---

### Clinical History

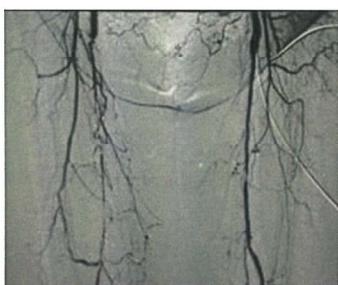

- 63 year old diabetic with end stage renal disease.
- Patient on hemodialysis.
- Presented to the office with two weeks history of wet gangrene.

---

### Procedure

- Patient was taken to the cath lab immediately for re-vascularization.

- Found to have popliteal artery occlusion and severe below knee disease.
- Patient was re-vascularized using orbital atherectomy, balloon angioplasty and stenting to his popliteal artery and laser atherectomy balloon angioplasty to his below knee disease.

(after re-vascularization)

---

### Results/Conclusion

- We were able to limit his amputation to transmetatarsal which kept his mobility intact.
