.1 The supplier of cast iron or ductile iron fittings shall furnish all glands and gaskets as recommended by the manufacturer and approved by the DISTRICT. All bolts and nuts shall be Corten; Teflon coated Corten or stainless steel. No direct payment will be made on these items; the cost of same to be included in weight paid for the fitting.

3.15.2 All tie rods shall be 316 stainless-steel. When required, tie rods shall be used to secure all bends ends of pipe, caps, plugs, etc. and all places where thrusting may produce “blow outs”. These tie rods will be used in conjunction with properly sized bands which will attach circumferentially to the pipe. Hot-dipped galvanized bands shall be coated with an approved bitumastic coating before and after installation.

3.15.3 Adapters between PE pipe and flange fittings shall be made with a Harvey adapter or approved equal.

3.16 JOINTS:

3.16.1 Joints of the push-on type shall conform to ASTM Specifications C-111-ASA A21.11.

3.16.2 Mechanical joints shall be in accordance with ASA Specifications A21.11 with Corten, Teflon coated Corten or stainless-steel bolts.

3.16.3 Joints of the restrained type shall be U.S. Pipe's TR FLEX restrained joint pipe, American's LOK-RING restrained joint, or CLOW'S Super-Lock joint pipe, or an approved equal.

3.16.4 Retainer glands, when allowed, for ductile iron pipe and PVC pipe 12-inches and smaller shall be EBAA, or NAAPCO glands with stainless steel set screws or approved equal.

3.17 FLANGED FITTINGS AND SPECIALS:

3.17.1 Flanged fittings shall conform in dimensions, methods of manufacture and tests to the "Standard Specifications for Cast Iron Pipe and Fittings", as adopted by ANSI Class 125.

3.17.2 All flanges and fittings shall conform in weight, thickness and drilling to the "Standard Specifications for Class 125 Cast Iron Flanges and Flanged Fittings", as adopted by ANSI. All flanges shall be faced and drilled, unless special drilling is required as detailed or specified on the plans. All drilling shall conform to the ANSI standards. Where cap screws or stud bolts are required by the plans or specifications, flanges shall be provided with tapped holes for such cap screws or stud bolts.

3.18 TAPPING SLEEVES:

3.18.1 Tapping sleeves shall be the stainless-steel sleeve type. The body shall be a full circle band that meet or exceeds the Waterworks Specifications for repair clamps, stainless steel 18-8 type 304 with gridded overlapping virgin neoprene rubber gasket. The flange shall be 304 (18-8) stainless steel or ductile iron AWWA C207 Class D ANSI 150 lb. drilling recessed to accept a standard tapping valve. Taping sleeves shall be Rockwell 662 or approved equal.

3.18.2 Tapping sleeve valves shall be similar to the valves specified in Division IV.

3.18.3 All bolts and nuts shall be Corten; Teflon coated Corten or stainless steel.

3.19 TESTS AND INSPECTIONS:

3.19.1 All pipe and fittings shall be inspected and tested at manufacturer's plant during manufacture in accordance with manufacturer's standard test procedures at the manufacturer's expense.

3.19.2 For ductile iron fittings, chemical analysis shall be furnished indicating the use of 80-06-03 metal in accordance with ASTM Specifications A339.

3.19.3 For polyvinyl chloride (PVC) pipe, all pipe and couplings shipped must be accompanied by the manufacturer's certificates of test and conformity to applicable ASTM and AWWA Specifications.

3.19.4 Testing of PE pipe and fittings supplied under this specification shall be in accordance with ASTM D-3350.

3.19.5 A letter shall be submitted to the PROJECT ENGINEER by the PE material manufacturer certifying that materials to be furnished meets or exceeds the requirements of AWWA C-906.

3.19.6 The test reports shall be submitted by the PROJECT ENGINEER to the DISTRICT with the request for final acceptance. These test reports shall certify that material furnished under this contract is in compliance with these specifications.

3.19.7 For polyvinyl chloride pipe, quality control shall randomly select pipe to check SDR requirements. This shall be done by cutting the pipe and measuring the actual wall thickness by the use of a micrometer. Result of check shall be submitted to the Project Representative.

3.20 WATER MAIN CONSTRUCTION AND INSTALLATION

3.20.1 GENERAL:

3.20.2 The construction of water lines includes the furnishing of all material in accordance with these specifications and all labor and equipment required for the installation of pipe, fittings, valves, road crossings, canal crossings, stream crossings, ditch crossings, and all incidental work required for completion of the water line system.

3.20.3 The installation of waterlines shall be in accordance with the manufacturer's pipe handbook and instructions.

3.21 DELIVERY OF MATERIAL:

3.21.1 Pipe shall be strung along the line of work in a manner that will not cause it to be a hazard to the public, block traffic or access to property, nor shall it be placed in a drainage ditch.

3.21.2 Protective coated fittings shall be received, stored and transported to a point of installation in a manner that will adequately protect the coating. Damaged coating will be cause for rejection of the fittings.

3.21.3 All pipes shall be removed from the transporting vehicle in a manner recommended by the manufacturer. Pipe removed from the vehicle in a manner not acceptable by the DISTRICT and/or manufacturer will be rejected.

3.22 CARE OF WORK AND MATERIAL:

3.22.1 The CONTRACTOR shall at all times handle, transport and install all material with the degree of care required to assure that these materials are in first class condition when installed.

3.23 INSPECTION OF MATERIALS:

3.23.1 The CONTRACTOR'S quality control representative shall inspect all materials before they are installed in the work, and shall ascertain that satisfactory test reports have been submitted to the PROJECT ENGINEER covering materials inspected. All material found to be defective shall be immediately removed from the work.

3.23.2 Should hidden or unobserved defects be discovered by the PROJECT ENGINEER after the material is in place or show up during testing, the CONTRACTOR shall be required to remove the defective material and replace it with satisfactory material. The CONTRACTOR shall be solely responsible for the quality of the material he supplies for installation in the work and shall have the full responsibility of obtaining material meeting the requirements of these specifications.

3.24 DEPTH OF LINES:

3.24.1 All water mains shall be laid to line and grade as shown on the plans. In general, a minimum cover of thirty (30") inches and a maximum cover of forty-two (42") inches shall be required from the finished ground surface.

3.24.2 The alignment and/or grade may be altered by the PROJECT ENGINEER or his representative as required because of interference with other pipes or structures and to get below ditch bottoms. In general, a minimum of two (2') foot cover is required in a ditch, or canal crossings and an eighteen (18") inch clearance is required below pipeline crossings. These alterations are within the scope of the contract and shall be provided at no extra cost to the OWNER. In the event of a major alteration resulting in a change in contract price, a change order will be issued prior to the execution of the construction work.

3.25 EXCAVATION:

3.25.1 Excavation shall be open cut with vertical sides unless in special cases the PROJECT ENGINEER shall permit sloping sides. The CONTRACTOR shall leave a berm on each side of trench to allow free passage and full working space for the PROJECT ENGINEER or his PROJECT REPRESENTATIVE.

3.25.2 The PROJECT ENGINEER shall have authority at any time to require the CONTRACTOR to discontinue use of any excavating machine or other appliance which in his judgment is not adapted to the situation in which it is being used. He may require last 4 inches in depth of excavation to be done by hand or by such machine as is acceptable to him and may forbid the use of such methods of excavation as seem likely to disturb the subgrade.

3.25.3 The CONTRACTOR shall confine his excavation to the least width that will allow the easy installation of the water main and its appurtenances; this width is here declared to be the distance between parallel vertical planes twelve (12") inches from each side of the outside of the barrel of the pipe unless the PROJECT ENGINEER shall specifically allow a greater or lesser width.

3.25.4 In case excavation is carried below grade as established by the PROJECT ENGINEER, the CONTRACTOR shall fill the bottom of excavation up to grade with suitable material and in a manner acceptable to the PROJECT ENGINEER without compensation for either the excavation or the refilling.

3.25.5 No greater length of trench shall be opened in advance of an installed, but not backfilled water main, than shall seem proper to the PROJECT ENGINEER, who will be guided by the circumstances in each case. The PROJECT ENGINEER, will at the request of the CONTRACTOR lay down a general rule to be followed but the right is reserved to the PROJECT ENGINEER to change this rule at his discretion.

3.25.6 If any stumps, roots, logs or other obstructions are encountered within the bounds of the trench, the obstruction shall be cut out to 6 inches below level of established bottom of the trench. The excess depth shall then be backfilled with good earth or aggregate, well tamped, in two layers.

3.25.7 Where there are large trees along the line of the work, large roots of these trees shall not be cut without authorization from the PROJECT ENGINEER. Wherever practicable trench shall be tunneled under such roots, which may require hand digging.

3.25.8 Excavation and piling of excavated material on lawns shall be done so as to cause the minimum of damage to shrubs and flower beds on lawns. Any damage that may result to shrubs and flower beds shall be the responsibility of the CONTRACTOR at no extra cost to OWNER.

3.25.9 Whenever pipe laying is stopped for the night, or for any other reason, the end of the pipe and openings on specials shall be closely secured with a cap or plug or otherwise to prevent the entrance of water, mud, insects, small animals or other obstructions. Unused openings shall be permanently plugged.

3.26 SHEATHING AND BRACING:

3.26.1 The CONTRACTOR must protect the sides of his trench by such shoring or bracing as may be necessary. He will be held fully responsible for all damage to property, pavement or underground structures, that may be caused by settlement or caving of the banks of the trench. No payment will be made for any shoring or bracing as such; its cost must be included in the price bid for laying water mains of such size. Sheathing Left-In-Place shall be done only after consulting with the PROJECT ENGINEER or his PROJECT REPRESENTATIVE.

3.27 FOUNDATION AND BEDDING:

3.27.1 Under average conditions, the soil at the bottom of the trench will be found to make a satisfactory foundation for the pipe. The bottom of the trench shall be leveled and pipe laid thereon. Bell holes shall be dug of sufficient size to let the whole length of the pipe barrel to be bedded as required and to allow proper assembling of joints.

3.27.2 When bottom of trench is not satisfactory for foundation, excavation shall be carried below level of established bottom of trench to a solid strata and backfilled to pipe grade with granular backfill material. Such extra excavation and backfill will be paid for at the unit price bid per cubic yard of granular backfill material.

3.28 LAYING POLYVINYL-CHLORIDE (PVC) PIPE OR POLYETHYLENE PIPE:

3.28.1 Trench width shall not exceed three (3') feet. The bottom of the trench shall be level to provide uniform bedding for the pipe. Excavate underneath pipe ends to allow pipe to rest firmly on trench foundation. Provide pumps as necessary to dewater the trench and keep the pipe essentially dry until initial backfilling has been accomplished.

3.28.2 Suitable tools and appliances for the safe and convenient handling and laying of the pipe shall be used.

3.28.3 All pipes shall be carefully examined for defects and may be subjected to extra tests as the PROJECT ENGINEER may deem necessary. If any defective pipe or specials should be discovered after having been laid, it shall be removed and replaced with a sound pipe or special without extra charge for the work or removing and replacing.

3.28.4 Caps, plugs and bends for C900 pipe shall be anchored by means of retainer glands, timber thrust block or tie rods and clamps in accordance with the details shown on the plans or other methods recommended by the manufacturer of the pipe.

3.28.5 Whenever pipe laying is stopped for the night, or for any other reason, the end of the pipe and openings on specials shall be closely secured with a cap or plug or otherwise to prevent the entrance of water, mud, insects, small animals or other obstructions. Unused openings shall be permanently plugged.

3.28.6 A blue, 4 mil, low density polyethylene tape as manufactured by New Source, Inc., Waterloo, Wisconsin, or approved equal shall be installed directly over the top center of the pipe approximately 12-inches above the pipe surface. Careful backfilling shall be required to retain tape in place during backfilling operations.

3.28.7 Tracer wire shall be a single No. 10 AWG; blue coated stranded conductor wire with UL approval direct burial insulation and shall be placed directly on top and center of the water main and service pipe. The tracer wire shall be taped to water pipe at 10-foot intervals.

3.28.8 Each mechanical joint, flanged joint, fitting, valves, restraining rods and bands shall be wrapped with a 6-mil thick polyethylene plastic wrap.

3.29 LAYING DUCTILE IRON WATERLINE:

3.29.1 All cast iron and ductile iron waterlines shall be protected by means of an 8-mil thickness polyethylene tube. Tubing shall be furnished and installed with the recommendation of the Cast Iron Pipe Research Association.

3.30 CONNECTIONS TO EXISTING WATER MAINS:

3.30.1 Work includes connections to existing water mains. Cutting-in operations shall be planned to cause a minimum of inconvenience to customers on existing mains and shall be done under the rules and regulations of the DISTRICT.

3.30.2 The CONTRACTOR shall not open or close any valve in an existing distribution system nor shall he open or close any valve set under this contract after a line has been placed in service, unless the DISTRICT has authorized him to do so.

3.30.3 Procedure for disinfecting at cut-in points shall be reviewed and approved by the DISTRICT.

3.31 THRUST RESISTORS:

3.31.1 All water mains, valves and fittings shall be blocked and/or restrained to resist thrust in conjunction with retainer glands in accordance with the manufacturer's recommendations for the individual pipe used. The cost of all labor and material required for thrust resistors shall be included in the unit price bid per foot for the water mains and fittings complete in place. Any timber used in connection with thrust blocks shall have wood preservative (pressure treatment) per AWDA Treatment C1 using water-borne ACA or CCA preservative with 0.25 percent retention.

3.31.2 Prior to backfilling, the PROJECT ENGINEER shall inspect all blocking techniques to ensure conformance with manufacturer’s recommendations.

3.32 PLUGS:

3.32.1 All fittings and discontinuous pipes shall be capped with a suitable MJ plug or cap and properly blocked. PE pipe shall have a fused cap.

3.32.2 All plugs shall be paid for by the pound as fittings unless otherwise shown on the plans. All plugs shall include thrust resistors.

3.33 BACKFILLING:

3.33.1 Backfill shall be thoroughly but carefully compacted, under and around the pipe to the spring line. Selected backfilled free of rocks or jagged material shall be carefully compacted over the top of the pipe for a depth of one (1) foot.

3.33.2 Remainder of backfilling shall be completed by filling the trench with earth firmly packed by tamping, rolling or other method approved by the PROJECT ENGINEER, so as to secure as compact a trench as possible.

3.33.3 Backfilling of trench across driveways and streets shall not be delayed pending line tests, but shall be completed immediately after line is placed. If necessary to locate leaks, joints located under this backfill shall be exposed for testing.

3.33.4 All excess excavation shall either remain the property of the OWNER and be placed and rough spread on the adjacent property, or shall become the property of the CONTRACTOR and be hauled away from the site, as directed by the PROJECT ENGINEER.

3.34 SAMPLING TAPS:

3.34.1 Sampling taps shall be installed at locations along the water main not to exceed 1,000 feet on centers, or at locations approved on the drawings.

3.34.2 The requirements for a sampling tap are as follows:

3.34.2.1 New brass faucet with no internal or external threads (vendor where these can be purchased is the USA Bluebook at (800) 548-1234 item number 45325 and 45326. No cut off faucets without adequate neck.

3.34.2.2 Faucet is facing downward.

3.34.2.3 Faucet has shut-off handle to enable collector to close valve and flame tap.

3.34.2.4 Faucet must be secured to a stake, 32 - 40 inches above the ground.

3.34.2.5 Faucet must be clean.

3.34.2.6 Sample location must be free of grass, weeds and debris.

3.34.2.7 No sample points in ditches.

3.34.3 After a satisfactory sample test report has been received, the sampling taps shall be removed and plugged at the main.

3.35 PRESSURE TESTING:

3.35.1 As the work progresses, all sections of pipe shall be tested to a minimum hydrostatic pressure of 125 pounds per square inch for a minimum period of 4 hours. If after 4 hours, the pressure drop is less than 10 psi, the test is acceptable. If after 4 hours, pressure drops to 10 psi or more, but less than 25 psi, let the test on overnight to determine what pressure the line will hold. If the pressure does not drop more than 25 psi, after 24 hours, the test is acceptable. If the pressure does drop more than 25 psi, within 24 hours, the test is not acceptable, and the line will be inspected for leaks and retested. (Any defective work revealed by the test must be repaired by the CONTRACTOR at his expense.) Test pressure shall not be exerted against a valve operated by the District. All test sections shall be sealed with plugs or caps.

3.35.2 There shall be a minimum of leakage in the lines under the stated pressure. Volume of leakage shall be determined from the quantity of water required to bring up the pressure and from direct meter readings on completed lines.

3.35.3 The entire cost of the test, including pumps, gauges, connection pipe, etc., will be made at the CONTRACTOR'S expense.

3.35.4 Potable water shall be used for testing and shall be obtained and paid for by the CONTRACTOR.

3.35.5 All hydrostatic pressure tests shall commence prior to 1:00 P.M. If the CONTRACTOR fails to reach the pressure of 125 psi by 1:00 P.M., the pressure test shall be postponed until the next regular working day.

3.35.6 CONTRACTOR shall submit to the PROJECT ENGINEER and the DISTRICT, a schedule of pressure tests which shall be revised as conditions require. The PROJECT ENGINEER and the DISTRICT shall be notified at least 24 hours in advance of the beginning of any test. It is imperative that testing be done immediately upon completion of each portion of the line. Failure to properly schedule and conduct tests will be sufficient cause for the PROJECT ENGINEER to prohibit the opening up of additional trench until all previously installed pipes and specials have been tested and all backfilling completed and work cleaned up. Work shall proceed in an orderly and expeditiously manner with all parts of the operation completion and cleaned up as the CONTRACTOR proceeds along the line.

3.35.7 The final pressure test shall be conducted against only newly installed valves; those install within one (1) year of the pressure test. The final pressure test shall be conducted with all fittings and valves in place as shown on the design plans.

3.36 STERILIZATION:

3.36.1 Procedure for disinfecting line shall be in accordance with paragraph 12:020-1 through paragraph 12:020-4, Chapter XII (Water Supplies) of the Louisiana State Sanitary Code dated March 20, 1984, or latest revision.

3.36.2 In general, after pressure tests have been made and any repairs found needed have been completed, the main shall be flushed as thoroughly as possible. When the initial flushing has been completed, pipes and all other parts of the system shall be thoroughly disinfected by the use of chlorine or chlorine compounds. The rate of application of chlorine shall be in such proportion to the rate of water entering the pipe or other appurtenances, such that the chlorine applied to the water shall be at least 50 ppm. Chlorinated water shall be retained in the pipe long enough to destroy all non-spore-forming bacteria, normally not less than 24 hours. After the chlorine treated water has been retained for the required time, the chlorine residual at pipe extremities and at other representative points shall be at least 5 ppm. If the residual is less than 5 ppm the disinfection procedure shall be repeated until a 5-ppm residual is obtained as required above.

3.36.3 At the end of 24 hours, the main shall again be thoroughly flushed. When flushing has been completed, the main shall be refilled with system water and allowed to stand for one (1) week. Samples shall then be taken by either a private laboratory or by the DISTRICT'S laboratory. Satisfactory test results are valid for forth-five (45) days from the date of sample collection.

3.36.4 The final inspection shall occur after receipt of satisfactory sample test reports, but within 15 days of sample collection. After an acceptable final inspection, the Development/Subdivision shall be opened to the public system and local service provided.

3.36.5 After the final inspection, the Development/Subdivision shall be submitted to the DISTRICT for acceptance within forty-five (45) days of sample collection.

3.36.6 If the system has not been accepted by the DISTRICT during this forty-five (45) day period, additional flushing, sterilization and sanitary testing may be required at the expense of the OWNER.

3.36.7 Mains containing water that does not meet standards of the DISTRICT shall be again disinfected and retested.

3.36.8 No special payment will be made for disinfecting. The entire cost of water, chemicals, equipment and testing shall be included in the unit price bid for laying pipe.

3.37 VALVES

3.37.1 GENERAL:

3.37.2 Watermains 12-inch and smaller shall have gate valves.

3.37.3 All valves shall open left (counter clock-wise).

3.37.4 Upon completion of construction, all valves shall be left in the open position.

3.38 GATE VALVES:

3.38.1 Gate valves 12-inch or smaller shall be cast iron, resilient wedge, and non-rising stem with standard mechanical joint or flanged ends.

3.38.2 Gate valves shall be manufactured to AWWA C-509, Standard Specifications for Gate Valves for ordinary Waterworks Service.

3.38.3 Mueller, A2360 Series or approved equal.

3.38.4 Gate valves for hydrant supply lines shall have flanged by mechanical joint ends.

3.38.5 All interior and exterior cast iron valve bodies shall receive 10 mil fusion epoxy coating in accordance with AWWA C550.

3.39 VALVE BOXES:

3.39.1 Valve boxes for all valves shall be B & T Company, Tyler Company, or approved equal two-piece valve box.

3.39.2 Covers for valve boxes shall be round drop covers indicating "water".

3.39.3 All valve boxes shall be supplied with a centering seal.

3.39.4 The top of the installed valve box shall be flush with the surface of the finished property elevation.

3.39.5 All valve boxes shall have an 18-inch by 18-inch by 4-inch square or 18-inch round plain concrete pad poured around the valve box flush with the level of the ground. Pads may be precast and sealed in place.

3.40 FIRE HYDRANT INSTALLATION

3.40.1 FIRE HYDRANTS:

3.40.2 Fire hydrants shall meet all provisions of the current AWWA Specifications governing fire hydrants. Hydrants shall be of the “Traffic Model or Break Flange Type” so designed when the hydrant is subjected to severe impact, the special break flange ring will shear off at the ground line. Hydrant shall be constructed that it can be extended without the necessity of digging. “O” ring seals shall be used to prevent leakage.

3.40.3 All residential hydrants shall be three-way hydrants with two 2½ inch hose nozzles and one 4½ inch pump nozzle. Commercial hydrants shall have two 4½” pump nozzles. Valve opening shall be 5¼ inch.

3.40.4 Threading shall be National Standard, opening left with a 1-1/2” pentagon operating nut.

3.40.5 End inlet shall be mechanical joint with Corten, Teflon coated Corten or stainless-steel bolts and nuts.

3.40.6 The term “bury” is defined as meaning the distance from the ground line to the bottom of the pipe. Average bury is approximately three feet, six inches (3'-6”). Before ordering hydrants, the amount of bury for each hydrant location shall be determined by the CONTRACTOR. The CONTRACTOR shall furnish labor and equipment needed for locating water line and establishing amount of bury.

3.40.7 All fire hydrants shall be water-tight when subjected to a hydraulic pressure test of 300 pounds per square inch. This test shall be applied to each hydrant by the manufacturer of the hydrant and certification that each hydrant has been tested shall be stamped on each hydrant by an approved testing lab.

3.40.8 Hydrants shall be Mueller “Centurion” or approved equal.

3.40.9 One spanner wrench shall be provided for each six (6) hydrants.

3.41 INSTALLATION OF FIRE HYDRANTS:

3.41.1 All hydrants shall be constructed in accordance with the drawing entitled “Typical Hydrant Setting”.

3.41.2 All fire hydrants shall be connected to the distribution system through a 6-inch feeder valve. In those locations where the fire hydrants are being installed on an existing four-inch (4”) main, a 4-inch by 6-inch increaser shall be installed on the tee.

3.41.3 Fire hydrants shall be set on and blocked by pressure treated (See 3.12.1) timber blocks placed on a bed of 6-inches of gravel or limestone. Hydrant shall be held in place by means of galvanized pipe straps, as shown on details or installed using a mechanical joint anchoring coupling. After straps or couplings are in place the hydrant joint and water line joint shall be wrapped with 6 or 8 mil polyethylene film, lapped so as to have two layers of film in each wrapping. Film shall be taped to pipe barrel on each of side of joint. Several holes shall be punched in film to allow drainage.

3.41.4 After wrapping is in place, limestone or gravel shall be used to fill around the inlet of the hydrant to a height of three inches (3”) above the drain hole.

3.42 TAPPING SLEEVE AND VALVES:

3.42.1 When used, these shall be Mueller mechanical joint ends, or stainless-steel tapping sleeve with test plug and stainless-steel flange, Ford “SST” or approved equal.

3.42.2 All bolts and nuts used on mechanical joints shall be Corten, Teflon coated Corten or stainless steel.

3.42.3 Each mechanical and each flanged joint shall be wrapped with polyethylene film as specified for hydrant joint.

3.43 FIRE HYDRANT EXTENSIONS:

3.43.1 It is anticipated that in some locations the bury of the fire hydrant will be in excess of the standard depth specified. At these locations a fire hydrant extension shall be installed to bring the break-off of the fire hydrant above the ground level. The use of fire hydrant extensions shall be approved by PROJECT ENGINEER prior to ordering.

3.44 CUTTING INTO EXISTING LINES:

3.44.1 When it is necessary to install a fire hydrant on an existing water main, when tapping sleeves and valves are not used, the tie-in shall be made by cutting the existing water main and inserting a mechanical joint on other approved tees. The CONTRACTOR shall plan this operation in a manner that will cause a minimum interruption of water service. Cards will be prepared and delivered to residents of the area where water is to be cut off advising them when service will be cut off and the approximate duration of the interruption of service.

3.44.2 Cutting of waterlines shall be done with a hydraulic pipe cutter.

3.44.3 Fittings shall be standardized mechanical joint type and shall conform with AWWA Specifications C-110 for 250 psi working pressure (ASA A-21.10). Inside lining shall be "enamel-line" type cement lining or approved equal. Outside coating shall be coal-tar dip (ASA A21.5). Bolts and nuts shall be Corten or stainless steel.

3.44.4 When a cut is made into a water line, excavation shall be kept dry to prevent water from entering pipe and to assist in keeping pipe and fittings clean. HTH or similar chemical for disinfection shall be dusted into each fitting, each piece of pipe and each hydrant as they are installed in the system.

3.45 STERILIZATION:

3.45.1 After hydrant installation is completed, water supply valve shall be opened just enough to fill the line and bleed air from line through the hydrant. As soon as water reaches hydrant, supply valve shall be closed and chlorinated water allowed to set in the hydrant supply line for 30 minutes, after which supply valve shall be opened and line flushed through the hydrant.

3.46 BACKFILLING AND CLEANING UP:

3.46.1 Excavation for hydrant installation shall be backfilled with best available material obtained from the excavation. Backfilling shall be done in layers not over nine inches (9"), each layer being thoroughly compacted. Before final inspection all hydrant location areas shall be redressed and cleaned-up.

3.47 COLOR CODING:

3.47.1 All fire hydrants shall be painted yellow bonnet and nozzle caps of the hydrant shall be color coded according to the measured flow from the hydrant. Color coding shall be as follows:

FLOW RANGE	COLOR CODE
Less than 500 GPM	Red (1210 Rust-O-Leum)
501 - 1,000 GPM	Yellow (659 Rust-O-Leum)
More than 1,000 GPM	Green (1282 Rust-O-Leum)

3.47.2 CONTRACTOR shall coordinate flow testing with fire company representative of DISTRICT where hydrant is being installed.

3.48 MEASUREMENTS AND PAYMENTS

3.48.1 GENERAL:

3.48.2 General contracts for waterlines are unit price contracts and all quantities are approximate quantities. The CONTRACTOR'S attention is directed to the items of work for which no payment item has been established. All work shown on the drawings and outlined in the specifications is to be completed in all respects, and the cost of all miscellaneous and associated work is to be included in the unit prices bid for the various items that payment items have been established for.

3.48.3 All quantities shall be measured and tabulated by both the PROJECT ENGINEER and CONTRACTOR. Requests for payment and supporting data shall be prepared by the CONTRACTOR and given to the PROJECT ENGINEER sufficiently in advance of payment date to permit thorough checking of all quantities.

3.48.4 CONTRACTOR shall submit a daily report and daily sketch sheet showing lines, fittings, valves, taps, etc., installed with sufficient data to accurately locate these items after trench has been backfilled.

3.48.5 The CONTRACTOR shall furnish the PROJECT ENGINEER whatever assistance is required, laborers, clerks and records that will enable the PROJECT ENGINEER to expeditiously check all estimates and especially the final “Record Drawing” quantities of the project.

END OF SECTION 3

SECTION 4 SEWER SYSTEM

4.1 GENERAL

4.1.1 All pipe, including specials and fittings used for the construction of gravity sewers shall be Poly Vinyl Chloride.

4.2 SEWER PIPE

4.2.1 Solid Wall P.V.C. Pipe and Fitting shall conform to A.S.T.M. Designation D-3034 latest edition. Sewer pipe to be installed per D2321, latest edition.

4.2.2 The CONTRACTOR must furnish a certificate from the manufacturer that the pipe furnished by him does conform thereto and to the requirements of these specifications and that it has been tested according to A.S.T.M. specifications by a testing laboratory of recognized standing. Wherever the word "pipe" is used in these specifications shall be interpreted as also referring to T's, Y's and other fittings, unless the shape of the fitting shall make the matter plainly applicable. Each pipe approved by the said testing lab shall be plainly marked by the INSPECTOR with the mark of the lab. The cost of all inspection and testing must be included in the prices bid for sewer pipe laid.

4.2.3 In addition to the lab tests all pipe and fittings will be subjected to a rigid inspection after delivery on the site of the work and just before being laid in the trench and those found to be defective in any way will be rejected and must be removed from the work.

4.3 PIPE SPECIALS

4.3.1 Specials, as tees, elbows and Y branches shall conform to the requirements of the applicable American Society for Testing Materials Specifications. Specials for house services shall be 6 inches in diameter and placed as shown in the plans or as ordered during construction. All 6-inch openings shall be plugged with a disc fitting the bell snugly. Disc shall be so designed and jointed as to be substantially water tight under service conditions, but removable without substantial risk to the pipe bell.

4.4 SEWER PIPE JOINTS

4.4.1 Pipe shall have factory-formed joints complying with A.S.T.M. designation C-425-60T, as revised.

4.4.2 O-ring gaskets, if used, shall be as per US Rubber Company Bulletin 834, 1961.

4.5 LINES AND GRADES

4.5.1 All sewers shall be laid to grade and elevation as shown on the plans or as notified on account of unforeseen conditions. Cut sheets will be furnished by the CONTRACTOR to the ENGINEER for approval, and these, in conjunction with the stakes, hubs and markers set by the CONTRACTOR shall be used to determine the location and elevation of all sewer pipes.

4.5.2 The CONTRACTOR shall submit cut sheets to the ENGINEER 24 hours in advance of beginning work on any section of the line. In this connection, the CONTRACTOR shall submit to the schedule of current week. This schedule shall be based on actual progress and shall be revised each week to make the planned schedule conform closely to actual schedule.

4.6 CHECKING LINES AND GRADES

4.6.1 All lines and grades approved by the ENGINEER shall be checked by the CONTRACTOR by "lining ahead" sufficiently in time to permit the ENGINEER to make any adjustments found necessary. At least four batter boards or grade boards shall at all times be set and checked for straight line grade in advance of laying any sewer pipe. The CONTRACTOR shall not attempt to adjust any error in grade found but shall immediately notify the ENGINEER who will have the correction made.

4.6.2 A reference benchmark shall be established by the CONTRACTOR'S instrument man at each junction manhole. Prior to acceptance of the work, check levels shall be run on each manhole invert, said work being done by the CONTRACTOR'S instrument man and recorded by the ENGINEER or his representative.

4.7 PROTECTION OF WATER AND GAS MAINS, STORM DRAINS, AND SUBSURFACE STRUCTURES

4.7.1 All water pipes, gas lines, telephone conduits, storm water drains, and other subsurface structures shall be properly supported and protected during and after construction and repaired or replaced if necessary and left in as good condition as before work started. The cost of substructure protection, replacement and repair shall be included in the price bid on other items.

4.8 EXCAVATION

4.8.1 Excavation shall be open cuts with vertical sides unless in special cases the ENGINEER shall permit tunnels or sloping sides. If tunnels are authorized by the ENGINEER, they shall be of the same width throughout as open cuttings and of sufficient height to allow a grade line to be stretched parallel with the flow line of the pipe and in the clear above the crown of the pipe.

4.8.2 The CONTRACTOR shall leave a berm at least two (2) feet in width on each side of the trench, between the trench and the spoil bank, to allow for free passage of the ENGINEER or INSPECTOR and to permit the INSPECTOR to perform his work in an expeditious and satisfactory manner.

4.8.3 The CONTRACTOR shall confine his excavation to the least width that will allow easy installation of the sewer and its appurtenances; in any case where quantities of pavement or of additional excavation are involved and the cost to the OWNER is affected, the ENGINEER will set a maximum width beyond which the CONTRACTOR may not go without bearing the whole cost of the additional excavation and of the extra pavement or other surface improvement involved.

4.8.4 In case the excavation for any structure is carried below the grade established by the ENGINEER, the CONTRACTOR shall fill the bottom of the excavation up to grade with suitable material and in a manner acceptable to the ENGINEER without compensation for either the excavation or the backfilling.

4.9 PERMISSIBLE LENGTH OF OPEN TRENCH

4.9.1 The length of trench to be opened or the area of the surface to be disturbed or restored to its original condition at any one time shall be limited by the ENGINEER with regard both to expeditious construction and to the convenience and comfort of business houses and persons residing in the neighborhood or frequently the streets in question.

4.9.2 New trenching will not be permitted when earlier trenches need backfilling or labor is needed to restore the surface of the street to a safe and proper condition. The ENGINEER will refuse additional lines and grades for new trenches should the CONTRACTOR fail to meet the requirements herein specified as to backfilling and resurfacing.

4.9.3 The "length of trench" is herewith defined as the maximum distance from the point where the backfilling and resurfacing is completed and in proper condition for traffic, to the point where the surface has been disturbed and unsafe for traffic.

4.10 SHEETING AND BRACING

4.10.1 The CONTRACTOR must protect the sides of his trench by such shoring or bracing as is necessary to make the trench secure from caving. He will be held fully responsible for all damage to persons, property, pavement, or underground structures that may be caused by settlement or caving of the banks of the trench. No payment will be made for any temporary shoring or bracing, as such; its cost must be included in the unit prices for bid for pipe.

4.10.2 When in the judgment of the ENGINEER removal of shoring or bracing either or both, is likely to cause damage of pavement or property, the ENGINEER may order such shoring or bracing as he considers necessary left in place and the CONTRACTOR shall be entitled to compensation therefor. Neither the giving of such orders by the ENGINEER nor his failure or refusal to issue such orders shall in any way relieve the CONTRACTOR of responsibility for damages to pavement, buildings, etc.

4.10.3 Sheeting shall not be driven down below the centerline of a sewer pipe without special permission from the ENGINEER. Sheeting driven below the centerline of the pipe without special permission shall not be removed and will not be paid for.

4.10.4 Any upper sheeting left in place must be cut off at least two (2') feet below the ground surface after backfilling and tamping has reached this level and all rangers and braces above this level must be removed.

4.10.5 If the CONTRACTOR wished to use steel sheeting, either interlocked or driven as separate units, he shall make request of the ENGINEER for permission and the ENGINEER will prescribe conditions and methods under which the CONTRACTOR may drive steel sheeting and pull it out again, unless the ENGINEER shall consider such action undesirable under the governing circumstances.

4.10.6 Except as stated in Paragraph (b) above, sheet piling, sheeting, bracing, or shoring of any type will not be paid for as such, its cost must be absorbed in the prices of items on which bids are asked in the Form of Proposal.

4.11 BEDDING OF SEWER PIPES

4.11.1 The bedding of the sewer pipe, whether in the natural soil or on artificial foundation, and the widths of the trenches are factors of strength of the sewer that have been taken into consideration in its design. The spacing of sheeting and bracing and the bedding of planking and shells must therefore conform closely to the requirements of the specifications and the drawing illustration the use of foundation materials, etc.

4.12 FOUNDATION

4.12.1 The ENGINEER will order the use of special foundation under pipe sewers where he considers it necessary.

4.12.2 Lumber used as foundation under pipe sewers, where it is laid longitudinally or laid transversely on the bottom of the trench or laid transversely or rangers as shown on the drawings, will be paid for as Foundation Lumber under Sewers.

4.12.3 The bedding material, which is usually clam shells or shell concrete shall be laid on the planking at the points designated by the ENGINEER and to such depths under and around the sewers, as he may require. The location and the quantities of all foundation materials under the pipe sewers, except the standard shell base, shall be at the direction of the ENGINEER and payment will be for such quantities, in place, at the prices bid.

4.12.4 The standard lumber for use as foundation for sewers, manholes, etc., shall be No. 2 Common Southern Short Leaf Yellow Pine; if substitutes are offered, they must meet with the approval of the ENGINEER.

4.12.5 The cost of cutting, placing, and fastening any lumber in sheeting, bracing, foundation, or elsewhere, including the nails, spikes, etc., used as fastenings, shall be absorbed in the cost of the lumber itself whether this lumber is paid for at a bid price or be included in the price of some other item.

4.13 REMOVAL OF WATER

4.13.1 The CONTRACTOR shall place on the job and shall maintain with each house connection crew at least 3 diaphragm pumps in good mechanical and operating condition. Failure of the CONTRACTOR to provide and maintain this minimum number of pumps per crew will constitute a violation of this contract. Previous experience on sewer construction in this vicinity makes this provision an essential part of this contract in order to enable the CONTRACTOR to work efficiently as well as to assure the quality of work expected under this contract.

4.13.2 The CONTRACTOR shall at all times during construction provide and maintain means and devices with which to promptly dispose of all water entering the excavations or other parts of the work and shall keep said excavations dry until the structures to be built therein are completed. No masonry shall be laid in water nor shall water be allowed to rise over masonry if there is danger of flotation or of setting up unequal pressures in the concrete, until the concrete has set up at least 24 hours and any danger of flotation has been removed. In water bearing sand or quicksand, suitable equipment of well points and/or sheeting shall be supplied with pump and other appurtenances of ample capacity to keep a dry excavation as specified.

4.13.3 Well point system selected by the CONTRACTOR shall be approved for use by the ENGINEER. The CONTRACTOR shall have analyses made of local sands and the manufacturer of well point equipment shall furnish the ENGINEER with satisfactory evidence that screens of this well points are the correct size to restrain these sands without becoming clogged up.

4.13.4 All well points shall be placed at least 3 feet away from the barrel of the pipe.

4.13.5 Drain wells may be required to dewater areas in which strata of water bearing sands are separated by lenses of impervious clay. These wells shall be made by cutting a hole of sufficient size through the impervious strata and installing a well point or points in a gravel well.

4.13.6 The CONTRACTOR shall dispose of water from the work in a suitable manner without damage to adjacent property or sewers. No water shall be drained into work built or under construction.

4.13.7 During the laying of sewers and until sewer pipe has finally bedded in place with at least two feet of backfill over the pipe, the CONTRACTOR shall keep the ground water plane below the bottom of the trench.

4.13.8 No sewer will be permitted to be laid except in a dry trench. Running water shall be completely blocked off by dewatering and/or sheeting, and no sewer shall be laid in a trench which sand is flowing into. The trench must be dry and clean to assure that the hub and spigot of the pipe are perfectly dry before a joint is made.

4.13.9 All removal and handling of water required to maintain dry trenches or other excavations for the construction of sewer or other structures in the dry shall be at the expense of the CONTRACTOR.

4.14 BACKFILLING - TAMPING

4.14.1 All trenches or excavations shall be backfilled to the original surface of the ground or to such other grades as may be shown and directed.

4.14.2 In backfilling sewer or other pipe trenches, no large stone, broken concrete, roots, timber, etc., shall be placed in the backfill. The backfilling around and over the pipe shall be carefully done by hand and tamped with suitable tools of approved weight to a point two (2') feet above the top of the pipe. This material shall be placed in layers approximately six (6") inches thick, each layer being thoroughly tamped and compacted in place.

4.14.3 When the backfill is mostly sand, the well points shall be kept in operation and the backfill drenched but not flooded with water to thorough compaction. Drenching the fill and operations of well points shall continue until the ENGINEER advises the CONTRACTOR that he has accepted the backfill and is ready to inspect the sewer line for leaks as hereinafter specified.

4.14.4 When the backfill is mostly clay, the backfill to a point of two feet (2') above top of pipe shall be best material available from trench excavation at point being worked. Clay backfills shall not be drenched or flooded.

4.14.5 The remainder of backfilling shall be completed after sewer lines have been tested. Backfilling shall be done in layers not to exceed one foot (1') in thickness. In no case will backfilling material from a bucket be allowed to fall directly on a sewer and in all cases the bucket must be lowered so that the shock of falling earth will not damage the sewer structures. All backfilling will be carried on as speedily as possible.

4.14.6 After each portion of the backfilling has been completed as specified herein, it shall be allowed to stand for such period of time as the ENGINEER may direct, but no longer than two (2) months. Immediately after the expiration of this time the CONTRACTOR shall gather up and remove all surplus material lying above the original surface of the ground and shall dispose of this material in a satisfactory manner at his own expense. He shall thoroughly clean the whole site of the work, make all repairs or replacements and leave the whole line of his work in a condition satisfactory to the ENGINEER.

4.14.7 In backfilling around concrete or other structures, all lumber, rubbish, braces, and refuse shall be removed from behind the walls before backfilling is started. Backfilling shall be made in a manner to prevent after-settlement, be tamped or wet down, and left at proper grade and with a smooth even surface.

4.15 DISPOSAL OF SURPLUS

4.15.1 All surplus dirt shall be hauled and disposed of on the adjacent property belonging to the OWNER.

4.16 LAYING OF SEWERS

4.16.1 All sewer pipes and specials shall be carefully inspected before being laid and no cracked, broken and/or defective pipe or specials shall be used in the work. Each piece of pipe shall be sounded before being placed in line.

4.16.2 The pipes and fittings shall be so laid in the trench that after the sewer is completed the invert thereof shall conform accurately to the grades and alignment established by the ENGINEER. At any stage of construction of a straight stretch between two consecutive manholes, the zero or starting end of the pipe shall be clearly visible on looking through the pipe in clear view.

4.16.3 Depression shall be left in the shell foundation for each bell and be of such depth to insure proper and satisfactory bearing along the entire length of each pipe and to allow sufficient space for making joints properly. Bell holes shall be no larger than needed for making up joint.

4.16.4 After the pipe has been laid, the best material available from excavation in the immediate vicinity of where the pipe is being laid shall be used to backfill around and over the pipe.

4.17 MAKING SEWER JOINTS

4.17.1 Pipe joints shall be factory made except where approved by the ENGINEER. During laying of the pipe, if necessary, the manufacturer shall send a qualified representative to the job to properly instruct the CONTRACTOR'S forces in procedure for making up joints and to ascertain the suitability of the joint for installation for job conditions. It is mandatory that during the instruction period, the manufacturer advise the CONTRACTOR and the ENGINEER of any job condition that may cause the joint to leak.

4.17.2 Each newly made joint will be inspected and if it is not found to be satisfactory the last laid length of pipe shall be removed at once. The bell of the preceding pipe shall be thoroughly cleaned, a fresh pipe shall be used for the new length and the joint shall not be re-laid until the spigot has been thoroughly cleaned.

4.17.3 Whenever pipe laying is stopped, whether for the night or for any other cause, the end of the pipe shall be securely closed to prevent the entrance of water, mud or other matter, and shall be secured in such a manner as to prevent the end pipe from being dislodged by any sliding or other movement of backfilling.

4.18 BRANCH LINES - TEES

4.18.1 Tees for the reception of house connections shall be built into pipe sewers at locations designated on the plans or by the ENGINEER.

4.19 RISERS

4.19.1 Risers consisting of six (6") inch sewer pipe and specials surrounded by concrete as shown on the plans, shall be built on the sewer where ordered by the ENGINEER. Care should be taken to surround and support the pipes thoroughly by concrete or masonry and to keep the interior of the pipe and specials clean and free from obstructions.

4.20 SEWER HOUSE CONNECTIONS

4.20.1 The CONTRACTOR shall lay six-inch (6") sewer pipe house connections from tee openings in the sewers to such points near the property lines as is designated by the ENGINEER. The standard connection will have a depth of not exceeding five feet (5') at the curb line and not exceeding seven feet (7') at the sewer, these depths measured from the house connection pipe. Excavation shall be included in the price bid per linear foot.

4.20.2 The price bid per linear foot for sewer house connections shall include excavation to the standard depths stated above bracing the trench, the tee in sewer mains, furnishing and placing the pipes and all fittings indicated in the drawings, furnishing the jointing materials and making the joints, backfilling and tamping the trench, cleaning up and removing surplus earth and waste materials; in completed installation of the house connections.

4.20.3 Payment for house connections will be made by horizontal measurements over the center of the connection, from the center of the sewer to the shoulder in the bell of the last pipe or fitting; payment for side branches out of the connection will be made the same way, by horizontal measurement, from the center of the main connection to the end of the laying length of the last pipe or fitting of the branch. The unused branches or fittings out of which future connections may be measured and paid for, only the used branch is covered by this paragraph. The CONTRACTOR shall furnish and set in sewer line a T-branch out of which shall be included in the price bid for sewer connections. If vertical pipe is needed to raise this tee to the proper height for sewer house connections, the length of vertical pipe used will be considered as riser pipe and will be paid for as such.

4.20.4 All unused openings in sewer house connections shall be closed with caps or plugs of same material as the pipe. Caps and plugs shall be held in place by other means than the joint material. Caps will be so designed and jointed as to be substantially water tight under service conditions, but removable without substantial risk of damage to the pipe bell. No special payment will be allowed for these caps and plugs and the fastenings, as the cost shall be included in the price bid for house connection pipe.

4.20.5 Foundation material for extra concrete ordered by the ENGINEER will be paid for at the prices bid for these items. The ENGINEER shall order the installation of any fittings, which are not indicated by the plans. The said fittings shall be furnished and installed and will be paid for as extra work, no deduction will be made for the cost of any straight pipes replaced by these extra fittings.

4.20.6 Joints in sewer house connections shall be made with the same material and in the same manner as is required for joints in sewers.

4.20.7 Sewer service marking shall consist of the placement of magnetic marking tape or 1 - #4 deformed bar, 12” in length and a 1” x 1” wood stake painted green or marked with green flagging at the end of the service.

4.21 PLUGS

4.21.1 T-branches and risers not extended to property lines by house connection sewers shall be plugged with scored discs. The discs shall be held firmly in the socket and shall be seated in a manner to prevent blowout in the event of flooding of the sewer line.

4.22 MARKING BRANCH OPENINGS

4.22.1 Every branch opening shall be marked by a 1" X 2" cypress or creosoted pine strip not less than four feet (4') long, set vertical in the backfill, over the opening and reaching to within one foot (1') of the ground surface.

4.23 BULKHEADS

4.23.1 The CONTRACTOR shall build inside the sewer, constructed under the contract suitable brick bulkheads to protect his work against the entrance of dirt or water and also to protect adjacent work built under another contract.

4.23.2 These bulkheads shall be constructed at such points and in such manner as ordered and directed by the ENGINEER, and when so ordered, they shall be removed by the CONTRACTOR. Prior to removal of such bulkhead, or prior to the joining up of adjacent work to the work built under the contract, the CONTRACTOR shall at his own expense remove all water which has collected behind such bulkheads and which may in any way affect their satisfactory removal or interference with adjoining work.

4.24 MANHOLES

4.24.1 Under this specification, the CONTRACTOR shall construct manholes in accordance with the Sewer Detail Sheet as attached to the Construction Plans or their approved alternate. The CONTRACTOR shall obtain from the ENGINEER, in writing, approval to substitute an alternate design prior to construction of manholes.

4.25 SEWER INSPECTION AND TESTS

4.25.1 Inspection and tests will be made by the ENGINEER at regular intervals as the work progresses to determine that the quality of workmanship specified herein is being obtained.

4.25.2 Certain limits of infiltration are set up, but these limits are applicable only after a manhole to manhole inspection has been made to eliminate all detectable leaks.

4.25.3 It is imperative that all sewers and manholes be built practically watertight and that the CONTRACTOR must adhere rigidly to the specifications for material and workmanship. All of the sewage must be pumped and special care and attention must be paid to securing watertight construction. After completion, the sewers, or sections therefore, will be tested and gauged and if the infiltration (leakage into sewer) is above allowable limits specified, the sewer will be rejected.

4.25.4 When backfilling has been completed sufficiently to prevent sewer pipe from floating, water shall be allowed to rise in the trench and before de-watering equipment is removed, the sections of sewer shall be tested for infiltration. If well points are used well points system shall not be disconnected until section of sewer has been approved in writing by the ENGINEER.

4.25.5 The allowable limit of ground water infiltration (leakage into sewer) for any one or more sections of sewer shall not exceed the following limits of infiltration rates for full acceptance: 200 gallons per inch diameter per 24 hr. day per mile of sewer for all depths of cut.

4.25.6 Tests shall be made before existing sewers and sewer flow are allowed into the sewer. The ground water infiltration will be measured by means of a V-notch weir, or by measuring the volume direct. All expense of above test or tests shall be borne by the CONTRACTOR and be included in the unit prices bid per foot of sewer under each respective size and excavation cut of sewer.

4.25.7 Any defects of whatever kind found in the system shall be made good at the expense of the CONTRACTOR.

4.25.8 On completion of a section, sewer is to be cleaned and inspected and all repairs shown necessary by the test are to be made; broken, or cracked pipe replaced, all deposits removed, the sewer left true to line and grade entirely clean, free from protruding joint material and ready for use. Each section of sewer between manhole is to show from either end on examination a full circle of light.

4.25.9 As the work progresses, all sections of sewer force main pipe shall be tested to a hydrostatic pressure of 125 pounds per square inch for a minimum period of four hours. If in four hours pressure drops to 115 psi, let test on overnight to determine what pressure the line will hold. If pressure does drop below 100 psi after twenty-four hours, the test is not acceptable, and the line will be inspected for leaks and retested. Any defective work revealed by the test must be repaired by the CONTRACTOR at his expense. Test pressure shall not be exerted against a valve. All test sections shall be sealed with plugs or caps.

There shall be a minimum of leakage in the lines under the stated pressure. Volume of leakage shall be determined from the quantity of water required to bring up the pressure and from direct meter readings on completed lines.

The entire cost of the test, including pumps, gauges, connection pipe, etc., will be made at the CONTRACTOR'S expense.

Potable water shall be used for testing and shall be obtained and paid for by the CONTRACTOR.

CONTRACTOR shall submit to the ENGINEER a schedule of pressure tests, which shall be revised, as conditions require. The ENGINEER shall be notified at least four hours in advance of the beginning of the test. It is imperative that testing be done immediately upon completion of each portion of the line. Failure to properly schedule and conduct tests will be sufficient cause for the ENGINEER to prohibit the opening up of additional trench until all previously installed pipe and specials have been tested and all backfilling completed and work cleaned up. Work shall proceed in an orderly and expeditious manner with all parts of the operation completed and cleaned up as the CONTRACTOR proceeds along the line.

4.26 MEASUREMENTS AND PAYMENTS

4.26.1 General contracts for sanitary sewerage extensions are unit price contracts and all quantities are approximate quantities. The location and grade of lines shown on the plans have been determined as accurately as possible. Should underground obstructions require the lowering of any sewer line, the extra work involved will be paid for only on the basis of the bracket cut in which the depth of sewer line falls. No claim will be accepted from the CONTRACTOR that the average depth of cut within any bracket as built is greater than that shown on the plans, nor will any credit be required if the average depth of cut within any bracket is less than shown on the plans.

4.26.2 The CONTRACTOR'S attention is directed to the items of work for which no unit price is set. All work shown on the plans and outlined in the specifications is to be completed in all respects and the cost of the work is to be included in the unit price bid for the various classes of work.

4.26.3 Measurement: Length of lines will be measured from center to center of manhole. Depth of cut will be determined from the offset stakes rather than from centerline profiles. Change in depth of cut from one bracket to another will be computed by interpolation between stations on cut sheets and not by field measurements. The unit price specified to be paid per foot for each

respective size of sewer pipe is payment in full and includes the work defined under excavation, backfilling, and grading; the complete restoration of ditches, streets, and shoulders as outlined; the reconnecting all existing sewers along each section of sewer; protection and care of all existing and underground structures in the line of the work, trenching and trimming, removal of sheath, refilling of all unauthorized excavation, tamping, fill; disposal of surplus dirt; de-watering trench and handling of all water, materials as selected for pipe; joints, sewer inspection and testing; all as herein specified under the various headings.

4.26.4 Payment per unit will include all bends, pipe, plug and sewer service marker from the tee branch in the sewer line to the end of the house connection.

4.26.5 8" sewer cleanouts will be placed at the end of a sewer line or in a six-inch (6") house connection branch line and will be measured as a unit and paid under 8" Sewer Cleanout which will include wye, concrete foundation under wye in sewer or house connection, eighth bend, riser pipe, plug, and cast-iron cleanout cover set in a concrete ring.

INTRODUCTION

1. This report contains the results of a geotechnical exploration performed for the proposed health and wellness facility for Terrebonne General Medical Center (TGMC) to be located in Houma, Louisiana. We provide a site vicinity map on Figure 1. The exploration was performed in general accordance with the alternate scope of work presented in Eustis Engineering L.L.C.'s revised proposal, dated 13 December 2021, which was authorized on 21 December 2021 by Ms. Diane Yeates, Chief Operating Officer of Terrebonne General Health System, the project owner. The project architect is Rozas Ward Architects, APC (Rozas Ward). The site civil engineer and structural engineer for the project are Milford & Associates, Inc. (Milford) and Schrenk Endom & Flanagan L.L.C. (SEF), respectively.

SCOPE OF SERVICE

2. The exploration included the drilling of three undisturbed sample-type soil borings and the performance of three cone penetration tests (CPTs) to determine subsoil conditions and stratification and to obtain samples of the various strata encountered. Soil mechanics laboratory tests, performed on samples obtained from the borings, were used

to evaluate the physical properties of the subsurface soils. Engineering analyses, based on the soil borings, laboratory tests, and CPT data, were performed to determine recommendations regarding site preparation and drainage, subsoil and groundwater conditions, placement and compaction of fill material, near-surface soil shrink/swell potential, estimates of allowable vertical pile load capacities, pile installation and testing methods, estimates of settlement, and recommendations for components and thicknesses for flexible and rigid pavements. General foundation construction recommendations are also provided. Additional laboratory testing to support a lime/soil-cement stabilization study was removed from our scope of service by agreement of Eustis Engineering, Milford, and Rozas Ward based on the results of the geotechnical exploration.

FIELD EXPLORATION

General

3. Three soil borings were drilled at the project site. The deepest boring, designated as B-1, was drilled on 27 January 2022 to a depth of approximately 100 feet below the existing ground surface. Two additional borings, designated as B-2 and B-3, were drilled on 28 and 31 January 2022 to an approximate depth of 80 feet each below the ground surface. Three CPTs were performed on 31 January 2022 to approximate depths of 80 feet below the ground surface using a track-mounted rig. The approximate location of the borings and CPTs are shown on Figure 2. Detailed descriptive logs of the borings are presented in both tabular and graphical form in Appendix I. Records of the CPT soundings are plotted graphically with depth and are provided in Appendix II. Approximate GPS coordinates for each exploratory location were obtained with a handheld device and

should be considered approximate. These coordinates are shown in terms of latitude and longitude on the boring logs and CPT records in Appendices I and II, respectively. Upon completion of field operations, the boring/CPT holes were grouted with cement bentonite grout mix and backfilled with soil in accordance with current regulatory requirements by the State of Louisiana.

Soil Borings

4. The undisturbed sample-type soil borings were drilled using a truck-mounted rotary-type drill rig. Samples of cohesive or semi-cohesive subsoils were obtained at close intervals or changes in stratum using a 3-in. diameter by 30-in. long thinwall Shelby tube sampling barrel (ASTM D1587). The samples were extruded from the sampling barrel in the field, inspected, and visually classified by Eustis Engineering's soil technician. Pocket penetrometer tests were performed on the soil samples to give a general indication of their shear strength or consistency. The results of these tests are shown on the boring logs under the column heading "PP." Representative samples were then promptly placed in moistureproof containers for transportation to our laboratory.

5. Samples of cohesionless and semi-cohesive materials were obtained during the performance of in-situ Standard Penetration Tests. These tests consist of driving a 2-in. diameter sampler 1 foot into the soil after first seating it 6 inches. A 140-lb weight dropped 30 inches is used to advance the sampler. The number of blows required to drive the sampler is indicative of the relative density of cohesionless soils and the consistency of cohesive soils. The samples were retained in moistureproof containers for preservation of their natural moisture content. The results of the Standard Penetration Tests are shown on the boring logs under the column heading "SPT."

Cone Penetration Tests

6. The CPTs were performed with a track-mounted rig using an electronic piezocone penetrometer having a 5-ton capacity and a net area ratio of 0.850. Testing was performed in general accordance with methods and procedures outlined in ASTM D5778-20. The CPTs were performed using a 10-cm^2 cross-sectional area cone with a 60° apex angled tip and 150-cm^2 sleeve area. The penetrometer was hydraulically advanced into the ground at an approximate rate of 2 cm/sec. During piezocone testing, CPT parameters (tip resistance, friction resistance, and pore pressure) were recorded at 2-cm depth intervals. In Appendix II, the CPT plots present the measured tip resistance (q_t), sleeve friction (f_s), and pore pressure (u_2). The estimated undrained shear strength (S_u), equivalent standard penetration resistance (N_{60}), and interpreted soil behavior type (SBT) are also provided on the CPT records.

7. Undrained shear strength estimates and estimated standard penetration resistances are interpreted from correlations developed by Lunne, Robertson and Powell (1997 and 1986) and our engineering experience in southern Louisiana. The interpreted SBT is determined according to the non-normalized friction-ratio based soil behavior chart established by Robertson and Campanella (1986). Please refer to the cone penetration test correlation document following the CPT records in Appendix II for additional information.

LABORATORY TESTS

8. Soil mechanics laboratory tests, consisting of natural water content, unit weight, unconfined compression shear (UC), and unconsolidated undrained triaxial compression

shear (OB), were performed on selected samples obtained from the borings. In addition, Atterberg liquid limits (LL) and plastic limits (PL) tests were performed on selected representative samples to aid in classification and determination of relative strength and compressibility of the subsurface soils. The results of these laboratory tests are provided on the boring logs in Appendix I.

DESCRIPTION OF EXISTING SITE CONDITIONS

Site Observations

9. The project site is located approximately 1,200 feet north of the intersection of Westside Boulevard Extension and Enterprise Drive in Houma, Louisiana. During field operations, the site consisted of predominantly cleared pastures with intermittent drainage swales. The project area is bounded to the north by a pond appearing to serve as a detention/drainage area for the development area.

Stratigraphy

10. Our interpretation of the stratigraphy at each boring location is shown on the logs in Appendix I. CPT records of encountered SBT are provided graphically in Appendix II. Review of the boring logs indicates near-surface deposits at the boring locations included very soft to medium stiff gray, tan, and brown fat clay that extended approximately 9 to 16 feet below the existing ground surface. Next in the stratigraphy, loose to medium dense sandy silt, silty sand, and fine sand were encountered to approximately 25.5 to 33.5 feet below the ground surface and were underlain by a stratum of soft to medium stiff gray and brown organic clay in Borings B-1 and B-3 between the 27 and 32-ft depths.

Below the 32 to 33.5-ft depths, materials encountered predominantly consisted of soft to medium stiff gray fat clay with isolated strata of lean clay to the terminal depth of the exploration, approximately 100 feet below the existing ground surface. An exception to this general stratigraphy included medium stiff gray and brown organic clay encountered in Boring B-3 between depths of 48 and 62 feet below the existing ground surface. The SBTs presented on the CPT records provide general agreement with the stratigraphy observed in the borings.

Groundwater

11. To estimate groundwater conditions at the time of the field exploration, observations were made in auger borings drilled near Boring B-1 and in Boring B-2. The auger borings near Boring B-1 and in Boring B-2 were drilled without the addition of water or drilling fluids to depths where free water was initially encountered approximately 9 and 5 feet, respectively, below the existing ground surface. After observational periods of 24 hours at Boring B-1 and 15 minutes at Boring B-2, free water was observed in both bore holes at a depth of approximately 4 feet below the existing ground surface. The depth to groundwater will vary with climatic conditions, local drainage improvements, water levels in the nearby pond, onsite construction activities, and other factors. For this reason, the depth to groundwater should be determined by those persons responsible for construction immediately prior to beginning work.

ENGINEERING ASSESSMENT AND RECOMMENDATIONS

Furnished Information

12. A conceptual layout furnished by Rozas Ward indicates major project features will include the proposed health and wellness center building, parking lot, and an exercising field. We present this furnished drawing in Appendix III. We understand the proposed building will be supported by deep foundations comprising either driven timber piles or auger cast-in-place (ACIP) piles. Fill will be required to raise the site to design grade; however, a site grading plan specifying the required fill height was not available during the writing of this report. Therefore, we have assumed between 2 and 3 feet of fill will be placed at the site. Anticipated traffic loadings and intensities were not furnished.

Foundation Recommendations

13. All loads supporting the proposed facility should be supported on deep foundations comprising driven timber or ACIP piles. Allowable pile capacity, structural load induced settlement potential, and settlement potential due to fill placement should be considered in pile size, spacing, and length selection. All structural loads from an isolated structure (floors, walls, and columns) should be supported on piles having the same tip embedment in order to minimize differential settlement. A Visqueen® vapor barrier should be provided beneath concrete slabs to prevent capillary migration of moisture. The pile-supported slabs should be designed and constructed as rigid as possible to minimize the effects of settlement and differential settlement. In this regard, we recommend the slabs be cast monolithically with grade beams and pile caps. Flexible connections should be used for all piping and utilities going to and from the proposed facility.

14. The near-surface soils at the site are moisture sensitive. Without proper preparation and drainage, the underlying soils could produce excessive settlement and especially differential settlement of incidental grade-supported structures relative to pile-supported project features. Therefore, site preparation and drainage are extremely important. Consideration should be given to differential settlement between pile-supported structures and adjacent sidewalks, patios, parking areas/drive aisles, and other structures which are not pile-supported. The use of landscaping and hinged connections adjacent to the facility will help to mitigate the effects of differential settlement and increase the overall aesthetics of site development. However, long-term recurring maintenance of pavements and sidewalks should be anticipated especially where surface-supported features adjoin pile-supported features.

15. Final grading plans were unavailable at the time of this report. All fill required to reach finished grade beneath the proposed facility should be placed as far in advance as possible of construction operations to reduce the undesirable effects of subsoil consolidation. Consolidation settlement induced by the placement of fill can result in negative skin friction (drag loads) on the surface of piles. These drag loads have the potential to increase settlement and/or internal pile stresses within pile foundations. Therefore, Eustis Engineering should be contacted to reevaluate the recommendations presented herein once grading plans are finalized.

16. Your structural engineer should determine the appropriate foundation type for each structure based on allowable pile load capacities, pile installation considerations, and settlement estimates presented in this report. Foundation selection should also consider the settlement tolerances for each structure.

Groundwater Management

17. Construction Drainage. The initial step to prepare the site for construction should be to establish adequate drainage that will prevent ponding of water and provide immediate runoff of rainfall. We recommend the contractor maintain adequate surface drainage away from all foundation and pavement areas throughout construction. This can be accomplished by grading the site to positively drain water away from all paved areas and foundations. Sumps and pumps may be required to remove rainfall and groundwater from shallow excavations. Throughout construction, the contractor should exercise caution during those times in which the subgrade may be saturated to ensure soil support is not degraded by construction operations.

18. Permanent Drainage. The near-surface soils are subject to a reduction in shear strength and excessive settlement if allowed to become saturated (naturally or as a result of construction operations). We recommend adequate permanent drainage be provided to collect rainfall away from the proposed foundations and pavements after completion of construction. Water should not be allowed to collect near foundations or pavement areas. Particular attention should be given to any surface-founded structures and pavements, and permanent drainage should be installed to discharge rainfall away from their foundations. Surface or above grade features should be crowned or designed to direct runoff to pipes which discharge into the site's stormwater collection and disposal systems. All downspouts draining rainfall away from the building's roof should be connected to pipes which discharge into the site's stormwater collection and disposal system.

Site Preparation

19. Clearing and Stripping. Beneath the construction areas, the existing ground surface should be stripped of vegetation, loose topsoil, debris, stumps, organic matter, pavements, and any other deleterious materials. Stripping should be to a depth necessary to remove weak surficial soils and reach firm undisturbed soil. The exact depth of stripping should be determined during construction. Deeper stripping may be required if root balls are encountered. Weak zones, excavated areas, or depressions resulting from clearing, stripping, and demolition operations should be thoroughly cleaned out to the surface of firm undisturbed soil and backfilled with a select structural fill material placed and compacted under controlled conditions. Clearing and stripping should also comply with Section 201 of the Louisiana Standard Specifications for Roads and Bridges (LSSRB).

20. Demolition. All existing pavements and structures located within the proposed construction areas should be demolished and removed from the site. Provisions should be made to locate any abandoned underground utilities and foundations which could impact new construction. Existing footings or abandoned pipes should be excavated and removed from the site. These structures could impact the performance of new foundations if not properly removed, proofrolled, and backfilled with structural fill material. Existing piles, if encountered, should not be removed. In general, these features should be cut off 3 feet below grade-supported foundations or 35 feet below pavements or the existing ground surface, whichever is greater. Removal and relocation of structures and obstructions should also comply with Section 202 of the LSSRB.

21. Subgrade Preparation. After the demolition, clearing, and stripping operations, the exposed surface should be proofrolled with a bulldozer or tracked vehicle exerting a ground pressure between 10 and 15 psi. The vibratory system on the compactor, if present, should not be used during proofrolling. Alternative proofrolling techniques may be proposed, but these methods should be approved by Eustis Engineering prior to their use at the site. Any depressions, stump holes, or weak areas identified should be thoroughly cleaned out to the surface of firm undisturbed soil and backfilled with a select structural fill material placed and compacted under controlled conditions.

22. Swales. If necessary, special care should be taken to demuck any existing swales or ditches which are to be abandoned and backfilled. Muck excavation should comply with Section 203.04 of the LSSRB. These features may also require relocation to provide adequate drainage for the site. Once demucked to the surface of firm undisturbed soil, these features should be backfilled with a select fill material placed and compacted under controlled conditions.

23. Structural Fill and Backfill. A select granular material, such as locally available river sand (AASHTO A-3), should be used as form fill, backfill, and/or fill required to reach design grade. All select fill should be non-plastic and free of roots, clay lumps, and other deleterious materials and have a maximum organic content of 5% by weight. Sand fill (A-3) should have no more than 10% by weight of material passing a U.S. Standard No. 200 mesh sieve.

24. Compaction of Fill. Structural fill used as backfill or form fill beneath pile-supported structures should be spread in loose lifts of 8 to 10 inches and compacted to at least 95% of its maximum dry density near optimum moisture in accordance with ASTM D698.

Sand subbase beneath pavements should be placed and compacted as discussed subsequently in the "Pavements" section in this report. Select fill or general fill used for non-structural grading should be spread in loose lifts of 10 to 12 inches and compacted by several passes of a bulldozer.

25. Quality Control. Prior to transporting structural fill to the site, a sample of the borrow material should be tested to verify its conformance to the project specifications. Density tests should be performed on each lift of the compacted structural fill to determine if the contractor has achieved the recommended density. The frequency of these tests is dependent on the individual structure, type of fill material, and site conditions, and should be determined once these variables are known. Should you require, Eustis Engineering is available to provide additional consultation. All clearing, filling, and compaction operations should be accomplished only during periods of dry weather. The contractor should exercise caution during and after inclement weather to ensure subsoil support is not degraded by construction operations.

Fill Settlement

26. Filling and grading plans were not available during the time of our analyses. From previous correspondence, we understand approximately 2 to 3 feet of fill will be required to raise the site to construction grade. Settlement analyses were performed by modeling the fill area as a rectangularly loaded area with plan dimensions of 226' x 226' for an equivalent approximate footprint area. Structural fill was assumed to have a bulk unit weight of 120 pcf. Based on our analyses, we estimate settlement near the center of the assumed filled area for a fill height of 2 feet to be approximately 3 to 5 inches. We estimate settlement due to the placement of 3 feet of fill to be approximately 6 to 9

inches. The corners and edges of the filled area are generally anticipated to settle approximately 25% and 50%, respectively, of the maximum settlement near the center of the filled area. Should our assumption regarding fill height be incorrect, Eustis Engineering should be contacted to reevaluate settlement due to the placement of fill required to raise grade to design elevation.

Areal Subsidence

27. Areal subsidence is a result of past filling and lowering of the groundwater level over large areas. Areal subsidence is considered a background condition over which man has no control and should be relatively uniform in the project area. Insufficient information is available in this geotechnical exploration to make accurate estimates of areal subsidence in the project area.

28. The presence of near-surface organic soils should be anticipated to biodegrade and disintegrate as the groundwater is lowered. Available information indicates the disintegration of organic soils can occur at a rate of 1 to 2 inches per year for soils exposed to the atmosphere. For organic soils covered by fill or impervious clays, but subject to air exposure, the disintegration rate can be estimated as ½ to 1 inch per year.

29. Ongoing areal subsidence can result in differential settlement of grade-supported features. Additional settlement of pile-supported structures may also be observed. Biodegradation of organic deposits is not uniform due to variations in the thickness of the organic deposit and the fluctuation of groundwater level. Fluctuations of the groundwater level is typically a seasonal occurrence; therefore, the observed subsidence may be concentrated during seasonal transitions.

In-Situ Properties

30. Seismic Site Classification. The site was classified in accordance with the 2021 International Building Code® (IBC). In reference to Table 20.3-1 of ASCE 7, referenced in the IBC, this site may be categorized as Site Class E, a "soft clay soil" profile. This classification is based on the IBC criteria that there is at least 10 feet of soil in the subsurface of the site with the following three conditions: a plasticity index greater than 20, a moisture content greater than 40%, and/or an undrained shear strength of less than 500 psf.

31. Evaluation of Shrink/Swell Potential. Based on the results of available laboratory index testing, the subsoils encountered at the boring locations appear to have low potential for volumetric change; however, the potential exists for soils to exhibit expansive behavior if recommendations in this report are not utilized. Therefore, it is important that strict attention be given to site grading and recommendations regarding site drainage.

Deep Foundations

32. Allowable Pile Load Capacities. Analyses were performed to determine the estimated allowable single load capacities in compression and tension for various sizes and embedments of treated ASTM D25 quality timber and ACIP piles. The results of these analyses are provided on Figures 3 and 4. Our estimates of allowable pile capacities at the site assume a cutoff at 2 feet below the ground surface for embedment within a pile cap or grade beam and that pile installation is vertical. Our capacities are presented as depth below the existing ground surface at the time of the field exploration. Actual pile

lengths should be determined based on the finished grade elevation. Installation criteria associated with our capacity assumptions are outlined subsequently.

33. Factors of Safety. The allowable single pile load capacities presented on Figures 3 and 4 contain a factor of safety of 2.0. Use of a factor of safety of 2.0 assumes a static load test will be performed or existing, pertinent static load test data are available to verify allowable pile load capacity estimates. A one-third increase in allowable axial load capacity can be used for temporary loads as allowed by applicable codes and appropriate testing.

34. Timber Piles. We recommend the treatment of timber piles meet the current American Wood Preservers Association Standards as outlined in Section 1014 of the LSSRB for both preservative and quality assurance. Treatment should also follow Section 812.06 where applicable. Furthermore, we recommend the timber piles meet the quality (clean peeled, straightness, etc.) requirements outlined in ASTM D25 and size requirements outlined in Table X1.5 of ASTM D25 for minimum pile tips. The pile dimensions assumed in our analyses are shown on Figure 3.

35. Auger Cast-in-Place Piles. We have assumed standard installation methods will be utilized to construct ACIP piles if they are utilized for the project. Standard installation methods are defined herein as the use of a single continuous flight, hollow shaft auger to produce the pile such that the spoils are removed. Under this assumption, we have evaluated allowable pile load capacities for typical ACIP pile diameters. The nominal ACIP pile diameters assumed in our analyses are shown on Figure 4. As indicated on Figure 4, a minimum overtake volume of 20% over theoretical was assumed to estimate these capacities. Should other methods be used to install ACIP piles, like positive

displacement ACIP (those where the drilled materials remain in the hole), Figure 4 shall not be considered valid. Eustis Engineering should be contacted to perform additional analyses to evaluate allowable load capacity for ACIP piles installed by methods not discussed in this report.

36. Quality control testing should be used to confirm grout return depths, minimum adjusted volumetric overtakes, and that installation requirements are being satisfied. Recommendations for integrity testing, including minimum reinforcing, are outlined subsequently.

37. Pile Weight. The allowable load capacities presented on Figure 4 for ACIP piles do not include the weight of the pile. When computing the resultant net compressive capacity of ACIP piles, a net load of 50 pcf may be used for the weight of the concrete (weight of the concrete minus the weight of soil removed). The full buoyant weight of the concrete of 87 pcf may be used to determine the tensile capacity of the piles provided they are designed to transmit these loads. The weight of timber piles may be considered negligible.

38. Structural Capacity. The estimated pile load capacities provided are based only on a soil-pile relationship. The structural capacity of the individual piles to transmit these loads, and any connections between the piles and the structure, should be determined by a structural engineer licensed in the State of Louisiana.

39. Pile Group Capacity. Foundation piles recommended in this report will derive a majority of their supporting capacity from skin friction; therefore, it is necessary to consider the effect of group action. In this regard, the supporting value of friction piles driven in

groups should be investigated on the basis of group perimeter shear by the formula shown on Figure 5. For group effects on tensile capacities, the second term of the equation should be neglected. This formula is only applicable to vertical group effects. Lateral group effects should be evaluated by detailed soil/structure interaction analyses.

40. Pile Group Spacing. The minimum center-to-center pile spacing within a row or group of timber piles should be 3 feet. The minimum center-to-center pile spacing within a row or group of ACIP piles should be determined by the minimum spacing formula shown on Figure 5. These spacings are generally recommended for construction tolerances and do not ensure vertical or group effects will not govern the design. The minimum spacing between rows or groups of piles should also meet the requirements discussed below regarding settlement.

41. Estimated Single Pile Settlement due to Structural Loads. We estimate single piles installed to embedment depths between 30 and 60 feet below the existing ground surface will settle approximately ½ to 1 inch due to sustained structural loads. Piles having a minimum tip embedment of 60 feet below the existing ground surface are anticipated to settle approximately ½ inch or less due to sustained structural loads. Eustis Engineering should be contacted to verify these settlement estimates once structure loadings, dimensions, and pile layouts are finalized. Note, piles installed in large groups and heavily loaded can result in settlements greater than that of a single pile. These estimates do not include elastic deformation of the piles which should be added to the settlement estimates. Elastic settlement of the piles may be estimated as 75% of the static column strain of a pile acting as a column. ***These estimates of settlement are only due to structural loads and are additive to settlement due to filling.***

42. Our settlement estimates due to structural loads assume piles will be installed in small groups or widely spaced rows. We have assumed the largest group dimension will be no greater than 20% of the pile length, and the center-to-center spacing between groups will be no closer than twice the largest group dimension. We have assumed the center-to-center spacing between rows of single piles will be no closer than 8 feet or 9 pile diameters, whichever is greater. In the event any of our assumptions are not met, Eustis Engineering should be contacted to evaluate the potential settlement of the pile foundations.

43. Effects of Fill Settlement on Pile Foundations. As fill settles from consolidation of the underlying subsoils, negative skin friction (drag loads) is induced on the piles as the soil settles along the piles. These drag loads have the potential to increase settlement of friction piles. We performed analyses to estimate the downdrag settlement resulting from placement of 2 and 3 feet of fill beneath the proposed structure. We estimate the impact on pile settlement due to fill placement will be negligible for any of the structures if fill placement is limited to 1 foot or less. Our estimates for pile settlement due to placement of 2 and 3 feet of fill below the proposed structure are presented in Table 1.

TABLE 1: ESTIMATES OF FRICTION PILE SETTLEMENT DUE TO FILL PLACEMENT

PILE TIP EMBEDMENT IN FEET	ESTIMATED LONG-TERM PILE DRAG SETTLEMENT IN INCHES	
	2 FEET OF FILL	3 FEET OF FILL
30	2 to 3	4 to 5
35		
40		
45	1½ to 2	3½ to 4½
50	1 to 1½	3 to 4
55	¾ to 1	2½ to 3½
60	¾ to 1	2 to 3
65	½ to ¾	1½ to 2½
70	½ to ¾	1 to 2
80	½ or Less	½ to 1
90	½ or Less	½ to ¾

44. Downdrag settlement should be considered additive to settlement estimated for the piles due to structural loading. If more than 3 feet of fill is anticipated to be placed under the proposed structure, Eustis Engineering should be contacted to estimate the additional drag load settlement potential of the piles.

45. All piles for structurally isolated buildings or appurtenant features should be installed to the same approximate tip elevations, and concrete for the pile caps should be structurally integrated with the concrete for the grade beams and structurally supported slabs. These recommendations are made to minimize the potential for differential movements.

46. Differential Settlement Considerations. Differential settlement will occur between pile-supported structures, the ground surface, and any adjacent surface founded structures or pavements. Differential settlement may also occur between structurally integrated elements supported on different foundation types. Therefore, appropriate architectural or structural features should be incorporated into your design to

accommodate differential settlement. A joint considering vertical movements should be provided between any adjoining integrated elements founded on different foundation types to accommodate potential differential settlement.

47. Utilities. We recommend flexible type connections be specified for all piping and utilities going to and from the pile-supported structures. In addition, pipes and conduits beneath the pile-supported structures should be structurally supported by hangers attached to the structural floor slabs.

Installation of Driven Piles

48. Quality Control. All pile driving operations should be supervised by experienced personnel to ensure proper procedures are followed and accurate records are kept during all pile driving operations. The driving records should include the date, type of pile, pile tip and butt diameters, depth and diameter of predrill, overall pile length, hammer make and model, driving energy, and number of blows per foot of penetration for the full embedment of the pile. An accurate driving record is especially important to verify piles are installed to the required tip embedment and to give an indication of any unusual driving characteristics which may include pile breakage. We recommend Eustis Engineering be retained to observe, record, and evaluate all pile driving operations with respect to the recommendations presented in this report.

49. Hammers. Treated ASTM D25 quality timber piles, with minimum tip diameters of 7 inches or greater and minimum butt diameters of 12 inches, may be driven with a single-acting air hammer having a rated energy of 15,000 ft-lbs per blow. The ram weight should not exceed 5,000 pounds, and the maximum stroke should be limited to 3 feet.

50. Pile Refusal. Refusal criteria for the timber piles may be taken as 25 blows per foot with the recommended hammer to minimize damage to these piles. If the piles are driven with the aid of a follower or if the pile driving helmet is allowed to impact the ground surface, Eustis Engineering should be consulted to adjust these refusal criteria.

51. Alternate Installation Methods. We do not recommend vibratory methods be utilized for pile installation. If a vibratory hammer is selected for the project, Eustis Engineering should be contacted to evaluate the reduction in the estimated allowable pile load capacities presented on Figure 3. If any other alternate installation methods are selected, Eustis Engineering should be contacted to evaluate the impact on the estimated capacities.

52. Predrilling. Predrilling may be considered to minimize vibrations in close proximity of existing residences, to identify obstructions, or to penetrate near-surface miscellaneous fill soils or crusts. Shallow predrilling may be performed by dry auger methods to a maximum depth of 10 feet below grade. The predrill bit should be no larger than the butt diameter for shallow predrilling (less than 6 feet) of timber piles and the pile tip diameter for deeper predrilling for timber piles. Deeper predrilling may be required to penetrate the silty sand layers present within the borings and CPTs from the approximate 15 to 30 feet depths. The need for predrilling should be fully evaluated during a test pile program by those parties responsible for pile installation. Predrilling at this depth, if required, should be by wet rotary methods. In all cases, piles should be embedded a minimum of 10 feet beyond the predrill depth.

53. Pile Installation Sequence. Timber piles are considered displacement piles because soil is displaced laterally when the piles are driven into the subsurface. These piles could

cause adjacent piles to refuse at shallower depths or, more likely, could result in heaving of piles previously installed. For these reasons, we recommend pile driving take place from the center of large foundations working outward.

Installation of Auger Cast-in-Place Piles

54. Quality Control. Successful installation of ACIP piles will be a direct function of the quality control used at the site and means and methods employed by the contractor. The contractor should review the boring logs and CPT records presented in Appendices I and II to make an independent interpretation of subsoil conditions at the site and their potential impact on means and methods used to install ACIP piles. As a minimum, the quality control should include the checking of the mix, fluidity, temperature, use of additives, and taking of samples for subsequent compressive strength testing. The quality of the grout mix used for the piles should be monitored using ASTM C109 procedures. Fluidity may be checked by using the modified U.S. Army Corps of Engineers (USACE) Specifications CRD C79 and ASTM C939. Flow rates should be in the range between 10 and 25 seconds using a flow cone modified to have a 0.75-in. opening.

55. As indicated on Figure 4, an actual pile volume or "adjusted volumetric overtake," as described subsequently, of 20% over theoretical was assumed to estimate capacities. The actual pile volume will differ from the total volume of grout used to construct the pile. A more representative pile grout volume, termed "adjusted volumetric overtake," can be estimated and considers grout observed exiting the top of the augured hole during pile construction. The depth of the auger tip at which the grout is observed exiting the top of the pile is termed "grout return depth." Deeper grout return depths yield higher total grout volumes and subsequent higher volumetric overtake percentage estimates

when based on total grout volume pumped. Additionally, because of inherent irregularities in the ACIP cross-section, higher capacities may be achieved at lower volumetric overtakes. Therefore, careful attention to overtake and proper assessment of actual overtake volume are critical to quality control.

56. Quality control during pile installation should include records for each pile installed. Prior to installation of any grout, the grout pump should be calibrated in units of volume per stroke. During installation, grout pressure and volume should be recorded by flow meter and pressure meter (supplied by the pile installation contractor) in addition to recording pump strokes. The flow meter should be capable of providing the total and incremental volume of grout pumped. We recommend a maximum increment of 5 feet be implemented for the meters and manual methods. The grout return depth should also be recorded on the installation records and the adjusted grout volume estimated based on this return depth. Finally, the theoretical volume of grout should be compared to this adjusted grout volume for each pile to determine the percent over theoretical volume.

57. Eustis Engineering should be contacted if the volume of grout placed for any 5-ft segment is less than 120% of the theoretical volume for an ACIP pile. Based on our experience, grout volume overtakes greater than 20% should be anticipated for standard ACIP pile installation methods. Generally, a total volumetric overtake of at least 120% with a grout return depth of 5 to 10 feet will result in an adjusted grout overtake of at least 120%; however, this should be verified with site-specific testing. Deeper grout returns yield higher total grout volumes and subsequent volumetric overtake percentages when based on the total grout volume pumped or total volumetric overtake. If the theoretical grout volume is reached after the grout return is observed, additional testing may be

recommended. Minimum adjusted volumetric overtake requirements may be revised if review of probe/test pile installation records, integrity testing, and static load testing confirm project requirements are being met at lower adjusted grout volumes.

58. Equipment and Techniques. ACIP piles should be made by rotating a continuous flight, hollow shaft auger into the ground to the necessary depth in order to develop the desired load capacity. The auger flighting should be continuous without gaps or breaks and should have a uniform diameter throughout its length. For ACIP pile lengths exceeding 40 feet, we recommend a middle guide be used. Adjacent piles should not be installed until the pile has set for a sufficient period, as determined by the structural engineer, to withstand earthen pressures exerted by the installation of adjacent piles. Typically, a minimum 24-hour set time is recommended.

59. For placement of reinforcing steel, a minimum clear distance of 3 inches is recommended between the rebar and the outer edge of the pile. Additional cover may be needed to meet structural or code requirements. If reinforcing cages are used, they should be centered in the bore hole using centralizers or other systems. Cross-bracing, within the reinforcing cage, should not be allowed in order to minimize the potential for void development in the concrete. We also recommend a full-length center bar be installed with a centralizer in each pile for inspection purposes.

60. The grout should be designed to provide an adequate strength to support the anticipated design load. The grout head should be 5 feet higher than the fluid levels in the bore hole and/or the bottom of the auger at all times. The grout should be placed continuously from bottom to top while the auger rotates during withdrawal. Final grout return depths should be evaluated by test/probe piles.

61. We do not recommend forcing the reinforcing cage or center bars into place with the use of heavy equipment, nor do we recommend twisting the center bars into place. Should the reinforcing steel not extend to the recommended depth due to anomalies indicative of soil "cave-ins" or grout water loss in cohesionless soils, we recommend the cage or center bar be withdrawn and the piles be immediately redrilled. If difficulty in inserting the reinforcing cage or center bar persists due to grout water loss, we recommend the use of a grout intrusion aid admixture such as Intrusion-Aid® MAX, by Specrete-IP Incorporated, or an approved equivalent. Eustis Engineering should be retained during construction in order to evaluate pile installation records and provide additional recommendations if necessary.

Integrity Testing for Auger Cast-in-Place Piles

62. In order to ensure successful installation of ACIP piles, the test piles (if applicable) and a selected percentage (typically 2%) of job piles should be subjected to integrity testing using an instrumented center reinforcing bar or reinforcing cage. Once the pile design and layout have been finalized, Eustis Engineering should be contacted to determine the appropriate percentage or number of piles that should be subjected to integrity testing. For the ACIP piles presented in this report, we recommend Thermal Integrity Profile (TIP) testing or single-hole sonic logging (SSL). If these tests or installation records reveal structural defects or anomalies, additional quality control tests consisting of TIP, SSL, or low strain integrity methods including pile integrity testing (PIT) may be required. TIP testing should be performed in accordance with ASTM D7949-14 by either the probe method or thermal wire method. SSL testing should comply with ASTM D6760-16. PIT should be performed in accordance with ASTM D5882-16. Note, PIT testing typically

does not provide accurate results below 40 pile diameters and may not be fully useful in application.

63. The TIP and SSL methods require installation of an access tube (typically PVC) or wires (thermal wire method) and therefore must be coordinated prior to construction. We have assumed all ACIP piles will have a full-length center bar or reinforcing cage that can be used for the testing. These tests must also be performed within a specific time frame to maintain their accuracy. The thermal wire method requires cable(s) fitted with uniformly spaced temperature sensors be installed on the reinforcing cage (or center rebar) prior to placement into the pile. Temperature data are then collected at selected intervals during the hydration process.

64. For the access tube method for TIP and SSL testing, the access tube(s) should be free of debris and other obstructions, and the outside of the PVC tube(s) should be made coarse to aid in the bonding with the concrete grout. If SSL testing is planned, the PVC tube(s) should be filled with water immediately upon completion of installing the pile in order to minimize debonding of the concrete to the surface of the PVC tube(s). Debonding of concrete to the PVC tube(s) may show false anomalies during SSL testing. Thermal testing (probe method) requires the access tube(s) to be dry during testing.

Test Piles and Load Tests

65. Eustis Engineering considers a test pile program and load test as an extension of our geotechnical exploration. Therefore, Eustis Engineering should be retained to perform these services. If driven piles are selected for support of the proposed structure, we recommend at least six probe piles be installed within the structure's footprint to assess

installation conditions. Note, we recommend probe piles be utilized to evaluate installation conditions regardless if static load testing is planned or not.

66. The probe piles should be the same type and embedment anticipated for the job piles and installed with the same equipment and techniques proposed for the job piles. Driven probe piles will provide definitive information regarding the anticipated driving resistance, vibrations from pile driving, sound levels during pile driving, and requirements for predrilling. ACIP test piles will allow for integrity testing and providing information regarding overtake volumes (total and adjusted), grout returns, and installation techniques.

67. If the basis of design will be a factor of safety of 2 and existing, pertinent static load test data are not available, a static load test or test(s) must be performed. Eustis Engineering should evaluate existing load test data, if any, to determine relevance for the subject project. The driven probe pile with the lowest resistance to driving as indicated by penetration resistance values (blow counts) or the ACIP pile with the lowest adjusted overtake volume should be subjected to static load testing. We recommend test piles be allowed to set for at least 14 days after the installation of the reaction system. The structural and geotechnical engineers of record should select the pile to be used for performance of the static load test. The test pile should then be load tested to failure in accordance with ASTM D1143 assuming the design is governed by compressive capacity. A lateral load test or tensile load test may be required depending on the final design. Results should be evaluated by Eustis Engineering to verify the estimated pile load capacities presented in this report.

Pavements

68. Method of Analysis. The pavement components and thicknesses for rigid and flexible pavements were determined using methods presented in the AASHTO Guide for Design of Pavement Structures. Traffic data assumptions were converted to equivalent 18-kip single axle loads (E18) using AASHTO equivalency factors for flexible and rigid pavements.

69. Design Assumptions. A 20-year design life without a growth factor and a terminal serviceability index (Pt) of 2.0 were used for the analyses of flexible and rigid pavements. The resilient soil modulus (Mr) of the subgrade was estimated based on the type of soil, probable drainage conditions, and engineering experience. We have assumed the site will be prepared as recommended in this report and proper construction and permanent drainage will be provided. We have not confirmed if these design criteria meet or exceed requirements of local building codes.

70. Traffic. The amount of passenger automobiles accessing the site per day was estimated using the furnished site layout drawing presented in Appendix III. Of the amount of available parking spaces, we assumed a vehicle distribution of 50% passenger cars and 50% pickup trucks, vans, or sport utility vehicles (SUVs). Below are our assumed traffic counts used in the evaluation of the parking areas (light-duty pavement). For the drive aisles and serviceways (heavy-duty pavement), we have assumed twice this amount of light-duty vehicles. Additionally, we have assumed the heavy-duty pavement will experience two delivery trucks per day; ten multi-passenger transit vehicles per day for guest transportation; and two garbage trucks per week. We present our assumed axle weights used for our analyses in Table 2.

TABLE 2: ASSUMED VEHICLE AXLE LOADS

TYPE OF VEHICLE	AXLE LOAD IN KIPS		
	FRONT	MIDDLE	REAR
Passenger Cars	2(S)	-	2(S)
Pickup Trucks, Vans, or SUVs	2(S)	-	5(S)
Delivery Trucks and Multi-Passenger Vans	12(S)	-	20(S)
Garbage Trucks	20(S)	-	44(T)

(S) = Single; (T) = Tandem

71. Our assumed traffic intensities should be verified prior to implementation of design. If traffic conditions are different than those presented, Eustis Engineering should be contacted to reevaluate the pavement recommendations contained in this report.

72. Flexible Pavement. For the parking areas, we recommend a light-duty pavement comprising 3 inches of hot mix asphaltic surface course consisting of at least 1.5 inches of Mix Level 1 wearing course and 1.5 inches of Mix Level 1 binder course. The asphalt should be underlain by 8 inches of stone base course and 12 inches of sand subbase. For the drive aisles, we recommend 4 inches of hot mix asphaltic surface course comprising at least 1.5 inches of Mix Level 1 wearing course and 3.5 inches of Mix Level 1 binder course. The asphalt should be underlain by 8 inches of stone base course and 12 inches of sand subbase. Structural fill subbase should be placed atop the subgrade following our subgrade preparation recommendations discussed in this report.

73. Our analyses assume all flexible paving materials will conform to the LSSRB. The asphaltic surface course should conform to all requirements for Superpave (Level 1) wearing and binder courses in accordance with Section 502 of the LSSRB. The material

for the crushed stone base course should conform to the requirements of Section 1003.03.1 of the LSSRB. The stone base course should be placed and compacted in accordance with Section 302 of the LSSRB for a Class II base course. Sand subbase should follow the material specifications given in the "Structural Fill and Backfill" section of this report. Structural fill used as subbase should be compacted to at least 95% of its maximum dry density near ±2% of optimum water content in accordance with ASTM D1557. Structural fill subbase should be placed on the prepared subgrade in accordance with the site preparation recommendations given in this report.

74. Rigid Pavement. Using the same soil and traffic conditions, Eustis Engineering recommends rigid pavement for the parking areas comprises 5 inches of Portland Cement Concrete (PCC). The drive aisles should comprise 6 inches of PCC. We recommend trash container pads be at least 8 inches thick. PCC should conform to the material requirements for pavement Type B concrete, as specified in Section 901 of the LSSRB. The concrete should have a specified 28-day compressive strength of 4,000 psi to give the pavement adequate flexural strength. The concrete pavement should consider the need for reinforcement against temperature and shrinkage and should be constructed in accordance with provisions of Section 601 of the LSSRB. All joints should be sealed to prevent infiltration of water. All pavement details (i.e., wire mesh, reinforcement, dowels, joints, curbs, etc.) should be designed by a pavement design engineer.

75. The concrete should be underlain by at least 6 inches of compacted sand fill. Sand fill should conform to the material requirements given in the "Structural Fill" section of this report. The sand subbase should be compacted to at least 95% of its maximum dry density within ±2% of its optimum water content using ASTM D1557.

76. Other Considerations. The subgrade should be prepared as recommended previously under "Site Preparation and Backfill." Grades should provide for adequate drainage to prevent saturation of the subgrade, subbase, base, and surface course materials. Otherwise, adequate surface or subsurface drainage and/or edge drains should be provided. If the type and thickness of pavement components are changed, Eustis Engineering should be consulted to determine the suitability of these materials and the structural number of the pavement.

77. Material separation should be provided between the prepared subgrade and the sand subbase to improve resiliency of the pavements. This may be accomplished with a geotextile stabilization fabric. The geotextile should meet or exceed the material requirements presented in Section 1019.01 of the LSSRB. A Class C geotextile should be used beneath the sand subbase. The geotextile should be placed directly on the prepared subgrade in accordance with Section 726.03 of the LSSRB and the manufacturer's construction recommendations. All seams and ends in the geotextile should be overlapped a minimum of 3 feet, or in accordance with the manufacturer's guidelines, and secured to maintain adequate material separation.

Vibrations

78. General. Pile installation, hauling of fill materials, and other construction operations will cause vibrations that may affect nearby structures, pavements, and underground utilities. Damage due to construction vibrations is usually associated with movements of equipment, particularly heavy trucks and cranes. Vibrations associated with vehicular construction traffic are dependent on the size and speed of individual vehicles as well as frequency.

79. Measurement. If vibrations are a concern, we recommend peak particle velocities due to construction operations be monitored at critical structures or pavements with a seismograph during all construction operations that have a potential to cause vibrations. The record of peak particle velocities will provide information in assessing potential damage and the types of changes best suited to the project requirements.

80. Generally, peak particle velocities of 1.5 to 2.0 in./sec are considered to be threshold levels for structural damage. Low peak particle velocity levels can also be a problem for poorly constructed buildings or structures that have been previously stressed by settlement or other movements. In such cases, vibrations on the order of 0.5 in./sec can initiate cosmetic damage or further cosmetic damage that has already taken place in the structure. Peak particle velocities between 0.25 and 0.5 in./sec may be sensed as being detrimental by human perception. In addition, peak particle velocities of 0.25 in./sec may densify cohesionless or semi-cohesive deposits (such as fill materials and subsurface sand deposits encountered in the borings/CPTs) and result in settlement of structures founded in or above these materials. Considering the potential for cosmetic damage and the adverse perception to human response, we recommend a level of 0.5 in./sec be set as a construction tolerance for transient construction activities (events less than 1 to 2 seconds). This level is generally achievable with current construction methods. However, if sustained peak particle velocities exceed 0.25 in./sec at a pavement, utility, or structure of concern, construction activities generating these vibrations should be suspended, Eustis Engineering should be notified, and consideration should be given to altering construction procedures.

81. Mitigation Techniques. Mitigation techniques to dampen the effects of vibrations on structures are generally associated with decreasing the energy exciting vibrations through

the soil. For construction traffic, tight speed controls can greatly reduce the vibrations imparted to adjacent structures.

GEOTECHNICAL SERVICES DURING CONSTRUCTION

82. To provide continuity among the exploration, design, and construction phases, Eustis Engineering should be retained to provide additional geotechnical and materials testing services. Geotechnical engineering services may include the review of the contract plans and specifications to evaluate their conformance to the recommendations contained in this report. We can also inspect and perform compaction and in-place density determinations on fill materials; inspect and log installations of test piles and job piles; perform and evaluate static load tests; perform and evaluate integrity tests (TIP, SSL, and PIT) on ACIP piles; monitor vibrations; and test and inspect steel, asphalt, and concrete. Eustis Engineering can also perform any other soils or materials testing services, which will provide quality control during construction and conformance to design specifications.

83. In summary, Eustis Engineering should be retained to monitor all geotechnical related work performed by the contractor. If construction problems arise, Eustis Engineering should be notified to participate in the development of solutions. This participation permits the geotechnical engineer to evaluate the effects of unanticipated conditions and propose solutions on the geotechnical design assumptions particular to the project. The design geotechnical engineer may also be able to judge how site-specific soil and groundwater conditions will affect the success of a proposed construction alternative.

LIMITATIONS

84. Eustis Engineering has provided engineering services in accordance with generally accepted geotechnical engineering practices in this locality at this time. No warranty or guarantee is expressed or implied.

85. Eustis Engineering has prepared this report in accordance with generally accepted geotechnical engineering practice for the exclusive use of TGMC for specific application to the subject site. In the event of any changes in the nature, design, or location of the proposed construction, the conclusions and recommendations contained in this report will not be considered valid unless the changes are reviewed, and the conclusions of this report are modified and verified in writing by Eustis Engineering. Should TGMC want to provide these data to be used by anyone other than TGMC, they shall seek written permission from Eustis Engineering, and the user must contact Eustis Engineering for interpretation of data and to secure other information which may be pertinent to the project.

86. The analyses and recommendations contained in this report are based, in part, on data obtained from soil borings, laboratory testing, and CPTs performed for the subject project. The boring logs and CPT records are considered representative of subsurface conditions at the boring/CPT locations on the dates completed. No warranty is given that the boring logs or CPT records are representative of subsurface conditions at other locations or times. The nature and extent of variations in subsurface conditions, between and away from the boring/CPT locations, may not become evident until construction. If such variations appear, it will be necessary to reevaluate the recommendations contained in this report.

87. Recommendations and conclusions contained within this report are to some degree subjective having partial basis in engineering judgement and experience particular to the design engineer. For this reason, this report should not be included in its entirety in the contract plans and specifications without addressing the limitations of its use. However, the results of the soil borings, laboratory tests, and CPTs contained in Appendices I and II of this report may be included in the plans and specifications. The construction contractor is obliged to make an independent interpretation of subsurface conditions at the site and their potential impact on means and methods used to achieve the plans and specifications.

88. This report is issued with the understanding that the owner or the owner's representative has the responsibility to bring the information and recommendations contained herein to the attention of the project engineer to ensure they are incorporated into the plans and specifications for the project. The owner or the owner's representative also has the responsibility to take the necessary steps to confirm the general contractor and all subcontractors follow such recommendations. It is further understood the owner or the owner's representative is responsible for submittal of this report to the appropriate governing agencies.

89. Eustis Engineering should be provided the opportunity for a general review of the design plans and specifications in order that earthwork and foundation recommendations may be properly interpreted and implemented in the design and specifications. If Eustis Engineering is not accorded the privilege of making this recommended review, we can assume no responsibility for misinterpretation of or failure to implement our recommendations.

90. The scope of our service does not include an environmental assessment or an investigation for the presence or absence of wetlands and hazardous or toxic materials in the soil; surface water; groundwater; or air on, below, or adjacent to the subject property. Furthermore, the scope of service does not include the investigation or detection of biological pollutants at the site. The term “biological pollutants” includes but is not limited to molds, fungi, spores, bacteria, viruses, and the byproducts of any such biological organisms.

ESTIMATES OF ALLOWABLE SINGLE PILE LOAD CAPACITIES
TREATED ASTM D25 QUALITY TIMBER PILES

PILE SIZE	PILE TIP EMBEDMENT BELOW EXISTING GROUND SURFACE IN FEET[1]	ESTIMATES OF ALLOWABLE SINGLE PILE LOAD CAPACITY IN TONS[2][3][4] FACTOR OF SAFETY ≈ 2.0[5]	
		COMPRESSION	TENSION
8-In. Tip 12-In. Butt	30 35	7½ 9	5 6
7-In. Tip 12-In. Butt	40 45 50 55	10 11½ 13½ 15	6½ 8 9 10½
7-In. Tip 13-In. Butt	60 65 70	18 20 22½	12 14 15½

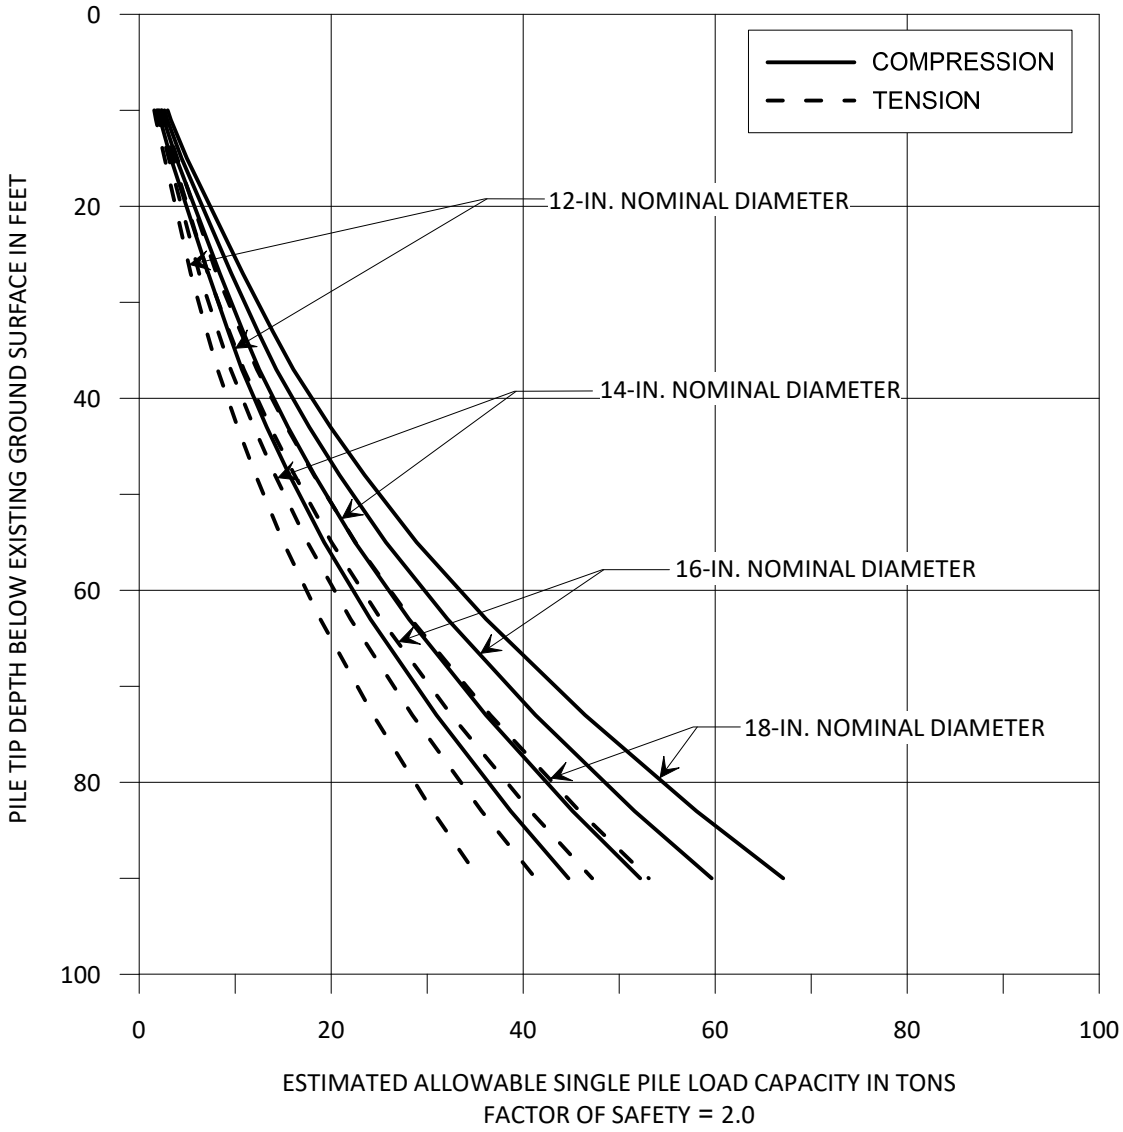
[1] Selection of pile length should consider the height of proposed fill above existing grade in order to meet minimum pile tip embedments as shown. Pile tip embedments should also consider settlement potential.

[2] Estimates include a capacity reduction for an approximate 2-ft embedment of the piles within a pile cap or grade beam.

[3] Piles assumed to be installed by impact driving equipment without assistance from vibratory equipment.

[4] These capacity estimates do not include limitations on structural capacity as imposed by some building codes.

[5] Use of a factor of safety of 2.0 assumes a static pile load test will be performed.



NOTES:

1. ALLOWABLE PILE LOAD CAPACITIES PRESENTED ON THIS FIGURE DO NOT INCLUDE THE WEIGHT OF THE PILES.
2. SELECTION OF PILE LENGTH SHOULD CONSIDER THE HEIGHT OF PROPOSED FILL ABOVE EXISTING GRADE IN ORDER TO MEET MINIMUM PILE TIP EMBEDMENTS AS SHOWN. PILE TIP EMBEDMENTS SHOULD ALSO CONSIDER SETTLEMENT POTENTIAL.
3. ESTIMATES INCLUDE CAPACITY REDUCTION FOR AN APPROXIMATE 2-FT EMBEDMENT OF THE PILES WITHIN A PILE CAP OR GRADE BEAM.
4. ESTIMATED CAPACITIES ASSUME AS-BUILT GROUTING OVERTAKES AT LEAST 120% OF THE THEORETICAL VALUE.
5. USE OF A FACTOR OF SAFETY OF 2 ASSUMES A STATIC PILE LOAD TEST WILL BE PERFORMED.
6. REFER TO REPORT FOR INSTALLATION RECOMMENDATIONS.

ESTIMATED ALLOWABLE SINGLE PILE LOAD CAPACITIES

DRAWN BY: SJB	JOB NO.: 24717
CHECKED BY: PAT	DATE: 2 FEB 2022
FILE NAME: AC APLC	FIGURE 4

CAPACITY OF PILE GROUPS

The maximum allowable load carrying capacity of a pile group is no greater than the sum of the single pile load capacities, but may be limited to a lower value if so indicated by the result of the following formula.

$$Q_a = \frac{P \; x \; L \; x \; c}{(FSF)} + \frac{2.6 \; q_u \; (1 + 0.2 \; \frac{w}{b}) \; A}{(FSB)}$$

In Which:

Q_a	=	Allowable load carrying capacity of pile group, lb
P	=	Perimeter distance of pile group, ft
L	=	Length of pile, ft
c	=	Average (weighted) cohesion or shear strength of material between surface and depth of pile tip, psf
q_u	=	Average unconfined compressive strength of material in the zone immediately below pile tips, psf (unconfined compressive strength = cohesion x 2)
w	=	Width of base of pile group, ft
b	=	Length of base of pile group, ft
A	=	Base area of pile group, sq ft
(FSF)	=	Factor of safety for the friction area = 2
(FSB)	=	Factor of safety for the base area = 3

The values of c and q_u used in this formula should be based on applicable soil data shown on the Log of Boring and Test Results for this report. In the application of this formula, the weight of the piles, pile caps and mats, considering the effect of buoyancy, should be included.

SPACING WITHIN PILE GROUPS

SPAC = $0.05 (L_1) + 0.025 (L_2) + 0.0125 (L_3)$

In Which:

SPAC	=	Center-to-center of piles, feet
L_1	=	Pile penetration up to 100 feet
L_2	=	Pile penetration from 101 to 200 feet
L_3	=	Pile penetration beyond 200 feet

NOTE: Minimum pile spacing = 3 feet or 3 pile diameters, whichever is greater

APPENDIX I

EUSTIS ENGINEERING SINCE 1946

LEGEND AND NOTES FOR LOG OF BORING AND TEST RESULTS

PP Pocket penetrometer: Resistance in tons per square foot

SPT Standard Penetration Test: Number of blows of a 140-lb hammer dropped 30 inches required to drive 2-in. O.D., 1.4-in. I.D. sampler a distance of 1 foot into the soil after first seating it 6 inches. Values shown have not been corrected.

SPLR Type of Sampling  Shelby, SPT, Auger, Vibracore, Geoprobe, No sample

SYMBOL Clay, Silt, Sand, Peat/Humus, Shells, Stone/Gravel

Predominant type shown heavy; modifying type shown light

USC Unified Soil Classification

DENSITY Unit weight in pounds per cubic foot

SHEAR TESTS

TYPE

- UC Unconfined compression shear
- OB Unconsolidated undrained triaxial compression shear on one specimen confined at the approximate overburden pressure
- UU Unconsolidated undrained triaxial compression shear
- ϕ Angle of internal friction in degrees
- c Cohesion in pounds per square foot

ATTERBERG LIMITS

- LL Liquid Limit
- PL Plastic Limit
- PI Plasticity Index

OTHER TESTS

- CON Consolidation
- -#200 Percent passing a U.S. No. 200 sieve
- SV Particle size distribution (sieve only)
- PD Particle size distribution (sieve and hydrometer)
- k Coefficient of permeability in centimeters per second
- SP Swelling pressure in pounds per square foot

Other laboratory test results reported on separate figures

GENERAL NOTES

(1) If a ground water depth is shown on the boring log, these observations were made at the time of drilling and were measured below the existing ground surface. These observations are shown on the boring logs. However, ground water levels may vary due to seasonal fluctuations and other factors. If important to construction, the depth to ground water should be determined by those persons responsible for construction immediately prior to beginning work.

(2) While the individual logs of borings are considered to be representative of subsurface conditions at their respective locations on the dates shown, it is not warranted that they are representative of subsurface conditions at other locations and times.

CPT Correlations

References are in parenthesis next to the appropriate equation.

General

p_a=atmospheric pressure (for unit normalization)
q_t=corrected cone tip resistance (tsf)
f_s=friction sleeve resistance (tsf)
$R_f = 100\% \cdot (f_s/q_t)$
u_2=pore pressure behind cone tip (tsf)
u_0=hydrostatic pressure

$B_q = (u_2-u_0)/(q_t-\sigma_{vo})$
$Q_t=(q_t-\sigma_{vo})/ \sigma'_{vo}$
$F_r=100\% \cdot f_s/(q_t-\sigma_{vo})$
$I_c = ((3.47-\log Q_t)^2 + (\log F_r+1.22)^2)^{0.5}$ 2
$I_{SBT} = ((3.47-\log(q_c/p_a))^2+(\log F_r+1.22)^2)^{0.5}$ 23
$I_{c\ J\&D} = \sqrt{\{3 - \log(Q_t \cdot (1 - B_q)\}^2 + [1.5 + 1.3 \cdot \log(F_r)]^2}$ 27
$I_{c\ J\&B} = \sqrt{\{3 - \log(Q_t \cdot (1 - B_q) + 1\}^2 + [1.5 + 1.3 \cdot \log(F_r)]^2}$ 28

K_o

K_0 (1) $K_o = (1-\sin\varphi)OCR^{\sin\varphi}$
K_0 (2) $K_o = 0.1(Q_t)$ 1

Stress History

$OCR = \sigma_p'/\sigma'_{vo}$
OCR (1) $\sigma_p' = 0.33(q_t - \sigma_{vo})$ - clays 8
OCR (2) $\sigma_p' = 0.53(u_2 - u_o)$ - clays 9
OCR (3) $\sigma_p' = 0.60(q_t - u_2)$ - clays 9
OCR (4) $OCR = 0.25\ Q_t^{1.25}$ – clays 37
OCR (5) $OCR = \left[\frac{0.192*(q_t/p_a)^{0.22}}{(1-\sin(\emptyset')\cdot(\sigma'_{v0}/p_a{}^{0.31})}\right]^{\frac{1}{\sin(\emptyset'-0.27)}}$ – sands 35
OCR (6) $\sigma_p' = .101 \cdot p_a{}^{0.102} \cdot G_{max}{}^{0.478} \cdot \sigma'_{v0}{}^{0.420}$ – all soils 36

N-Value

$N_{60} = (q_t/p_a)/[8.5(1-I_c/4.6)]$ 6

Undrained Shear Strength

S_u (1) $S_u = (u_2 - u_o)/N_u$ where $7 \le N_u \le 9$ 10
S_u (2) $S_u = (q_t - \sigma_{vo})/N_{kT}$ where $15 \le N_{kT} \le 20$ 11
S_u (3) $S_u = 0.091 * ((\sigma'_{vo}{}^{0.2}) * (q_t - \sigma_{vo})^{0.8}$ 21
S_u (4) $S_u = (q_c - \sigma_{vo})/N_k$ where $15 \le N_k \le 20$ 11
S_u (5) $S_u = q_t/N_c$ where $XXX \le N_c \le YYY$
S_u (6) $S_u = q_c/N_c$ where $XXX \le N_c \le YYY$

Effective Cohesion

$c' = 0.02 * \sigma_p'$ 38

Drained Friction Angle

φ' (1)	$\varphi' = 17.6 + 11.0\text{Log}[q_t/(\sigma_{vo}')^{0.5}]$	1
φ' (2)	$\varphi' = \arctan[0.1 + 0.38\text{Log}(q_t/\sigma_{vo}')]$	13
φ' (3)	$\varphi' = 30.8\text{Log}[(f_s/\sigma_{vo}')+1.26]$ (for clays or sands)	14
φ' (4)	$\varphi' = 29.5\ B_q^{0.121}\ (0.256 + 0.33\ B_q + \text{Log}(Q_t))$	24

Unit Weight

$\rho = \gamma/\gamma_w$

$\rho = 0.8\text{Log}(V_s)$ V_s in m/sec 17

Relative Density and Void Ratio

D_R (1)	$D_R = 100(q_{c1}/305)^{1/2}$	where, $q_{c1} = q_c/(\sigma_{vo}')^{1/2}$	1
D_R (2)	$D_R = -1.292 + 0.268\ln(q_c \cdot (\sigma_{vo}'^{-0.5}))$		18
D_R (3)	$D_R = (1/2.41)\cdot\ln(q_{c1}/15.7)$		3
D_R (4)	$D_R = 1/2.91 * \ln((q_c/(61* \sigma'^{0.71}_{vo}))*100$		20
D_R (5)	$D_R = 100*(0.268*\ln((q_t/p_a)/(\sigma'_{vo}/p_a)\text{^}0.5) - 0.675)$		34

$e_o = 1.099 - 0.204\log(q_{c1})$ 1

$E_D = 5\ q_t$ $I_D = 2.0 - 0.14(R_f)$ $K_D = E_D/(34.7\cdot I_D\cdot \sigma_{vo}')$

Compressibility

$M(1) = R_m\ E_D$ where R_m= function(I_D, K_D) see the following table 22

$I_D <= 0.6$	$R_M = 0.14 + 2.36 \log K_D$
$I_D >= 3$	$R_M = 0.5 + 2 \log K_D$
$0.6 < I_D < 3$	$R_M = R_{M,D} + (2.5 - R_{M,D})\log K_D$
	$R_{M,D} = 0.14 + 0.15(I_D - 0.6)$
$K_D > 10$	$R_M = 0.32 + 2.18 \log K_D$
$R_M < 0.85$	$R_M = 0.85$

M (2)	$M = q_c\cdot 10^{(1.09-0.0075D}R^{)}$ *sands*	1
M (3)	$M = 8.25\ (q_t - \sigma_{vo})$ *clays*	1
M (4)	$M = \alpha \cdot G_{max}\ where\ 0.02 < \alpha < 2$ and $G_{max}\ is\ from\ Vs$	33

Rigidity Index

$I_R = exp\left[\left(\frac{1.5}{M} + 2.925\right)\cdot\left(\frac{q_t-\sigma_{vo}}{q_t-u_2}\right) - 2.925\right]$ where $M = 6\sin\emptyset'/(3-\sin\emptyset')$ 39

Sensitivity

S_t (1)	$S_t = 7.5/R_f$	2
S_t (2)	$S_t = (q_t - \sigma_{vo})/(15\cdot f_s)$	2

Fines Content

$FC = [(3.58-\log(q_t))^2+(1.43+\log(R_f))^2]^{1.8}$ 4

$FC = [5.31(I_{cfs})^{2.31}]+9.61$, where $I_{cfs} = [(1.95-\text{Log}Q_t)^2+(\log F_r+1.78)^2]^{0.5}$

Shear Wave Velocity

$V_s(1) = 277 \cdot q_t^{0.13} \cdot {\sigma'_{vo}}^{0.27}$ (sands) - m/s and MPa 29

$V_s(2) = 1.75 \cdot q_t^{0.627}$ (clays) - m/s and kPa 30

$V_s(3) = (10.1 \cdot \log q_t - 11.4)^{1.67} \cdot (\frac{f_s}{q_t} \cdot 100)^{0.3}$ (all soils) – m/s and kPa 31

$V_s(4) = 118.8 \cdot \log f_s + 18.5$ (all soils) – m/s and kPa 32

$G_{max} = \rho V_s^2$

Hydraulic Conductivity

Lookup based on SBT and SBTn (1986 and 1990) 40

INTRODUCTION

1. This report contains the results of supplemental geotechnical exploration and design performed for the proposed health and wellness facility for Terrebonne General Medical Center (TGMC) to be located in Houma, Louisiana. We provide a site vicinity map on Figure 1. The exploration was performed in general accordance with the scope of service presented in Eustis Engineering L.L.C.'s proposal, dated 24 January 2024. Ms. Giulia Irwin, Project Architect with AQ Studios, LLC (formerly Rozas Ward Architects, Inc.) provided authorization through signed acceptance of our proposal on 25 January 2024. The project owner is Terrebonne General Medical Center (TGMC). AQ Studios is the project architect. The site civil engineer and structural engineer for the project are Milford & Associates, Inc. (Milford) and Schrenk Endom & Flanagan L.L.C. (SEF), respectively.

2. Geotechnical engineering analyses and construction recommendations were provided in our previous report entitled "Geotechnical Exploration, Terrebonne General Medical Center, Proposed Health and Wellness Center, Houma, Louisiana, SEF Project No. 6925, Eustis Engineering Project No. 24717," dated 11 March 2022. We subsequently provided

a recommended preload/surcharge program in a supplemental letter entitled "Additional Engineering Analyses, Terrebonne General Medical Center, Preload/Surcharge Monitoring Program, Proposed Health and Wellness Center, Houma, Louisiana, Eustis Engineering Project No. 24717.01," dated 13 October 2023. Eustis Engineering recommended this deeper supplemental exploration in our 13 October 2023 letter to validate assumptions made for preload/surcharge analyses regarding the subsurface conditions below the terminal depth of our original exploration. Recommendations and analyses provided in our original geotechnical report, dated 11 March 2022, or supplemental letter, dated 13 October 2023, not addressed in this supplemental report remain valid.

SCOPE OF SERVICE

3. The supplemental exploration included the drilling of six undisturbed sample-type soil borings to determine subsoil conditions and stratification and to obtain samples of the various strata encountered. Soil mechanics laboratory tests, performed on samples obtained from the borings, were used to evaluate the physical properties of the subsurface soils. Engineering analyses, based on the soil borings, laboratory tests, and results of borings and cone penetration tests (CPTs) from the original exploration, were performed to provide estimates of allowable single pile load capacity for square, precast concrete (SPC) piles and validate the earthen preload/surcharge program previously recommended.

AVAILABLE GEOTECHNICAL INFORMATION

4. Geotechnical data from the original geotechnical exploration including soil borings, CPTs, and laboratory tests presented in our 11 March 2022 report were utilized for the analyses presented herein. We include soil boring logs and records of the CPT soundings from the original exploration in Appendix I. The approximate locations of borings and CPTs from the original exploration are shown on Figure 2. Subsurface profiles for borings and CPTs referenced for these analyses are shown on Figure 3.

FIELD EXPLORATION

General

5. The supplemental exploration included drilling six undisturbed sample-type soil borings at the project site. Three borings, designated as Borings B-4 through B-6, were drilled to depths of approximately 150 feet each below the existing ground surface. Three additional borings, designated as B-7, B-8, and B-9, were initially washed without sampling to the approximate 80-ft depth and then samples were collected between 80 and 150 feet each below the existing ground surface. The borings were drilled between 14 February and 16 March 2024. The boring locations were selected by SEF as shown on Figure 2. Detailed descriptive logs of the borings are presented in both tabular and graphical form in Appendix II. Approximate GPS coordinates for each boring location were obtained with a handheld device and should be considered approximate. These coordinates are shown in terms of latitude and longitude on the boring logs Appendix II. Upon completion of field operations, the borings were grouted with cement-bentonite

grout mix and backfilled with soil in accordance with current regulatory requirements by the State of Louisiana.

Soil Borings

6. The undisturbed sample-type soil borings were drilled using a track-mounted rotary-type drill rig by Challenge Testing, Inc. Samples of cohesive or semi-cohesive subsoils were obtained at close intervals or changes in stratum using a 3-in. diameter by 30-in. long thinwall Shelby tube sampling barrel (ASTM D1587). The samples were extruded from the sampling barrel in the field, inspected, and visually classified by Eustis Engineering's soil technician. Pocket penetrometer tests were performed on the soil samples to give a general indication of their shear strength or consistency. The results of these tests are shown on the boring logs under the column heading "PP." Representative samples were then promptly placed in moisture-proof containers for transportation to our laboratory.

7. Samples of cohesionless and semi-cohesive materials were obtained during the performance of in-situ Standard Penetration Tests. These tests consist of driving a 2-in. diameter sampler 1 foot into the soil after first seating it 6 inches. A 140-lb weight dropped 30 inches is used to advance the sampler. The number of blows required to drive the sampler is indicative of the relative density of cohesionless soils and the consistency of cohesive soils. The samples were retained in moisture-proof containers for preservation of their natural moisture content. The results of the Standard Penetration Tests are shown on the boring logs under the column heading "SPT."

LABORATORY TESTS

8. Soil mechanics laboratory tests, consisting of natural water content, unit weight, unconfined compression shear (UC), and unconsolidated undrained triaxial compression shear (OB), were performed on selected samples obtained from the borings. In addition, Atterberg liquid limits (LL) and plastic limits (PL) tests as well as the test establishing the percent passing a U.S. Standard No. 200 mesh sieve (-#200) were performed on selected representative samples to aid in classification and determination of the relative strength and compressibility of the subsurface soils. The results of these laboratory tests are provided on the boring logs in Appendix II.

9. To further define compressibility characteristics and stress history of the subsoils we encountered, consolidation tests (CONS) were performed on select undisturbed cohesive samples. The results of these tests performed on samples obtained from the borings are included following the boring logs in Appendix II. A total of four tests were performed.

DESCRIPTION OF EXISTING SITE CONDITIONS

Site Observations

10. The project site is located approximately 1,200 feet north of the intersection of Westside Boulevard Extension and Enterprise Drive in Houma, Louisiana. During field operations, the site consisted of predominantly cleared pastures with intermittent drainage swales. The project area is bound to the north by a pond appearing to serve as a detention/drainage area for the development area.

Stratigraphy

11. Review of the boring logs indicates near-surface deposits at the boring locations included medium stiff to very stiff brown, gray and tan fat clay that extended approximately 6 to 9 feet below the existing ground surface. These clays were underlain by very soft to soft gray, tan, and brown fat clay that extended approximately 15 to 16 feet below the existing ground surface. Next in the stratigraphy, very loose to medium dense silty sand was encountered to approximately 25.5 to 30.5 feet below the ground surface. Below this sand, soft to medium stiff gray fat clay with isolated strata of medium stiff brown and gray organic clay; loose gray sandy silt and fine sand; and loose white shells were encountered to between 50 and 60 feet below the ground surface. Medium stiff to stiff gray clay continued to approximately 135 feet below the ground surface with strata of medium stiff black and brown organic clay and wood encountered between 120 and 125 feet below the ground surface. Below the 135-ft depth, medium dense fine sand and silty sand continued to the terminal depth of the supplemental exploration approximately 150 feet below the ground surface, becoming dense to very dense near the 140-ft depth. Our interpretation of the stratigraphy at each boring location is shown on the logs in Appendix II. A subsurface profile is shown on Figure 3.

Groundwater

12. To evaluate groundwater conditions at the time of the field exploration, observations were made in an auger boring drilled near Boring B-6. The auger boring was drilled without the addition of water or drilling fluids to depths where free water was initially encountered approximately 8 feet below the existing ground surface. After an observation period of 20 minutes, free water was observed in the borehole approximately

1.7 feet below the existing ground surface. Groundwater was initially observed during our original geotechnical exploration approximately 5 to 9 feet below the ground surface subsequently rising to approximately 4 feet after observation periods ranging from 15 minutes to 24 hours. The depth to groundwater will vary with climatic conditions, local drainage improvements, water levels in the nearby pond, onsite construction activities, and other factors. For this reason, the depth to groundwater should be determined by those persons responsible for construction immediately prior to beginning work.

ENGINEERING ASSESSMENT AND RECOMMENDATIONS

Furnished Information

13. We understand that major project features will include the proposed health and wellness center building, parking lot, and an exercising field. AQ Studios and SEF previously indicated the proposed building will be supported by deep foundations comprising either driven timber piles, augered cast-in-place piles (ACIP), or SPC piles. We understand the project design currently uses driven timber piles with a pile tip embedment 70 feet below the existing ground surface supporting a single pile compressive design load of 22.5 tons.

14. Based on furnished site plans, the proposed development will include a main building with adjacent parking areas and sidewalks. We understand a finished floor elevation (FFE) for the main building is to be el 9.0 (NAVD 88). Finished grades for the proposed parking areas will vary between el 5.0 and el 4.0. Existing grades vary across the site and are generally between el 1.0 and el 5.0. At the proposed building pad, existing grades vary between el 1.0 and el 3.5. We understand portions of the site were previously filled with miscellaneous fill materials. The thickness, timing, and composition of the previous site

filling are unknown, but the fluctuation of current grades do, in fact, reflect that prior filling. To achieve a FFE for the proposed building, approximately 5.5 to 8.0 feet of fill is necessary. Between 1.0 and 3.0 feet of additional fill is necessary for grading the parking areas.

15. SEF indicated via email on 27 September 2023 that the proposed building will be supported on deep foundations with a design tolerance for a post-construction settlement of approximately ¾ inch or less. We understand handicap accessible parking areas and American With Disabilities Act (ADA) ramps will be designed for the same tolerance. SEF indicated parking areas will be designed for an anticipated post-construction settlement of approximately ¾ inch during the anticipated 20-year design life of the pavements.

Foundation Recommendations

16. Based on the results our supplemental geotechnical exploration, highly compressible organic clay and wood deposits were encountered below the proposed pile tip embedment approximately 70 feet below the existing ground surface. We estimate residual settlements after the surcharge program, as previously described in our 13 October 2023 letter, will exceed the furnished settlement tolerances; thus, requiring alterations to the prior ground improvement program which we outlined in this letter.

17. To achieve the furnished settlement tolerances, we recommend settlement-sensitive structures (defined as anything requiring less than ¾ inch of total settlement) be supported on deep foundations with tips firmly embedded in the underlying sand deposits encountered approximately 135 to 140 feet below the existing ground surface.

The depth of wicks for the proposed surcharge program should also be extended to refusal within sand deposits approximately 135 to 140 feet below existing grades. Foundation and surcharge recommendations from our 11 March 2022 geotechnical report or 13 October 2023 supplemental letter, not addressed herein, remain valid.

18. The surcharge program should be monitored using geotechnical instrumentation (during construction and during the hold period) as described in our 13 October 2023 letter to validate actual rates and magnitudes of settlement as well as to estimate the degree of consolidation at the termination of the surcharge program prior to construction moving forward. Variations in the observed magnitudes and time-rates of settlement during such ground improvement surcharge programs should be anticipated due to previous site filling activities, differences in subsurface soils encountered, and potential ongoing consolidation settlement. ***Therefore, the estimated hold period durations and resulting residual settlements may change due to additional information gained during monitoring and interpretation of the geotechnical instruments read as part of the ground improvement surcharge program.***

19. The duration and efficacy of the proposed surcharge program is affected by drainage ditches provided during the surcharge hold period as well as after construction. Adequate surface and perimeter drainage must be maintained to collect and direct water from the surcharge program, and runoff from rainfall, away from the surcharge areas. Failure to maintain positive drainage may result in slower rates of consolidation, longer required hold periods, and/or additional residual post-construction settlement. The drainage ditches also serve as a conduit to remove water that rises to the surface from the consolidation process within the foundation soils settling beneath the building surcharge pad.

20. As stated, we recommend the proposed facility be supported on a deep foundation system comprising driven piles with tip embedments firmly embedded in the underlying dense to very dense sand strata encountered approximately 135 to 140 feet below the existing ground surface. All structural loads from the proposed structure (floors, walls, and columns) should be supported on piles having the same approximate tip embedment to minimize differential settlement. Pile caps should be structurally integrated with the floor slabs and grade beams, if utilized.

21. Differential settlement should be expected between the surcharged areas with wick drains, surcharged areas without wick drains, and areas not surcharged. This may be an issue for future grade-supported features such as driveways, sidewalks, ADA ramps, and/or utilities. The potential for this differential settlement should be considered during future development. Hinged connections or joints at driveways and utilities can be used to mitigate potential differential settlements near the edge of the proposed surcharge footprint. Consideration should be given to differential settlement between pile-supported structures and adjacent sidewalks, patios, parking areas/drive aisles, and other structures which are not pile-supported. It should be noted that even with the implementation of a surcharge program, the use of landscaping and hinged connections adjacent to the facility can help to mitigate the effects of differential settlement and increase the overall aesthetics of site development. However, long-term recurring maintenance of pavements and sidewalks should be anticipated especially where surface-supported features adjoin pile-supported features.

Earthen Preload/Surcharge Program

22. Building Pad Ground Improvement Surcharge Program. For the purposes of this report we define "preload" as placing fill to the necessary design grades while the term "surcharge" is the fill placement above the necessary design grades which is placed in an effort to load the foundation soils to a stress greater than the design grades.

23. We recommend the surcharge program include wicks installed with a 5-ft triangular spacing with top of wicks at el 4 and bottom of wicks installed to refusal within underlying sand deposits encountered approximately 135 to 140 feet below the existing ground surface. Sand fill must also be placed to el 10 and be held for a minimum of 6 months (or as directed by the geotechnical engineer based on instrumentation data). At the termination of the surcharge program, the sand fill should be removed to el 2 and replaced with lightweight aggregate (LWA) fill having a total unit weight not exceeding 70 pcf to the FFE at el 9.

24. We recommend the surcharge and wicks extend, in plan view, 10 feet beyond the proposed building dimensions or other structures sensitive to settlement in plan view. To reduce the potential for differential settlement between the building pad surcharge and adjacent pavement surcharge, we recommend a 5 horizontal to 1 vertical (5H:1V) side slope to transition from el 10 to the adjacent pavement surcharge. The building pad surcharge is recommended for any structures with FFE at el 9 or requiring a total settlement tolerance less than ¾ inch. The results of our analyses for the building pad surcharge are summarized below in Table 1.

25. Pavement Areas Surcharge Program. Furnished drawings indicate approximately 1 to 3 feet of fill will be required to achieve proposed grades for the pavement areas. Based on the results of our analyses, we recommend sand fill be placed 1 foot higher than the proposed finished grades during the surcharge program across the site. This surcharge should be held for at least 6 months prior to construction of the permanent paving. Upon the termination of the surcharge program, excess material should be removed to proposed grade. We do not estimate wick drains to be required for this surcharge. These recommendations are only valid for areas receiving less than 3 feet of fill above existing grade with an allowable residual settlement of ¾ inch after 20 years. The results of our analyses are summarized below in Table 1.

TABLE 1: SUMMARY OF RECOMMENDED SURCHARGE PROGRAMS

AREA	SURCHARGE HEIGHT ABOVE PROPOSED GRADE (FEET)	SURCHARGE STACK TOP ELEVATION (NAVD 88)	ESTIMATED MINIMUM DURATION OF SURCHARGE (MONTHS)[(1)]	TRIANGULAR WICK DRAIN SPACING (FEET)	ESTIMATED CONSOLIDATION SETTLEMENT DURING SURCHARGE (INCHES)
Building Pad	Varies[(2)]	el 10	6	5[(3)]	16 to 22
Parking Area	1	Varies	6	NONE	6 to 8

[(1)] The estimated minimum duration shown is based on theoretical predictions and estimates. The total duration will be as directed by the geotechnical engineer based on the geotechnical instrumentation and observation program.

[(2)] Assumes the surcharge will comprise sand fill to be removed and replaced with lightweight aggregate from el 2 to el 9 at the end of the surcharge program.

[(3)] Wicks to be installed from 135 to 140 feet below the ground surface with top of wick tied to horizontal wicks at el 4.

26. Residual Settlement. The surcharge programs presented in Table 1 were designed to reduce post-construction residual settlement due to the placement of fill to approximately ¾ inch after 20 years for the pavement areas, and less than ¾ inch for piles supporting the proposed building.

27. Other Considerations. Our estimates of settlement include consolidation settlement of foundation materials and do not consider settlement due to improper site preparation and drainage, poor fill compaction or quality, and non-uniform foundation conditions. Durations for the surcharges are estimated based on time-rate of settlement and should be confirmed by geotechnical instrumentation. Shorter durations may be considered depending on the results of settlement monitoring; however, longer durations may also be necessary, particularly if insufficient drainage is provided.

28. Recommendations regarding both vertical and horizontal wick specifications, site preparation (including drainage, fill composition, and compaction), and instrumentation provided in our 13 October 2023 letter remain valid and must be used in conjunction with the recommendations provided in this report.

29. Areal Subsidence. The project area is affected by ongoing areal subsidence that is the result of past filling, drawdown of groundwater levels due to drainage improvements, and biodegradation of near-surface organic soils subsequent to groundwater drawdown. The amount of future subsidence cannot be reliably estimated from information developed for this report. Subsidence is generally observed to be a relatively uniform ground surface settlement over large areas. However, ongoing areal subsidence can result in differential settlement of grade-supported structures and pavements. Additional settlement of pile-founded structures may also be observed. Areal subsidence can also result in differential settlement magnitudes between grade-supported and pile-supported structures that are larger than what would be estimated by consolidation settlement theory.

Deep Foundations

30. Estimates of Single Pile Allowable Load Capacity. Analyses were performed to estimate allowable single axial pile load capacity in compression and tension for various sizes and embedments of SPC piles at the request of SEF. We also provide estimates of allowable capacity for open-end steel pipe (OSP) piles as a potentially more cost effective solution. The pipe piles were not requested but are provided for your structural engineer's consideration. The results of these analyses are provided on Figures 4 and 5, respectively. Our estimates of allowable pile capacity at the site assume a cutoff at 2 feet below the ground surface for embedment within a pile cap or grade beam and that pile installation is vertical. Our capacity estimates are presented as depth below the existing ground surface at the time of the field exploration. Actual pile lengths should be determined based on the finished grade elevation. Installation criteria associated with our capacity assumptions are outlined subsequently.

31. Factors of Safety. The allowable single pile load capacity estimates presented on Figures 4 and 5 contain a factor of safety of 2.0. Use of a factor of safety of 2.0 assumes a static load test will be performed or existing, pertinent static load test data are available to verify allowable pile load capacity estimates. As an alternative, dynamic pile testing (DPT) may be performed to confirm the load capacity estimates for driven SPC piles or OSP piles. If neither static nor dynamic load testing is performed to verify our axial pile capacity estimates, the allowable capacity estimates on Figures 4 and 5 must be adjusted for a factor of safety of 3.0. A one-third increase in allowable axial load capacity can be used for temporary loads as allowed by applicable codes and appropriate testing.

32. Precast Concrete Piles. We recommend the precast concrete piles meet the requirements outlined in Section 805.09 of the Louisiana Standard Specifications for Roads and Bridges (LSSRB), 2016 edition. Precast concrete piles should be designed to have a strand prestress structurally sufficient to facilitate handling and driving the piles without damage. Our analyses are based on a solid, square pile. Alternative precast pile configurations (pipe, triangle, etc.) should be further evaluated. Voids within square concrete piles should not significantly affect the estimates of vertical capacity. The side dimensions assumed in our analyses are provided on Figure 4.

33. Open-End Steel Pipe Piles. We recommend the OSP piles meet the requirements outlined in Sections 804 and 1013.11 of the LSSRB. The steel piles should be designed to have wall thicknesses that are structurally sufficient to withstand handling and driving stresses. The pile dimensions assumed in our analyses are based primarily on the outside pile diameter. The actual wall thickness selected for the open-end pile will generally not affect our estimates of vertical capacity. However, if a closed-end pile is considered, Eustis Engineering should evaluate the effect on the capacity and driveability. The pile dimensions assumed in our analyses are provided on Figure 5.

34. Pile Weight. As indicated above, the pile capacity estimates we present on Figures 4 and 5 do not include the weight of the pile. When computing the resultant net compressive capacity of concrete piles, a net load of 45 pcf may be used for the weight of the concrete (weight of the concrete minus the weight of soil removed). The full buoyant weight of the concrete of 87 pcf may be used to determine the tensile capacity of the pile, provided the pile is designed to transmit these loads. Similar methods may be utilized for timber or steel piles.

35. Structural Capacity. The estimates of pile load capacity provided are based only on a soil-pile relationship. The structural capacity of the individual piles to transmit these loads, and any connections between the piles and the structure, should be determined by a structural engineer licensed in the State of Louisiana.

36. Pile Group Capacity. Piles firmly embedded in the medium dense to very dense sand deposits encountered approximately 135 feet below the ground surface will derive significant compressive capacity through end bearing; thus, it will not be necessary to consider group action. Piles not tipped in the medium dense to very dense sand deposits and all piles resisting tensile loads will derive the majority of their compressive and/or tensile capacity through skin friction. Thus, the supportive compressive and tensile value of the piles driven in groups should be investigated on the basis of group perimeter shear by the formula shown on Figure 6. For group effects on tensile capacities, the second term of the equation should be neglected.

37. Pile Group Spacing. The minimum center-to-center pile spacing within a row or group of SPC piles should be determined by the minimum spacing formula shown on Figure 7. These spacings are generally recommended for construction tolerances and do not ensure vertical or group effects will not govern the design. The minimum spacing between rows or groups of piles should also meet the requirements discussed below regarding settlement.

38. Estimated Single Pile Settlement Due to Structural Loads. We estimate single piles firmly embedded within the underlying medium dense to very dense sand deposits approximately 135 to 140 feet below the ground surface will settle approximately ¼ inch or less due to sustained structural loads. Piles not firmly embedded in sand deposits

below 135 feet, but having a minimum tip embedment of 60 feet below the existing ground surface, are estimated to experience settlement of up to ½ inch due to sustained structural loads. Piles having tip embedments between 30 and 60 feet below the existing ground surface are anticipated to settle approximately ½ to 1 inch. Eustis Engineering should be contacted to verify these settlement estimates once structure loadings, dimensions, and pile layouts are finalized. Note, piles installed in large groups and heavily loaded can result in settlements greater than that of a single pile. These estimates do not include elastic deformation of the piles which should be added to the settlement estimates. Elastic settlement of the piles may be estimated as 75% of the static column strain of a pile acting as a column. ***These estimates of settlement are only due to structural loads and are additive to settlement due to fill placement, as discussed subsequently.***

39. Our settlement estimates due to structural loads assume piles will be installed in small groups or widely spaced rows. We have assumed the largest group dimension will be no greater than 20% of the pile length, and the center-to-center spacing between groups will be no closer than twice the largest group dimension. We have assumed the center-to-center spacing between rows of single piles will be no closer than 8 feet or 9 pile diameters, whichever is greater. In the event any of our assumptions are not met, Eustis Engineering should be contacted to evaluate the potential settlement of the pile foundations.

40. <u>Effects of Fill Settlement on Pile Foundations.</u> As fill settles from consolidation of the underlying subsoils, negative skin friction (drag load) is induced on the piles as the soil settles along the piles. These drag loads can potentially increase settlement of friction piles. We estimate the impact on pile settlement due to fill placement will be negligible

for any of the structures if fill placement is limited to 1 foot or less. We performed analyses to estimate the downdrag settlement resulting from placement of 5.5 and 8.0 feet of fill (as indicated by the furnished site grading plans) beneath the proposed structure. With consideration for the proposed surcharge program, we estimate piles firmly embedded within the underlying sand deposits encountered approximately 135 to 140 feet will experience ¼ to ½ inch of drag settlement. Piles not firmly embedded in the underlying sand deposits but with pile tip embedments of at least 60 feet are anticipated to experience ¼ to ¾ inch of drag settlement. Piles having tip embedments approximately 30 to 60 feet below the ground surface are anticipated to experience approximately ¾ to 1½ inches of drag settlement due to the placement of the proposed building pad. These drag settlement estimates assume piles are installed after the proposed surcharge program.

41. Piles firmly embedded within the underlying sand deposits should also be evaluated for their structural adequacy for potential drag load. Estimates of additional loads on piles firmly embedded in sand deposits encountered approximately 135 to 140 feet below the ground surface are presented in Table 2. ***These loads should be added to the applied load at the pile butt and the total load should be used to evaluate internal stresses and the structural adequacy of the piles. However, the allowable capacity estimates shown on Figures 4 and 5 should not be reduced for these loads unless the structural adequacy of the piles is exceeded.***

TABLE 2: ESTIMATED COMPRESSIVE LOADS ON PILES FIRMLY EMBEDDED IN SAND DEPOSITS DUE TO FILL PLACEMENT

PILE TYPE	PILE SIZE (INCHES)	ESTIMATED ADDITIONAL COMPRESSIVE LOAD DUE TO PROPOSED FILL PLACEMENT (TONS)
Square, Precast Concrete	14	84
	18	108
	24	144
Open-End Steel Pipe	14	66
	18	85
	24	113

42. Downdrag settlement should be considered additive to settlement estimated for the piles due to structural loading. Drag loads are not anticipated for piles not firmly embedded in the underlying sand deposits. If more than 8 feet of fill is anticipated to be placed under the proposed structure, Eustis Engineering should be contacted to estimate the additional drag load settlement potential of the piles.

43. Utilities. We recommend flexible-type connections be specified for all piping and utilities going to and from the pile-supported structures. In addition, pipes and conduits beneath the pile-supported structures should be structurally supported by hangers attached to the structural floor slabs.

Installation of Driven Piles

44. Quality Control. All pile driving operations should be supervised by experienced personnel to ensure proper procedures are followed and accurate records are kept during all pile driving operations. The driving records should include the date, type of pile, pile

tip and butt diameters, depth and diameter of predrill, overall pile length, hammer make and model, driving energy, and number of blows per foot of penetration for the full embedment of the pile. An accurate driving record is especially important to verify piles are installed to the required tip embedment and to give an indication of any unusual driving characteristics which may include pile breakage. We recommend Eustis Engineering be retained to observe, record, and evaluate all pile driving operations with respect to the recommendations presented in this report.

45. Hammers. Generally, we recommend a single-acting air hammer be used to install concrete or steel piles. The manufacturer's rated energy required to drive the piles will depend on the piles' allowable compressive capacity. The estimated hammer energy versus allowable compressive capacity (factor of safety ≈ 2.0) for piles recommended in this report is provided in Table 3. For precast concrete piles, we also recommend the ram stroke be limited to 3 feet, and the ram weight be approximately one-half of the pile weight.

TABLE 3: RECOMMENDED SINGLE-ACTING AIR HAMMER DRIVING ENERGIES

ESTIMATES OF ALLOWABLE SINGLE PILE LOAD COMPRESSIVE CAPACITY ASSUMING FACTOR OF SAFETY ≈ 2.0 (TONS)	APPROXIMATE RATED SINGLE-ACTING HAMMER ENERGY (FT-LBS/BLOW)
Up to 60	19,500
60 to 120	24,000
120 to 180	32,500

46. For piles with allowable compressive capacity estimates in excess of 180 tons, we recommend pile driving equipment be selected using Wave Equation methods as described in Section 804 of the LSSRB. Selection of the driving equipment should also consider requirements for the testing program.

47. Alternative Hammers. A diesel or hydraulic hammer may also be used for the installation of concrete or steel piles. We recommend a diesel hammer have a rated energy of one and one-half times the energy recommended for a comparable installation with a single-acting air hammer. Similarly, a hydraulic hammer should have a rated energy that is equated to the air hammer based on efficiency. Other impact hammer types may also be suitable for pile impact installation. We recommend dynamic analyses be performed for hammer selection and approval if hammer type is not an air hammer. In addition, DPT should be conducted if a diesel hammer or other variable energy hydraulic hammer is proposed for installing concrete piles. This testing will reduce the risk of overstressing the piles which can occur during soft driving (i.e., excessive tensile stresses can develop when concrete piles advance rapidly through soft soils, particularly when driven by a diesel hammer).

48. Alternative Installation Methods. We do not recommend vibratory methods be utilized for pile installation. If a vibratory hammer is selected for the project, Eustis Engineering should be contacted to evaluate the reduction in the estimates of allowable pile load capacity presented on Figures 4 and 5. If any other alternative installation methods are selected, Eustis Engineering should be contacted to evaluate the impact on the capacity estimates.

49. Predrilling. Predrilling may be considered to minimize vibrations in close proximity of existing residences, to identify obstructions, or to penetrate near-surface miscellaneous fill soils or crusts. Shallow predrilling may be performed by dry auger methods to a maximum depth of 10 feet below grade. The predrill bit should be no larger than the pile width for shallow or deeper predrilling for concrete piles. Deeper predrilling may be required to penetrate the silty sand layers present within the borings and CPTs from the

approximate 15 to 30-ft depths. The need for predrilling should be fully evaluated during a test pile program by those parties responsible for pile installation. Predrilling at this depth, if required, should be by wet rotary methods. In all cases, piles should be embedded a minimum of 10 feet beyond the predrill depth.

50. Pile Installation Sequence. SPC and OSP piles are considered displacement piles because soil is displaced laterally when the piles are driven into the subsurface. These piles could cause adjacent piles to refuse at shallower depths or, more likely, could result in heaving of piles previously installed. For these reasons, we recommend pile driving take place from the center of large foundations working outward.

51. Dynamic Analyses. The SPC piles and OSP piles should be designed by a structural engineer to have a cross-section which is structurally sufficient to facilitate driving of the piles without damage. Wave Equation Analysis of Piles (WEAP), or dynamic analyses, can be performed to evaluate driving stresses, pile cushion, and driveability once the hammer and appurtenant equipment have been selected. Structural requirements can then be verified by a structural engineer and installation criteria can be established. Eustis Engineering recommends hammer approval by WEAP analyses in accordance with Section 804.05.02 of the LSSRB.

Test Piles and Load Tests

52. Eustis Engineering considers a test pile program and load test as an extension of our geotechnical exploration. Therefore, Eustis Engineering should be retained to perform these services. If driven piles are selected for support of the proposed structure, we recommend at least six probe piles be installed within the structure's footprint to assess

installation conditions. Note, we recommend probe piles be utilized to evaluate installation conditions regardless of whether static load testing is planned or not.

53. The probe piles should be the same type and embedment anticipated for the job piles and installed with the same equipment and techniques proposed for the job piles. Driven probe piles will provide definitive information regarding the anticipated driving resistance, vibrations from pile driving, sound levels during pile driving, and requirements for predrilling.

54. If the basis of design will be a factor of safety of 2.0 and existing, pertinent static load test data are not available, a static load test or test(s) must be performed. Eustis Engineering should evaluate existing load test data, if any, to determine relevance for the subject project. The driven probe pile with the lowest resistance to driving as indicated by penetration resistance values (blow counts) should be subjected to static load testing. We recommend test piles firmly embedded in sand deposits encountered approximately 135 feet below the ground surface be allowed to set for at least 7 days after the installation of the reaction system. Test piles at other tip embedments should be allowed to set for at least 14 days after the installation of the reaction system. The structural and geotechnical engineers of record should select the pile to be used for performance of the static load test. The test pile should then be load tested to failure in accordance with ASTM D1143, assuming the design is governed by compressive capacity. A lateral load test or tensile load test may be required depending on the final design. Results should be evaluated by Eustis Engineering to verify the estimates of pile load capacity presented in this report.

55. Dynamic Pile Tests. The initial installation of driven SPC or OSP test/probe piles and job piles may be monitored and evaluated using DPT with a Pile Driving Analyzer® (PDA). The performance of DPT may be used to evaluate actual driving stresses, penetration of resistance, and integrity and capacity of the test piles and/or job piles. The PDA can also monitor energy transferred to the pile from the hammer and evaluate installation efficiency. In order to evaluate pile capacity, "restrike" DPT should be performed at least 14 days after its initial installation. Shorter set times may be considered but the ultimate capacity of the pile may not be realized. In addition, an increased hammer energy may be required for the restrike DPT to fully mobilize the pile. Data from this restrike should be further evaluated by signal matching verification of the computed capacity at the time of testing by CAPWAP® analyses. Eustis Engineering is available to perform and evaluate the results of DPT and CAPWAP analyses. If a PDA is used as the sole means to evaluate capacity to establish allowable capacity estimates, the factor of safety should be increased from 2.0 to 2.5.

Vibrations

56. Pile driving, as well as other construction activities, has the potential to generate vibrations that may affect nearby structures, pavements, and underground utilities. Eustis Engineering recommends vibrations be monitored during the test pile program and subsequent construction activities of concern. In addition, vibration monitoring may be a requirement for certain features within 1,500 feet of the Mississippi River levee (MRL). Construction permits should be reviewed to determine if vibrations need to be monitored at the MRL. This monitoring should evaluate peak particle velocities during pile driving at critical structures with a seismograph, as well as other construction activities generating vibrations (hauling of fill, moving heavy equipment, etc.). The record of peak particle

velocities will provide information in assessing potential damage and the need for changes in construction operations.

57. Peak particle velocities (measured at a structure, pavement, or utility of concern) exceeding 0.50 in./sec may induce damage to the feature, particularly when this feature has been previously stressed by settlement or other movements. Peak particle velocities between 0.25 and 0.50 in./sec may be sensed as being detrimental by human perception. Peak particle velocities of 0.25 in./sec have been documented to cause densification of cohesionless materials, which may be present as fill near the site. Densification of these materials could result in settlement and subsequent damage to pavements, structures, or utilities founded in or above these materials. If sustained vibration levels of 0.25 in./sec are measured at a structure, pavement, or utility of concern, Eustis Engineering should be notified, the construction operations generating these vibrations terminated, and consideration given to altering these procedures.

GEOTECHNICAL SERVICES DURING CONSTRUCTION

58. To provide continuity among the exploration, design, and construction phases, Eustis Engineering should be retained to provide additional geotechnical and materials testing services. Geotechnical engineering services may include the review of the contract plans and specifications to evaluate their conformance to the recommendations contained in this report. We can also inspect and perform compaction and inplace density determinations on fill materials; inspect and log installations of test piles and job piles; perform and evaluate static or dynamic load tests; monitor vibrations; and test and inspect steel, asphalt, and concrete. Eustis Engineering can also perform any other soils

or materials testing services, which will provide quality control during construction and conformance to design specifications.

59. In summary, Eustis Engineering should be retained to monitor all geotechnical related work performed by the contractor. If construction problems arise, Eustis Engineering should be notified to participate in the development of solutions. This participation permits the geotechnical engineer to evaluate the effects of unanticipated conditions and propose solutions on the geotechnical design assumptions particular to the project. The design geotechnical engineer may also be able to judge how site-specific soil and groundwater conditions will affect the success of a proposed construction alternative.

LIMITATIONS

60. Eustis Engineering has provided engineering services in accordance with generally accepted geotechnical engineering practices in this locality at this time. No warranty or guarantee is expressed or implied.

61. Eustis Engineering has prepared this report in accordance with generally accepted geotechnical engineering practices for the exclusive use of TGMC for specific application to the subject site. In the event of any changes in the nature, design, or location of the proposed construction, the conclusions and recommendations contained in this report will not be considered valid unless the changes are reviewed, and the conclusions of this report are modified and verified in writing by Eustis Engineering. Should TGMC want to provide these data to be used by anyone other than TGMC, they shall seek written permission from Eustis Engineering, and the user must contact Eustis Engineering for

interpretation of data and to secure other information which may be pertinent to the project.

62. The analyses and recommendations contained in this report are based, in part, on data obtained from soil borings, laboratory testing, and CPTs performed for the subject project. The boring logs and CPT records are considered representative of subsurface conditions at the boring/CPT locations on the dates completed. No warranty is given that the boring logs or CPT records are representative of subsurface conditions at other locations or times. The nature and extent of variations in subsurface conditions, between and away from the boring/CPT locations, may not become evident until construction. If such variations appear, it will be necessary to reevaluate the recommendations contained in this report.

63. Recommendations and conclusions contained within this report are to some degree subjective having partial basis in engineering judgement and experience particular to the design engineer. For this reason, this report should not be included in its entirety in the contract plans and specifications without addressing the limitations of its use. However, the results of the soil borings, laboratory tests, and CPTs contained in Appendices I and II of this report may be included in the plans and specifications. The construction contractor is obliged to make an independent interpretation of subsurface conditions at the site and their potential impact on means and methods used to achieve the plans and specifications.

64. This report is issued with the understanding that the owner or the owner's representative has the responsibility to bring the information and recommendations contained herein to the attention of the project engineer to ensure they are incorporated into the plans and

specifications for the project. The owner or the owner's representative also has the responsibility to take the necessary steps to confirm the general contractor and all subcontractors follow such recommendations. It is further understood the owner or the owner's representative is responsible for submittal of this report to the appropriate governing agencies.

65. Eustis Engineering should be provided the opportunity for a general review of the design plans and specifications in order that earthwork and foundation recommendations may be properly interpreted and implemented in the design and specifications. If Eustis Engineering is not accorded the privilege of making this recommended review, we can assume no responsibility for misinterpretation of or failure to implement our recommendations.

66. The scope of our service does not include an environmental assessment or an investigation for the presence or absence of wetlands and hazardous or toxic materials in the soil; surface water; groundwater; or air on, below, or adjacent to the subject property. Furthermore, the scope of service does not include the investigation or detection of biological pollutants at the site. The term "biological pollutants" includes, but is not limited to, molds, fungi, spores, bacteria, viruses, and the byproducts of any such biological organisms.

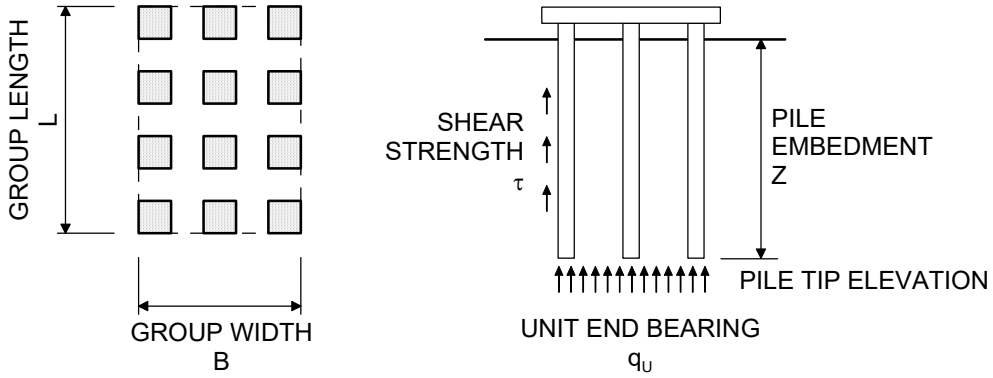
Load Capacity of Rows or Groups of Piles



PLAN VIEW **ELEVATION VIEW**

The capacity of a row or group of piles may be equal to or less than the sum of the individual load capacities of piles within the group. The pile row or group may be considered a single equivalent pier, in which case the row or group capacity may be investigated using the following formula.

$$P_{GROUP} = \frac{(2L+2B)(\tau)(z)}{FS_{SIDE}} + \frac{(B)(L)(q_U)}{FS_{BASE}}$$

Where:

B	=	The width of the pile group in plan dimension.
L	=	The length of the pile group in plan dimension.
Z	=	The embedded pile length.
τ	=	The average unit shear strength acting on the embedded pile length.
q_U	=	The ultimate unit end-bearing pressure appropriate for the pile group.
FS_{SIDE}	=	A factor of safety against mobilization of the ultimate skin friction, typically 2.
FS_{BASE}	=	A factor of safety against mobilization of the ultimate end bearing, usually at least 3.

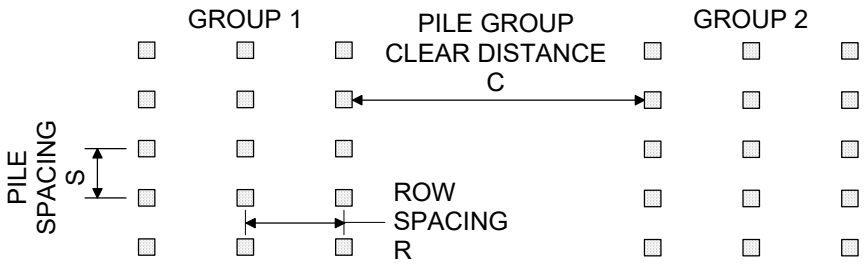
Notes:

(1) The average unit shear strength acting on the embedded pile length may be taken as the weighted average value of undrained shear strength (or undrained cohesion) acting over that length for assessments of the short term load capacity of the group.

(2) For assessments of the short term load capacity of the group, the ultimate end bearing is commonly estimated by multiplying an undrained shear strength (or undrained cohesion) by a bearing capacity factor, which typically varies between 5 and 6. The appropriate undrained shear strength and bearing capacity factor should consider the width and length of the pile group and the presence of any weak strata beneath the pile tips. In general, the unit end bearing pressure applicable to the pile group is not the same as the unit end bearing pressure used to estimate the load capacity of a single pile.

(3) The factor of safety against base failure should consider that large deformations may be required to mobilize the ultimate end bearing soil pressure estimated for the pile group.

Spacing of Pile Groups and Spacing of Piles Within Rows or Groups



Piles should be arranged to provide a minimum center-to-center spacing, S, within rows or groups. This minimum recommended spacing may be taken as the largest value from the following criteria:

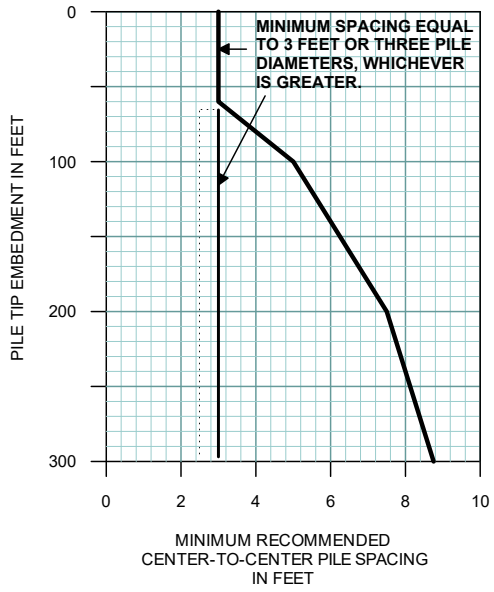
$$S = \frac{L_1}{20} + \frac{L_2}{40} + \frac{L_3}{80} \text{ ,or}$$

$$S = 3B \text{,or}$$

$$S = 3 \text{ feet}$$

where S = Center-to-center pile spacing, as illustrated above,
L_1 = Pile embedment up to 100 feet,
L_2 = Pile embedment between 100 and 200 feet,
L_3 = Pile embedment between 200 and 300 feet, and
B = Pile outside diameter or side dimension

These criteria can be presented graphically as follows:



In addition, rows of single piles should provide a minimum center-to-center spacing, R, that is at least as large as the center-to-center pile spacing, S. Finally, individual pile groups should be arranged to provide a clear group spacing, C, equal to twice the largest dimension of the larger pile group. It should be noted that pile spacings greater than the minimum values presented above may be required to minimize the influence of individual piles on each other with respect to lateral load resistance and settlement or to ensure pile group capacity is adequate when investigated for group perimeter shear.

APPENDIX I

EUSTIS ENGINEERING SINCE 1946

LEGEND AND NOTES FOR LOG OF BORING AND TEST RESULTS

PP Pocket penetrometer: Resistance in tons per square foot

SPT Standard Penetration Test: Number of blows of a 140-lb hammer dropped 30 inches required to drive 2-in. O.D., 1.4-in. I.D. sampler a distance of 1 foot into the soil after first seating it 6 inches. Values shown have not been corrected.

SPLR Type of Sampling  Shelby, SPT, Auger, Vibracore, Geoprobe, No sample

SYMBOL Clay, Silt, Sand, Peat/Humus, Shells, Stone/Gravel

Predominant type shown heavy; modifying type shown light

USC Unified Soil Classification

DENSITY Unit weight in pounds per cubic foot

SHEAR TESTS

TYPE

- UC Unconfined compression shear
- OB Unconsolidated undrained triaxial compression shear on one specimen confined at the approximate overburden pressure
- UU Unconsolidated undrained triaxial compression shear
- ϕ Angle of internal friction in degrees
- c Cohesion in pounds per square foot

ATTERBERG LIMITS

- LL Liquid Limit
- PL Plastic Limit
- PI Plasticity Index

OTHER TESTS

- CON Consolidation
- -#200 Percent passing a U.S. No. 200 sieve
- SV Particle size distribution (sieve only)
- PD Particle size distribution (sieve and hydrometer)
- k Coefficient of permeability in centimeters per second
- SP Swelling pressure in pounds per square foot

Other laboratory test results reported on separate figures

GENERAL NOTES

(1) If a ground water depth is shown on the boring log, these observations were made at the time of drilling and were measured below the existing ground surface. These observations are shown on the boring logs. However, ground water levels may vary due to seasonal fluctuations and other factors. If important to construction, the depth to ground water should be determined by those persons responsible for construction immediately prior to beginning work.

(2) While the individual logs of borings are considered to be representative of subsurface conditions at their respective locations on the dates shown, it is not warranted that they are representative of subsurface conditions at other locations and times.

CPT Correlations

References are next to the appropriate equation.

General

p_a=atmospheric pressure (for unit normalization)
q_t=corrected cone tip resistance (tsf)
f_s=friction sleeve resistance (tsf)
$R_f = 100\% \cdot (f_s/q_t)$
u_2=pore pressure behind cone tip (tsf)
u_0=hydrostatic pressure

$B_q = (u_2-u_0)/(q_t-\sigma_{vo})$
$Q_t=(q_t-\sigma_{vo})/\sigma'_{vo}$
$F_r=100\% \cdot f_s/(q_t-\sigma_{vo})$
$I_c = ((3.47-\log Q_t)^2 + (\log F_r+1.22)^2)^{0.5}$ 2
$I_{SBT} = ((3.47-\log(q_c/p_a))^2+(\log F_r+1.22)^2)^{0.5}$ 23
$I_{c\ J\&D} = \sqrt{\{3-\log(Q_t\cdot(1-B_q)\}^2 + [1.5+1.3\cdot\log(F_r)]^2}$ 27
$I_{c\ J\&B} = \sqrt{\{3-\log(Q_t\cdot(1-B_q)+1\}^2 + [1.5+1.3\cdot\log(F_r)]^2}$ 28

K_o

K_0 (1) $K_o = (1-\sin\varphi)OCR^{\sin\varphi}$
K_0 (2) $K_o = 0.1(Q_t)$ 1

Stress History

$OCR = \sigma_p'/\sigma'_{vo}$
OCR (1) $\sigma_p' = 0.33(q_t - \sigma_{vo})$ - clays 8
OCR (2) $\sigma_p' = 0.53(u_2 - u_o)$ - clays 9
OCR (3) $\sigma_p' = 0.60(q_t - u_2)$ - clays 9
OCR (4) $OCR = 0.25\ Q_t^{1.25}$ – clays 37
OCR (5) $OCR = \left[\frac{0.192*(q_t/p_a)^{0.22}}{(1-\sin(\phi')\cdot(\sigma'_{v0}/p_a{}^{0.31})}\right]^{\frac{1}{\sin(\phi'-0.27)}}$ – sands 35
OCR (6) $\sigma_p' = .101\cdot p_a{}^{0.102}\cdot G_{max}{}^{0.478}\cdot\sigma'_{v0}{}^{0.420}$ – all soils 36

N-Value

$N_{60} = (q_t/p_a)/[8.5(1-I_c/4.6)]$ 6

Undrained Shear Strength

S_u (1) $S_u = (u_2 - u_o)/N_u$ where $7 \le N_u \le 9$ 10
S_u (2) $S_u = (q_t - \sigma_{vo})/N_{kT}$ where $15 \le N_{kT} \le 20$ 11
S_u (3) $S_u = 0.091 * ((\sigma'_{vo}{}^{0.2}) * (q_t - \sigma_{vo})^{0.8}$ 21
S_u (4) $S_u = (q_c - \sigma_{vo})/N_k$ where $15 \le N_k \le 20$ 11
S_u (5) $S_u = q_t/N_c$ where $XXX \le N_c \le YYY$
S_u (6) $S_u = q_c/N_c$ where $XXX \le N_c \le YYY$

Effective Cohesion

$c' = 0.02 * \sigma_p'$ 38

Drained Friction Angle

φ' (1) $\varphi' = 17.6 + 11.0\text{Log}[q_t/(\sigma_{vo}')^{0.5}]$ 1

φ' (2) $\varphi' = \arctan[0.1 + 0.38\text{Log}(q_t/\sigma_{vo}')]$ 13

φ' (3) $\varphi' = 30.8\text{Log}[(f_s/\sigma_{vo}')+1.26]$ (for clays or sands) 14

φ' (4) $\varphi' = 29.5\ B_q^{0.121}\ (0.256 + 0.33\ B_q + \text{Log}(Q_t))$ 24

Unit Weight

$\rho = \gamma/\gamma_w$

$\rho = 0.8\text{Log}(V_s)$ V_s in m/sec 17

Relative Density and Void Ratio

D_R (1) $D_R = 100(q_{c1}/305)^{1/2}$ where, $q_{c1} = q_c/(\sigma_{vo}')^{1/2}$ 1

D_R (2) $D_R = -1.292 + 0.268\ln(q_c \cdot (\sigma_{vo}'^{-0.5}))$ 18

D_R (3) $D_R = (1/2.41)\cdot\ln(q_{c1}/15.7)$ 3

D_R (4) $D_R = 1/2.91 * \ln((q_c/(61* \sigma'^{0.71}_{vo}))*100$ 20

D_R (5) $D_R = 100*(0.268*\ln((q_t/p_a)/(\sigma'_{vo}/p_a)^{0.5}) - 0.675)$ 34

$e_o = 1.099 - 0.204\log(q_{c1})$ 1

$E_D = 5\ q_t$ $I_D = 2.0 - 0.14(R_f)$ $K_D = E_D/(34.7\cdot I_D\cdot \sigma_{vo}')$

Compressibility

M (1) = $R_m\ E_D$ where R_m= function(I_D, K_D) see the following table 22

$I_D <= 0.6$	$R_M = 0.14 + 2.36 \log K_D$
$I_D >= 3$	$R_M = 0.5 + 2 \log K_D$
$0.6 < I_D < 3$	$R_M = R_{M,D} + (2.5 - R_{M,D})\log K_D$
	$R_{M,D} = 0.14 + 0.15(I_D - 0.6)$
$K_D > 10$	$R_M = 0.32 + 2.18 \log K_D$
$R_M < 0.85$	$R_M = 0.85$

M (2) $M = q_c\cdot 10^{(1.09-0.0075D}R^{)}$ *sands* 1

M (3) $M = 8.25\ (q_t - \sigma_{vo})$ *clays* 1

M (4) $M = \alpha \cdot G_{max}\ where\ 0.02 < \alpha < 2$ and $G_{max}\ is\ from\ Vs$ 33

Rigidity Index

$I_R = exp\left[\left(\frac{1.5}{M} + 2.925\right)\cdot\left(\frac{q_t-\sigma_{vo}}{q_t-u_2}\right) - 2.925\right]$ where $M = 6\sin\emptyset'/(3-\sin\emptyset')$ 39

Sensitivity

S_t (1) $S_t = 7.5/R_f$ 2

S_t (2) $S_t = (q_t - \sigma_{vo})/(15\cdot f_s)$ 2

Fines Content

$FC = [(3.58-\log(q_t))^2+(1.43+\log(R_f))^2]^{1.8}$ 4

$FC = [5.31(I_{cfs})^{2.31}]+9.61$, where $I_{cfs} = [(1.95-\text{Log}Q_t)^2+(\log F_r+1.78)^2]^{0.5}$

Shear Wave Velocity

$V_s(1) = 277 \cdot q_t^{0.13} \cdot {\sigma'_{vo}}^{0.27}$ (sands) - m/s and MPa 29

$V_s(2) = 1.75 \cdot q_t^{0.627}$ (clays) - m/s and kPa 30

$V_s(3) = (10.1 \cdot \log q_t - 11.4)^{1.67} \cdot (\frac{f_s}{q_t} \cdot 100)^{0.3}$ (all soils) – m/s and kPa 31

$V_s(4) = 118.8 \cdot \log f_s + 18.5$ (all soils) – m/s and kPa 32

$G_{max} = \rho V_s^2$

Hydraulic Conductivity

Lookup based on SBT and SBTn (1986 and 1990) 40

APPENDIX II

EUSTIS ENGINEERING SINCE 1946

LEGEND AND NOTES FOR LOG OF BORING AND TEST RESULTS

PP Pocket penetrometer: Resistance in tons per square foot

SPT Standard Penetration Test: Number of blows of a 140-lb hammer dropped 30 inches required to drive 2-in. O.D., 1.4-in. I.D. sampler a distance of 1 foot into the soil after first seating it 6 inches. Values shown have not been corrected.

SPLR Type of Sampling  Shelby, SPT, Auger, Vibracore, Geoprobe, No sample

SYMBOL Clay, Silt, Sand, Peat/Humus, Shells, Stone/Gravel

Predominant type shown heavy; modifying type shown light

USC Unified Soil Classification

DENSITY Unit weight in pounds per cubic foot

SHEAR TESTS

TYPE

- UC Unconfined compression shear
- OB Unconsolidated undrained triaxial compression shear on one specimen confined at the approximate overburden pressure
- UU Unconsolidated undrained triaxial compression shear
- ϕ Angle of internal friction in degrees
- c Cohesion in pounds per square foot

ATTERBERG LIMITS

- LL Liquid Limit
- PL Plastic Limit
- PI Plasticity Index

OTHER TESTS

- CON Consolidation
- -#200 Percent passing a U.S. No. 200 sieve
- SV Particle size distribution (sieve only)
- PD Particle size distribution (sieve and hydrometer)
- k Coefficient of permeability in centimeters per second
- SP Swelling pressure in pounds per square foot

Other laboratory test results reported on separate figures

GENERAL NOTES

(1) If a ground water depth is shown on the boring log, these observations were made at the time of drilling and were measured below the existing ground surface. These observations are shown on the boring logs. However, ground water levels may vary due to seasonal fluctuations and other factors. If important to construction, the depth to ground water should be determined by those persons responsible for construction immediately prior to beginning work.

(2) While the individual logs of borings are considered to be representative of subsurface conditions at their respective locations on the dates shown, it is not warranted that they are representative of subsurface conditions at other locations and times.

APPROXIMATE FILL HEIGHT ELEVATION IN FEET

20 15 10 5 0

NOTES:

1. SETTLEMENT PLATE SP-1 WAS INSTALLED AND INITIALIZED ON 27 FEBRUARY 2025.

2. SETTLEMENT PLATES (SP-2 THROUGH SP-9 AND SP-18) WERE INSTALLED BETWEEN 20 MARCH AND 24 MARCH 2025. ALL PLATES WERE INITIALIZED BY 25 MARCH 2025.

3. APPROXIMATE FILL HEIGHT IS DETERMINED BY A GROUND SURFACE ELEVATION SHOT TAKEN NEAR SP-2 DURING OUR FIELD VISITS TIED TO PROJECT DATUM. FILL HEIGHT MONITORING WAS INITIALIZED ON 25 MARCH 2025.

Ladies and Gentlemen:

Geotechnical Exploration
Instrumentation Installation Report
Terrebonne General Medical Center
Surcharge Monitoring Program
Proposed Health and Wellness Center
Houma, Louisiana
Eustis Engineering Project No. 24717.03

Eustis Engineering L.L.C. has prepared this letter report to document the geotechnical instrumentation that has been installed to monitor the earthen surcharge/preload program being performed for the Terrebonne General Medical Center's (TGMC's) new Health and Wellness Center in Houma, Louisiana. This work was performed in general accordance with the scope of service outlined in Eustis Engineering's proposal, dated 2 August 2024.

Background

The project site includes an earthen surcharge program being performed for the proposed building along with a preload program for proposed parking areas. The construction areas were cleared, stripped, and leveled to near el 4 (NAVD 88) by Beverly Construction Company, L.L.C., (Beverly) prior to Eustis Engineering mobilizing to the project site. DGI-Menard Inc. (Menard) installed prefabricated vertical ("wick") drains and horizontal strip drains. Once installed, Beverly covered the wick and horizontal strip drains with approximately 6 inches of structural fill. Eustis Engineering mobilized to the site to begin our instrument installations on 27 February 2025 as Menard was nearing completion of their installations.

Scope of Service

Our scope of service includes installation and monitoring of seven vibrating wire piezometer "nests" to monitor pore pressures in the foundation soils below the proposed surcharges. A "nest" is a group of piezometers installed at one location with piezometers positioned at various depths within the subsurface. Additionally, our scope includes fabrication, installation, and monitoring of 19 settlement plates, designated as SP-1 through SP-19, with 5 to 10 feet of riser pipes extending above the surface. Finally, our scope of service includes providing one installation report and ongoing monitoring of the instrumentation.

Instrumentation Installation Procedures

Vibrating Wire Piezometers. Between 27 February and 25 March 2025, Eustis Engineering drilled seven 4-in. diameter boreholes at the TGMC project site. The boreholes were advanced to approximately 105 feet below the existing ground surface (B.E.G.S.). Piezometers were installed to approximate depths of 10', 40', 80', and 100' B.E.G.S. Approximate locations of each piezometer nest installation are shown on the Enclosure and are denoted as P-1 to P-7.

VIBRATING WIRE PIEZOMETERS DETAILS

INSTRUMENT IDENTIFICATION	TOTAL DEPTH DRILLED (B.E.G.S.) IN FEET
P-1	105
P-2	105
P-3	105
P-4	105
P-5	105
P-6	105
P-7	105

All piezometers were drilled using mud-rotary techniques with our track-mounted drill rig. Four piezometers were "nested" together within the boreholes affixed to a 0.75-in. PVC tremie grout pipe, per the manufacturer's recommendations. The piezometers were installed with the piezometer's screen/filter pointing upward at the appropriate depths. The piezometers and signal cables were secured to the PVC tremie pipe bound together with tape.

Prior to grouting the boreholes, a representative of Eustis Engineering measured the grout/mud weight of a Portland Cement Concrete (PCC) and bentonite gel mixture. The PCC and bentonite gel grout mix was then tremied into the boreholes through the PVC grout pipe before extracting the surface casing. The piezometers are permanently held into position by the PVC grout pipe which remains in place to ensure correct piezometer placement. Once the piezometers were grouted in place, the PVC grout pipe was cut at the anticipated ground surface. Refer to

Appendix I for the piezometer installation data sheets, Appendix II for information on grouting procedures, and Appendix III for calibration certificates for all piezometers.

During installation of the piezometer nests, drilling fluid circulation was lost in an apparent shell layer near the 50 to 55-ft. depth at the P-5 location. Three attempts at the originally proposed location were undertaken before moving the piezometer nest adjacent to SP-9 for successful installation.

Settlement Plates

Settlement plates are surficial monuments used to measure settlement over time at the project site. Approximate locations of each settlement plate are shown on the Enclosure and are denoted as SP-1 to SP-19. Eustis Engineering installed 19 settlement plates comprising a 2' x 2' x 0.25" steel plate with 2-in. couplings welded to the base of the plate, and 5-ft riser pipes attached to extend above the surface. On 27 February 2025, SP-1 and SP-10 through SP-16 were installed and initial elevations were recorded. On 13 March 2025, SP-17 and SP-19 were installed and initial elevations were recorded. Between 20 and 24 March 2025, SP-2 through SP-9 and SP-18 were installed and initial elevations were recorded on 25 March 2025.

The parking lot was constructed to el 6. SP-1, SP-10 through SP-17, and SP-19 were installed approximately 1-ft. B.E.G.S. within the parking lot surcharge area. This area is not receiving any additional fill placement, so only one 5-ft. riser pipe has been affixed to the steel plate. SP-2 through SP-9 and SP-18 are located within the building footprint surcharge area. This area is receiving fill placement, requiring two 5-ft. riser pipes affixed to the steel plates to extend above the ground surface. All riser pipes were marked at 1-ft. intervals to assist in observing the progress of fill placement.

On 22 March 2025, SP-17 was observed to be damaged by a likely vehicle impact and a replacement plate was installed on 24 March 2025. On 1 April 2025, SP-11 was also observed damaged and has been abandoned. Each settlement plate will be surveyed weekly by a representative of Eustis Engineering for up to one month after the completion of fill placement and bi-weekly until the end of the 6-month hold period. Refer to Appendix I for the settlement plate installation data sheets for additional information.

Data Loggers

The 4-channel V-Logger data loggers are supported on 2-in. riser pipes of the settlement plate adjacent to each piezometer nest. The signal cables of each piezometer nest are connected by the manufacturer's instructions and in sequence to each instrument nest. Data loggers will record readings on an hourly interval during surcharge monitoring. A representative of Eustis Engineering will manually download data from the data loggers once a week during monitoring and once every two weeks during the hold period. Refer to Appendix III for calibration certificates for all data loggers.

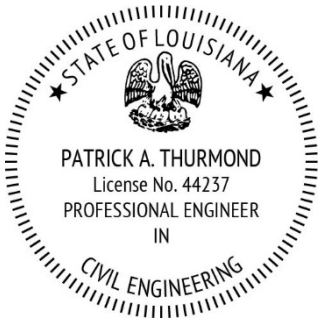
Closing

Thank you for asking us to perform these services. If you have any questions, please do not hesitate to contact us.

Yours very truly,

EUSTIS ENGINEERING L.L.C.

PATRICK A. THURMOND, P.E.



A.E. Russell:rmw/ssp

Cement-Bentonite Grout Backfill for Borehole Instruments

P. Erik Mikkelsen

The backfill for a borehole instrument is often an item that receives a disproportionate lack of attention. The behavior of the backfill, the material that is in the most intimate contact with both the formation and the instrument, is critical for obtaining correct measurements. In many situations, instrument observations may just reflect unstable backfill, lack of backfill or backfill that is too stiff or too soft. Sand, gravel and various bentonite products have proven to be both too difficult to place and often entirely inappropriate. Experience has shown the author that cement-bentonite grout is the most universally applicable material for successfully backfilling a borehole instrument. Single-component bentonite grouts have been used in related industries a long time, and have been adopted for borehole instrumentation with mixed success. Their uses are more involved and, as explained below, should be avoided. The use of fly ash as a substitute for cement promises to be a good way for reducing grout stiffness when required.

Current Use of Bentonite

Materials and Technology

Although this article advocates the use of cement-bentonite grout it is appropriate to review current bentonite backfill and sealing products to illustrate why their use should be limited. To the uninitiated, there is a confusing array of various pellets, chips, granulated and powder-forms of sodium bentonite commercially available in North America and elsewhere. Calcium type montmorillonite and opalite are also used. The proper use of these products is a mature and complex technology employed by the environmental, water-well and petroleum industries. Basic research has been done and their properties are known. For example, Baroid Industrial Products (1994), a manufacturer of about two-dozen drilling-products gives a five-day workshop in Houston, Texas including a hands-on laboratory day. Here, the user learns about the difference between drilling muds and bentonite used for sealing (single-component grouts) and how to place the materials. However, drillers and geo-professionals who install piezometers and other borehole instruments for the geotechnical industry generally do not have this background and often have limited understanding of bentonite products outside of powder used to make mud and dropping chips down the hole. Going "high-tech" requires more knowledge, better equipment, and a higher level of quality control, which appears to be unrealistic for borehole instrumentation.

Solid Bentonite Seals

Installation of bentonite balls, pellets or chips as seals above a sand pocket have dominated piezometer installation procedures over the last 50 years. It is classic procedure for open standpipe piezometers. Installation is usually very time consuming, particularly on deeper boreholes or when caving occurs. When you manage to get such seals installed without bridging the hole, there is usually no question about their permeability being adequately low. These seals have a very low permeability, often lower than many in-situ clays. Establishment of proper procedures for placement of such materials has been important not only because sealing is important, but also because the installation conditions are often difficult and the procedures cumbersome. Many installations end up less than satisfactory. Over the last decade, experience has shown that bentonite chips (as opposed to balls and pellets) are the easiest to place. These chips look like crushed gravel and hydrate very slowly. However, the fine clay-dust unavoidably mixed in with the chips can make conditions increasingly sticky as filling proceeds, leading to bridging and blockage higher in the borehole. For relatively simple installations where the seal heights and volumes are not too extensive, this material usually does not bridge and is often the seal of choice for environmental observation wells and open standpipe piezometers.

Pellets, chips and polymer-suspended granules can also be tremied to the desired location in the boring. The potential for clogging is always a hazard, but at least a clogged tremie-pipe can be withdrawn and discarded. If clogging or bridging occurs while dropping the ma-

terials directly into the borehole, there is no recourse except to start over.

Bentonite Grouts

These products are the least desirable for sealing or backfilling. They are made from water and powdered bentonite mixed into slurry-like drilling mud, but to a higher density with the aid of additives and specialized grout mixing units. The higher the bentonite solids-content is, the lower the permeability is. The water-content of such slurry is extremely high and it never really sets up to anything more than thick paste, not a solid like the chip-seals. A number of bentonite sealing grouts are available, but none appear to set up to a solid form. They are sensitive to over-mixing (leading to a flash set) and can be difficult to pump down the small diameter grout pipes (3/4 inch) often used for piezometers and other geotechnical borehole instruments where space is at a premium. Their working time tends to be too short, and mix dilution to circumvent mixing and pumping problems will lead to a permanently soupy backfill.

Cement-Bentonite Grouts

Basics

A bentonite grout backfill consisting of just bentonite and water may not be volumetrically stable and introduces uncertainty about locally introduced pore water pressures caused by the hydration process. Introducing cement, even a small amount, reduces the expansive properties of the bentonite component once the cement-bentonite grout takes an initial set. The strength of the set grout can be designed to be similar to the surrounding ground by controlling the cement content and adjusting the mix proportions. Controlling the compressibility (modulus) and the permeability is not so easy. Weaker cementitious grouts tend to remain much stiffer than normally consolidated clays of similar strengths. The bentonite solids content has the greatest influence on the permeability of cement-bentonite grout, not the cement content.

Cement-bentonite grouts are easier to use than bentonite grouts, provide a long working time before set and are more forgiving should the user deviate from the design recipe or mixing equipment and method. It is easier to adjust the grout mix for variations in temperature, pH and cleanliness of the water. Pure bentonite grouts must be mixed and deployed by strictly following measured quantities and procedures that are not common practice among drillers doing test borings.

Strength and Deformation

The general rule for grouting any kind of instrument in a borehole is to mimic the strength and deformation characteristics of the surrounding soil rather than the permeability. However, while it is feasible to match strengths, it is unfeasible with the same mix design to match the deformation modulus of cement-bentonite to that of a clay for example. The practical thing to do is to approximate the strength and minimize the area of the grouted annulus. In this way the grout column would only contribute a weak force in the situation where it might be an issue.

Strength data collected informally from various sources by the author over the years are summarized in Figure 1. A trend line drawn through the data points illustrates the decrease in strength with increasing water-cement ratio. The water-cement ratio controls the strength of the set grout (Marsland, 1973). Marsland's rule-of-thumb is to make the 7-day strength of the grout to match one quarter that of the surrounding soil.

Water and cement in proportions greater than about 0.7 to1.0 by weight will segregate without the addition of bentonite or some other type of filler material (clay or lime) to suspend the cement uniformly. In all cases sufficient filler is added to suspend the cement and to provide a thick-creamy-but-pumpable grout consistency. The bentonite does not add significant strength to the grout. The background data for Figure 1 also suggests the amount and type of bentonite or hydrated lime does not influence strength as long as the grout is non-bleeding and pumpable. If the grout bleeds the water-cement ratio decreases and strength increases. If fly ash were to be used as a substitute for cement the strength and modulus would be expected to drop. Fly ash contains less cementing agents (calcium and gypsum).

Grout Permeability

Permeability of the grout is mainly an issue that is limited to piezometer installations, and is the subject of a paper to be published in the near future. It is general practice to grout the borehole above a bentonite seal placed above the piezometer "intake zone" (sand that surrounds the piezometer), but the pa-

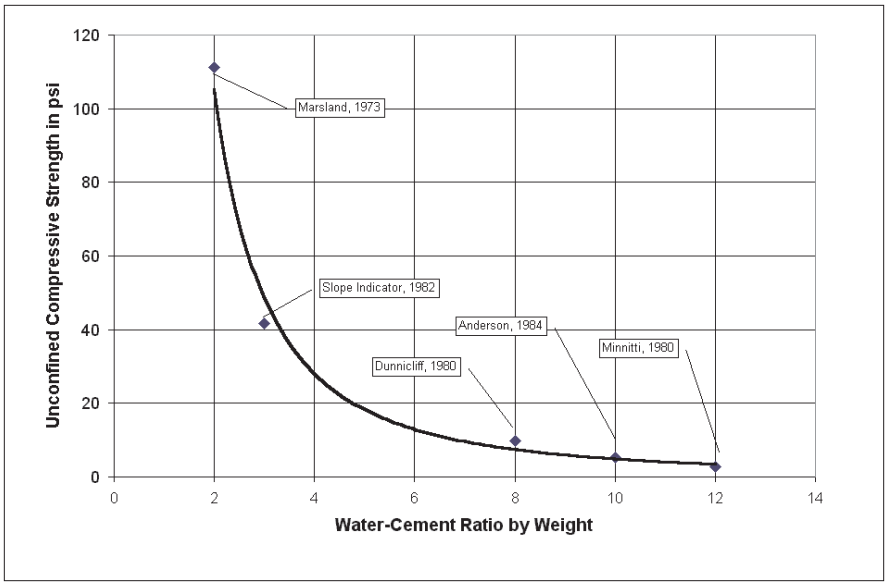

Figure 1. 28-day cement-bentonite grout strength vs. water-cement ratio. Data from author's personal files.

Table 1. Permeability, k, of some grouts			
Grout Type	**Characteristics**	**k (cm/sec)**	**Source**
Neat cement	w/c ratio = 0.89 to 0.53	10^{-5} to 10^{-7}	Baroid
Bentonite chips	hydrated	10^{-8}	Baroid
Bentonite slurry	6 % solids	10^{-5}	Baroid
Bentonite slurry	20 % solids	10^{-8}	Baroid
Cement-bentonite	water/solids = 4 to 1	10^{-6}	Vaughan, 1969
Cement-bentonite	w : c : b = 4 : 1 : 1	5 x 10^{-8}	Vaughan, 1973

per argues that boreholes may be fully-grouted for diaphragm piezometers, omitting both the sand and the bentonite seal. Two articles by Vaughan (1969 and 1973) make the point clear in theory and practice. This procedure not only simplifies difficult installation situations, but also improves the quality of the installation. It is really not a question of whether or not diaphragm piezometers work when fully surrounded with grout, but rather it is a question of making a grout with a suitable permeability. Cement-bentonite grout is generally well suited to accomplish this task.

The cement-bentonite fabric when set is an irregular honeycomb structure held together with both cured cement and colloidal bonds. It is a highly porous solid with a low permeability that lies somewhere in the cement and bentonite range, from $1x10^{-5}$ to $1x10^{-9}$ cm/sec. Typical published values of permeability are listed in Table 1. Vaughan (1973) quotes a coefficient of permeability for a pumpable cement-bentonite grout mix on the order of $5x10^{-8}$ cm/sec. For low bentonite solid contents the permeability can be expected to be close to $1x10^{-6}$ cm/sec and for higher bentonite solids content it would be close to $1x10^{-8}$ cm/sec. This is an area for further testing and research where the water-cement ratio, bentonite solids content and permeability should be established.

Typically used Bentonite

Drilling contractors in the US who do test borings in soil usually carry a high yielding sodium bentonite such as Supergel or Quik-Gel brands on their rigs. This is a finely ground, powered form of bentonite that yields as much drilling mud per sack as possible without additives. Other bentonite powder products have additives to enhance certain mud characteristics such as viscosity, density and filtration. Such additives are probably not detrimental to making a suitable cement-bentonite grout, but are not really relevant or cost effective in such a context. What seems not to be well understood is the feasibility of using coarser grains of bentonite to increase solids content for lowering the permeability in cement-bentonite grout. Would polymer additives be needed for mixing stability, for example?

As a side-note, sodium bentonite absorbs more water than calcium bentonite. According to clay mineralogists (Papp, 1996) the presence of sodium as the dominant exchangeable ion facilitates many interlamellar water layers to be absorbed into the crystalline structure, a phenomenon which does not occur with calcium or magnesium as dominant ions. Sodium bentonite is characterized as capable of absorbing at least five times its weight in water and expands when fully saturated with water to a volume 12 to 15 times its original dry size.

Sodium bentonite powder appears to be the most practicable and efficient to use in this context, but this does not mean that other fillers of different grain sizes and composition could not be used. It is matter of availability and convenience of a good product for this application. For example, in a 50-gallon batch of cement-lime grout, 150 pounds of hydrated lime can be replaced by using about 25 pounds of bentonite powder.

Mix Design Rules

In order to keep field procedures simple the emphasis should be on controlling the water-cement ratio. This is accomplished by mixing the cement with the water first. This is contrary to procedures used at more sophisticated grout plants for compaction grouting and sealing purposes. When water and cement are mixed first, the water-cement ratio stays fixed and the strength/modulus of the set grout is more predictable. If bentonite slurry is mixed first, the water-cement ratio cannot be controlled because the addition of cement must stop when the slurry thickens to a consistency that is still pumpable.

Making cement-bentonite grout in the field is a straightforward process. The most effective mixing is done in a barrel or tub with the drill-rig pump, cir-

Table 2. Cement-bentonite grout mixes				
Application	**Grout for Medium to Hard Soils**		**Grout for Soft Soils**	
Materials	Weight	Ratio by Weight	Weight	Ratio by Weight
Water	30 gallons	2.5	75 gallons	6.6
Portland Cement	94 lbs. (1 sack)	1	94 lbs. (1sack)	1
Bentonite	25 lbs. (as required)	0.3	39 lbs. (as required)	0.4
Notes	The 28-day compressive strength of this mix is about 50 psi, similar to very stiff to hard clay. The modulus is about 10,000 psi.		The 28-day strength of this mix is about 4 psi, similar to very soft clay.	

culating the batch through the pump in 50 to 200 gallon quantities. The rig pump provides the kind of jet-mixing required for getting the job done quickly. Any kind of bentonite powder used to make drilling mud combined with Type 1 Portland cement and water can be used, but the appropriate quantity of bentonite will vary somewhat depending on grade of bentonite, mixing sequence, mixing effort (agitation), water pH and temperature.

Grout mixes should be controlled by weight and proportioned to give the desired strength of the set grout. The conversion factors contained in Appendix H.10. in Dunnicliff (1988, 1993) are very helpful in mix design. Two mixes are given in Table 2 that varies in 28-day strength from 50 psi to 4 psi for water-cement ratios of 2.5 to 6.6 respectively.

The amount of bentonite that is required for the above mixing procedure would vary due to factors mentioned earlier. The amount of bentonite shown in Table 2 should only be used as a guide, but is also handy for estimating material quantities to be shipped to the site. With this method **more** bentonite is required than if water and bentonite were mixed first. This is an advantage from the standpoint of wanting a low permeability. When the bentonite solids content increases, the density increases and the permeability is lowered. A lower permeability is generally preferred since cement-bentonite grouts have a higher permeability than high-density bentonite grout or chip seals. Thus, another good reason for mixing water and cement before adding bentonite.

Old habits die hard, so that some users will insist on mixing water and bentonite powder first. This is normally the way drilling mud is mixed and it yields more slurry per sack of bentonite than the above method. Also, use of hydrated bentonite with cement added last is common practice in grouting technology for ground improvement. Such mixes are highly thixotropic and rely on industrial type mixing plants and methods. The cement content is difficult to control under ordinary borehole installation circumstances.

Mixing Procedure

A rig pump with one suction hose and a return hose fitted with a jet nozzle and a 50-gallon barrel, shown in Figure 2, are the minimum requirements for circulation batch mixing of grout. Paddle or high shear mixers can also be used. A measured quantity of clean water goes into the mixing tub/barrel first and the pumping and circulation starts. Then the cement is gradually added to the water and mixed thoroughly. At this stage the mix is like gray water. Next, bentonite powder is slowly added into the jetting area of the barrel, slowly enough so clumps of bentonite do not form. This should be constantly checked by scraping the bottom with a shovel. When clumps form, slow down and do not add any more powder until they are dissolved. Keep adding bentonite until the watery mix transitions to an oily/slimy consistency. Observe the consistency while mixing and let the grout thicken for another five to ten minutes. Generally, the mix thickens some more with added mixing time. Add more bentonite as required. When it is smooth and like thick cream or pancake batter, it is as heavy as is it feasible to pump. Drips of the grout should then barely come off a dipped finger and should form "craters" in the fluid surface. That is the correct consistency for pumping the grout batch down the tremie-pipe. When possible, withdraw the tremie after each batch an amount corresponding to the grout level in the boring to keep the pumping pressures as low as possible. When mixing grout 100 feet or more from the borehole, thinner consistency would be required, but at the risk of some bleeding.

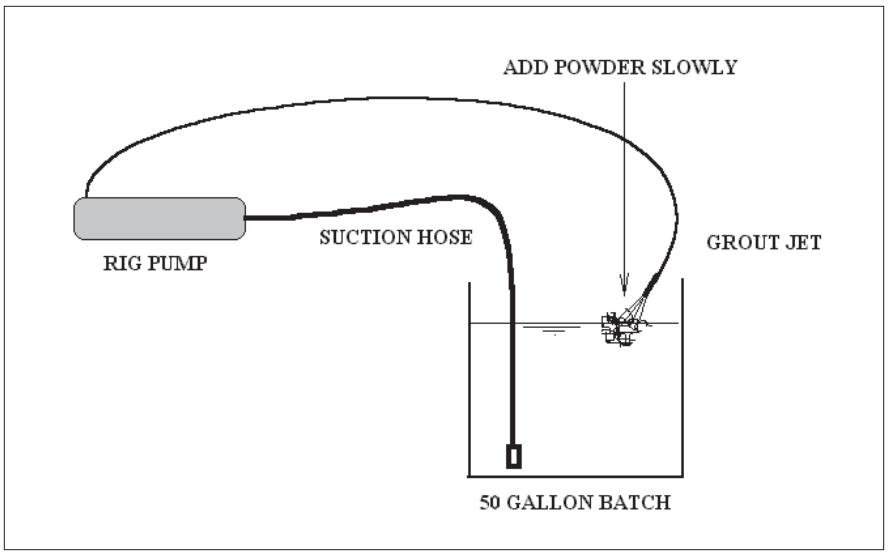

Figure 2. Circulation batch mixing of grout (minimum configuration). After mixing grout is tremied to bottom of the borehole.

Additional Considerations

Strength is often used to characterize a grout for deformation-type instruments, but modulus of deformation should ideally be the basis for judging compatibility with ground conditions. The grout column in a borehole will carry a total axial force smaller or greater than the material it replaced, according to its stiffness. When there is too much stiffness or force, displacements will be diminished and axial measurements can be less than displacements of the surrounding ground. Thus extra grout stiffness for extensometers is much more undesirable than for inclinometers, for example. More care should be taken in making a grout for axial borehole deformation measurements than for lateral deformation measurements.

Instrumentation installations often encounter the combination of both soft and hard ground in the same borehole. Obviously, staged grouting to match the required properties would be the ideal

procedure, but this is seldom warranted or practicable. Most of the design and installation challenge lies with deformation measurements in the axial direction of the borehole where large volumes of grout backfill must be placed. So, for extensometers, it is better to err on the softer side of the spectrum.

Lateral displacements of an inclinometer casing are generally unaffected by added grout stiffness. Where the grout column is too stiff the displacements will be distributed over a greater depth interval, but not be diminished in overall magnitude. The same is probably true if the grout is too soft, but there is the additional concern for lack of lateral confinement. Since inclinometer casings generally are under compression, lack of backfill or confinement can produce localized shifts in the borehole, masking smaller actual displacements. So, for inclinometers, it is better to err on the stiffer side of the spectrum.

It may not be possible to achieve a suitable grout with cement for softer clays. Fly ash promises to be a good substitute for reducing the modulus, but more testing is needed in this regard.

Conclusions

Grout backfill should ideally be selected according to the field instrument type being used and the given ground conditions. The reality however is that grouting practices will remain relatively crude and, at best, with only marginal control over the grout properties. Drillers, geologists and engineers alike still have a lot to learn about what is appropriate. We cannot just borrow ideas from drilling mud and grouting technology that have no relevance to what is needed for instrumentation functionality.

1. Avoid using a bentonite alone for a borehole grout. It is not a volumetrically stable material and can influence both piezometer and displacement measurements when it keeps hydrating or desiccating. It is often very difficult to place successfully.
2. A stable grout can be made using cement or fly ash with bentonite. Relatively small amounts of cement or fly ash are used as compared to grouts used for other geotechnical purposes such as compaction grouting and sealing of seepage. Grouting for instrumentation has different property priorities.
3. Grouting for field instrumentation should remain a relatively simple endeavor, using materials commonly available to drillers. However, when working in soils like normally consolidated clay, more attention should be paid to the mix design. Since little information is available on softer grouts, particularly those mixed with fly ash, a few trial batches in the laboratory are appropriate to determine basic characteristics for use on such projects.
4. Grout mixing should start with water and cement (or fly ash) first. Strength and modulus are more predictable that way. Also, and just as important, is that more bentonite solids can be added to the mix to lower permeability where required for sealing.
5. Grout permeability is an issue for piezometers installed in clay. The grout should have permeability no greater than one (possibly two) orders of magnitude above the clay to get representative readings.
6. Grout stability is very important during both the liquid and set conditions. The liquid grout consistency should be as thick as possible, yet liquid enough to be pumpable. This is a property that requires field experience. Field crews tend to err to the more liquid end of the spectrum, resulting in bleeding and possibly cracking when set.
7. Strength is often used to characterize a grout for deformation-type instruments, but modulus of deformation should ideally be the basis for judging compatibility with ground conditions. There is very little in the literature to help us select a grout mix for sealing piezometers in boreholes. Further testing and research is needed (see editor's note below).

DGSI
DURHAM GEO SLOPE INDICATOR

Part Number: 52615140 Serial Number: 2430819

Specification

Frequency Accuracy: ± **(0.002% of Reading +0.04Hz)**
Temperature Accuracy: ± **.5 °C**

Frequency Generator

Calibration Standard: Agilent 33210A Serial Number: 20-78-SI
Calibrator Re-Certification Due: July 6, 2024

Temperature Resistance

Calibration Standard: DGSI Resistance Box Serial Number: 20-14-SI
Calibrator Re-Certification Due: July 6, 2024

	INPUT (Hz)	*ACCEPTABLE RESPONSE (Hz)*	*ACTUAL RESPONSE (Hz)*
FREQUENCY	450.000	449.951 to 450.049	449.998
	1000.000	999.940 to 1000.060	999.996
	2000.000	1999.920 to 2000.080	1999.993
	3000.000	2999.900 to 3000.100	2999.988
	4000.000	3999.880 to 4000.120	3999.985
	5000.000	4999.860 to 5000.140	4999.986
	6000.000	5999.840 to 6000.160	5999.978

	INPUT (Ω)	*IDEAL RESPONSE (°C)*	*ACCEPTABLE RESPONSE (°C)*	*ACTUAL RESPONSE (°C)*
TEMPERATURE RTD	1715	-20.0	-20.5 to -19.5	-19.9
	2076	30.0	29.5 to 30.5	30.2
	2482	80.0	79.5 to 80.5	80.2
THERMISTOR	29142	-20.0	-20.5 to -19.5	-20.0
	2416	30.0	29.5 to 30.5	29.9
	377	80.0	79.5 to 80.5	80.0

This Certificate confirms that the equipment listed above has been calibrated in accordance with the manufacturer's specifications with calibration standards that are traceable to the National Institute of Standards and Technology (NIST).

FLOOD INFORMATION:
THIS PROPERTY IS LOCATED IN ZONES "AH" & "D" AS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY RATE MAP, COMMUNITY NO. 225192C, PANEL NO. 0235, SUFFIX "E", AND DATED SEPTEMBER 7, 2023. ZONE "AH" HAS A B.F.E. REQUIREMENT OF 3' AND ZONE "D" IS A UNDETERMINED FLOOD HAZARD AREA.
PLEASE CHECK WITH THE PARISH FLOOD PLAIN MANAGER FOR POSSIBLE FUTURE CHANGES IN THE BFE REQUIREMENTS PRIOR TO CONSTRUCTION.

THIS OFFICE WAS NOT FURNISHED WITH AN ABSTRACT OF THE PROPERTY THEREFORE THIS MAP DOES NOT PURPORT TO SHOW ALL SERVITUDES, RIGHT-OF-WAYS, EASEMENTS OR OTHER PHYSICAL OBJECTS THAT MAY AFFECT THE PROPERTY SURVEYED.

ALL SURVEY CONTROL IS US FEET, ESTABLISHED BY GPS OBSERVATIONS AND POST PROCESSED WITH NGS C4G USING GEOID 18, THE VERTICAL DATUM IS NAVD '88 AND THE HORIZONTAL DATUM IS NAD 83, LOUISIANA SOUTH ZONE 1702.
