---

### Clinical History

- 59 year old.
- Active smoker with moderately controlled hypertension and hyperlipidemia.
- Presented with two weeks history of acute limb ischemia with multiple visits to the ER.
- Patient's primary care doctor noted skin blistering, loss of pulse of the dorsal foot.
- Patient was referred to our limb salvage center.
- Found to have acute spontaneous distal superficial femoral/popliteal arteries dissection with embolic debris below the knee.

## Procedure

- Patient was treated with laser atherectomy, balloon angioplasty and stenting to popliteal segment and catheter directed thrombolytic therapy overnight to improve his outflow.

---

## Results / Conclusion

- Patient's foot and leg was saved.
