Angus Open Day
15th August - On Property at Gilgandra

Sale Location

From Dubbo, turn left at Brocklehurst, onto Burraway Road for 8kms, turn right onto Dulcidene Road and travel a further 2.2 kms. Watch for signs on sale day.

Please bring this catalogue to the sale!

Follow us on 

Welcome

Welcome to the 2023 Bull Sale.

A lot has changed since last year's Sale. With the seasons becoming a lot tougher and markets tapering off dramatically. It has certainly shocked us how quickly things can change.

With bulls being more affordable, this year is a great opportunity to improve your core breeding herd and get set up for any future positive market movement.

An important change for buyers to note is that this year, after having bulls physically sell through a ring, we are changing to a video auction. There will be TV screens set up around the sale ring, playing recorded bull footage. The auction will go ahead as normal in the shed, with Paul Dooley in the rostrum. As usual the sale will also be on Auctionsplus, with online bidding available.

With this change, it puts more importance on inspecting bulls prior to the sale. The bulls will be penned on Sale morning as normal from 10 am to check them out prior to the sale.

Another chance to inspect the bulls is at our Open Day on the 15th of August - On Property at Gilgandra, where the bulls will be penned from 10 am until 4 pm.

Inspections can also be arranged by appointment leading up to the sale.

It's pleasing to see many of our bulls this year rank in the top 20% of the breed (marked with shaded boxes within the breedplan figures), for traits we have been focusing on in recent years. Some consistent key commercial traits worth highlighting are short gestation length, structural feet and leg data plus rib and rump fat. These traits lead to calving ease, general soundness and an ability to turn off quicker. Attributes we will continue to focus on moving forward.

Another pleasing aspect is the high percentage of tight sheath's across the offering. An important visual trait to keep under control for both cross breeding and straight Angus producers, to help position and maintain market specifications. A tight sheath also helps lessen the chance of injury for the bull.

This year we again offer a small run of yearling bulls selected for calving ease.

These yearling bulls suit heifer joining, with the backing of genomics. They are best suited to smaller mob sizes than their 2yo counterparts. This is since, they are still growing rapidly while working. Up to 25 - 30 heifers for each yearling bull is a good guide. It's also best to join them 7 - 14 days earlier than usual to give them time to adjust to working life and to join them to similar age females also helps

The bulls have been developing nicely and present ready for work come sale day. They have been supplemented with a slow burn ration over the extended dry end of Summer and early Winter and have been lucky enough to finish on grazing crops.

They have all had Genomics testing, sire verification and freeze branding. Vet checked and passed semen morphology. Been vaccinated for Vibrio, Pestigard and 7 in 1 and have tested negative to pestivirus.

We are proud to offer this year's run of bulls and recommend them to you

Hope to see you Sale day

Randall & Kylie Carlow

Strong Milwillah pedigree, used lightly as a cover bull last year over stud females. Tremendous length and tremendous thickness, particularly through his hind quarter. Moves well and stands up on his feet nicely. Good outlook and head carriage. Proven calf getter, used to add a bit more Identity P134 influence in the herd. Scrotal 38cm 15-6-23. NLIS 982 123755879059

Beefclass Structural Assessment

How to use:

The Beef Class Structural Assessment System uses a 1-9 scoring system for feet and leg structure:

- A score of 5 is ideal
- 4 and 6 show slight variation from ideal, but this includes most animals. Any animal scoring 4 and 6 would be acceptable in any breeding program
- 3 and 7 shows greater variation, but would be acceptable in most commercial breeding programs, however seedstock producers should be wary
- 2 and 8 are low scoring animals and should be looked at carefully before purchasing

A 1-5 scoring system is used for sheath attachment. For feet and leg assessment, animals need to be on a hard, flat and even surface where animal can move/stand naturally.

Traits:

	<i>Scoring Range</i>	<i>Description</i>
Front Feet Claw Set	1 - 9	1 - open divergent; 5 - good; 9 - extreme scissor claw
Rear Feet Claw Set	1 - 9	1 - open divergent; 5 - good; 9 - extreme scissor claw

Reference: Shape (primarily curl) and evenness of the claw set.

Front Feet Angle	1 - 9	1 - steep (stubbed toe); 5 - good; 9 - shallow heel
Rear Feet Angle	1 - 9	1 - steep (stubbed toe); 5 - good; 9 - shallow heel

Reference: Strength of pastern, depth of heel and length of foot.

Rear Legs Side View	1 - 9	1 - straight (post legged); 5 - good; 9 - sickle hocked
----------------------------	-------	---

Reference: Angle measured at the front of the hock.

Rear Leg Hind View	1 - 9	1 - bow legged; 5 - good (parallel) ; 9 - cow hocked
---------------------------	-------	--

Reference: Direction of the feet when viewed from the rear.

RECESSIVE GENETIC CONDITIONS

This is information for bull buyers about the recessive genetic conditions, Arthrogryposis Multiplex (AM), Hydrocephalus (NH), Contractural Arachnodactyly (CA) and Developmental Duplications (DD).

Putting undesirable Genetic Recessive Conditions in perspective

All animals, including humans, carry single copies (alleles) of undesirable or “broken” genes. In single copy form, these undesirable alleles usually cause no harm to the individual.

But when animals carry 2 copies of certain undesirable or “broken” alleles it often results in bad consequences. Advances in genomics have facilitated the development of accurate diagnostic tests to enable the identification and management of numerous undesirable or “broken” genes.

Angus Australia is proactive in providing its members and their clients with relevant tools and information to assist them in the management of known undesirable genes and our members are leading the industry in their use of this technology.

What are AM, NH, CA and DD?

AM, NH, CA and DD are all recessive conditions caused by “broken” alleles within the DNA of individual animals. When a calf inherits 2 copies of the AM or NH alleles their development is so adversely affected that they will be still-born.

In other cases, such as CA and DD, calves carrying 2 copies of the broken allele may reach full-term. In such cases the animal may either appear relatively normal, or show physical symptoms that affect their health and/or performance.

How are the conditions inherited?

Research in the U.S. and Australia indicates that AM, NH, CA and DD are simply inherited recessive conditions. This means that a single gene (or pair of alleles) controls the condition.

For this mode of inheritance two copies of the undesirable allele need to be present before the condition is seen; in which case you may get an abnormal calf. A more common example of a trait with a simple recessive pattern of inheritance is black and red coat colour.

Animals with only one copy of the undesirable allele (and one copy of the normal form of the allele) appear normal and are known as “carriers”.

What happens when carriers are mated to other animals?

Carriers, will on average, pass the undesirable allele to a random half (50 %) of their progeny.

When a carrier bull and carrier cow is mated, there is a 25% chance that the resultant calf will inherit two normal alleles, a 50% chance that the mating will result in a carrier (i.e. with just 1 copy of the undesirable allele, and a 25% chance that the calf will inherit two copies of the undesirable gene.

If animals tested free of the undesirable gene are mated to carrier animals the condition will not be expressed at all. All calves will appear normal, but approximately half (50%) could be expected to be carriers.

How is the genetic status of animals reported?

DNA-based diagnostic tests have been developed which can be used to determine whether an individual animal is either a carrier or free of the alleles resulting in AM, NH, CA or DD.

Angus Australia uses advanced software to calculate the probability of (untested) animals to being carriers of AM, NH, CA or DD. The software uses the test results of any relatives in the calculations and the probabilities may change as new results for additional animals become available.

The genetic status of animals is being reported using five categories:

AMF	Tested AM free
AMFU	Based on Pedigree AM free - Animal has not been tested
AM_%	_% probability the animal is an AM carrier
AMC	Tested AM-Carrier
AMA	AM-Affected

For NH, CA and DD, simply replace AM in the above table with NH, CA or DD.

Registration certificates and the Angus Australia web-database display these codes. This information is displayed on the animal details page and can be accessed by conducting an “Database Search” from the Angus Australia website or looking up individual animals listed in a sale catalogue.

Implications for Commercial Producers

Your decision on the importance of the genetic condition status of replacement bulls should depend on the genetics of your cow herd (which bulls you previously used) and whether some female progeny will be retained or sold as breeders.

Most Angus breeders are proactive and transparent in managing known genetic conditions, endeavouring to provide the best information available. The greatest risk to the commercial sector from undesirable genetic recessive conditions comes from unregistered bulls with unknown genetic background. The genetic condition testing that Angus Australia seedstock producers are investing in provides buyers of registered Angus bulls with unmatched quality assurance.
