ANALYZE

ANALYZE-F-0002

Break an argument into checkable claims and show what is supported, assumed, contradicted, ambiguous or still missing evidence.

WHAT IT IS

CLAIM AUDITOR is an evidence-structure formula. It turns persuasive prose, research notes, reports or debates into atomic claims so you can see which statements are observations, which are inferences and which depend on evidence that has not actually been supplied.

It does not decide what you should believe. It exposes the support chain, distinguishes absence of evidence from contradiction and identifies the exact verification work required to strengthen or reject a claim.

BEST FOR

Reports, proposals, investigations, research drafts, articles, pitches, internal memos, debates, vendor claims and AI-generated material where confident wording can hide weak support.

WHAT YOU GIVE IT

The text or argument to audit plus, optionally, the source material or evidence set that the claims are supposed to rely on.

WHAT IT RETURNS

A claim ledger showing claim type, supplied support, gaps, contradictions, hidden assumptions, dependency chains, verification priority and the minimum evidence needed to resolve uncertain claims.

HOW TO USE IT

1. Paste the argument exactly as written so the audit can distinguish what is claimed from what you merely intended to imply.
2. Include the evidence or source set when available; otherwise the formula will audit internal support and specify what external verification is still needed.
3. Use high-priority gaps as a research queue instead of treating every missing citation as equally important.

GOOD FIT IF...

Choose this formula when a text sounds convincing but you need to know which parts are actually established and which parts are riding on assumptions.
