

STAINLESS STEEL OVERHEAD SECTIONAL DOORS

CHARACTERISTICS

Sectional doors of our production is a completely different design from other solutions on the market. Each element is made of stainless steel (door panels, rails, hinges, door systems between patches). Top quality sealing (thick, double gasket between 50mm thick door panels filled with pressed PU foam) provide very good insulation properties. Our doors are designed for the most demanding customers. They are used in areas with the most severe operating conditions (strong winds of coastal warehouses, high salinity, moisture, strong chemicals).

SLIDING SYSTEM

All sliding profiles are made of stainless steel and guarantee durability for ages, even under very difficult conditions. Power springs ensure light work even manually operated doors. Optionally the doors can be equipped with power drive.

All drive elements (made of zinc coated steel) are covered with stainless steel cover. [®]

SEALING

Thanks to using double rubber gasket between all sections, the doors can be used as typical chiller doors.
