PRECISION SWITCHES

3	Introduction to KLIXON® precision switches
6	KLIXON® AT Series – Snap Action Precision Position Switches (rated 4 amps @ 28VDC)
22	KLIXON® 10AT / 11AT / 12AT Series – Hermetic Control Switches
24	KLIXON® 10AT-MIL Series – Military Qualified Snap Action Precision Position Switches
32	KLIXON® KX Series – Precision Sine Switches (rated 10 amps @ 28VDC, 120VAC)
38	KLIXON® 4HVS Series – High Performance Hermetic Interlock Switches
40	KLIXON® 6PS & 7PS Series – Hermetic Stainless Steel Pressure Switches
48	KLIXON® 2SE Series – Solid-State Airflow Sensors
52	MIL-SPEC Qualification List & “Closest Match” Cross Reference

INTRODUCTION TO KLIXON® PRECISION SWITCHES

- Hermetically sealed with dry nitrogen gas backfill
- Excellent shock and vibration resistance
- Switching up to 10 amps
- Optimal for low level circuits
- Temperature range between -275°F and 450°F
- Single and multiple pole designs available
- Small, axis-symmetric design for robustness and reliability
- Small and lightweight
- Various mounting configurations for custom applications
- Sealed and unsealed plunger options
- Wide range of side plate designs for narrow width applications
- Proven snap-action switching, reliable performance and long life
- MIL-S-8805 qualification option
- Approvals for various space, weapons, military and commercial aircraft OEMs

KLIXON® hermetic miniature and sub-miniature snap-action switches are ideal for extremely harsh and demanding environments as found in aircraft, military, aerospace, and aircraft engines applications. KLIXON® precision hermetic switches have been used for over 40 years in a wide range of applications, and can be found on virtually all commercial and military aircraft, as well as various space vehicles and satellites worldwide.

Sensata specialize in custom and semi-custom solutions. Over time we have built-up a design library of over 2,000 switch packages, and have an off the shelf solution to meet most standard and non-standard needs.

We offer a wide choice of precision switches ideally suited for rugged and high cost of failure applications. Sensata Technologies also manufactures a hermetically sealed snap-acting pressure switch line for applications in aerospace and electronics where high reliability and resistance to severe environments is essential.

APPLICATIONS

- Aircraft landing gear and helicopter weight-on-wheels
- Valve position indication in aircraft engines and APU's
- Aircraft environmental control systems and engine controls
- Aircraft flight control surfaces
- Stores away (munitions)
- Door stairway indication
- Brake controls
- Parachute openers
- Bomb racks and ejectors
- APUs
- Satellite panel indication and satellite arm indication
- Pilot ejection seats
- Missile launchers
- Thrust reversers
- Explosive actuators
- EVA equipment
- IUS platform
- Hydraulic / servo controls
- Engine valve indication
- Gearboxes
- Warhead safety circuits
- Weapon firing systems and trigger switches
- Rocket motor controls
- Space station

NOMENCLATURE

Precision hermetic switches are often referred to as:

- Aerospace switches
- Aircraft switches
- Hermetic switches
- Limit switches
- Military switches
- Position switches
- Miniature switches
- Sensitive switches
- Switches

TECHNICAL TERMS

Electrical Life

The minimum number of cycles allowable for a switch under a specified combination of electrical load, actuation and environmental criteria. Usually specified for the maximum current and temperature rating of the switch.

Mechanical Life

The minimum number of cycles allowable for a switch with no electrical load, and a specified combination of actuation and environmental criteria.

Contact Erosion

A general loss of material from one or both surfaces of a pair of mating contacts. This is as a result of switching electrical loads.

Pole

The number of completely separate circuits contained in a switch. A single pole switch can control only one circuit at a time. A double pole switch can control two independent circuits at the same time.

Throw

The number of circuits that each individual pole of a switch can control. The number of throws is completely independent of the number of poles.

Contact Resistance

The resistance offered to flow of current during its passage between electrical contacts. For practical reasons, lead and terminal resistance may be included in the actual measurement, as well as the contact resistance proper.

Termination Leads or Connectors

Sensata uses 20 gauge wire per MIL-W-22759 as shown below. Alternative gauges, MIL specs and color coding schemes are available upon request. Sensata will also provide switches with connectors to meet customer application needs.

Single Pole Color Coded	Mutlipole White Leads - Coding Every 6 Inches	
	A 	C 
	B 	D 

Terminal Identification
Red = Normally Open
Green = Common
Black = Normally Closed

Wire Leads
AWG 20 MIL-W-22759/9

NOTE:
Diagrams show circuits when actuator is in free position.

Dielectric Withstanding Voltage *

The maximum voltage that a switch can withstand between specified points without leakage current exceeding a specified value.

Insulation Resistance *

The resistance offered by the insulating members of a component part to a direct voltage tending to produce a leakage current through or on the surface of these members. Insulation resistance should not be considered the equivalent of dielectric withstanding voltage.

** Insulation resistance measurements should not be considered to be equivalent to dielectric withstand voltage tests. A clear, dry insulation may have a high insulation resistance and yet possess a mechanical fault that would cause failure in the dielectric withstand voltage test. Conversely, a dirty, deteriorated insulation with a low insulation resistance might not break down under a high potential of a DWV test.*

Loads

Three types of loads associated with electrical switches are: resistive, inductive and lamp. Of concern when discussing loads are their effect on the switch contacts.

Resistive

Purely resistive loads are the easiest to switch. Contact life is maximized when switching purely resistive loads because contact erosion is minimized.

Inductive

Inductive loads result in the most contact erosion. This is due to the tendency of the current to continue travelling across the contact while opening, causing arcing.

Lamp

In-rush current is the condition that results in the lamp load rating. The resistance rating of a lamp is normally specified when the lamp is hot. However, when the lamp is cold the resistance is low. This in-rush current can be 10 times the normal current, resulting in welding of the contacts.

Low Level Circuit

Low level circuits are classified in MIL-8805 as those with resistive loads less than 10mA at 30mV. The use of gold plated contacts and the hermetic enclosure of the switch contacts afford an ideal environment for switching low level loads.

Pretravel

The distance the button moves from the free position to the actuation point.

Free Position

The position of the button when there is no external force other than gravity applied to it.

Actuation Point

The position of the button at which the movable contact snaps from the normally closed contact position to the normally open contact position.

Release Position

The position of the button at which the movable contact snaps from the normally open contact position to the normally closed contact position.

Maximum Overtravel Position

The position of the button when the positive overtravel stop is reached. Further overtravel would damage the switch.

Actuation Force

The force which must be applied to the button to cause the movable contact to snap from the normally closed contact position to the normally open contact position.

Release Force

The level to which the force on the button must be reduced to allow the contacts to snap from the normally open position to the normally closed contact position.

Overtravel

The distance that the button can travel beyond the actuation point.

Movement Differential

The distance the button moves from the actuation point to the release point.

KLIXON® | AT Series

Snap Action Precision Position Switches

FEATURES

- Meet the demands of low-level current switching applications
- Various mechanical and electrical configurations available as standard or custom configurations
- Actuation plungers of various shapes and materials available
- Multi-pole switch package options
- Mounting via threaded brushings or side-plate design
- Wiring can be supplied as flying leads or via a variety of standard connectors

INTRODUCTION

The Klixon® AT series are our most popular family of precision hermetic switches because of their broad performance envelope, small size, and ability to be easily incorporated into a wide variety of packages. Klixon® AT series switches are available as basic switches, basic switches with mounting brackets and actuators, or as switch packages. Packages are formed by configuring various electrical terminations, actuator means and physical construction around one or more basic switches.

Within this family there are four basic switches: the AT, the 3AT, the 4AT, and the 10AT. Each has been optimized for particular performance characteristics and is capable of meeting the demands of low-level current switching applications.

Standard AT Series

The AT basic switch is the standard device in the AT family, capable of switching up to 3 amps at 28 VDC into resistive loads. See the chart for inductive and lamp loads. Electrical life at these loads is 25K cycles, minimum. Lower currents extend life up to the minimum mechanical life of 100K cycles.

High Temperature 3AT Series

If your application requires a device which operates at higher ambient temperatures, then consider the 3AT. Electrical and mechanical life are the same, while the maximum current level is 1A at 28 VDC into resistive loads.

Low Temperature 4AT Series

This device is designed to operate at temperatures lower than the standard AT switch, ideal for space applications. Electrical life at 3A, 28VDC is 10K cycles for resistive loads.

High Amperage 10AT Series

Designed to operate at lower temperatures and higher current capability than the standard AT switch, the 10AT's maximum current has been extended to 4A at 28VDC (resistive), with an electrical life is 25K cycles and mechanical life is 50K cycles. 10AT's are on the military qualified parts list (MIL-S-8805).

PERFORMANCE & ACTUATION CHARACTERISTICS CHART

		AT		3AT	4AT	10AT
Device Type		Standard		High Temperature	Low Temperature	High Amperage
Maximum Actuating Force (STP)		20 oz		20 oz	28 oz	30 oz
Minimum Release Force (STP)		4 oz		4 oz	1 oz	1 oz
Maximum Pretravel		0.009"		0.009"	0.009"	0.009"
Maximum Movement Differential		0.003"		0.003"	0.003"	0.003"
Minimum Overtravel		0.002"		0.002"	0.002"	0.002"
Overtravel Stop		No		No	No	No
Maximum Force on Actuator		5 lb		5 lb	5 lb	5 lb
Current Ratings in Amps (28VDC)	Resistance	3	1	1	3	4
	Inductive	1	½	½	1	1
	Lamp	1	½	½	1	2
Minimum Life @ Rated Load		25K	50K	25K	25K	25K
Minimum Mechanical Life Cycles		100K		100K	50K	50K
Ambient Temperature Range		-65°F to 275°F (-53.8°C to 135°C)		-65°F to 450°F (-53.8°C to 232.2°C)	-275°F to 275°F (-170.5°C to 135°C)	-85°F to 275°F (-65°C to 135°C)
Dielectric Strength Terminal to Case Terminal to Terminal		1000 VRMS 800 VRMS		500 VRMS 500 VRMS	1000 VRMS 800 VRMS	1000 VRMS 800 VRMS
Max Leakage		1 x 10 ⁻⁸ Std. cc He/Sec @ 1 atmosphere differential				
Shock Resistance		200G, 6 ms sawtooth				
Vibration Resistance		65G, 10-2000Hz, .5DA or 65GTMS				
Insulation Resistance @ 500VDC		100 Megohms				
Voltage Drop @ 1 amp		0.04		0.12	0.04	0.04
SEAL (MIL-S-8805)		Design enclosure 5				
Backfill		Dry nitrogen with 10% helium				

NOTE FOR DRAWINGS :

1. Because of restricted space we can only show a small percentage of our switch packages and dimensional drawings. Please contact the factory if you do not see the solution you need, or if you require more detailed envelope drawings.
2. Unless otherwise noted, standard leads are AWG #20 per MIL-W-22759/9.
3. All exposed materials on packaged designs are corrosion resistant steel with the exception of the side plates on Style 7 switches which are anodized aluminum alloy.
4. All hardware provided is corrosion resistant steel.

Klixon® | 10AT / 11AT / 12AT Series

Hermetic Control Switch Packages

INTRODUCTION

The Klixon® 10AT series are stainless steel, hermetic position limit switches, Klixon® 11AT and 12AT series are position control switches. All are ideal for extremely harsh and demanding environments as found in aircraft, military, aerospace, and aircraft engines applications. Klixon® precision hermetic position switches have been used for over 40 years in a wide range of applications, and can be found on virtually all commercial and military aircraft, as well as various space vehicles and satellites worldwide.

SPECIFICATIONS

Current Rating (Resistance Inductive Lamp)	4 amps, 28VDC 1 amp, 28VDC 2 amp, 28VDC
Dielectric Strength	1050 volts (RMS) Terminal to Case, 800 volts (RMS) Terminal to Terminal
Life Cycles	25,000 cycles @ rated load, mechanical life of 100,000 cycles
Ambient Temperature Range	-85°F to +275°F (-65°C to +135°C)
Seal	Hermetic per MIL-PRF-8805, design enclosure 5
Max Leak Rate	1x10 ⁻⁸ C.C. std. HE/sec @ 1 ATM differential
Voltage Drop at 1 amp	0.040 volts max
Insulation	100 megaohms min
Vibration Resistance	65G, 10-2000Hz, .5 DA or 65 G RMS
Shock Resistance	200 G, 6 ms sawtooth

Klixon® | Military Qualified 10AT Series

Snap Action Precision Position Switches

FEATURES

- Stainless steel, hermetic seal construction
- Rated up to 4 amps, 30VDC
- MIL-PRF-8805 qualified
- Various mounting configurations for custom applications
- Excellent shock and vibration resistance
- Distributor stock available

KLIXON® | KX Series

Precision Sine Switches

KX FEATURES

- Hermetic seal provides exceptional operational freedom from environmental conditions
- Compactly designed to fit small, narrow spaces
- Available with either screw or solder lug type terminals
- Snap-acting sine switch provides exceptional resistance to shock and vibration
- Embedded leads are available
- Lead lengths can be supplied to customer requirements

INTRODUCTION

The Klixon® KX Series hermetically sealed sine switch is a precision snap-acting device. It is designed for use in the aerospace industry and for other applications where operational freedom from environmental conditions is a requirement.

KX series switches are sealed within a one-piece steel case engineered to withstand extremely low or high ambient pressures. True hermetic sealing is achieved with a metal “wave type” diaphragm at the actuating lever. The actuating arm is keyed to hold the arm in alignment and to prevent damage to the diaphragm.

The switching element is the versatile Klixon® sine switch. This simple, one-piece element eliminates knife edges and high friction joints. Rigidly supported at both ends and accurately prestressed in tension, the sine switch features outstanding resistance to shock and vibration.

Klixon® switches have been used in a variety of aircraft, weapons systems, aircraft engine and aerospace applications for well over 30 years. A brief listing of typical applications include:

- Door interlock systems
- Aircraft engine ignitions
- Aircraft missile launcher position indication
- External stores emergency jettison switches
- Stowed / deployed indication for thrust reversers
- Safety ignition indication for military jet engines
- Radar pod door switches
- Tank/armored personnel carrier missile launcher switches
- Tank gun turret position indication

KLIXON® | 4HVS Series

High Performance Hermetic Interlock Switches

FEATURES

- Explosion-proof device
- Stainless steel, hermetic seal construction
- Rated to 10 amps
- Rated for 28 VDC and 110 VAC, 60-900 Hz
- Available in single pole, double throw (SPDT) and double pole, double throw (DPDT)
- Screw or soldier terminals

INTRODUCTION

The Klixon® 4HVS series of interlock switches utilizes a hermetically sealed snap-acting sine switch to create a high reliability yet cost effective solution. The 4HVS Series was developed for the most severe environments, and the most demanding applications. Ideal for guarding engine compartments, access and maintenance hatches, electrical cabinets, machinery, and industrial equipment. Its explosion-proof design and one-piece steel case construction make it well suited for fuel wetted areas. Its high vibration resistance makes it an ideal choice for ground and air vehicle applications.

Our part number building block approach utilizes standard components and provides a wide variety of options...while retaining the cost advantage of off-the-shelf devices.

Klixon® | 6PS & 7PS Series

Hermetic Stainless Steel Pressure Switch

FEATURES

- Hermetically sealed per MIL-E-5400 paragraph 6.3.10
- Covers actuation range of 45 to 700 PSIA
- Maximum corrosion resistance under hostile conditions
 - 300 series stainless steel construction for all environment exposed parts
 - Stainless steel and brass construction for media exposed parts
- High vibration resistance
- 8000 psi minimum burst pressure
- SPDT switch configuration
- Available in a wide range of standard and custom configurations

INTRODUCTION

The Klixon® 6PS and 7PS series precision pressure switches are snap-acting, all-welded devices with hermetically sealed switch contacts. Our pressure switches were developed for applications in aerospace and electronics where high reliability and/or resistance to severe environments is required. To ensure maximum corrosion resistance under hostile conditions, all parts exposed to the pressure media and the environment are made of brass or 300 series stainless steel — no rubber parts are used.

Small and lightweight, 6PS and 7PS Series switches can be mounted by their pressure ports alone, allowing maximum flexibility of design. Full contact force is maintained even during high shock and vibration—regardless of applied pressure—because the positive, snap-action disc works in tandem with snap-action switch contacts.

There are over 1,000 existing 6PS switch package designs. The 6PS is ideal for highly customized package and performance needs. The 7PS is ideal for higher volume standard solution needs.

SPECIFICATIONS

Temperature Rating	-65°F to 275°F (-53.8°C to +135°C)
Vibration Resistance	25 G, 20–2000 cps (no contact chatter in excess of 10 microseconds)
Burst Pressure	8,000 PSI minimum
Proof Pressure	8 times actuating pressure
Life @ Rated Current	50,000 cycles
Current Capacity	Resistive : 5amp @ 28 VDC Inductive : 2amp @ 28 VDC Lamp : 1amp @ 28 VDC
Dielectric Strength	Terminal to terminal : 1000 vrms Terminal to case : 1000 vrms
Weight	Without Leads : 30 grams maximum With Connector : 60 grams maximum
Metal Parts Exposed to Pressure & Environment	300 series stainless steel CA-360-2 (1/2 hard leaded brass)
Potting Material	Epoxy resin

S = ± 20						
3. Actuation Pressure						
Enter a 3-digit value from 45 PSIA to 700 PSIA. If under 100PSIA, place a "0" in front, for example 45PSIA = 045						
2. Deactuation Pressure Tolerance						
A = ± 5	T = ± 25					
C = ± 7	U = ± 30					
F = ± 10	V = ± 35					
L = ± 15	W = ± 40					
S = ± 20						
5. Deactuation Pressure						
Enter a 3-digit value from 45 PSIA to 700 PSIA. If under 100PSIA, place a "0" in front, for example 45PSIA = 045						
6. Lead Length Code (if applicable)						
D = 6"	J = 36"					
E = 12"	K = 42"					
F = 18"	L = 48"					
G = 24"	M = 60"					
H = 30"	N = 72"					

Klixon® | 2SE Series

Solid-State Air Flow Sensors

FEATURES

- Solid-state design for improved reliability
- SPST or SPDT configuration
- Normally open or normally closed
- Commercial or military grades available
- Low power dissipation (approximately 3 watts)
- Excellent shock and vibration resistance

INTRODUCTION

Sensata is a world leader in the design and manufacture of air flow sensors. We build devices that are high-quality, dependable, and reasonably priced. We can customize Klixon® air flow sensors to meet your engineering needs. Our solid-state vane switch is ideal for recognizing loss or reduction of airflow in electronic equipment. Typically used in power supplies, data processing equipment, and large electronic cabinets.

Unlike its electromechanical vane switch predecessor, our solid-state switch continues to provide reliable switching even in the dirtiest of environments. Klixon® air flow sensors are designed to recognize loss or reduction of airflow in:

- Power supplies
- Data processing units
- Commercial electronic equipment
- Military electronic equipment

SPECIFICATIONS	
Supply Voltage	30 VDC max
Switching Capacity	up to 400 milliamps
Operating Temperature	+10°C to +50°C
Amb. Temperature Range	up to 150°C
Life Cycles	100,000
Average Weight	20 grams

STANDARD PART NUMBER BUILDER

TERMINALS ARE GOLD PLATED BRASS

$\frac{0.092 \pm 0.005}{[2.34 \pm 0.127]}$ WIDE X $\frac{0.031 \pm 0.003}{[0.787 \pm 0.08]}$ THICK

WIRE LEADS AVAILABLE INTERNALLY WIRED, 22 AWG

MATING FEMALE QUICK-CONNECT
TERMINALS ARE AVAILABLE, ORDER
P/M 17874-1 FOR KIT OF 3.
(ARK-LES P/N 3700HZC)

Important Notice: Sensata Technologies reserves the right to make changes to, or to discontinue, any product or service identified in this publication without notice. Before placing orders, users should obtain the latest version of the relevant information to verify that the information being relied upon is current.

Sensata Technologies assumes no responsibility for customers' product designs or applications. Users must determine the suitability of the Sensata device described in this publication for their application, including the level of reliability required. Many factors beyond Sensata's control can affect the use and performance of a Sensata product in a particular application, including the conditions under which the product is used and the time and environmental conditions in which the product is expected to perform. As these factors are uniquely within the user's knowledge and control, it is essential that the user evaluate the Sensata product to determine whether it is fit for a particular purpose and suitable for the user's application.

Sensata Technologies products are sold subject to Sensata's Terms and Conditions of Sale which can be found at: www.sensata.com/terms.htm
