

Mildura Water Tank

Australian Reservoir Services and Lower Murray Water engaged Aqua Prep to create a specialised program for removing the entire coating from the floor and walls of a 50.5m diameter x 10m structure within an extremely tight timeline.

An independent coatings inspector evaluated the coating after the removal and treatment process. Their assessment confirmed that the treated water met the standards for safe disposal into the sewer system.

This innovative approach resulted in significant cost savings for Lower Murray Water, reducing disposal expenses by thousands of dollars. The project was completed earlier than anticipated, with production rates reaching 1000 square meters daily.
