

400/500 Series

# BALE BEDS

## BENEFITS OF UNROLLING

- Unrolling hay can save as much as 40% over feeding in a bale ring.
- Spread your herd out so all can eat at one time. Dominant cows tend to push weaker cows to the back when feeding in a bale ring. This provides faster weight gain on calves & eating quality hay instead of what is left over.
- Unrolling reduces the need to re-seed bare spots left by rings.
- Unrolling moves the manure around the pasture. Reduces the need to fertilize.
- Pasture recovery. Cattle will clean up hay better when bales are unrolled. Piles of hay are left behind when fed in a ring. This left over hay needs to be burned or removed to allow crop to recover.
