Integrity's managed IT and communications services are built on partnership. We take the time to understand your business and future plans before we recommend solutions to suit your requirements.

The Final Months Before the Analogue Switch-Off

The retirement of the UK's analogue telephone network is getting closer, and businesses still using traditional phone lines should now be preparing for the move to digital services.

Planning ahead helps avoid unnecessary disruption and ensures there is time to choose the right solution before demand increases. Many of our clients have already completed the transition, with improved flexibility and functionality as a result. If you're unsure whether any of your services will be affected, please speak to your Account Manager.

Technology Should Support Growth, Not Hold It Back

As businesses grow, technology often evolves one purchase at a time. A new laptop here, an additional switch there, another Microsoft licence when a new employee joins. Over time, this can create an IT environment that's difficult to manage and no longer reflects the needs of the business.

Regular technology planning helps ensure your infrastructure continues to support your organisation. If you have expansion plans or changes on the horizon, letting us know early will help us support you best.

Planning for Equipment Replacement

Every piece of business technology has a lifespan. Replacing equipment before it becomes unreliable helps avoid disruption, improves performance and makes budgeting far more predictable than reacting to unexpected failures. It's one of the reasons we work closely with our clients to help plan future technology investment rather than simply responding when something breaks.

If you'd like to discuss your future technology plans, your Account Manager will be happy to help.

Ask the Engineers – Why does my computer become slower over time?

As software is installed, files accumulate and operating systems receive regular updates, computers naturally require more resources to maintain the same level of performance. Older hardware can also begin to struggle with the demands of modern applications.

While regular maintenance helps keep devices running efficiently, there comes a point where upgrading hardware becomes the more cost-effective option. If you've noticed one or more computers becoming noticeably slower, get in touch.

QUICK TIP OF THE MONTH

If you regularly save files to your desktop, spend a few minutes organising them into folders. It makes important documents much easier to find and simplifies backups.
