## **COMMITMENT TO INNOVATION**

Pro-Earth has experience in listening to its customers and innovating solutions to the obstacles and potential hazards that may cause environmental incidents.

Our innovations have included the design of a plug and play, natural passive filtration for Southern Water, designed to be transported between wastewater treatment plants, as required. We have introduced head tank reservoir feed and system water quality auto-sampling.

We have redesigned drain protection mats for WEM 6 Framework companies, working on Environment Agency contracts, allowing water to be used to clear hydrocarbon and chemical spills without causing environmental damage.

We have redesigned traditional marine containment and absorbent booms, for use in fast flowing water, allowing continuous deployment for 12 months, increasing absorbency and capturing contamination that would previously avoided capture.

We are currently designing a hopper feed system to reduce disposal costs associated with concrete wastewater washout.
