

Unlock your unique genetics to better control your health

PrecisionCare+ powered by **FLEXHEALTH**

Healthcare engineered to your DNA

PrecisionCare+ focuses on transforming the quality of life by empowering physicians with the information and insights they need through pharmacogenetics.

Understanding your genetic makeup will help identify drugs that your body can metabolize efficiently and safely. Without this genetic information, it can be a game of trial and error.

We make genetic insights actionable, with pharmacists that provide therapeutic recommendations based on the individual's genetic makeup.

Life is complicated. Healthcare shouldn't be.

PrecisionCare+ allows you to learn which medications and doses work best for your genetic makeup so you can stop playing trial-and-error with your healthcare.

Two people taking the same drug and dose may respond in very different ways. A certain drug might cause side effects for one person, but not for someone else. **Aim to optimize your medication.**

How We Help

We've optimized medication plans and taken the guesswork out of healthcare with precision prescribing. The PrecisionCare+ Program integrates pharmacogenetic (PGx) testing, pharmacist review, sophisticated FDA approved drug-gene reporting, and clinical decision support for the treating provider.

 **95%**

95% of people have genetic variants impacting medication

PrecisionCare+ and the Member Experience

What to expect when integrating pharmacogenetic (PGx) testing into your health

After a thorough review of the pharmacy claims data for Quality Widgets Company, several employees, including Pam, have been identified as favorable candidates for PGx testing. Many factors impact how a favorable candidate may be identified, including:

- Genetic factors
- Illness or organ dysfunction
- Food interactions
- Other medications

Pam and the others are offered the opportunity to participate in PGx testing.

Upon opting in, Pam receives a test kit that is quickly and easily completed via a cheek swab at home. Once complete, she places the swab into the prepaid postage packaging and mails it to the laboratory.

In 1-2 weeks, Pam receives her PGx results via the TrueScripts Member Portal and in the mail. A TrueScripts pharmacist calls Pam to go over her results and provide alternative treatment recommendations, if necessary. These results and recommendations will be provided to Pam's doctor(s), as well.

The TrueScripts clinical team continues to monitor red-flag drugs and provide first-line intervention as needed. Our proactive approach ensures that patients receive clinically effective treatment and **Amazing Care.**
