Did you know?

**Vaccine development has a proven process**

The COVID-19 vaccines were developed following the same process all vaccines do and showed no major safety concerns in trials.* While all COVID vaccines have been granted emergency use authorization by the FDA, the Pfizer-BioNTech COVID-19 Vaccine now has been fully approved by the FDA.

**Getting COVID doesn’t mean you’re immune**

Just because your body builds up natural immunity for a period after infection, researchers warn that you could get the virus again. The best way to lower your risk is to get fully vaccinated.*

**COVID spreads easily in communities**

COVID-19 is highly contagious. If you get COVID-19, you also risk giving it to loved ones who may get very sick. Getting a COVID-19 vaccine is a safer choice.*

**Vaccination reduces your risk**

Infections happen in only a small proportion of people who are fully vaccinated, even with the Delta variant. When these infections occur among vaccinated people, they tend to be mild, and are less likely to spread to others.* Nearly all COVID-19 deaths—99.5 percent of known cases—are unvaccinated people, and 97 percent of those hospitalized for the illness are unvaccinated.*
