Energy Management
and Home Automation

It's All Connected

Alarm.com's suite of Energy Management and Home Automation services enables remote control, automation and intelligent optimization of lights, thermostats and locks.

By integrating energy management and home automation with the security platform, data becomes a valuable asset allowing for informed decisions to better manage your home. Leveraging the door, window and motion sensors helps optimize and automate energy usage better than any stand alone device.

✓ Automate lights and thermostats to adjust to your schedule

✓ Learned activity patterns from your home will better optimize your energy use

✓ Take control of your energy usage with easy to use mobile apps

✓ Always on, at a glance awareness of your home's critical systems

✓ Text and email alerts let you know instantly when your thermostat settings change

✓ Automate your lights to turn off when the system is armed or the door is closed

Alarm.com Energy Management features:

Smart Schedules™

Smart Schedules Activity Patterns allow you to adjust and optimize your thermostat settings based on actual activity patterns throughout your home as captured by your home's door, window and motion sensors.

Power Outage Notifications

Power outage notifications send real-time mobile alerts when a power outage occurs and also uses community intelligence to alert you to the percentage of nearby customers who have lost power as well.

Severe Weather Alerts

Severe Weather Alerts notify you of approaching tornadoes and other potentially dangerous weather events in the immediate area.

Extreme Temps

With Extreme Temps, your thermostats can automatically adjust when extremely hot or cold weather is forecasted in order to reduce energy costs and lessen the chance of widespread power outages.

Demand Response Programs

Demand Response Programs, where available, allow you to take part in rebate programs from local utilities by allowing slight adjustments to your thermostats on extremely hot days to help prevent potential blackouts.
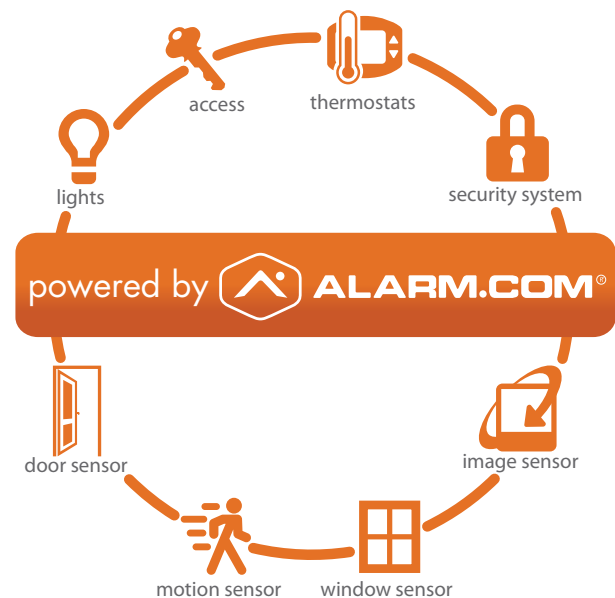

Learning From Experience

One of the key benefits of using Energy Management and Home Automation services from Alarm.com is the integration with your security system and sensor data.

The connection between your Energy Management tools and your Alarm.com powered security system allows you to automatically adjust your lights and thermostats in addition to scheduling your lights to turn on or off based on alarm, arming, geo-location, or sensor activity triggers. The data captured through door, window and motion sensors provides the intelligence and learning needed to enhance this all-in-one service application.

Intelligently Connected

Fully connected through the Alarm.com service platform creating a tightly integrated system for your home:

access · thermostats · security system · image sensor · window sensor · motion sensor · door sensor · lights
