

Sun Damage Screening (DermaScan Face Viewer)

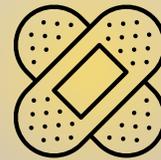

A DermaScan is a non-invasive screening that visually reveals hidden sun damage on the skin, including long-term effects from past exposure, as well as oily and dry spots. Using special UV lights, get a quick view in minutes to learn more about your skin.

NOTE: This is not a skin cancer test and requires doctor follow-up for concerns.

Boosts Health Awareness

Reveals hidden sun damage from past exposure, motivating employees to consult doctors and improve daily skin care.

Aids Damage Prevention

Demonstrates sunscreen's limits (incomplete protection against tanning and UV harm), encouraging better sun-safety habits.

Improves Wellness

Acts as a quick interim check between doctor visits to monitor skin changes and treatment progress

Promotes Early Detection

Highlights hidden sun damage (e.g., asymmetry, border irregularity, etc.) to prompt timely doctor follow-up.
