Pancreatic Cancer

- Most difficult to solve surgical issue
- 4th leading cause of cancer-related death
- 2nd by 2030
- Poor prognosis even after PD + adj chemo
 1. 20-25% 5-yr survival
 2. 15-25 months OS
- R1 resections 20-50%  Early Recurrence 15-60%  Early Death
- Close Anatomy with SMA, SMV, CT
- Median/SMA margin: Most frequent site of rec after PD ± SMV invasion

MESOPANCREAS – Japan Pancreas Society

**How to assure a high possibility of
R0 resections in BR
Surgical strategy**

**Step 1:
En bloc resection of the mesopancreas
TMpE**

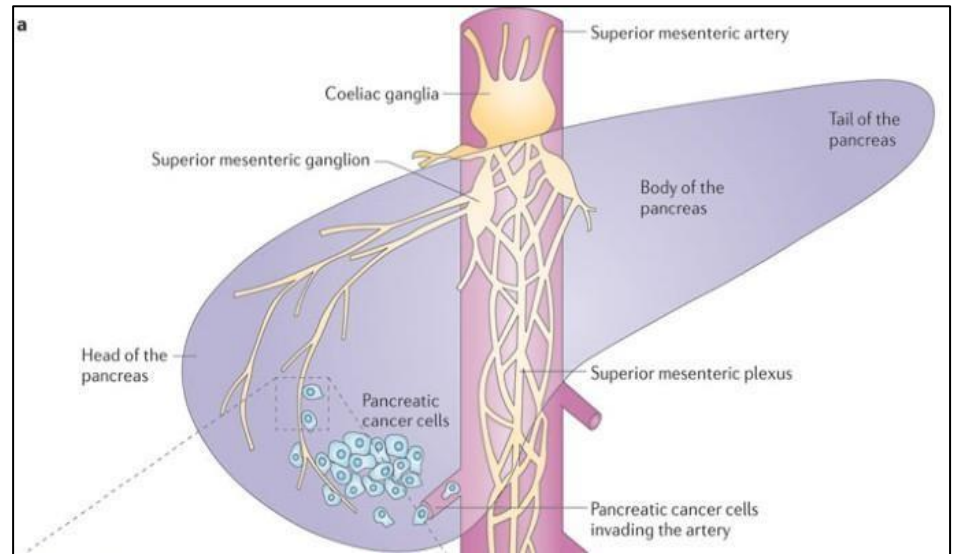

**How to assure a high possibility of
R0 resections in BR
Surgical strategy**

**Step 2:
Minimize the risk of local recurrence –
focus on perineural invasion**

Perineural invasion:

- Early spreading to the retroperitoneal space, along the arterial vessels and to the Lymph nodes
- Non-continuous spreading

**How to assure a high possibility of
R0 resections in BR
Surgical strategy**

**Step 3:
Minimize the risk of local recurrence –
focus on perineural invasion**

- Level 1 LV1: Not for PDAC
- Level 2 LV2:

Ligation of IPDA+JA1+JV1 and systemic resection of correspondent lymph nodes incl. mesopancreas

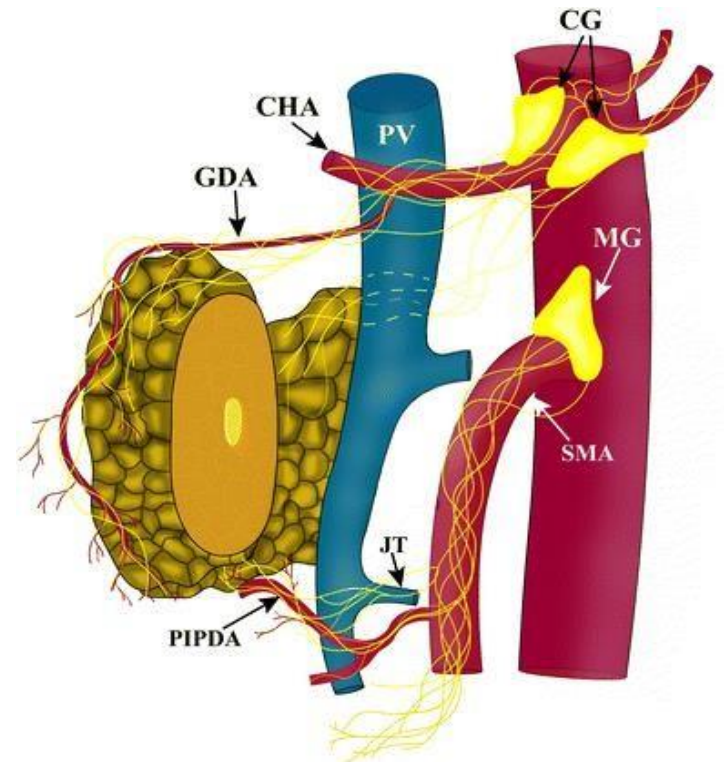

- Level 3 LV3:

Hemicircumferential resection of the plexus

- Extended Level 3 ExtLV3:

Completed peri SMA plexus resection (diarrhea)

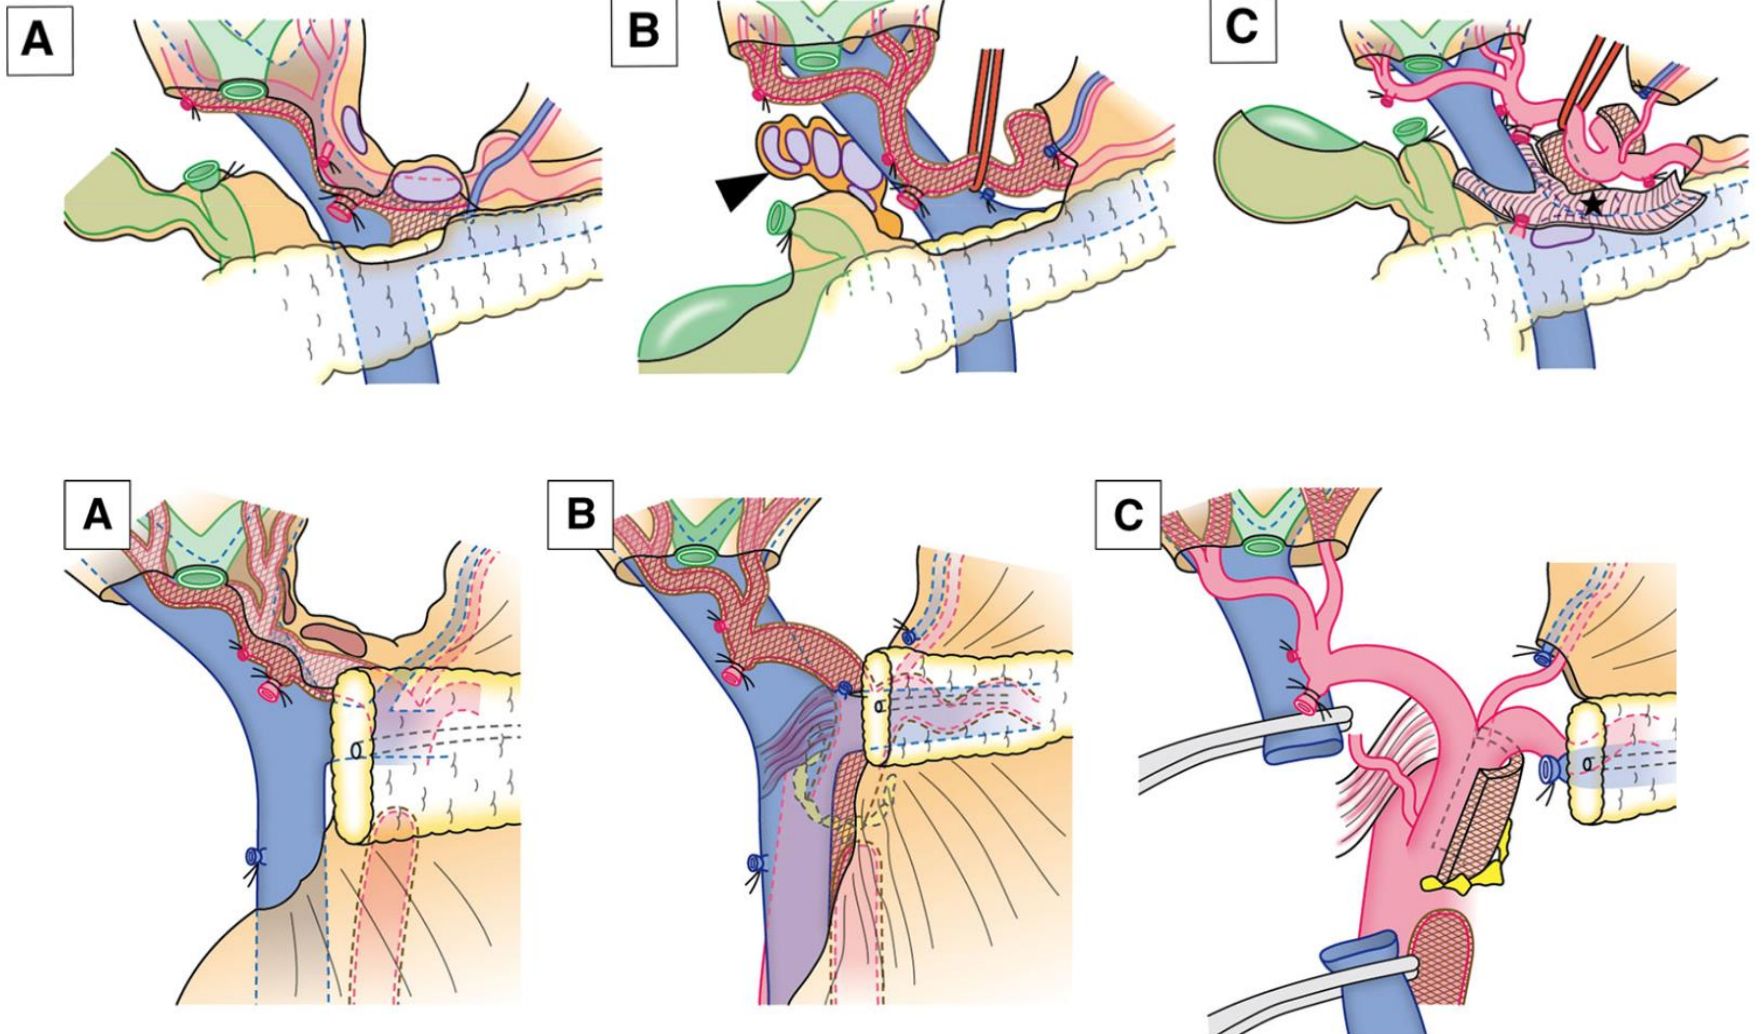

Periarterial divestment

inferior supracolic

superior

Uncinate First Approach

HOW TO DO IT

Uncinate process first—a novel approach for pancreatic head resection

Thilo Hackert • Jens Werner • Jürgen Weitz •
Jan Schmidt • Markus W. Büchler

Retrograde resection:

good vessel control (PV & SMA)
convenient situs during resection
standard technique in Heidelberg
can be combined with **artery first approach**

Uncinate First

starting dissection caudally

Uncinate First

preparation along SMA & PV

Uncinate First

complete retrograde mobilisation of the pancreatic head

TMPE – Surgical Technique

Artery First Approach - Advantages

Resection without breaching tumor planes
NO cell spillage!

↑R0 resection, ↓local recurrence

Complete resection of peripancreatic
retroperitoneal tissue TMpE

↑RLNs

Early assessment of non-resectability (SMA
involvement)

Better delineation of SMA – abnormalities

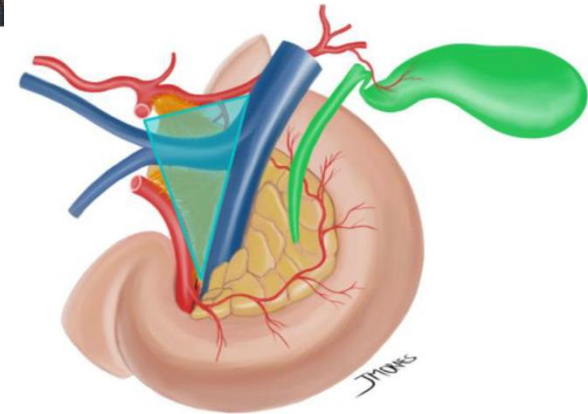

Easier “en block” resection and
”NO touch” PV-SMV reconstruction

Reduced need for graft substitution

Reduced operative time and reduced blood
loss (early ligation of IPDA/JA1)

TRIANGLE Operation – Vascular Oriented technique

TMPE – Surgical Technique

The TRIANGLE operation for pancreatic head and body cancers: early postoperative outcomes

Rosa Klotz^{1,2}, Thilo Hackert¹, Patrick Heger^{1,2}, Pascal Probst^{1,2}, Ulf Hinz¹, Martin Loos¹, Christoph Berchtold¹, Arianeb Mehrabi¹, Martin Schneider¹, Beat P. Müller-Stich¹, Oliver Strobel¹, Markus K. Diener^{1,2}, André L. Mihaljevic^{1,2,*} & Markus W. Büchler^{1*}

HPB 2022

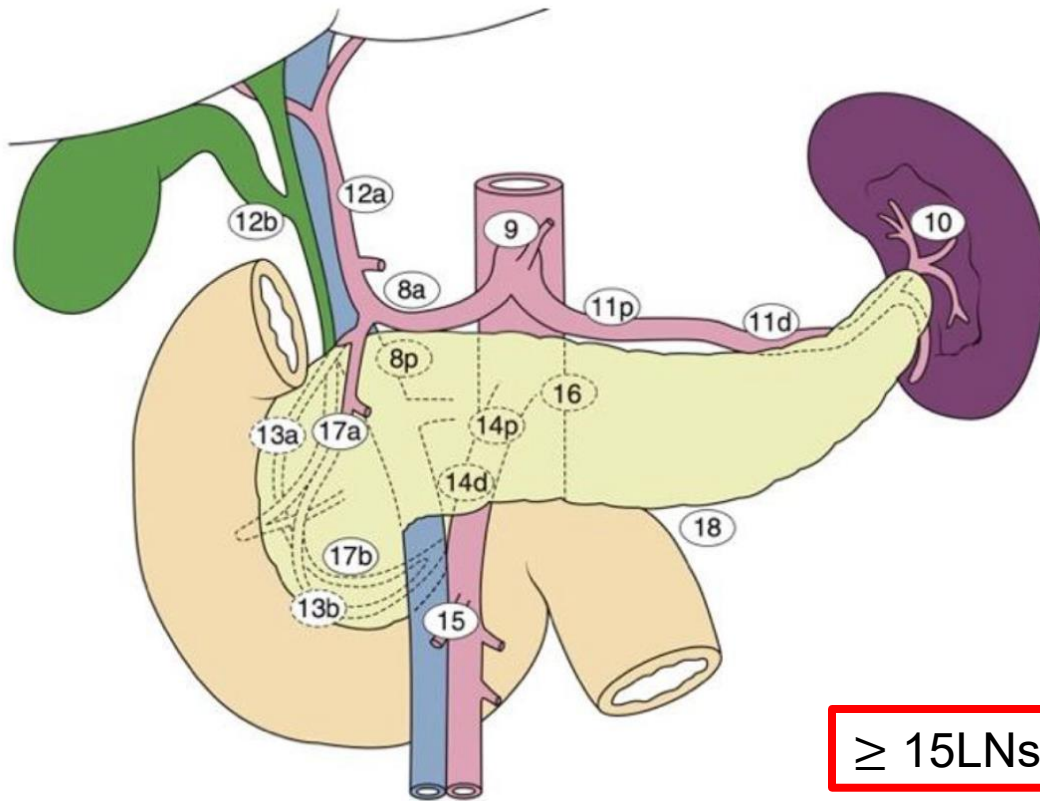

TMPE – Sharp dissection – Frozen sections
Arterial Skeletonization – Avoid arterial resection / reconstruction
No increase in Mortality / Morbidity
Increase RLNs – R0 rate

Consensus

Definition of a standard lymphadenectomy in surgery for pancreatic ductal adenocarcinoma:
A consensus statement by the International Study Group on Pancreatic Surgery (ISGPS)

Standard Lymphadenectomy in Pancreatoduodenectomy

Supra and infra pyloric
(stations 5/6)

Anterior-superior group along
the CHA (station 8a)

Along the bile duct/cystic duct
(stations 12b/12c)

Posterior aspect of the
superior/inferior aspect of the
head of pancreas (13a/13b)

Right lateral side of the SMA
(stations 14a/14b)

Anterior surface of
superior/inferior aspect of head
(stations 17a/17b)

Conclusions

- Standardized right oncological pancreatectomy
- R0 resection
- TMPe as the standard approach in PD
- Artery – first
- Regional but not “extended” lymphadenectomy
- Increase RLNs improves R0 and Survival rates (>20LNs)
- Individualized treatment
