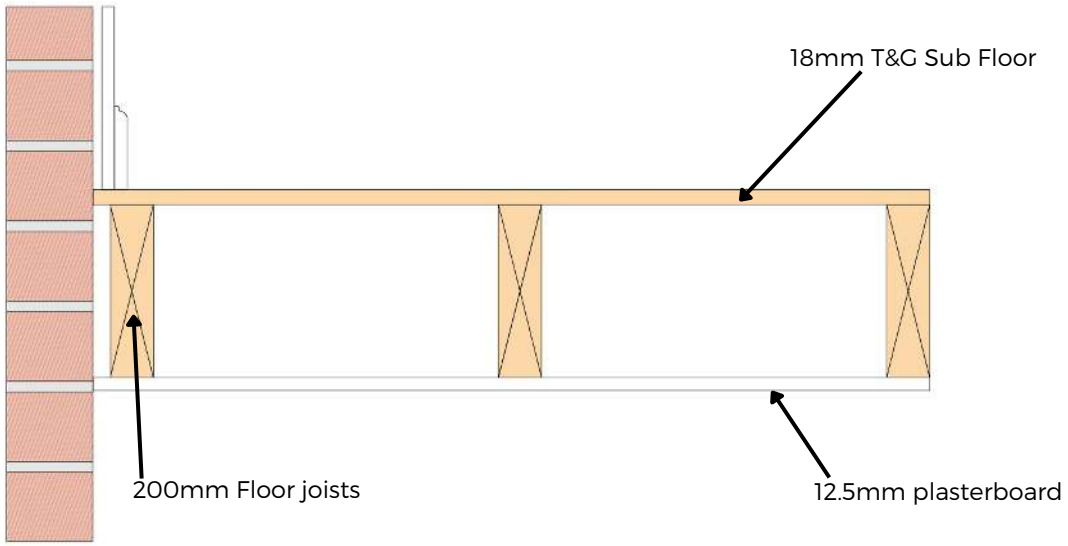
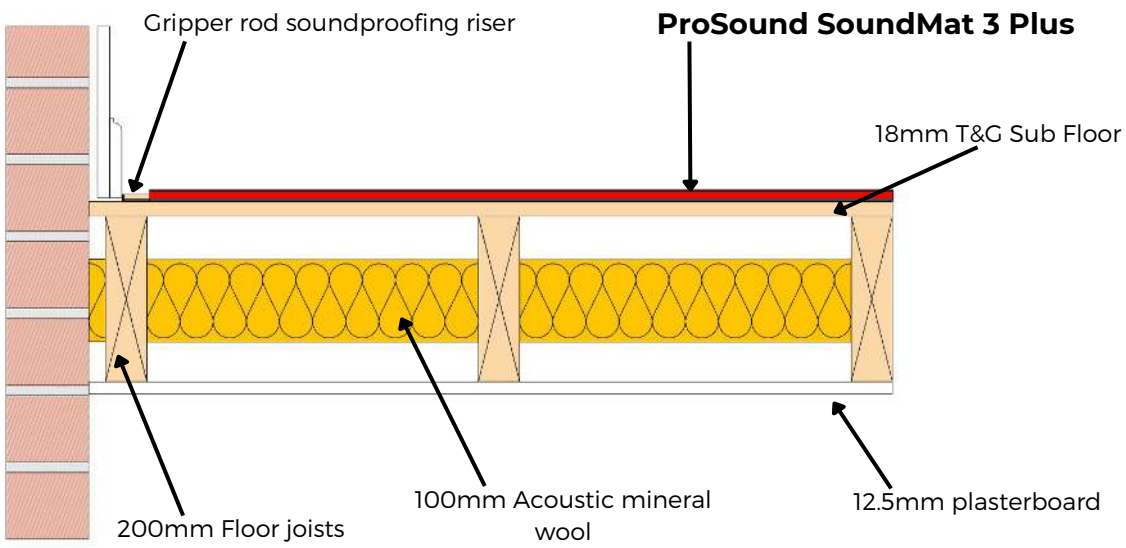
Timber Joisted Floor: Build-up

Untreated Floor



Treated Floor

Fig.1



Structure Layers	Weight Per Sqm
15mm SoundMat 3 Plus	16Kg m^2
18mm T+G P5 Chipboard Floor	12Kg m^2
200mm Timber Floor Joists	N/A
100mm Acoustic Mineral Wool Fitted Between Floor Joists	6Kg m^2
12.5mm Plasterboard	9.3Kg m^2

Timber Joisted Floor: Airborne Test Data

Standardised airborne sound level difference according to BS EN ISO 140-4
Field measurement of airborne sound insulation between rooms
Source room volume - 47m^3
Receiving room volume - 42m^3

Frequency - Hz	DnT Value 1/3 Octave -dB Untreated Floor	DnT Value 1/3 Octave -dB Treated Floor
63	#	#
80	#	#
100	6	25
125	15	32

* Resonate Frequency - 42Hz

Reference: Fig. 1

Airborne Sound Test Results

Untreated Floor	Treated Floor	Floor Improvement
DnT,w = 38dB	DnT,w = 51dB	DnT,w = 13dB
DnT,w + Ctr = 25dB	DnT,w + Ctr = 43dB	DnT,w + Ctr = 18dB

Rating according to ISO 717-1

With airborne noise a higher value equals a better performance

Timber Joisted Floor: Impact Test Data

Standardised impact sound pressure levels difference according to BS EN ISO 140-7
Field measurement of impact sound insulation of floors
Source room volume - 47m^3
Receiving room volume - 42m^3

Frequency - Hz	L'nT Value 1/3 Octave -dB Untreated Floor	L'nT Value 1/3 Octave -dB Treated Floor

Impact Sound Test Results

Untreated Floor	Treated Floor	Floor Improvement
L'nT,w = 82dB	L'nT,w = 51dB	L'nT,w = 31dB

Rating according to ISO 717-2

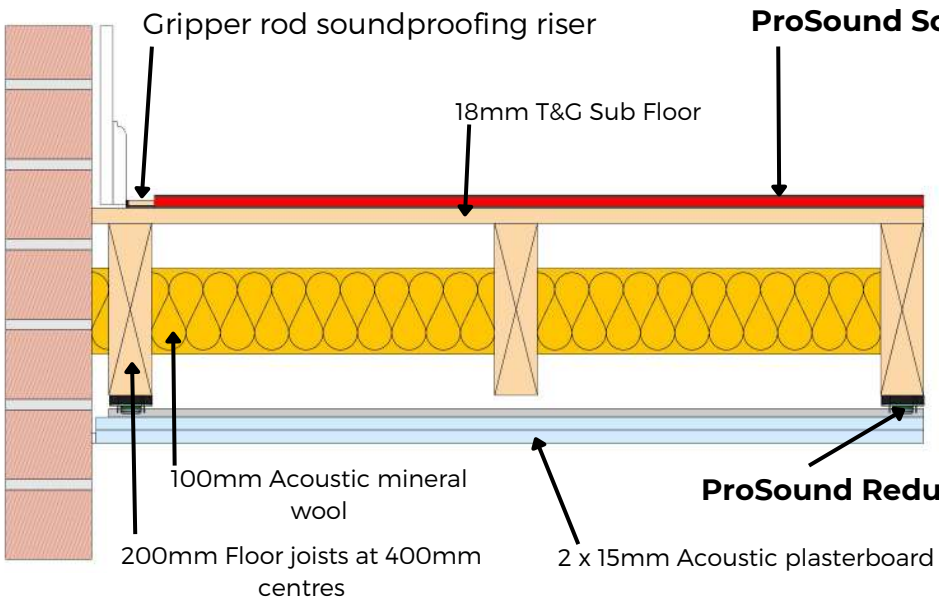
With impact noise a lower value equals a better performance

Timber Joisted Floor: Build-up (Recommended for Part E)

The below is recommended when needing to pass Part E Building Regulations.

Treated Floor

Fig.2



Structure Layers	Weight Per Sqm
15mm SoundMat 3 Plus	16Kg m^2
18mm T+G P5 Chipboard Floor	12Kg m^2
200mm Timber Floor Joists Filled with 100mm 60Kg m^3 Mineral Wool	6Kg m^2
25mm ReductoClip & Furring Bar	N/A
15mm Acoustic Plasterboard	12.8Kg m^2
15mm Acoustic Plasterboard	12.8Kg m^2

Timber Joisted Floor: Airborne Test Data (Recommended For Part E)

Standardised airborne sound level difference according to BS EN ISO 140-4
Field measurement of airborne sound insulation between rooms
Source room volume - 47m^3
Receiving room volume - 42m^3

Impact Sound Test Results

Treated Floor
L'nT,w = 42dB

Rating according to ISO 717-2

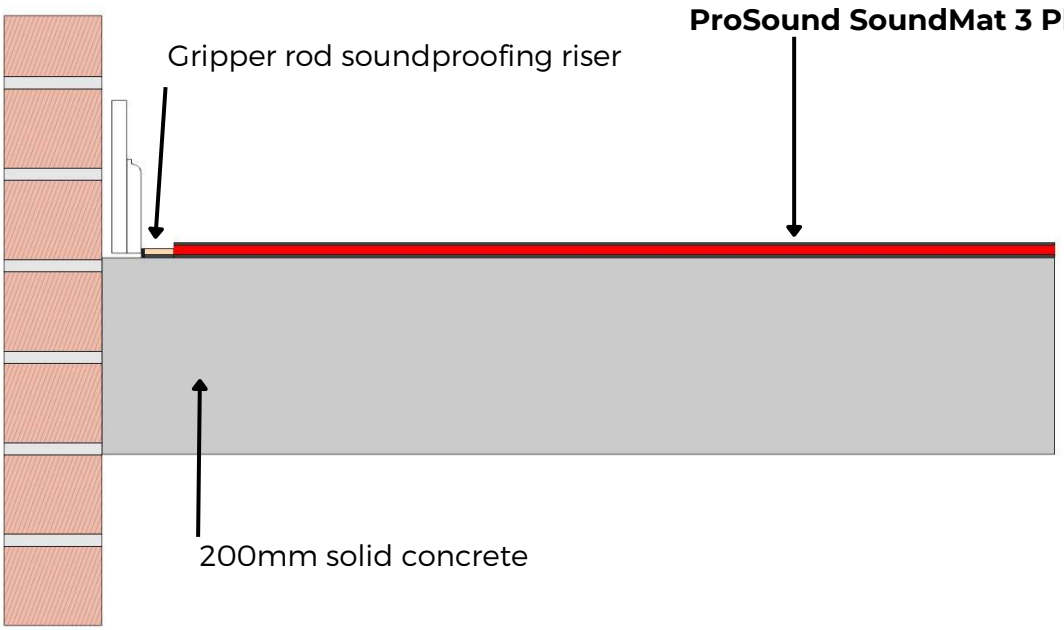
With impact noise a lower value equals a better performance

Concrete Floor: Build-up

Concrete testing is purely for impact performance.

Treated Floor

Fig.3



Structure Layers	Weight Per Sqm
15mm SoundMat 3 Plus	16Kg m^2
200mm Solid Concrete	490Kg m^2

Concrete Floor: Impact Test Data

Standardised impact sound pressure levels difference according to BS EN ISO 140-7
Field measurement of impact sound insulation of floors
Source room volume - 62m^3
Receiving room volume - 51m^3

Impact Sound Test Results

Untreated Floor	Treated Floor	Floor Improvement
L'nT,w = 76dB	L'nT,w = 47dB	L'nT,w = 29dB

Rating according to ISO 717-2

With impact noise a lower value equals a better performance

Part E Regulations For England & Wales

Element of Construction	Airborne Sound DnT,w + Ctr Minimum Value	Impact Sound L'nT,w Maximum Value
Floors		
Separating floors between purpose built dwelling-houses and flats (i.e. New Build) & purpose built rooms for residential use.	(Higher than) 45dB	(Lower than) 62dB
Separating floors between dwelling-houses flats and residential rooms formed by a material change of use (i.e. conversions)	(Higher than) 43dB	(Lower than) 64dB

Part E Regulations For Scotland

Element of Construction	Airborne Sound DnT,w Minimum Value	Impact Sound L'nT,w Maximum Value
Floors		
Separating floors between dwelling-houses flats and rooms for residential purposes. New build and conversions	(Higher than) 56dB	(Lower than) 53dB
Separating floors between dwelling-houses flats and rooms for residential purposes. Conversion of traditional buildings	(Higher than) 53dB	(Lower than) 58dB

Technical Terms

DnT,w - Weighted Standardised Field Level Difference

The difference, in decibels, between the level of noise either side of a structure tested in the field / on site.

This measurement type is used in Scottish Part E Building Regulations.

DnT,w + Ctr - Weighted Standardised Field Level Difference Adjusted For Control

The difference, in decibels, between the level of noise either side of a structure tested in the field / on site. But it is adjusted to include how well it stops low frequency noise.

This measurement type is used in England and Wales Part E Building Regulations.

L'nT,w - Weighted Standardised Field Impact Sound Pressure Level

The amount of impact noise transmitted through a floor structure, in field conditions, so includes flanking transmission.

This measurement type is used in all Part E Building Regulations.

Sound Tests

Sound tests are carried out by and independent testing company.

For airborne testing high volume "white" noise is generated from a single loudspeaker in the source room, positioned in order to obtain a diffuse sound field.

A spatial average of the resulting one-third octave band noise levels between 100 Hz and 3150 Hz is obtained by using a moving microphone technique over a minimum period of 15 seconds at one position.

The same measurement procedure is followed in the receiver room.
The entire procedure is then repeated, with the loudspeaker located in a different position.
The results of the tests are rated in accordance with BS EN ISO 717-1: 1997

For impact testing a tapping machine is placed on the floor which has a set of 5 steel hammers to produce impact noise on the separating floor. Level measurements are acquired in the receiving room at 2 microphone positions, at one third octave band intervals from 100 to 3150 Hertz using an average time of at least 6 seconds for each of 4 tapping machine positions, creating 8 individual measurement readings.
The procedure is repeated in different positions.
The results of the tests are rated in accordance with BS EN ISO 717-2: 1997
