Palm weevil feeding results in tree death

PALM WEEVIL MANAGEMENT EXPERTISE

The South American palm weevil (SAPW) has devastated the Canary Island date palm population from Tijuana to Oceanside. It's destruction can now be seen in San Onofre, with reports as far north as Newport Beach and Fallbrook. SAPW is active year-round, its most active months being March-October.

Symptoms can be hard to detect without a very trained eye, and populations as low as 30 can kill a palm within a matter of days to weeks,. Females can lay 120-150 eggs in a 30-day window.

EXPERT TREATMENT BY TREELIFE

There is not a one-size-fits-all treatment regimen for SAPW infesting palms. Every tree's environment and value can be different, and treatment regimens can be adjusted to suit.

TreeLife guides decision-making by providing information and education.

WHY TREELIFE

- Education and information provided upfront
- Customized treatment plan based on understanding of the issue and customer expectations.
- Peace of mind all year long
- Treatments proven over years of research, monitoring and in-field experience.
- High-value trees given the protection they deserve (Canary Island date palms cost ~\$500/foot, not taking in to account delivery).
- Removals are very costly and it doesn't stop there. Tree loss can make us emotional!
