## **Surface Mounted Low Profile Cable Molding**

### **F&M-SMLP-CM**

When you have a need to run wiring for access control products, we provide an efficient and attractive option. Our low-profile molding mounts right onto the face of the door frame face and, when color-matched, blends right into the appearance of the frame itself. The molding system primarily consists of the base blocks, which are mounted onto the frame, and the molding cover, which snaps onto the blocks and is removable with a special tool. Whether your project is new construction or retrofit, this product provides an excellent option for running your power and communication wiring because of how it provides easy accessibility during install and after the installation is complete.

**Pic1** shows the basic components: the base block and the cover (one with an angle cut and one with straight cuts, both ends). **Pic2** shows how the base blocks provide two distinct paths for the wiring runs. **Pic3** shows an actual retrofit where this product was used to get wiring to the components and the molding was color matched per the owner's standard color requirements.
