2025 Annual Impact Report

Prepared by: William James Herath, Operations Director, Wells 4 Wellness

Overview of Completed Project Work

In 2025, Wells 4 Wellness successfully scaled operations to bring clean, sustainable water to communities in need. Our primary focus in 2025 was the drilling, installation, maintenance, training, and community handover of new water infrastructures.

Through strategic deployment of resources and collaboration with local partners, we successfully completed 55 wells over the course of 2025. Each project included initial drilling, borehole encasement, pump installation, water delivery infrastructure, and the critical step of establishing local water committees to oversee the new source of clean water.

Clear Overview of Impact and Results

The completion of 55 wells has created a profound ripple effect across our partner communities.

Health and Hygiene: Immediate access to clean water has drastically reduced the prevalence of waterborne illnesses, directly impacting community health and lowering local medical burdens.

Time and Opportunity: Women and children, who typically bear the heavy daily burden of water collection, now save countless hours. This reclaimed time is actively being redirected toward school attendance and local commerce.

Long-Term Sustainability: We trained 55 unique local water committees in basic mechanical maintenance and hygiene education. This ensures community ownership and the long-term viability of every well we drill.

Grant Fund Allocation and 2025 Financial Summary

Generous matching grants served as a vital catalyst for our 2025 funding cycle. This inspired tremendous donor confidence, allowing us to successfully leverage the match and expand our overall capacity.

2025 Financial Summary

Total Revenue: *$562,915.89*
Total Expenses: *$418,772.04*
Net Income saved for 2026 budget: *$147,977.74*
Average Cost of a Well: *$7,614.04*

Funds were deployed directly into our core drilling and installation programs. These funds covered heavy equipment operation, raw materials (including piping, concrete, and mechanical pumps), local labor, and community hygiene training. The healthy net income generated this year provides a crucial operating reserve as we purchase supplies and plan our international project logistics for the upcoming 2026 build season.

Explanation of Changes in Original Objectives

We largely stayed true to our core objective of providing functional, high-quality water infrastructure. However, as we encountered unexpected geological challenges in the Dakoro region of Niger, Africa our team had two failed attempts. Unfortunately, we still do not have wells in that region. We also had truck repair costs with our truck in Niamey, Niger plus six pumps failed and were replaced. Additionally, we upgraded one pump in Tamou, Niger in order to meet higher demand due to a population increase. Ultimately, the adaptability and efficiency of our team caused us to exceed our 50 well target by completing 55 wells in 2025.
