## Auto Contact Tip Reformer

---

CTR-001

## Outline

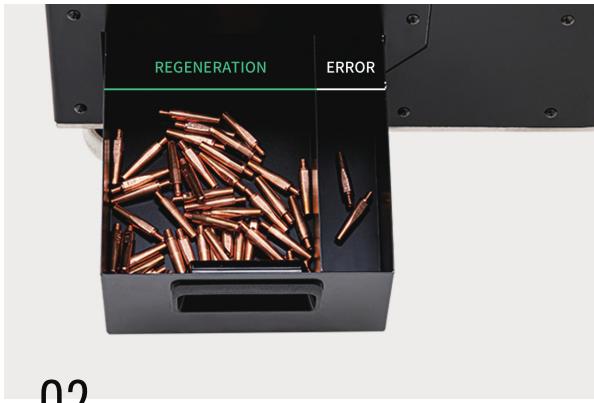

Our originally designed technique allows used contact tips to be automatically renewed. The process to renew one contact tip takes approximately 40 seconds to complete. The maximum amount of tips that can be loaded at one time is 150 pieces. The Auto Contact Tip Reformer is capable of adapting to various kinds of contact tips. The Auto Contact Tip Reformer will enable the ability to recycle conventionally disposed tips thus saving cost and reducing waste.

※It needs to change some component parts of the machine to adapt to each type of your actual contact tips.

01

All operation can be controlled from a touch panel. The maximum amount of tips to process at one time is 150 pieces.

02

It can eject renewed tips from a drawer at bottom of the machine body. If an error occurs during the process, rejected tips are automatically sorted out and are separately ejected.

03

The hole formed at the top of the renewed tip will be triangular. The triangular form will allow protruding wire to touch two points on the tip which has a positive effect on keeping steady power distribution.
