## R4 Series

R4 Series sensors provide non-contact continuous level measurement of difficult liquids and solids that cannot be measured with ultrasonic technology.
By using improved microwave pulse technology, these sensors can track any target material from the tip of its antenna to the bottom of the tank. Sensors are unaffected by sludge and biomass, dust, foam, oil, grease, and other coatings, uneven surfaces, turbulence, pressure, and vacuum, and provide accurate level sensing over larger ranges.

## Specifications

- Body Material: Aluminum
- Antenna Material: Teflon
- Accuracy: $\pm 0.25 \%$ of Full Scale
- Beam Angle: $10^{\circ}$
- Calibration: Programmable via communications port or push button
- Frequency: 6.3 GHz \& 26 GHz
- Ingress Protection: NEMA 6 (IP68)
- Input Voltage: 115V AC
- Max. Pressure: 72.5 psi
- Mounting: 2" NPT
- Output: 4-20 mA
- Resolution: $\pm 0.1^{\prime \prime}$
- Response Time: Standard Unit 2-3 echo's per second. Standard with less damping 6 echo's per second. Fast Protocol Unit 10-30 echo's per second.
- Transmitter Power: 50 uW average
- Approvals: FCC, FM, CSA

| Part Numbers | Adjustable Range |
| :--- | :---: |
| R4-33R2R6 | $33^{\prime} / 10 \mathrm{~m}$ |
| R4-50R2R6 | $50^{\prime} / 15.2 \mathrm{~m}$ |
| R4-50R2R6 | $100^{\prime} / 30.5 \mathrm{~m}$ |

NOTE: Other fittings and voltages are available. Contact us to discuss your application.

## Electrical Considerations

When using Madison level switches, it is important to consider the application's electrical parameters. Our level switches utilize reed switch technology, which are glass encapsulated, magnetically actuated switches. Madison generally provides electrical ratings for resistive loads; however, where the maximum current of the load permits, the switches are capable of controlling devices such as motors, solenoids or coils that produce capacitive or inductive electrical loads. Where possible, Madison recommends the use of general-purpose/isolation relays or controllers to protect the switch.

## Protection Techniques and Common Failure Modes

Reed Switch protection is the most successful method of increasing the performance and life of your level sensor. Since every application varies, it is important to understand your protection options. The life of the reed switch is typically 1 million cycles, within rated load conditions. The table below is a guide to suggested protection techniques and common failure modes associated with each load type.

| Load | Load Example | Protection | Diagram | Common Failure Modes | Failure Mode Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Resistive (DC) | Indicator Lamp, Heaters | Current Limiting Resistor | A | In-rush Current (Switching) | In-rush current exceeds rating and welds switch closed |
|  |  |  |  | Over-Current (Carry) | Carry-current exceeds rating and switch welds or burns open like a fuse |
| Inductive \& Capacitative (DC) | Relay Coil, Solenoids, Motor | Reversing Diode | B | Over-Voltage (Arcing) | Voltage arcing during switching welds contacts closed |
| Inductive \& Capacitive (AC or DC) |  | Resistor \& Capacitor Network | C |  |  |
| Resistive, Inductive \& Capacitive (AC or DC) | Indicator Lamp, Heaters, Relay Coil, Solenoids, Motor | Varistor or MOV | D | Over-Voltage (Arcing) | Transients voltage spikes exceed breakdown voltage and weld switch closed |

## Capacitive Load

Diagram A: Current Limiting Resistor

Diagram C: RC Network

For DC circuits: Insert a 1 N 4004 diode across the load (i.e.: relay coil) with the cathode end (marked with circular line) connected toward the positive side. This way the diode conducts only when the field collapses. General rule is to use a diode with a voltage rating at least three times the circuit voltage. A 1N4004 has a rating of 1 amp continuous, 30 amp surge, 400 V max. Refer to diagram B .

Inductive Load

Diagram B: Reversing Diode

Diagram D: Varistor or MOV

For typical 120V AC circuits: Insert a 50 to 100 ohm, 1/2 watt Resistor in series with a .1 micro farad 400 to 600 volt capacitor across the switch. The capacitor is a high impedance to 60 hertz, but is essentially a short circuit to high frequencies of generated voltages. Alternately, a varistor V130LA10A by itself across the switch will also work for 120 V AC. Refer to diagram D.
